EPISCOPALES VALVULÆ, the ſame as the Valvulæ Mitrales, are, particularly, two Valves in the pulmonary Vein, which prevent the Reflux of the Blood to the Heart. *Blancard.*

EPISEION, ἐπίσειον. The Pubes. *Hippocrates*, *Lib.* 1. περὶ γυναικ.

EPISEMASIA, ἐπσημάσια, from ἐπσημαίνω, to indicate; is the ſame as ANNOTATIO, which ſee. The Verb ἐπσημαίνω, in *Hippocrates*, *de Morbo Sacro*, bears a very peculiar Senſe, ſignifying to receive a Mark, or Characteriſtic, from the Paroxyſm of an Epilepſy, as a Diſtortion of an Eye; whence ſuch Patients are called ἐπίσημα παιδία, "characterized Children;" and ſuch as have no ſuch Diſtinction, take the Appellation of ἄσημα, "uncharacterized." *Caſtellus.*

EPISION. The ſame as EPISEION. *Blancard.*

EPISPASMOS, ἔπισπασμὸς, from ἐπισπάω, to attract, in *Hippocrates*, according to *Galen*, *Com. in* 6 *Epid. Sect.* 5. *Aph.* 30. is the ſame as εἴσπνοὴ, "Inſpiration;" or, as others will have it, a more quick and frequent Inſpiration than is natural. What Kind of ſorbile Liquors *Hippocrates* means by his ἐπισπαστικὰ ῥοφήματα, *Lib. de R. V. I. A. Galen*, in his Comment, ſays, cannot be determined. But *Hor. Augen. Epiſt.* & *Conſil. Med. T.* 2. takes them to be ſorbile Aliments, mix'd with Purgatives. In a particular Senſe, *Epiſpaſticum Medicamentum*, a dry Medicine, prepared for the Cure of malignant Ulcers by Inſperſion, and *Epiſpaſticum Emplaſtrum*, in *Scribonius Largus*, *N.* 216. is a drawing Plaiſter, for extracting of Pus, or whatever elſe requires Extraction. *Caſtellus.*

EPISPASTICA, ἐπισπαστικὰ, from ἐπισπάω, to attract. Epiſpaſtic. See VESICATORIA and CANTHARIDES.

EPISPHÆRIA, ἐπισφαίρια, from σφαῖρα, a Sphere. The Turnings and Windings of the exterior Subſtance of the Brain. *Blancard.*

EPISTASIS, ἐπίστασις, from ἐφίστημι, to reſtrain, repreſs; in many Places of *Hippocrates*, ſignifies the ſame as EPISCHESIS, which ſee. But, *Lib. de Inſom.* and 7 *Aph.* 34. it ſignifies the Subſtance ſwimming on the Superficies of the Urine; in Oppoſition to *Hypoſtaſis*, the Sediment at the Bottom.

EPISTAXIS, ἐπίσταξις, from ἐπὶ, importing Addition, or Repetition, and στάζω, to diſtil, is uſed by *Hippocrates*, to ſignify a repeated Diſtillation of Blood from the Noſe; as, for Inſtance, on the critical Day, after a preceding Diſtillation on the indicatory Day, or EPIDELUS, which ſee.

EPISTOMION, ἐπιστόμιον, from στόμα, a Mouth. A Stopper. But it is uſed by ſome Chymiſts to ſignify the Mouth, or Vent-hole of a Furnace, called a Regiſter.

EPISTROPHE, ἐπιστροφὴ, from ἐπιστρέφω, to invert or diſtort. It implies an Inverſion, Diſtortion, or a Relapſe.

EPISTROPHEUS, ἐπιστροφεὺς, from ἐπιστρέφομαι, to turn, or be incurvated. The Name of the ſecond Vertebra of the Neck. See SPINA.

EPISYNTHETICI, ἐπισυνθετικοὶ, from ἐπισυντίθημι, to accumulate. Certain Phyſicians among the Antients, of which *Leonidas*, mentioned by *Cœlius Aurelianus*, ſeems to have been the moſt celebrated. We know little, or nothing, of their Syſtem; but, by the Derivation of the Word, it ſhould ſeem, that they were attached to no particular Sect; but either reconciled

ciled them all together, or elſe choſe out of each what they moſt approved.

EPITASIS, ἐπίτασις, from ἐπιτείνομαι, to be augmented, heightened, in *Hippocrates* ſignifies the Increaſe and Beginning of the Paroxyſm of a Fever. *Lib. de R. V. I. A.* Ἐπίτασις, alſo, ſeems ſometimes to ſignify the ſame as ἐπίσασις, "a Suppreſſion;" as 2 *Prorrhet.* But ſome Copies have ἐπίσασις, though *Galen*, after *Dioſcorides*, reads ἐπίτασις.

EPITECNOS, ἐπίτεκνος, from ἐπὶ, to, or towards; and τέκνον, a Child, Offſpring; ſignifies fruitful, or well-diſpoſed towards the Office of Generation; and is ſpoken of both Sexes. 5 *Aph.* 62.

EPITEDEUMA, ἐπιτήδευμα, from ἐπιτηδεύω, fit, diſpoſed; is the Way of living, or Courſe of Life, which any Perſon preſcribes to himſelf; whether for ſake of Profit, or Neceſſity; called by *Cælius Aurelianus*, *Vitæ Affectiones*; and by *Celſus*, *Vita propoſita*.

EPITEX, ἐπίτεξ, from ἐπὶ, towards, and τέξις, Birth. An *Ionic* Word, applied to a Woman, and importing her being near her Time of Delivery. *Hippocrates*, *de Mulierum Morbis*, *Lib.* 1.

EPITHEMA, ἐπίθημα, from ἐπιτίθημι, to lay upon, or apply. In *Hippocrates*, it ſignifies a Lid, or Cover; but later Authors uſe the Word to expreſs a certain topical Medicine, of different Conſiſtences, neither of the Nature of an Ointment, nor that of a Plaiſter, to be applied to the Surface of the Body, for various Puposes and Intentions. When this Species of Medicine is applied warm, it is called a Fomentation.

There are three Kinds of Epithems; firſt, the liquid; ſecondly, the dry, or ſolid; and, thirdly, thoſe of the ſoft and poultice Kind. The two former retain the general Name of Epithem, and the latter is called Cataplaſm, Poultice, or Malagma. See CATAPLASMA.

A liquid Epithem, called alſo, ſometimes, a Fomentation, is a medicated Liquor, either ſimple or compound, applied either cold or hot, by the Intervention of a proper Vehicle, to the Surface of the Body; and calculated, either for inducing ſuch a Change on it, or the ſubjacent Parts, as the Intention of the Phyſician ſhall require.

The Liquors for theſe Intentions may be Water, Milk, Wine, Vinegar, Spirit of Wine, liquid Juices, Oil, or Urine, either ſimple by themſelves, or variouſly prepared, and mix'd either with each other, or with other officinal and extemporaneous Medicines, of whatever Conſiſtence, ſuch as diſtilled Waters of all Kinds, Vinegars, infuſed Oils, Decoctions, aromatic Spirits, Tinctures, Eſſences, ſaline Liquors, Lixiviums, Forge-water, Lime-water, and, eſpecially, Infuſions and Decoctions prepared from theſe and other proper Materials, expreſſed Juices, Emulſions, and Mixtures of various Kinds.

The Choice of the Phyſician, with reſpect to proper Materials, is to be directed by the Nature of the Part to be changed, or to which the Application is made, the malignant or benign Nature of the Symptoms, and the particular Quality of the Liquor to be uſed.

The ſame Cautions are to be uſed in the Management of theſe, as in that of ſuch Forms for internal Uſe: Only, as in the former Caſe it is not neceſſary we ſhould regard the Taſte, the Smell, or the Colour of the Medicines; ſo, for this Reaſon, we are to omit the Sugars and Syrups uſed for correcting internal Remedies.

A pretty thick Conſiſtence is no Diſadvantage to liquid Epithems, though, at the ſame time, when a deep Penetration into the Part affected is required, thoſe of a leſs thick Conſiſtence are, when all other Circumſtances are alike, to be preferred.

As a Change of the Part only, to which the Application is immediately made, is not always intended, but, ſometimes, alſo, of the Viſcera and Organs lying under it; ſo the Subſtances moſt proper for Applications of this Kind are thoſe, whoſe Virtues conſiſt in their volatile, highly fine, and penetrating Principles, eſpecially when a Change of the internal Parts is intended: For this Reaſon, Subſtances of an earthy or ſtony Nature, Aſtringents, and Materials of an inſpiſſating Nature, can poſſibly be of no Service for this Purpoſe; ſince, in conſequence of their Thickneſs, they either cannot be abſorbed, or, by bracing up the Mouths of the Pores, prevent their own Ingreſs. But, perhaps, better Effects may be produced by adding ſome penetrating Aromatic, or Spirit, to gentle Aſtringents.

It is alſo to be carefully conſidered, whether the Nature of the Part, to which the Application is immediately to be made, is ſuch, as, without being injured, is capable of bearing the Liquor, whether Oil, Water, Spirits, or acrid Fluids; leſt, whilſt we do Service to one Part, we ſhould injure or hurt another.

Such Subſtances as are rarely, or never, exhibited internally, are uſed for preparing Epithems of this Kind; ſuch as the moſt acrid and mercurial Preparations, Preparations of Lead, Alcohol of Wine alone, Henbane, Mandrake, Nightſhade, and Hemlock. But, in the Uſe of theſe, and other draſtic Materials, we are carefully to remember, that the whole Surface of the Body is of a bibulous Nature; and that the Subſtances it abſorbs are conveyed into the Maſs of Blood, without paſſing through the Stomach.

Their Quantity is not confined to Meaſure or Weight, but is to be determined by the Largeneſs of the Part to be cheriſh'd, and the greater or leſs abſorbent Quality of the Subſtance, by whoſe Intervention the Liquor is applied. Woolen are preferable to Linen, and double, or threefold, to ſingle Cloths, becauſe they imbibe more Liquor.

As the general Quantity is ſeldom leſs than half a Pint, ſo it uſually amounts to one, two, three, or more Pints, according as the Part to be cheriſhed is ſmall or large; according as there is only one, or more Parts to be ſo treated; according as the Vehicle is more or leſs bibulous; according as the Fomentation is to be continued for a longer or ſhorter time, or renewed at longer or ſhorter Intervals; or, according as the Liquor itſelf is more or leſs ſubject to Corruption, or prepared with Eaſe or Difficulty. It is more expedient rather to prepare too much, than too little; eſpecially if more Parts than one, or thoſe of the larger Kind, are to be fomented; leſt the Liquor ſhould fall ſhort too ſoon, or immediately after the firſt Application.

The mutual Proportion of the Ingredients is to be determined by the various Intentions of the Phyſician, and the known Virtues of the reſpective Materials. However, ſo great Accuracy is not required in preparing Epithems for external, as Forms for internal Purpoſes; only we muſt have a due Regard to their Conſiſtence, leſt by their Thickneſs they ſhould be rendered of a leſs penetrating Nature.

The Parts to be cheriſhed by Epithems are either, firſt, external, and capable of having the Liquor immediately applied to them. With reſpect to theſe, as being directly ſubjected to our Senſes, I ſhall only obſerve, that when there are Wounds or Ulcers in them, theſe ought previouſly to be covered with proper Medicines, leſt the Epithem ſhould by burning, or ſome other Circumſtance, ſo far incommode them, as to prevent their Conglutination. Or, ſecondly, the Parts to be changed by Epithems are internal. For this Purpoſe, a proper external Region muſt be choſen for the Application, according to the Situation of the internal Part, and the various Intentions of the Phyſician. For this Reaſon, it is of the higheſt Importance accurately to know, and conſider, the Situation and mutual Conſent of the Parts, together with the Courſe and Direction of the Veſſels. When the Epithem is intended to act immediately on the Part affected, either by corroborating, ſoftening, moiſtening, refrigerating, reſolving, or diſſipating, the Matter impacted on it, the Application is moſt properly and commodiouſly made, where the Integuments are ſofteſt, and leaſt thick. Where Revulſion or Derivation are intended, then the Epithem is to be applied either above or below the Part affected, according to its Situation, and its greater or leſs Conſent with particular external Parts. When Epithems are intended to act upon the whole Maſs of Blood, the moſt proper Places for their Application are thoſe external Parts where the Veſſels are largeſt, and leaſt covered, ſuch as the Temples, the Neck, the Arm-pits, the Wriſts, the Groin and the Hams.

As for the Vehicles of liquid Epithems, theſe are very various, ſuch as Linen or Woolen Cloths of various Colours, but eſpecially red Silk, Stupes, toaſted Bread, Crumb of Bread, Sponge, dry Epithems, or Bags: Sometimes the Liquor is, alſo, included in a large Hog's Bladder. The Vehicles of theſe Epithems are to be determined by the different Intentions of the Phyſicians, and Natures of the Parts affected, as alſo by the Eaſe and Quickneſs with which ſome are prepared in Compariſon of others. When a large Quantity of Liquor is to be applied, and its Heat long preſerved, Woolen Cloths, Stupes, and Sponges, anſwer the Intention beſt. A Bladder prevents the Diſſipation of the Liquor, preſerves its Heat, and does not ſtain the Part to which it is applied; but it only ſlowly tranſmits the more fine and ſubtile Particles: And from this Circumſtance we are to form a Judgment of the Caſes in which it may be properly uſed. When the Part to be cheriſhed is tender, and when the Epithem is applied cold, or where there is no urgent Neceſſity for preſerving the Heat, we may for a Vehicle uſe Linen Cloths, either double, triple, or more folded, in proportion to the Quantity of Liquor to be applied.

The Intention of the Phyſician, the Nature of the Part, and the Qualities of the Epithem, muſt concur to determine whether one of the cold or hot Kind ought to be applied. When the Intention is powerfully to reſolve, penetrate, and attract, thoſe of the hot Kind are moſt commodious and advantageous: But Heat is injurious to Parts conſtricted by intenſe Cold, as alſo ſpirituous and volatile Liquors; and thoſe that are cold, or at leaſt tepid, are to be us'd. The Coldneſs of the Liquor may, if 'tis thought proper, in ſome meaſure be taken off, by heating the Vehicle before 'tis ſoak'd with the Liquor.

The Epithem is to be ſecur'd by Bandage; but when a long Application of the Liquor, and Continuation of the Heat, are requir'd, 'tis proper to lay an Hog's Bladder, previouſly anointed with Oil, over it; and, over all, a Bag full of hot Sand, Bricks, or any other hot Body which retains the Heat long; and theſe, when become cold, are to be remov'd, and warm'd again; the Epithem, in the mean time, remaining on the Parts.

There is a very great Variety with reſpect to the Time they are to be left on the Part affected, how long their Uſe is to be continued, and the particular Seaſons at which they are to be renew'd: Sometimes they are remov'd, when the Symptoms for the Removal of which they were applied, ceaſe; when, for Inſtance, the Pain, the Watchings, the Cold, the Heat, the Uneaſineſs, the Vomiting, the Hæmorrhage, the Loſs of Strength, the Delirium, or any other Symptoms, remit: At other times they are remov'd, when the Virtue and Energy of the Liquor is diſſipated; when, for Inſtance, it is become cold, or the Vehicle is render'd dry: At other times, ſtated Periods are fix'd for their Removal, ſuch as the Morning, the Evening, once or twice a Day, or every two or three Hours; but, in particular Caſes, the Times may be eaſily regulated by a Phyſician, who duly conſiders his own Intention, the Genius of the Diſeaſe or Symptom, the volatile or fix'd Nature of the Liquor, the Matter of the Vehicle, and the Eaſe or Difficulty with which it is prepar'd.

Epithems of this Kind are of very univerſal Uſe, by affording Relief in acute and chronical, external and internal Diſorders: They are beneficial both to the Solids and Fluids, either by their emollient, aſtringent, corroborating, repellent, attracting, heating, refrigerating, diluent, diſſolvent, diſcutient, ſoothing, and exciting Qualities; or thoſe by which they are proper for correcting Acrimony, and allaying Pain: They are alſo conducive both to the Production and Promoting of Evacuations almoſt of all Kinds: They are proper for Patients of all Ages, provided the Materials are choſen with Judgment, and the Application ſeaſonably made. By Epithems, internal Medicines are ſometimes excellently ſupply'd in Infants, and others who either abhor internal Medicines, or cannot ſwallow them; but to others, the Application and Renovation of them is more troubleſome and uneaſy, than the Uſe of Internals. Epithems ſometimes prove hurtful, by being unſkilfully us'd, ſince they remove the Symptoms, without deſtroying the Cauſe of the Diſorder: But this principally holds true with reſpect to ſtupefying Epithems, or in Caſes where Repellents, when the Matter of the Diſeaſe is not ſufficiently moveable, by conſtricting the Veſſels, render it more compact; or when Epithems, which were requir'd hot, are, by their long Application, become cold. But as theſe Diſadvantages only attend the Abuſe of Epithems, they may be avoided by the Skilful and the Cautious.

A dry Epithem is a medicated Powder, for the moſt part ſew'd up in a Cloth, and apply'd to the Surface of the Body, with various Intentions, for changing both internal and external Parts: It is call'd *Sacculus*, *Saccus*, *Cucupha*, *Cucullus*, *Frontale*, *Scutum*, *Lectulus*, and *Pulvinar*; according to the various Parts and Uſes to which it is apply'd.

The Powders us'd for this Purpoſe are generally groſs, or but moderately fine, becauſe the Adheſion of their Particles, or their falling thro' the Cloth in which they are included, is not intended.

The Materials of theſe are Powders in general, and whatever elſe of a like Nature is judg'd proper for external Uſe: The Choice of theſe Materials is to be determin'd by the Intention purſued, and the Relation betwixt that Intention and the Ingredients us'd. However, the drier Parts of Animals, Roots, Barks, Leaves, Flowers, Seeds, Berries, Aromatics, indurated Juices, and the officinal Species compounded of theſe, are moſt generally us'd for this Purpoſe.

When in theſe a penetrating Quality is requir'd, 'tis often cuſtomary, not only for the ſake of Conſiſtence, but alſo of Efficacy, to add liquid Epithems, that by their means the dry Materials may not only be render'd more active, but alſo prove a Vehicle to the other.

In preparing thoſe Species of dry Epithems, call'd *Lectuli*, or Couches, and *Pulvinaria*, or Cuſhions, Chaff is uſually mix'd with the medicated Powder, in order to diſperſe it the better: But in preparing Cucuphas, or other Bags of a like Nature, which are requir'd ſoft, and not much moiſten'd, 'tis ſometimes better to uſe Cotton, or the Wool of ſome Animal.

To this Claſs alſo belong Bags fill'd with Sand, when us'd either alone, or with a liquid Epithem, in Caſes where a long-continued Heat, either of the dry or moiſt Kind, is requir'd.

The Quantity of the Materials is to be limited by the Largeneſs of the Bag to be fill'd, which is again to be proportion'd to the Surface of the Part to be cheriſh'd: Hence both are very various. That Part of the Head which is cover'd with Hairs, the Stomach, and the Liver, generally require two, three, or four Ounces; the Heart, the Spleen, and Kidneys, one or two Ounces; and the other Parts, a Quantity proportion'd to their reſpective Bulks. Couches, or Cuſhions, to lie or ſit upon, require a conſiderable Number of Pounds.

The various Ages of Patients, and the different States and Conditions of the Parts affected, require Materials and Management of widely different Natures.

The Bags muſt not be too hard ſtuff'd, but only fill'd in a looſe and ſpongious Manner, that they may be ſufficiently pliant and ſoft.

The general Quantity of the Materials is to be determin'd from the Largeneſs and Number of the Bags to be fill'd; for frequently a conſiderable Number are preſcrib'd, either to be apply'd to different Parts all at once, or to the ſame Parts ſucceſſively and alternately.

The mutual Proportion of the Ingredients is, as in other Epithems, to be determin'd by the Intention of the Phyſician, and the Qualities of the ſeveral Subſtances.

The Powders, employ'd for theſe Purpoſes, are ſometimes prepar'd by cutting down, but more generally by a coarſe and groſs Trituration; after which they are to be carefully mix'd: Sometimes ſome only, or all of the Ingredients, are order'd to be roaſted in a Frying-pan, that their Virtues may be either augmented, or their Qualities chang'd; but in volatile Subſtances this Practice is hurtful. At other times the Materials are, before they are put into the Bag, ſprinkled with efficacious and aromatic Liquors, Spirits, Oils, and Tinctures.

The Bags for theſe Epithems are, for the moſt part, made of coarſe Linen Cloth, pretty much wore, as alſo of fine Linen, or Silk, but rarely of Woolen Cloth. We are to be directed in our Choice of the Cloth for this Purpoſe, by the Nature of the Part to be cheriſh'd, the Quantity of the Powder, its Quality, the greater or leſs Streſs the Bag is to bear in the Application, the Price of the Cloth, and the Inclination of the Patient. The Figure of the Bag is to be accommodated to the Part it is to be apply'd to, and the Intentions propos'd: For the Head 'tis commonly made in the Form of an Hood; for the Forehead, of an oblong ſquare Figure; for the Heart, pyramidal; for the Stomach, in the Form of a Shield; for the Liver, in the Form of a Creſcent; for the Spleen, in the Form of an Ox's Tongue; and for the Navel, round: Couches and Cuſhions are to be made ſo large as to anſwer the End, but retain the uſual Form and Shape: Sometimes their Breadth and Length, correſponding to the Part to be cover'd, are confin'd to a particular Number of Inches; at other times the Part to be cheriſh'd is only mention'd, and the reſt left to the Skill and Judgment of the Apothecary: The Number alſo, when more than one are to be made, is to be ſpecify'd.

Before the Bag is fill'd, the Powder is to be mix'd with Chaff, Cotton, or Wool; and the Materials thus prepar'd are, for the moſt part, ſew'd up in the Bag: But ſometimes 'tis ſufficient only to tie or fold them up, when an exact Figure, or long Application, are not requir'd: Large Bags are ſew'd in ſuch a manner, as comes near to what we call Quilting, leſt the included Powder ſhould be form'd into Concretions, or unequally collected to one Part.

Epithems of this Kind are apply'd either, firſt, by themſelves, dry, and, for the moſt part, previouſly warm'd; or, ſecondly, previouſly impregnated with the medicinal Virtues of other Subſtances, in order to render them more efficacious; for this Reaſon they are often, before their Application, moiſten'd, macerated, ſprinkled, or boil'd with a liquid Epithem: At other times they are impregnated by the Steam of ſome proper Decoction, or the Smoke of a kindled Fumigation: Or, thirdly, they are us'd over the Applications of liquid Epithems, in order to preſerve their Heat, or increaſe their Virtues.

Their Uſe is the ſame with that of liquid Epithems, only their penetrating Quality is leſs, and their Operation ſlower, without the Addition of one of the liquid Kind: There are, however, ſome Caſes, in which a dry Heat is at once more beneficial, and more eaſily born. To this Claſs of Medicines, alſo, belong Epithems of live Whelps, Pigeons, and Chickens, laid open; the Omentum, and other Parts of Animals, as yet poſſeſs'd of the vital Heat; Bread, as yet warm from the Oven; and ſome others of a like Nature, which may be either apply'd alone, or in Conjunction with other Subſtances, which are judg'd more efficacious. *Gaubius, de Formulis Medicamentorum.*

EPITHESIS, ἐπίθεσις. Of the ſame Derivation as EPITHEMA. In Surgery it imports the Rectification of crooked Limbs, by means of Inſtruments or Machines. *Caſtellus.*

EPITHYMBRUM. A Species of Moſs, which grows on the *Thymbra*, Winter Savory.

EPITHYMUM. See CUSCUTA.

EPITOCOS, ἐπίτοκος, from τίκτω, to bring forth; in *Hippocrates*, ſignifies with Child. *Epidem. L.* 6.

EPOCHE, ἐποχή. The ſame as EPISCHESIS, in Medicine.

EPOCHETEUSIS, ἐποχέτευσις· from ἐποχετεύομαι, to be derived or diverted into ſome new Canal or Duct. Derivation of the Blood, or Juices, from one Part to another.

EPOSCHION, ἐπόχιον. A Tendril of a Plant. *Galen. Exeg.*

EPODE, or EPODOS, ἐπῳδή, or ἐπῳδός· from ἐπὶ, on, or over, and ᾠδή, a Song. The Method of curing Diſtempers by Incantations. *Galen*, in the laſt Chapter of his Work *de Uſu Partium*, has this remarkable Paſſage relative to *Epodæ*. "This laſt Book, he ſays, which is the ſeventeenth of my "Work *de Uſu Partium*, like a good *Epodos*, explains the "Uſes and Advantages of the Whole. When I ſay *Epodos*, "I would not be thought to mean one who uſes *Epodæ* (In-"cantations); but as our lyric Poets make the Action of the "Chorus to conſiſt in the *Strophe*, and *Antiſtrophos*, and in a "third Part, which is the *Epodos*, wherein they ſtand before "the Altars, and ſing an Hymn in Honour and Praiſe of the "Gods, I was determin'd, that as this Book agrees in Office "with the Part of the Chorus now mentioned, it ſhould bear "the ſame Title, and be called the *Epodos*."

EPOMIS, ἐπωμίς· from ἐπὶ, upon; and ὦμος, the Shoulders. That Part of the Body, which lies betwixt the Articulation of the Humerus with the Scapula and the Neck.

EPOMPHALION, ἐπομφάλιον· from ἐπὶ, upon, and ὀμφαλὸς, the Navel. A Medicine which purges, by being apply'd to the Region of the Navel.

EPOPS, ἔποψ. The Bird call'd UPUPA; which ſee. *Caſtellus.*

EPOS, ἔπος. *Hippocrates*, in his Treatiſe *de internis Affect.* uſes this Word to expreſs a ſteep Place.

EPOSILINGA. Scales of Iron. *Rulandus.*

EPULIS, ἐπουλὶς· from ἐπὶ, upon, and οὖλα, the Gums.

A Species of Tubercles growing on the Gums, of which there are two Kinds; for ſome are entirely without Pain, whilſt others afflict the Patient in a moſt terrible manner, becauſe they are of a malignant Nature, and gradually degenerate into a Cancer. Tubercles of this Kind are alſo in ſome meaſure diſtinguiſh'd from each other, by their different Bulks and Conditions; ſince ſome are as big as a large Nut, and others no bigger than a ſmall one; ſome hard, others ſoft; ſome have a ſlender, and others a larger and broader Root: When theſe Tubercles are of the large Kind, they not only diſtend and deform the Jaws, but alſo prove a conſiderable Obſtruction to Maſtication and Speech; for which Reaſon, they require a ſpeedy and expeditious Cure: Now no Method of Cure is more expeditious, than a total Extirpation of theſe Caruncles, as is uſual in other Tubercles of a like Nature: When, therefore, the Roots are ſmall, a Thread is carefully to be paſs'd about them, with which they are to be tied pretty tight: But when the inferior Part of the Tubercle is pretty large, the Uſe of ſome gently corroſive Medicine is proper; and this Intention is excellently anſwer'd, by Oil of Tartar *per Deliquium*, or a Solution of Sal Ammoniac. But in Caſes of this Nature we are abſolutely to abſtain from the more draſtic and poiſonous Corroſives, ſince, for the moſt part, they not only excite violent Inflammations and Exulcerations of the Mouth, but may alſo produce the Death of the Patient, if they ſhould happen to be unfortunately ſwallow'd: For this Reaſon, in Caſes where the milder Corroſives are not ſufficient, 'tis more expedient and ſafe to ſeek the means of Relief from the Knife, whilſt theſe Caruncles, being laid hold of by a Pair of Forceps, or a ſmall Hook, are to be extirpated and cut out, either by the Knife, or a Pair of Sciſſars: But this is to be done cautiouſly, leſt, by cutting out the whole Subſtance of the Gum at the ſame time, a Caries ſhould be excited in the denudated Bones of the Jaw. The Diſcharge of the Blood is to be permitted for ſome time; but if it ſhould continue too long, in order to ſtop it the more eaſily, and cleanſe the Blood out of the Mouth, 'tis highly proper to make the Patient often waſh his Mouth with warm Wine, eſpecially of the red and aſtringent Kind, or with Oxycrate, mix'd with a little Alum, till he has ſpit out all the Blood: When the Diſcharge of the Blood is ſtopt, the Wound is to be daily anointed, till heal'd, with Oil of Myrrh *per Deliquium*, or Eſſence of Myrrh mix'd with Honey of Roſes. If any Part of the Tubercle ſhould remain, or if it ſhould begin to appear afreſh, it is with all Expedition to be conſum'd by the Corroſives already mentioned, or by blue Vitriol, or any other corroſive Medicine; or it may be again extirpated by means of the Sciſſars or Knife. The actual Cautery is by ſome recommended in Caſes of this Nature, and Inſtances of Cures happily perform'd by it alledg'd; but 'tis not only incommodious to apply, but alſo excites intolerable Pain; 'tis however to be us'd, when the Tubercle cannot be repreſs'd by other means. *Meckren*, in his twenty-eighth Obſervation, gives us a ſingular Inſtance of a Cure of this Diſorder, together with the Deſcription of a Knife, accommodated to this Purpoſe. *Sculletus*, in his thirty-fifth Obſervation informs us, that by means of a Forceps us'd in eradicating Polypuſes, he happily extirpated a Caruncle of this Kind, adhering to the Gum of the anterior Teeth, hard by the Palate. Some Years ago, I myſelf, ſays *Heiſter*, ſaw ſuch a Caruncle in the Palate of a Monk, behind the *Dentes Inciſores*; but becauſe his Misfortune was complicated with a Spina Ventoſa in the Bones of the Palate, and becauſe he would not ſubmit to the Uſe of the actual Cautery, the Caruncle could not be totally remov'd; but the Patient, gradually loſing his Strength, at laſt died. *Heiſter. Chirurg.*

EPULOTICA, ἐπουλωτικὰ, from οὐλὴ, a Cicatrix. Topical Medicines, which apply'd to Wounds, or Ulcers, dry up the ſuperfluous Humidity, repreſs fungous Fleſh, and diſpoſe them to cicatrize.

EQUICERVUS. The Elk. See ALCE.

EQUISETUM.

The Characters are;

The Root is very creeping: The Leaves are round, hollow, and articulated by a pyxidated Inſertion, or after the manner of Boxes, a leſs within a greater: The Flower has no Petals, is ſtamineous, or thready, has a fungiform or muſhroom-like Head, and is Male in one Plant: The Fruit conſiſts of black, rough Grains, growing cloſe together on the Plant, which bears no Flowers.

Boerhaave mentions ten Species of this Plant; which are,

1. Equiſetum; paluſtre; longioribus ſetis, *C. B.* 15. *Tourn. Inſt.* 533. *Boerh. Ind. A.* 2. 106. *Dill. Cat.* 55. *Cauda Equina, & Equiſetum majus*, Offic. *Equiſetum majus*, Ger. 935. Emac. 1113. Raii Hiſt. 1. 128. Synop. 42. *Equiſetum majus paluſtre*, Park. 1200. *Equiſetum majus aquaticum*, J. B. 3. 729. Chab. 551. Hiſt. Oxon. 3. 621. GREAT MARSH HORSETAIL.

The great Horſetail has many hollow, whitiſh-green, ſmooth, and neatly chanel'd round Stalks, having many Joints at ſome Diſtance one from another, the uppermoſt being always ſet-in or articulated into that next under it: They grow to be a Foot and half, or two Foot high, taper, and ſcarce a Foot thick: They are ſurrounded at every Joint, with a great Number of long, very ſlender, rough Leaves, which, like the Stalks, are jointed one within another, and ſtand ſo thick, that the whole Stalk appears like an Horſe's Tail: Early in the Spring, before the Stalks come up, there ariſe from the Root ſeveral ſhort Stalks, without Leaves, but jointed as the others, having at their Tops a browniſh round Head like the Top of an Aſparagus, in which lies the Seed: The Root is long and ſlender, full of Joints, and ſpreading much. It grows in Ditches and marſhy Grounds.

Horſetail is reſtringent, drying, and binding; good to ſtop Bleeding in Wounds, and all Hæmorrhages in any Part of the Body, redundant Catamenia, and the Fluor Albus, for Ulcerations in the Kidneys or Bladder, and is uſeful in all Kinds of Ruptures. *Miller's Bot. Off.*

Horſetail has an herby, ſaltiſh Taſte; it is deterſive, and gives hardly any Tincture of Red to blue Paper: Its Salt ſeems to reſemble that of Coral; but it is mixed with a little Sal Ammoniac and Sulphur: By the chymical Analyſis, it affords ſeveral acid Liquors, a little Oil, a great deal of Earth, no concreted volatile Salt, but a little urinous Spirit: Its fixed Salt does not eaſily diſſolve in the Air, neither does it give an orange Colour to the Solution of corroſive Sublimate.

All Authors agree, that the Horſetail is very vulnerary and aſtringent: Its Decoction is preſcribed for Spitting of Blood, the immoderate Flux of the Piles, Menſes, and all Sorts of Hæmorrhages. *Tabernæmontanus* preſcribes a Dram of the Powder of the Root for Spitting of Blood: He mix'd the Powder of the whole Plant in the Food of conſumptive Perſons; and gave two or three Ounces of its Juice, to thoſe that had the Dyſentery. *Tragus* preſcribed this Juice to thoſe that made bloody Urine, or had Ruptures: The ſame Juice is very good for Wounds and Ulcers. *Martyn's Tournefort.*

Frederic Hoffman recommends a Decoction, or Infuſion, by way of Tea, made of this Plant, as excellent in the Stone; and *Fuller* gives a Decoction thereof, intended againſt Ulcers of the Bladder.

2. Equiſetum; paluſtre; brevioribus ſetis. *C. B. P.* 15.

3. Equiſetum; paluſtre; brevioribus foliis; polyſpermum, *C. B. P.* 15. *Hiſt. Oxon.* 3. 621. *Raii Hiſt.* 1. 129. *Synop.* 42. *Boerh. Ind. A.* 2. 107. *Polygonum fœmina*, Offic. *Equiſeti facie Polygonum fœmina*, J. B. 3. 732. Chab. 552. *Cauda Equina fœmina*, Ger. 957. Emac. 1114. *Equiſetum alterum brevioribus ſetis*, Park. 1201. *Pinaſtella Ruppio*, Buxb. 261. *Pinaſtella ſurrectior*, Rupp. Flor. Jen. 275. FEMALE HORSETAIL.

It grows in Pools and Lakes, and by the Banks of Rivers: The Herb is in Uſe, and accounted a Vulnerary. *Dale.*

4. Equiſetum; paluſtre; tenuiſſimis, & longiſſimis, ſetis. *C. B. P.* 16. *Prodr.* 24. 3. *J. B.* 3. 729.

5. Equiſetum; ſylvaticum; tenuiſſimis ſetis. *C. B. P.* 16.

6. Equiſetum; pratenſe; longiſſimis ſetis. *C. B. P.* 16. *Hippuris, frontalis.* Lob. Obſ. 461.

This is found betwixt *Wandſworth* and *Wimbleton*, in the Mid-way in the Meadows.

7. Equiſetum;

7. Equiſetum; arvenſe; longioribus ſetis. *C. B. P.* 16. *Park.* 1202. *Raii Hiſt.* 1. 128. *Synop.* 42. *Hiſt. Oxon.* 3. 621. *Tourn. Inſt.* 533. *Dill. Cat.* 38. *Boerh. Ind. A.* 2. 107. *Cauda Equina minor & Equiſetum minus.* Offic. *Equiſetum ſegetale.* Ger. 956. Emac. 1114. *Equiſetum minus terreſtre.* J. B. 3. 730. Elem. Bot. 424. *Equiſetum minus terreſtre ſive arvenſe.* Chab. 351. CORN HORSETAIL. *Dale, p.* 62.

It bears its Flowers, or Aſparagi, ſeparate from the Stalks, which bear the Leaves. They appear in *April* and *May*.

This Species of Equiſetum is a potent Aſtringent: Whence a Dram of the Herb pulverized, and drank in Wine or Water, or four Ounces of the Decoction, in Wine, taken Morning and Evening, or three Spoonfuls of the diſtil'd Water, taken for two or three Days together, are a noble and effectual Remedy for vomiting of Blood, and for Fluxes of the Uterus; eſpecially the red Flux, and for the Dyſentery, and other Fluxes of the Belly. It alſo cures Hæmorrhages, whether they proceed from an *Anaſtomoſis*, or a *Diæreſis*, and Exulcerations of the Kidneys and Bladder.

The Inhabitants of *Tuſcany*, as *Matthiolus* informs us, eat the young Sprouts, ſometimes for want of better Food, and ſometimes for the Dyſentery, and other Fluxes of the Belly; and ſometimes find themſelves ſo much bound by them, as to be affected with the Colic. The Herb, uſed in a Plaiſter, conglutinates the largeſt Wounds; and even thoſe where the Nerves are divided. *Dioſcorides* ſays it provokes Urine. For Spitting of Blood, exhibit a Dram of the Root dry'd and powder'd, with the Juice of four Pomegranates. For Ulcers of the Breaſt and Lungs, drink three Ounces of the Decoction, Morning and Evening, warm, or two Ounces of the Juice. *Caſp. Hoffman* aſſures us, that he and others had done ſurpriſing Cures with it in long, and even malignant Fevers. A Dram of the Powder taken in three Ounces of Plantain-water, Morning and Evening for ſome Days together, is recommended for the Phthiſis. *Raii Hiſt. Plant.*

8. Equiſetum; foliis nudum; non ramoſum; ſive Junæum; ἵππουρις ἄζυλος. *C. B. P.* 16. *M. H.* 3. 621. NAKED HORSETAIL.

This bears its Flowers at the Extremities of the Stalks, which are chaneled.

This is uſed by Artificers to poliſh; whence it is called *Shave-graſs*. It is not common in *England*. Mr. *Ray* mentions it to grow at *Middleton* in *Warwickſhire*, and *Broadſtitch* Abbey in *Wiltſhire*. *Martyn's Tournefort.*

9. Equiſetum; foliis nudum; ramoſum. *C. B. P.* 16. *M. H.* 3. 621. BRANCHED NAKED HORSETAIL.

It flowers in *May*, and bears its Flowers at the Extremities of the Stalks, which are very ſmooth, and not at all chaneled. *Martyn's Tournefort.*

10. Equiſetum; fœtidum; ſub aqua repens. *C. B. P.* 16. *Prodr.* 25. 5. *M. H.* 3. 621. Common in ſtanding Waters. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 106.

EQUITATIO. Riding. In Medicine conſider'd as an Exerciſe. See the Article FIBRA. See alſo *Fuller's Medicina Gymnaſtica.*

EQUUS. Offic. Schrod. 5. 285. Aldrov. de Quad. 12. Mer. Pin. 166. Geſn. de Quad. 403. Jonſ. de Quad. 1. Scha. Quad. 89. Raii Synop. A. 62. THE HORSE.

The Parts uſed in Medicine are the Blood, Rennet, Milk, Dung, Warts [*Lichen*], Teſticles, Fat, Hoofs, Hairs, Saliva, Teeth, the Stone found in the Stomach or Inteſtines, which, for its Figure and Structure, conſiſting of Laminæ, is not unlike the *Weſt-Indian* Bezoar.

The Blood is mixed with Cauſtics and Septics: The Rennet, called *Hippace*, is particularly ſerviceable in the Cœliac Paſſion, and the Dyſentery. The Milk is thought to be good in the Epilepſy, Phthiſis, Cough, and Aſthma. The Dung, uſed externally, ſtops Hæmorrhages, and expels the dead Child and Secundines; internally, it is exhibited in the Colic, Strangulation of the Uterus, Pleuriſies, and, alſo, for the Expulſion of the dead Child and After-birth; where that of a Stone-horſe is moſt effectual. The Warts are particularly recommended in Hyſterics, and for the Stone and Epilepſy. The Teſticles are a preſent Remedy for expelling the Secundines, and are recommended in Colics. The Fat is uſed to good Purpoſe in anointing Luxations, and the Hairs repreſs an Hæmorrhage; the Saliva, or Spume of the Mouth, drank for three Days, cures a Cough, and mitigates the violent Heat of the Fauces. The Teeth, when they firſt begin to appear, are ſaid to facilitate Dentition in Infants. The Stone, called the *Hippolithus*, is ſuppoſed to be endu'd with the ſame Virtues as the *Weſt-Indian* Bezoar. *Dale* from *Schroder.*

The Dung of a Stone-horſe ſeems to be a popular Remedy; but I can ſay very little of its Virtues from my own Experience. *Quincy* gives the following Account of it:

It ſeems to owe its preſent Credit in Medicine to the modern Practice. It is certainly of great Efficacy in Pleuriſies, Inflammations, and Obſtructions of the Breaſt: In Aſthmas, and Difficulty of Breathing, alſo, it ſometimes prevails, where the moſt powerful Balſamics and Pectorals have been tried in vain; in all theſe Intentions it is now very much preſcrib'd. It is beſt in Decoction, wherein it is ſometimes join'd with other Pectorals, more or leſs warm and deterſive, as the Caſe and Conſtitution ſeem to direct. The ſimple Waters of Peny-royal, or Hyſſop, are as good as moſt Liquors to infuſe it in. It ought to have but a gentle Heat, and to be kept cloſe ſtopt. White-wine ſeems beſt to take off its Nauſeouſneſs, but may not be ſo agreeable, in ſome Circumſtances, as ſofter or more oily Vehicles. But whatſoever it is infuſed in, I never obſerv'd it the leſs effectual for Clarification; and that will bring the Liquor to look fine, and be leſs nauſeous, tho' it will not deſtroy its natural Smell, but that the Patient may ſtill diſcern it.

EQUI *Clibanus*, in Chymiſtry, is the Heat of Horſe-dung.

ERADICATIVUS. An Epithet for ſtrong and draſtic Cathartics, us'd by *Fallopius.*

ERAGROSTIS, ἐραγρωστις. A Name for the *Gramen*; *paniculis elegantiſſimis. Boerh. Index alter.* See PHALARIS.

ERANTHEMUS. A Name for the ADONIS FLOS, Pheaſant's Eye. See ADONIS.

ERASISTRATUS. The Name of a celebrated Phyſician among the Antients; for an Account of whom ſee the Preface.

ERAWAY. A Name for the *Ricinus Vulgaris minor.*

EREBINTHUS. A Name for the CICER.

ERECTORES *Penis*. The Name of two Muſcles belonging to the Penis, which ſerve to erect it when they act. See GENERATIO.

EREGMOS, ἔρεγμος, from ῥήγνυμι, to break, properly ſignifies a Bean decorticated, and broken into ſmall Particles; and is the ſame with reſpect to the Bean, as Ptiſan to the Grain of Barley, or Alica to Zea. But ſometimes it ſignifies other leguminous Fruits decorticated and broken in like manner. *Eregmos* alſo ſignifies, according to *Foeſius*, Bean-meal; but this is deny'd by *Gorræus*. In *Erotian*, and *Galen*'s Exegeſis, Eregmos is expounded a Bean divided into two Parts; it is otherwiſe written ἔρεγμα, *Eregma*, and ἔριγμα, *Erigma.*

EREISMA, ἔρεισμα, from ἐρείδω, to lean againſt, ſignifies, in *Hippocrates*, a Stay or Support, with reſpect to Bandages; or an Impreſſion or Illiſion, with regard to Things apply'd forcibly to the Body. *Lib. de Fract.*

ERETHISMOS, ἐρεθισμὸς, from ἐρεθίζω, to excite, irritate. Any thing which irritates. "Under the Term ἐρεθισμὸς, "ſays *Galen*, *Com.* 2. *in Lib. de R. V. I. A.* he (*Hippocrates*) "comprehends whatever reduces the Faculty (δύναμιν) to an "infirm State; among which may be reckon'd acrimonious "and pungent Humours in the Inteſtines or Stomach, parti-"cularly in the Mouth of the Stomach; alſo want of Sleep, "Anger, Sorrow, Worms aſcending from the Inteſtines to the "Stomach, and nocturnal Itchings of the whole Skin, or ſome "Parts of it, which not only by their Irritation, but by Pre-"vention of Sleep, exhauſt the Strength." So *Hippocrates*, in the ſame Book, by σημεῖον ἐρεθιστικὸν, intends to ſignify whatever ſolicits and exhauſts the Strength of Nature; and again, in the ſame Book, among the Cauſes of Imbecillity, he reckons ἄλλόν τινα ἐρεθισμὸν, "ſome other Irritament;" which *Galen* expounds by ſome biting Pain of the Belly or Inteſtines, want of Sleep, or ſome Affection of the Mouth of the Stomach. Ἐρεθισμὸς, in particular, ſignifies an Irritation of the Belly, from thin and acrimonious Humours diſcharging themſelves in liquid Stools; as in 1 *Epid. Ægr.* 2. and *Ægr.* 12. In general, whatever is an Obſtacle to Nature, or retards its Motion towards a Criſis, whether it be Aliment, Medicine, Phlebotomy, topical Remedies, or any other Affection of the Mind or Body, may be termed an *Erethiſmos*. *Aretæus, curat. acut. Morb. Lib.* 1. *Cap.* 1. for ἐρεθισμὸς uſes ἐρεθμὸς, in the ſame Senſe. Οἱ καλὰ φάρυγγα ἐρεθισμοὶ, *Coac.* 264. are Irritations or Vellications of the Fauces, from a Deflux of acrimonious Humours, which excite Tumors of the Glands of the Ears.

ERETRIA TERRA.

Terra Eretria. Offic. Matth. 1392. *Terra Eretria cinerea ultramarina, qua Medici utuntur.* Kentm. 1. ERETRIAN EARTH.

There are two Sorts of *Terra Eretria*; the one white, the other aſh-colour'd. What is moſt eſteem'd, approaches to an Aſh-colour, and is very ſoft, and drawn over Copper-plates, leaves a Line of a Violet-colour.

According to *Dioſcorides*, it has an aſtringent and refrigerating, with ſomewhat of a mollifying Virtue; incarnates, and conglutinates recent Wounds. *Dale.*

ERETRIS, ERETRIAS TERRA, ἐρέτρις ἢ ἐρέτριὰς γῆ, the ſame as the preceding. *Hippocrates, Lib.* 3. *de Morbis*, directs rubbing of it on the Breaſt, in order to diſcover in what Part thereof Pus lies concealed. See EMPYEMA.

EREUMENA URA, ἐρευμένα ὕρα ὑποπίπτοντα ἐν μέσῳ, in *Coac.* 532. according to *Foeſius*, are "Urines aſſuming a "cloudy Conſiſtence in the Middle;" where *Foeſius* expounds ἐρευμένα by μεταλαμβάνοντα, aſſuming, becauſe ἐρεύμενον, in *Heſiod*, is thus expounded by *Varinus.*

EREUXIS, ERYGE, EREUGMOS, ἔρευξις, ἐρυγὴ, ἐρεύγμὸς, from ἐρεύγω, to belch; Eructation, or an Excretion of Flatulences by the Mouth.

ERGALIA, in *Libavius, Alchym. Lib.* 1. *Cap.* 2. & 3. is the Part of Alchemy, explaining the Inſtruments thereof. *Coſtellus* from *Libavius*.

ERGASIMA. A Name for the worſt Sort of Myrrh. *Dioſcorides, Lib.* 1. *Cap.* 77.

ERGASTERIUM, ἐργαστήριον, from ἐργάζομαι, of ἔργον, a Work, or Operation, is the ſame as *Laboratorium*, a Laboratory. *Ergaſterion*, in particular, ſignifies, alſo, that Part of the Furnace in which the Copel, Alembic, Retort, or other Inſtrument, containing the Matter to be acted upon, is repoſited.

ERGATA. The Name of a Piece of Machinery, which concurs in the Conſtitution of the Female Screw. *Oribaſ. de Machinament.*

ERGON, ἔργον, Work, Action, or Function. In *Hippocrates*, it frequently implies ſomewhat of Difficulty.

ERICA.

The Characters are;

The Leaves are ſmall and evergreen; the Flower monopetalous, Bell-ſhaped, naked, and often ſhap'd like a Pitcher. The Ovary in the Bottom of the Flower becomes a roundiſh Fruit, gaping in four Places, divided into four Cells full of ſmall Seeds, and cover'd with the lower Part of the Flower, as with a Calyx.

Boerhaave mentions eight Species of this Plant; which are,

1. Erica, vulgaris glabra. *C.B.Pin.*485. *Dill. Cat.Giſſ.* 171. *Buxb.* 104. *Tourn. Inſt.* 602. *Elem. Bot.* 475. *Boerh. Ind. A.* 1. 221. *Erica* Offic. Ind. Med. 48. Mont. Ind. 42. *Erica vulgaris*, Park. Theat. 1480. Raii Hiſt. 2. 1713. Synop. 3. 470. Merc. Bot. 1. 33. Phyt. Brit. 38. *Erica vulgaris ſeu pumila*, Ger. 1196. Emac. 1380. Mer. Pin. 36. *Erica vulgaris flore purpureo & albo*, Rupp. Flor. Jen. 71. *Erica vulgaris humilis, ſemper virens, flore purpureo & albo.* J. B. 1. 354. *Erica, vel Erice*, Chab. 75. *Erica folio Myricæ vulgaris glabra*, Jonſ. Dendr. 449. COMMON HEATH. *Dale, p.* 334.

Matthiolus's Figure of this Plant is better than thoſe of any other Authors. *Cluſius* and *J. Bauhine* took the Flower to be tetrapetalous, whereas it is monopetalous; but the Empalement of this Species is often miſtaken for the Flower.

The Flower of this Plant is of a very ſingular Structure. It is a little Bell prolonged and double. The outer one, which is the longeſt, is formed by four Petals, encompaſſing the other, which ſeems to be monopetalous, open only at the fore Part, and cut into four equal Segments. The Cavity of this inner one is filled with eight Chives, diſpoſed round a Pointal, which does not exceed the Thickneſs of a middling Pin's Head, and is raiſed with eight rounded Ribs, and ſurmounted by a Style, terminated with a Button, which uſually juts out of the Flower. Theſe Parts are ſuſtained by a little Empalement, like a Cup, cut to the very Baſe into four equal Parts. This double Flower is Purple, as is alſo the Style; but the Chives are white.

The Decoction of Heath is diuretic. *Cluſius* affirms, that *Rondeletius*, the famous Profeſſor of Phyſic at *Montpelier*, uſed the Oil of its Flowers for Tetters, with a great deal of Succeſs. *Tabernæmontanus* ſays, that it is a Specific for theſe Sorts of Diſeaſes; and that a Fomentation, with the Flowers of Heath, eaſes the Pain of the Gout. For the ſame Diſeaſe they prepare a Vapour-bath, with its Leaves and Flowers. *Martyn's Tournefort.*

The Juice of Erica, or the diſtil'd Water of the Flowers, cures Redneſs of the Eyes, and mitigates Pains in them. A Decoction of the Leaves of *Erica*, taken warm, to the Weight of five Ounces, Morning and Evening, three Hours before Meat, for thirty Days ſucceſſively, is effectual for breaking and expelling the Stone in the Bladder, as *Matthiolus* experienced; but he obſerves, that this Remedy becomes more ſucceſsful, if the Patient, after the ſaid Term of thirty Days, bathes himſelf in a Decoction of *Erica*, and, while he is therein, ſeats himſelf on the boiled Plant, and repeats the ſame Practice ſeveral times. *Matthiolus* adds, that he knew ſome, who, obſerving an accurate Regimen of Diet, by only drinking this Liquor, voided Stones from the Bladder, crumbled into very ſmall Particles.

The *Scotch* Highlanders often make their Beds of *Erica*, placing the Roots downwards, and the Leaves upwards, in ſo artificial a Manner, that they are as ſoft as Feather-beds, and much wholſomer. For the Erica, by its natural drying Quality, exhauſts the ſuperfluous Moiſture, and by that means reſtores Vigour to the Nerves; ſo that they, who went to Bed weak and fatigu'd, riſe the next Morning full of Spirit and Alacrity. *Ray, Hiſt. Plant.*

2. Erica; vulgaris; flore albo. *C. B. P.* 485. COMMON HEATH, WITH A WHITE FLOWER.

3. Erica; Myricæ folio; hirſuta. *C. B. P.* 485.

4. Erica; maxima; alba. *C. B. P.* 485.

5. Erica; maxima; purpuraſcens; longioribus foliis. *C. B. P.* 485.

6. Erica; humilis; cortice cineraceo; Arbuti flore. *C. B. P.* 486.

7. Erica; humilis; cortice cineraceo; Arbuti flore albo. *H. R. Par.*

8. Erica; Africana; arboreſcens; tenui folio; ramis attè ſurſum unitis. *H. Boerh. Ind. Alt. Plant. Vol.* 1. *p.* 221.

ERICERUM, ἠρίκηρον, the Name of ſeveral *Collyria*, in *Aetius. Tetrab.* 2. *Serm.* 3. *C.* 102. ſo call'd from *Erica*, Heath, a principal Ingredient. Theſe are much recommended for drying up ſuperfluous Moiſture. See ACHARISTON.

ERICIS, ἠρικὶς, from ἠρίκω, to break. Barley groſly divided, or ſplit in two. *Galen. Exegeſ.*

ERIEN. A Name for the APOCYNUM. *Raii Hiſt. Plant.*

ERIGERUM. See SENECIO.

Erigerum quartum. A Name for the *Conyza*; *cærulea*; *acris.*

Erigerum tomentoſum. A Name for the *Jacobæa*; *Pannonica.*

ERIMOIDES. A Word peculiar to *Paracelſus*, which ſhould ſeem to import Sand ſubſiding in the Urine.

ERINACEUS. The Urchin, or Hedghog. See *Herinaceus.*

ERINEOS, ἠρινεὸς, ſignifies the *Caprificus*, Wild Fig-tree.

ERINOS, ἠρινὸς. The Name of a Plant in *Dioſcorides*, *L.* 4. *C.* 29. He ſays it grows near Rivers and Fountains, with Leaves like the *Ocymum*, but leſs, and divided on the ſuperior Part; it has five or ſix Branches about a Span long. The Flower is white, but the Seed black, ſmall, and rough to the Taſte; the Leaves and Stalks are full of Juice. Two Drams of the Seeds, mix'd with four Drams of Honey, reſtrain Rheums of the Eyes, if they are therewith anointed. The Juice, mix'd with Sulphur, which has never been melted, and Nitre, and pour'd into the Ears, relieves Pains therein.

J. Bauhine mentions two Plants by this Name; the *Erinos major Fab. Columnæ*, *Rapunculo affinis*, which ſeems to correſpond with that above-deſcrib'd, from *Dioſcorides*; and the *Erinos Fab. Columnæ minor.* And *Muntingius* takes notice of a third.

ERION, ἔριον, Wool. See LANA.

ERIOPHORON, ἠριόφορον. A ſort of woolly Bulb, mention'd by *Theophraſtus.*

ERIPHOS, ἠριφὸς. A Kid.

ERITHRONIUM *Satyrium.* The Name by which *J. Bauhine* calls the *Dens Canis, latiore, rotundioreque Folio.*

ERIX, ἠρὶξ, in *Galen's Exegeſis*, is explain'd, the ſuperior Part of the Liver. But *Foeſius* is of Opinion, that *Galen* read ἠρὶξ, inſtead of σύεργξ, becauſe the former Word does not, in our Copies, occur.

ERMESIA, ἑρμεσία. *Gorræus* informs us, that this was the Name of a Compoſition us'd by the Magi, in order to enable them to get ſtrong and handſome Children. It conſiſted of Honey, Myrrh, Saffron, and Palm-wine, beat together, which was to be taken in Milk. The Women, it ſeems, were to take this, as well as the Men. As *Gorræus* has not quoted his Author for this, I don't know his Authority.

ERODENTIA. Eroding or corroding Medicines.

ERODINIUM. A Word us'd by ſome of the enthyſiaſtical Chymiſts to expreſs, as it ſhould ſeem, a Prognoſtic.

EROSIO. Eroſion, or Corroſion.

EROTION. A Name for the APIASTRUM. *Marcellus Empiricus, C.* 28.

EROTYLUS. A Name for the *Fungus*; *Coralloides*; *Encephaloides*; *fuſcus*; *Gyris in Medio ſulcatis, lamellatis, ſerratis.*

ERPES. See HERPES.

ERRATICUS. Erratic, wandering, irregular. The ſame as ATACTOS; which ſee.

ERRHINA, ἐρρῖνα, from ῥὶν, the Noſe. Medicines which, when ſnuff'd up the Noſe, promote a Diſcharge of Mucus from that Part.

The Excretion of the mucid Lymph, ſecreted in the Glandular Pituitary Membrane, which lines the Cavities of the Noſtrils, and the twelve Sinuſes of the Brain, is excellently promoted by *Errhines* and *Sternutatories*; the former of which only gently, but the later more forcibly, ſtimulate the Coats, and excite them to an excretory Motion. Among the milder Kind, or the Errhines, we juſtly reckon Marjoram, Baſilicon, Thyme, Hyſſop, Savory, Marum Syriacum, the Tops of Origanum, Flowers of Lilies of the Valley and Benjamin, the Reſin of Guaiacum, fine Raſpings of Aloes-wood; dry volatile Salt of Sal-ammoniac perfum'd with Oil of Marjoram; as alſo white Vitriol. On the contrary, violent Sneezing is produc'd by Euphorbium, and the Powder of white Hellebore; and, in a milder Degree, by the various Kinds of Snuffs, precipitate Mercury, and Pepper.

Sternutatories draw the Humours from the Coats of the Noſtrils in the ſame manner Purgatives do from the glandulous Coats of the Inteſtines; that is, by their ſubtile and highly acrid Salts, which ſtimulate, and, as it were, produce a Criſpature of theſe Coats. But, as acrid Purgatives, ſo alſo Sternutatories ought to be very rarely us'd, becauſe, in the Work of Evacuation, Nature rather delights to be gently led, than forc'd and compel'd. But Errhines, which are more friendly to the Conſtitution and Nerves, by their ſubtile, acrid, and volatile

Salt, gently ſtimulate the pituitary Membrane, draw the mucid Humour from it, and are much ſafer than Sternutatories, ſince theſe latter induce a kind of convulſive Motion on the Nerves, and, by Conſent, on the whole Breaſt; whereas the former, in their Operation, rather corroborate the Nerves and nervous Coats.

Errhines prepar'd of Cephalic Herbs, eſpecially Marjoram, Marum Syriacum, Flowers of Benjamin and Lilies of the Valley, and Raſpings of Aloes-wood, with the Addition of a Grain or two of Ambergriſe, are of ſingular Service in oppreſſive Pains of the Head, a Hemicrania, lethargic Diſorders, Weakneſs of Memory, Stuffing of the Head, a Coryza, Dulneſs of Hearing, a pituitous Cephalalgia, eſpecially that which has its Seat in the Bones of the Forehead, and for the moſt part ariſes from a Suppreſſion of a Coryza, mucous Defluxions of the Eyes, Drowſineſs, Vertigoes, and in Caſes where malignant Humours, generated by a Lues Venerea, are lodg'd in the Membranes of the Noſtrils. And theſe Errhines, beſides the Evacuations procur'd by them, convey a certain Vigour and Energy to the animal Functions. A few Grains of the volalite Salt of Sal-ammoniac mix'd with the Balſamic Elixir, and put up the Noſtrils, are of ſingular Efficacy in Dulneſs of Hearing, Dimneſs of Sight, and lethargic Diſorders; and as this Preparation excites Sneezing in delicate Conſtitutions, 'tis often advantageous in paralytic and apoplectic Caſes, where the Humours of the Head are to be ſtimulated to a briſker Motion.

At preſent, Smoaking, and taking Snuff, are more uſed than is conſiſtent with Health; for by continually ſnuffing up the Powder of Tobacco, the Smell, in conſequence of the Obſtruction, and, as it were, Induration of the nervous Papillæ of the Membranes, which cover the Oſſa Squamoſa, and Noſtrils, is not only injur'd, but the Voice, which was before clear, becomes hoarſe, by a Congeſtion of Humours to the Parts. *Frederic. Hoffman.*

ERRIPSIS, ἔρριψις, from ῥίπτω, to precipitate.

When us'd with reſpect to the Body, it imports that utter Dejection, and Proſtration of Strength, which ſuffers a Perſon to ſink down like a Carcaſe, as is explain'd under the Article *Decubitus*. When apply'd to the Eyes, it ſignifies a very great Weakneſs, which prevents their being kept open.

ERROR LOCI. This is a Term introduc'd, as far as I remember, by *Boerhaave*. This celebrated Author informs us, that in the Body there is a decreaſing Series of Veſſels; by which he means, that the firſt Order of Veſſels are adapted to receive the red Globules of the Blood; the next are, perhaps, ſmaller, and convey the Serum; the next the Lymph; and the next in Order, yet finer Fluids. Now, when the red Globules of the Blood are propel'd into the Veſſels deſtin'd for the Conveyance of Serum, or when the Serum gets into Veſſels, in which only a finer Fluid ought to circulate, this he calls an *Error Loci*.

ERVADO *Capitaon*. The Name of a Plant which grows in *Braſil*; call'd, alſo, by *Margrave*, *Cotyledon, repens, Braſilienſis*.

ERUCA.

The Characters are;

The Pod is full of roundiſh Seeds, and the Plant has a particular Taſte, and a particular fetid Smell above all others.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Eruca; ſylveſtris; major; lutea; caule aſpero. *C. B. Pin.* 98. *Tourn. Inſt.* 227. *Boerh. Ind. A.* 2. 15. *Eruca ſylveſtris*, Offic. Ger. 191. Emac. 246. Raii Hiſt. 1. 807. Synop. 3. 296. Merc. Bot. 1. 34. Phyt. Brit. 39. *Eruca ſylveſtris major vulgatior fœtans*, Hiſt. Oxon. 2. 231. *Eruca tenuifolia perennis flore luteo*, J. B. 2. 862. Chab. 276. WILD ROCKET. *Dale*, *p.* 203.

This Rocket has a long white Root, with many Fibres at the Bottom; from which ariſe a great many ſtriated Stalks a Foot or two high, full of narrow, long, and deeply laciniated Leaves. The Flowers are pretty large and yellow, of four Leaves apiece, which are ſucceeded by long, narrow, angular Pods, full of ſmall, hot, bitteriſh Seed. The whole Plant has an ungrateful, fetid Smell. It grows frequently upon old Walls, as on the Walls of the City of *London*, in great Plenty; flowering great Part of the Summer.

This Rocket is hot and dry, and much of the Nature of the following; but is very rarely uſed in Phyſic. *Miller's Bot. Off.*

This Plant is of a Taſte altogether acrid and burning, mixed at laſt with a little Bitterneſs; it gives a pretty deep Tincture of Red to the blue Paper, and its Smell reſembles that of fetid Oils rectified over Quick-lime; which makes us believe, that it contains a Salt very acrid, which in ſome meaſure reſembles the Sal-ammoniac, mixed with a great deal of fetid Oil and Earth.

Thus it is no Wonder, that the Plant, of which we are ſpeaking, ſhould be aperitive, inciſive, and diuretic. *Matthiolus* affirms, that, being boiled with a little Sugar, it is good for the Cough in Children, which is generally occaſioned by glutinous Matters, irritated in the Bronchia and Veſicles of the Lungs. *Martyn's Tournefort.*

2. Eruca; major; ſativa; annua; flore albo; ſtriato. *J. B.* 2. 859. *Raii Hiſt.* 1. 806. *Hiſt. Oxon.* 2. 228. *Boerh. Ind. A.* 2. 15. *Eruca*, Offic. Chab. 276. *Eruca latifolia alba ſativa Dioſcoridis*, C. B. P. 98. Tourn. Inſt. 227. Elem. Bot. 193. *Eruca ſativa*, Ger. 191. Emac. 246. Park. Parad. 502. *Eruca ſativa alba*, Park. Theat. 816. GARDEN ROCKET. *Dale*, *p.* 203.

The common Garden Rocket has a ſlender white woody Root, of a hot biting Taſte; the Leaves ſomewhat reſemble Muſtard in Shape, but are much ſmoother; the Stalks grow to be two or three Foot high, cloathed with leſſer Leaves, having on their Tops many Flowers of a whitiſh-yellow Colour, full of dark-purple Veins; the Seed-veſſels, which ſucceed them, are long, ſlender and ſmooth, parted in two by a thin Membrane, and opening at the Sides when the Seed is ripe, which is very ſmall, of a rediſh yellow Colour, and a roundiſh Shape, and hot Taſte. It is ſown in Gardens, and the Seed is ripe in *July*.

Rocket is eaten frequently among other Herbs as a Sallad, tho' many People diſlike it for its ſtrong, ungrateful Smell; it has the Name of a Provocative, and Exciter to Venery, and is likewiſe a good Diuretic. *Matthiolus* commends the Leaves, boil'd with Sugar, to be given to Children for a Cough: I ſuppoſe he means, that they ſhould be made into a Syrup. *Camerarius* ſays, that an equal Part of the Powder of Rocket and Cumin-ſeed is a mighty Preſervative againſt an Apoplexy. *Miller's Bot. Off.*

The Seed bruiſed and drank in Wine, kills Worms, and reduces a tumid Spleen. The Leaves bruiſed and apply'd to the Eyelids, ſharpen the Sight. The Seed mix'd with Honey removes all Spots and Freckles from the Face, and more effectually with an Addition of Ox-gall. The Root, boiled in Water, and apply'd, draws out Fragments of Bones. *Ray's Hiſt. Plant.*

3. Eruca; ſolio bellidis. *M. H.* 2. 231. *a.* DAISY-LEAV'D ROCKET.

4. Eruca; tanaceti folio. *H. R. Par.* TANSY-LEAV'D ROCKET.

5. Eruca; ſativa; foliis magis diſſectis. *H. Edinburgh.* GARDEN ROCKET WITH DEEP-CUT LEAVES.

6. Eruca; cœrulea; in arenoſis creſcens. *C. B. P.* 99.

7. Eruca; tenuifolia; perennis; flore luteo. *J. B.* 2. 861. *a.* NARROW LEAV'D PERENNIAL ROCKET, WITH A YELLOW FLOWER.

Boerhaave, *Ind. alt. Plant. Vol.* 2. *p.* 15.

ERUCA. Offic. Schrod. 5. 341. *Eruca Braſſicaria maxime vulgaris, nigro, luteo, & cœruleo coloribus variegata.* Raii Inſect. 113. THE CATERPILLER.

It is the Fœtus of a Sort of Butterfly, and undergoes the ſame Metamorphoſis as the Silk-worm, and at length paſſes into a Butterfly. There are many Species; but that which ought to be uſed in the Shops, is an Inſect known to every body, that feeds upon the Leaves of the Cabbage.

Caterpillers bruiſed, or the Powder of them, raiſe a Bliſter like Cantharides, and take off the Skin. *Mouffet* ſays, they will cauſe the Teeth to fall out of their Sockets; and *Hippocrates* writes, that they are good for a Quinſey.

The Caterpillers of Pine-trees are mentioned by *Dioſcorides*, without any Deſcription. *Matthiolus* informs us, that they are frequently found on the Pine-trees about *Trent*: And, as far as may be collected from his Deſcription, they are gregarious, like ſome of the ſeparian, or incloſing, Kind, which incloſe themſelves in one large Web. *Dale.*

ERUCAGO.

The Characters are;

The Fruit is like a quadrangular and creſted Club, divided, generally, into four Cells, full of roundiſh beaked Seed.

Boerhaave mentions but one Species of this Plant, which is,

Erucago; ſegetum. *T.* 232. 108. *Sinapi echinatum.* Lugd. 647. J. B. 2. 858. *Raphaniſtrum, diſpermum, Monſpeliacum, ſilicula quadrangula, echinata.* H. L. 520. CORN-ROCKET. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 10.

Lemery ſays, it is inciſive, and attenuating, proper to rarefy the pituitous Humours of the Brain, and to provoke Sneezing.

The Hiſtory of Plants, attributed to *Boerhaave*, mentions it as an Antiſcorbutic.

ERUCTATIO. Eructation, or Belching.

ERVILIA. A Name for the *Ochrus, folio integro, Capreolos emittente.*

ERUPTIO. Eruption. It imports a ſudden and copious Excretion of Humours; for Example, of Pus, or Blood. But it alſo ſignifies the ſame as Exanthema.

ERVUM.

The Characters are;

The Pods are articulated, and undulated on both Sides, as if knotted, and full of roundiſh Seeds. The Leaves grow by Pairs, as if conjugated to a middle Rib.

Boer-

Boerhaave mentions two Species of this Plant; which are,

1. Ervum; verum. *Tourn. Inſt.* 398. *Elem. Bot.* 317. *Boerh. Ind. A.* 2. 47. *Orobus, Ervum.* Offic. Chab. 148. *Orobus ſiliquis articulatis, ſemine majori.* C. B. P. 346. *Orobus receptus Herbariorum.* Ger. 1051. Emac. 1225. *Orobus vulgaris Herbariorum,* Park. Theat. 1025. *Orobus ſativus, ſive Ervum ſemine anguloſo, ſiliquis inter grana junctis.* Hiſt. Oxon. 2. 74. *Orobus, ſive Ervum multis.* J. B. 2. 321. Raii Hiſt. 1. 915. BITTER VETCH.

This Vetch ſeldom grows to above a Foot and an half, or two Foot, high; full of weak angular Stalks, having many winged Tare-like Leaves, whoſe obtuſe Pinnæ are more numerous and ſlender. The Flowers grow at the ſetting on of the Leaves, ſingly, in Shape like the Flower of a Tare, or Vetch, but leſs, and of a white Colour; and are ſucceeded by ſmall round Pods, containing two or three large round white Seeds, which ſwell out the Pod, making it appear, as it were, jointed: It grows in *Italy*, and ſome Parts of *France*; and flowers in *June*.

The Powder of bitter Vetch, mixed with Honey, is accounted good to cleanſe the Lungs of tough Phlegm. It is a ſtrong Diuretic, and expels the Stone and Gravel; but, if taken too frequently, it cauſes bloody Urine: It is but ſeldom uſed. The Meal of it was formerly employed to make up the Trochiſci Scillitici; but now we make them up with the Meal of the Cicers. *Miller's Bot. Off.*

It is ſometimes, though but rarely, cultivated in Gardens, and flowers in *June*. The Part in Uſe is the angulous, roundiſh, brown, rediſh Seed, or Grain, which is of a leguminous, bitteriſh, and ungrateful Taſte. In its farinaceous Subſtance it anſwers to the Fenugreek, and contains a diuretic Salt; on which Account it is commended, as good to expel the Stone. *Dale.*

2. Ervum; Orientale; alopecuroides; perenne, fructu longiſſimo. *T. C.* 27. *H. R. D.* ORIENTAL PERENNIAL ERVUM, WITH A VERY LONG FRUIT.

Boerh. Ind. alt. Plant. Vol. 2.

Miller takes notice of two more Species.

ERYGE, ἐρυγή. An Eructation. See RUCTUS. Hence Erygmatodes, ἐρυγμαῶδης, flatulent; attended with Eructations.

ERYNGIUM.

The Characters are;

The Leaves grow alternately on the Stalks, which are remarkably ſmooth; the Flowers conſiſt of five ſmall Petals, which are reflected, or turned backwards, towards a common Centre, and inſixed in a tubular quinquefid Calyx, bearded on the lower Part, and ſquamoſe within; and are collected into a ſcaly echinated, or prickly, Head, which, at the Baſe, is ſurrounded with a radiated prickly Crown; and theſe Heads are diſpoſed in form of an Umbella. The Ovary conſiſts of two Seeds, which are ſometimes foliated, ſometimes plain.

Boerhaave mentions eleven Species of this Plant; which are,

1. Eryngium; maritimum. *C. B. P* 386. *Hiſt. Oxon.* 3. 165. *Tourn. Inſt.* 327. *Elem. Bot.* 278. *Boerh. Ind. A.* 134. *Eryngium.* Offic. *Eryngium marinum.* Chab. 355. Ger. 999. Emac. 1062. Park. Theat. 986. J. B. 3. 86. Raii Hiſt. 1. 384. Synop. 3. 222. Mer. Pin. 36. *Eryngium marinum, ſive vulgare.* Merc. Bot. 34. Phyt. Brit. 39. ERYNGO. *Dale.*

This Eryngo has pretty large, white, and long Roots, which ſpread much in the Earth, and run deep in it. The Leaves are hard, ſtiff, and veiny, narrow at Bottom, and broad and roundiſh at the End, with ſeveral Laciniæ terminating in ſharp Prickles; the Stalk ariſes not to any great Height, being ſmooth, creſted, and chaneled; the Leaves on the Stalks are leſs, and rather ſtiffer, ſet on without Foot-ſtalks, with prickly Edges. At the Ends of the Branches come forth round and ſomewhat prickly Heads, beſet with ſtiff narrow Leaves, growing like a Star, under them. The Flowers are ſet in theſe Heads, of a greeniſh white Colour, each in a ſeparate Calyx, like the Teaſel, ſucceeded by flatiſh Seed. It grows by the Sea-ſide, in many Places, in ſandy Ground, and flowers in *June* and *July*. The Roots only are uſed.

Eryngo-roots are hepatic and diuretic, opening the Obſtructions of the Liver, helping the Jaundice and Dropſy, provoking Urine, and eaſing the Strangury. Candy'd with Sugar, they are accounted very reſtorative, good for conſumptive Perſons, and thoſe waſted with long Illneſs, and too much Venery; they being reckoned Strengtheners to the Parts of Generation. They are recommended by ſome for the Lues Venerea and Gonorrhœa, as taking off the Acrimony and Heat of Urine uſually attending thoſe Diſtempers, by their balſamic ſoftening Qualities. *Miller's Bot. Off.*

The Root is nephritic and alexipharmic, and is of principal Service in Obſtructions of the Menſes, Urine, the Liver, Gall, Spleen, and other Parts: Whence it is effectual in the Jaundice and Colic. *Dale* from *Schroder.*

2. Eryngium; vulgare. *Offic. C. B. P.* 386. *J. B.* 3. 85. *Raii Hiſt.* 3. 384. *Synop.* 222. *Tourn. Inſt.* 327. *Elem. Bot.* 278. *Rupp. Flor. Jen.* 222. *Buxb.* 105. *Boerh. Ind. A.* 134. *Hiſt. Oxon.* 3. 165. *Eryngium.* Chab. 354. *Eryngium Mediterraneum.* Ger. 999. Emac. 1062. *Eryngium Mediterraneum, ſeu Campeſtre.* Park. Theatr. 986. COMMON ERYNGO. *Dale.*

Cæſalpinus ſays, there is no diſcovering any Flower upon this Plant. *Dodonæus* affirms its Flower to be blue, and ſeldom yellow. For my Part, I have obſerved it to conſiſt of five whitiſh Petals.

One finds ſome Acrimony in the Eryngo, upon chewing it; its Leaves give a faint-red Colour to the blue Paper; its Roots give it a deeper: So that it is likely, that their Salt, in ſome meaſure, reſembles Sal Ammoniac; but that it is joined with ſome Sulphur, and terreſtrial Subſtances.

There is an indifferent Quantity of concreted volatile Salt, and a great deal of Oil and Earth, obtained from this Plant by the chymical Analyſis. *Martyn's Tournefort.*

It is ſcarce in *England*, but common in foreign Countries; it flowers in *July*; and the Root is uſed, which has the ſame Virtues as the preceding. *Dale.*

3. Eryngium; latifolium; planum. *C. B. P.* 386. *M. H.* 3. 165. BROAD-LEAV'D PLAIN ERYNGO.

4. Eryngium; latifolium; caule ex viridi palleſcente, flore albo. *C. B. P.* 386.

5. Eryngium; latifolium; caule & flore Amethyſtino pulcherrimo.

6. Eryngium; Orientale; foliis trifidis. *T. Cor.* 23. *H.*

7. Eryngium; planum; minus. *C. B. P.* 386. *M. H.* 3. 166.

8. Eryngium; Orientale; tenuiſſime inciſum, capite ſtellato *T. Cor.* 23. *H.*

9. Eryngium; planum; latifolium; Creticum; flore cœruleo ex albo miſto variegato. *Sher. H. Maurocen.*

10. Eryngium; maritimum; Luſitanicum; folio ampliori. *T.* 327. *H. R. Par. M. H.* 3. 165. *H.*

11. Eryngium; Hiſpanicum; annuum; folio cæſio, ſplendente; floſculis vix conſpicuis. *a.*

Boerh. Ind. alt. Plant. Vol. 1. *p.* 134.

Beſides the above-mentioned Species of this Plant, *Dale* mentions the following:

Eryngium trifolium. Offic. Alpin. Exot. 153. Park. Theat. 987. Raii Hiſt. 386. Hiſt. Oxon. 3. 167. TREFOIL ERYNGO. *Dale.*

The Root provokes Urine, and excites to Venery. *Ray.*

ERYSIMUM.

The Characters are;

It has a long, thin, ſlender Pod, full of very ſmall round Seeds; and it has a peculiar Appearance.

Boerhaave mentions eleven Species of this Plant; which are,

1. Eryſimum; vulgare. *C. B. Pin.* 100. *Hiſt. Oxon.* 2. 218. *Tourn. Inſt.* 228. *Elem. Bot.* 194. *Boerh. Ind. A.* 2. 14. *Rupp. Flor. Jen.* 65. *Dill. Cat. Giſſ.* 93. *Buxb.* 109. *Eryſimum.* Offic. *Eryſimum Dioſcoridis Lobelii,* Ger. 198. Emac. 254. *Eryſimum vulgare, ſive Irio.* Mer. Pin. 36. *Eryſimum Tragi floſculis luteis, juxta muros proveniens.* J. B. 2. 863. *Irio, ſive Eryſimum.* Chab. 278. Merc. Bot. 1. 44. Phyt. Brit. 621. *Iris, ſive Eryſimum vulgare.* Park. Theat. 833. *Eruca ſiliquâ cauli appreſſâ, Eryſimum dicta.* Raii Hiſt. 1. 810. *Eruca hirſuta ſiliqua cauli appreſſa Eryſimum dicta.* Synop. 3. 298. HEDGE-MUSTARD. *Dale.*

The Root of Hedge-muſtard is long, whitiſh, frequently crooked, and full of ſmall Fibres. The Stalk ariſes to be a Foot and an half, or two Foot, high, tough and pliant, branching out, uſually, on all Sides, like a Shrub, or Buſh. The lower Leaves are long and narrow, cut into ſeveral jagged Segments, ſet oppoſite to one another, with one more blunt at the End, and are ſomewhat hairy; the Leaves, which grow on the Stalks, have fewer Segments, the upper many times but three, appearing like the Head of an Halbert; the Flowers are yellow, very ſmall, and four-leaved, growing thick together at the lower End of the Branches; which flowering gradually, and the Stalk ſtill extending itſelf, the Spikes of the Seed-veſſels grow to a great Length, being round, ſharp-pointed, clapping cloſe to the Stalks, and are full of hot biting Seed. It grows every-where, by the Way-ſide, flowering good Part of the Summer. The Herb is uſed.

Hedge-muſtard is hot and dry, opening and attenuating, and, by its warming Quality, is good to diſſolve thick, groſs, ſlimy Humours in the Lungs, to help a Cough, and Shortneſs of Breath; and it is particularly recommended againſt an habitual Hoarſeneſs, to recover the Voice. *Riverius* praiſes a Decoction of it, in Wine, againſt the Colic.

The only officinal Preparation of this Plant is the *Syrupus de Eryſimo. Miller's Bot. Off.*

Hedge-muſtard has an herby Taſte, a little ſaltiſh, and glutinous. It gives a pretty deep red Colour to the blue Paper; which gives us Reaſon to believe, that it contains a Salt reſembling Sal Ammoniac, tempered with Phlegm, Sulphur, and

and Earth: Thus, the Hedge-muſtard is proper for all the Diſeaſes of the Lungs, where a condenſed Lymph is to be diſſolved, which adheres to the Bronchiæ, and Veſicles, as it often happens in old Coughs, and in an Aſthma. They preſcribe a Handful of it in Cock-broth. They macerate cold, in Water, this Plant, haſhed coarſe. The Syrup, made with the Juice, is very good. The Syrup, deſcribed in *Rondeletius*'s Diſpenſatory, printed in the Memoirs of *Pena* and *Lobel*, and publiſhed in 1605. is too compound. *Martyn*'s *Tournefort*.

The Eryſimum is a good external Remedy for Cancers not exulcerated, and for hard Tumors. *Ray*.

SYRUPUS DE ERYSIMO: *Syrup of Eryſimum.*

Take of Hedge-muſtard, freſh gathered, ſix Handfuls; of Elecampane-root, and Coltsfoot, alſo very freſh gathered and Liquorice-roots, of each two Ounces; of the Leaves of Borrage, of Succory, and Maidenhair, of each one Ounce and an half; of the cordial Flowers, and the Flowers of Roſemary and Betony, of each half an Handful; of Aniſe-ſeeds, half an Ounce; of ſton'd Raiſins, two Ounces: Let them infuſe together, a whole Day, in Water and Mead, of each two Pints and an half; and of the Juice of Hedge-muſtard, eight Ounces. Boil them in a Bath-heat; and to the Liquor, ſtrongly preſſed out, and clarified, put four Pounds and an half of Loaf-ſugar; and boil to a Syrup, in the ſame Heat. *S. A.*

2. Eryſimum; alterum; ſiliquis Erucæ. *C. B. P.* 101.

3. Eryſimum; anguſtifolium; majus. *C. B. P.* 101. *Rapiſtrum ſylveſtris, Irionis folio,* ἀπλοπαναχιεῖον. T. Cor. 266. *Rapiſtrum Italicum, ſiliquis longiſſimis.* C. B. P. 95. GREAT NARROW-LEAV'D HEDGE-MUSTARD.

4. Eryſimum; Genuenſe; ſylveſtre. *Flor.* 1. *Sinapi Genuenſe, ſylveſtre.* J. B. 2. 858.

5. Eryſimum; Genuenſe; ſylveſtre; flore ſulphureo. *Ind.* 143. *a.*

6. Eryſimum; Polyceratium, vel corniculatum. *C. B. P.* 101. HEDGE-MUSTARD WITH MANY CROOKED PODS.

7. Eryſimum; ſemine minimo pallido; ſiliquis Erucæ. *a.*

8. Eryſimum Orientale; folio Sonchi; flore ſulphureo, ſiliquis longiſſimis. *a.*

9. Eryſimum; Orientale; ſiliquis ſtrictiſſimis. *Sher. a.*

10. Eryſimum; minimum; flore albo; Montis Aurei. *Vaill.*

11. Eryſimum; Monſpeſſulanum; ſinapios foliis. *Raii Hiſt.* 1. 812. *Boerh. Ind. A.* 2. 14. *Eryſimum latifolium.* Offic. *Eryſimum latifolium majus glabrum.* C. B. Pin. 101. Chom. 105. Tourn. Inſt. 228. Elem. Bot. 194. Hiſt. Oxon. 2. 218. *Eryſimum latifolium Neapolitanum,* Park. Theat. 298. Raii Hiſt. 1. 811. Synop. 3. 298. *Eryſimum hirſutum, foliis Erucæ.* Flor. Pruſſ. 69. *Sinapi ſylveſtre Monſpeſſulanum, lato folio, floſculo luteo minimo, ſiliqua longiſſima.* J. B. 2. 858. BROAD-LEAV'D HEDGE-MUSTARD. *Dale.*

The Figure which *Columna* has given, is good. Some make the Syrup of Eryſimum with the Juice of this Species. *Martyn*'s *Tournefort.*

It agrees in Virtues with the common Eryſimum. *Dale.*

ERYSIPELAS, ἐρυσίπελας. An Eryſipelas, or St. Antony's Fire. This Diſtemper ſeems to have taken its Denomination from the Colours which it induces on the Parts it affects; and to be derived from ἐρυθρὸς, red, and πελὸς, livid, or black.

The Nature of an Eryſipelas, and the Characters by which it is diſtinguiſhed from a Phlegmon, are thus deſcribed by *Galen*: "If a Fluxion, ſays he, be mixed of Blood, and yellow Bile, immoderately hot, or only of fervid and very thin Blood, the Affection is called an Eryſipelas, and is much hotter than a Phlegmon, and of a yellower Colour; and, if you touch it, the Blood eaſily retires from the Place, and flows thither again, being exquiſitely thin, and red to the Sight. Beſides, it is not attended with a Pain, as in a Phlegmon, nor reſembles any Species of Plegmon, either in Pulſation, Compreſſion, or Tenſion; but is ſometimes very favourable to the Patient, and eſpecially when it is effuſed, or ſpends its Force only upon the Skin, leaving the ſubjacent Fleſh unaffected. And thus it is, indeed, for the moſt part, or whenever it is a perfect and genuine Eryſipelas; whereas one that injures the ſubjacent Fleſh, being not conſtituted of an exquiſitely thin Flux, is not a ſimple Eryſipelas, but a Diſorder compoſed of an Eryſipelas and a Phlegmon; in which, ſometimes, the proper Symptoms of an Eryſipelas are moſt predominant, and then it is called, by our modern Phyſicians, a Phlegmonoide Eryſipelas; ſometimes theſe of a Phlegmon, in which Caſe they give it the Name of an Eryſipelatous Phlegmon: But if the Symptoms of neither prevail above thoſe of the other, but there appears an Equality between them, they ſay the Diſeaſe is a Complication of a Phlegmon and an Eryſipelas. A true and perfect Eryſipelas, therefore, is an Affection of the Skin alone; but a Phlegmon, though not alone, yet principally, of the ſubjacent Fleſh, and ſometimes, alſo, of the Skin; which latter, in other reſpects, is no leſs painful and afflictive than the other, but is not attended with a Pulſation." *Lib.* 2. *ad Glauc.* The ſame Author, *Lib.* 14. *Meth. Med.* ſpeaks in the following Manner: "There is another Diſeaſe, not much different from a Phlegmon, which is called Eryſipelas, conſiſting of a bilious Humour: Some Characters it has in common with a Phlegmon, as a preternatural Tumor, and an Heat; but there is a Difference between them, which conſiſts, firſt and principally, in Colour: While the Colour appears red, it is called a Phlegmon; but when pale, or yellow, or mixed of theſe two, it acquires the Name of Eryſipelas. Moreover, the Pulſation is a proper Symptom of a great Phlegmon, becauſe this Diſorder is generally profoundly ſeated in the Body; but an Eryſipelas affects the Skin more than the Parts underneath; for the Humour of the pale Bile is of a thin Conſiſtence, ſo as to be eaſily tranſmitted through the carnous and rare Parts of the Body to the very Skin; but the Denſeneſs of the Skin is not, in like manner, pervious to this Bile, unleſs it be extremely thin and aqueous, much of the ſame Nature with what is eliminated every Day in Sweat." In another Place of the ſame Book, he tells us, "that, if the Humour be immoderately thick and acrimonious, it excoriates the Epidermis, and, in time, corrodes the ſubjacent Parts; ſo that there are two Kinds of Eryſipelas, one attended with an Exulceration, the other not." And the ſame Diſtinction is expreſſed by *Hippocrates*, 5 *Aph.* 23. See INFLAMMATIO.

In eryſipelatous Fevers, which are juſtly claſſed among thoſe of the exanthematous Kind, the Blood and Humours being in an intenſe Motion, an acrid Serum, of a ſulphureous and cauſtic Nature, is, by that means, propelled to the Surface of the Body; and produces a Swelling, accompanied with Redneſs, Heat, and Pain.

An eryſipelatous Fever is ſo far from being ſo innocent and ſimple as is generally thought, that it is often violent, dangerous, frequently mortal, and nearly allied to a peſtilential Fever, the moſt formidable of all Diſorders; for, as this laſt-mentioned Diſeaſe ſeizes ſuddenly with an intenſe Horror, Heat, Proſtration of the Strength, a violent Pain of the Back and Head, Vomiting, and a Delirium; ſo eryſipelatous Fevers are, in the Beginning, accompanied with the ſame Symptoms. As in a peſtilential Fever the malignant Matter is, between the third and fourth Days, propelled to the Surface of the Body, by which the Violence of the Symptoms is diminiſhed; ſo the ſame happens in eryſipelatous Fevers. As in peſtilential Fevers the poiſonous Matter affects the Glands, eſpecially thoſe of the Groin, and firſt produces a Pain and Tenſion of them; ſo, in a violent Eryſipelas, a Swelling, Redneſs, and Pain, are firſt perceiv'd in the inguinal Glands; after which a Matter of a hot and burning Nature deſcends to the Legs. As in peſtilential Fevers the peccant Matter, moſt frequently, fixes its Seat in the mammary, axillary, and parotid Glands; ſo the ſame happens in an Eryſipelas, which, when it ſeizes the Head, firſt affects the parotid Glands; and, when it ſeizes the Breaſt, the axillary Glands. As in peſtilential Fevers the noxious Matter forms Abſceſſes in the Glands, and readily induces a Gangrene and Sphacelation on the external Parts; ſo in an Eryſipelas the Glands, eſpecially thoſe of the Axillæ and Breaſts, are often ſo burned, as to contract Pus, whilſt, at the ſame time, the Joints are affected with an unſeemly Corruption, as is ſufficiently known by every one in the leaſt converſant in the Practice of Phyſic. Laſtly, as in the the Plague nothing is more dangerous than a Retroceſſion of the expelled Matter from the Surface to the internal Parts of the Body, ſo the ſame Danger and Diſadvantages are produced by the Retroceſſion of the Matter in eryſipelatous Caſes.

But an eryſipelatous differs from a peſtilential Fever in this, that the former is not produced by Contagion, but by an internal Cauſe. It does not, by the Exhalations of the Body, infect thoſe who are ſound; nor is it ſo violent, and immediately productive of the Death of the Patient, as a Fever of the peſtilential Kind. Eryſipelatous Inflammations are diſtinguiſhed from others by this, that in the former the Tumor is more depreſſed, the Pain not ſo tenſive, and the Colour of the Skin more red and florid than in the latter, where it is rather darker. A Phlegmon is diſtinguiſhed from an Eryſipelas by this, that in the latter the Swelling is more ſuperficial, ſpreads farther, and, when preſſed, loſes its Colour; the Matter is, alſo, thin, and ſmall in Quantity; whereas in a Phlegmon the Inflammation is deeper, affecting not only the Skin, but the ſubjacent Fat and Muſcles; and ſo hard, that it does not loſe its Colour upon being preſſed. It is produced by an impure and ſtagnant Blood, and eaſily degenerates into a Gangrene.

An Eryſipelas is, by Phyſicians, commonly diſtinguiſh'd into that of the legitimate Kind, which is alſo call'd ſimple; and that of the ſpurious Kind, which is alſo call'd ſcorbutic.

The

The ſimple Kind only affects the Surface of the Skin, and eaſily yields to the Influence of proper internal and external Medicines. But that of the ſpurious or ſcorbutic Kind is of a more chronical Nature, more deeply ſeated, in conſequence of the Impurity of the Juices, not to be cured without Difficulty, and eaſily degenerating into Ulcers of a bad Kind. The ſpurious or ſcorbutic Eryſipelas is ſubdivided into that with, and that without, Exulceration. In the former, more Trouble is created to the Phyſician, and more Danger to the Patient; ſince the Ulcers are often with Difficulty conſolidated after a long time. Beſides, eryſipelatous Fevers are ſometimes of the idiopathic or primary, and ſometimes of the ſymptomatic and ſecundary Kind; for in an Anaſarca, an Aſcites, as alſo in a long-continued Jaundice, whether of the black or yellow Kind, it frequently happens, that a ſymptomatic Eryſipelas ſoon deſtroys the Patient. This Diſorder is alſo frequently complicated with Wounds of the nervous Parts, eſpecially of the Cranium, and its Membranes, as alſo with Fractures of the Bones; in which Caſes, the Patient's Life is in Danger. *Frederic Hoffman.*

An Eryſipelas is diſtinguiſh'd into that of the ſimple, and that of the exulcerated Kind. Both theſe generally begin with a Horror and Fever, but never come up to the State of a real Inflammation; afterwards they become painful, turgid, and diffuſe themſelves over a great Part of the Surface of the Body. They are of a rediſh-yellow Colour, which diſappears when the Part affected is preſs'd with the Finger, but returns upon its Removal. They are not accompanied with Pulſation, much leſs with any Degree of Tenſion. They alſo remove from one Place to another, and excite a gnawing and burning Senſation in the Part affected.

A ſimple Eryſipelas diſcovers itſelf by a Heat, or a certain Burning and Redneſs of the Parts, without any Ulcer. *Hippocrates*, in his Aphoriſms, calls this Diſorder ὀπολίγυσμα, but the Moderns ſtyle it the *Roſe*, from the Reſemblance its Colour bears to that of this Flower. According to the now quoted Author, this Diſorder, when ſuddenly ſtriking inwards, after it has once appear'd on the Breaſt, proves very terrible and fatal by means of the Quinſey it excites.

In an Eryſipelas of the ulcerated Kind, which is properly call'd the *Ignis Sacer*, the Surface of the Skin is ſometimes cover'd with ſmall Scales, reſembling Bran; at other times, the whole Skin is ulcerated, and the Puſtules, breaking, diſcharge a purulent Sanies. An Eryſipelas frequently appears on the Face, and ſometimes ſpreading over the Whole of it, ſo diſtends and tumefies it, as to endanger a Suffocation, unleſs the Patient is ſpeedily relieved by proper Remedies. An Eryſipelas, ariſing from a fractur'd or denudated Bone, is generally of bad Preſage. 'Tis always proper and beneficial to force an Eryſipelas from the internal to the external Parts; whereas 'tis prejudicial, if not fatal, to repel it from the latter to the former. In this Diſorder, a Putrefaction or Suppuration happening, are bad Signs; but theſe ſcarce ever occur in a ſimple Eryſipelas, which is, for the moſt part, inſenſibly diſſipated by cutaneous Perſpiration. *Lommii Medic. Obſervat.*

This Diſeaſe affects every Part of the Body, but eſpecially the Face; and it happens at all times of the Year, but principally at the Cloſe of Summer, at which time it frequently attacks the Patient whilſt he is abroad. The Face ſwells of a ſudden, with great Pain and Redneſs, and Abundance of ſmall Pimples appear; which, upon the Increaſe of the Inflammation, often riſe up into ſmall Bliſters, and ſpread conſiderably over the Forehead and Head, the Eyes, in the mean time, being quite cloſed by the Largeneſs of the Tumor. The Country-people term it a Blaſt, or Blight; and, in reality, it differs little from thoſe Symptoms which accompany the Wounds made by Stings of Bees, or Waſps, excepting only that there are Puſtules. And theſe are the Signs of the common and moſt remarkable Species of the Eryſipelas.

But whatever Part is affected by this Diſeaſe, and at whatever time of the Year it comes, a Chilneſs and Shivering, unleſs they preceded a Day or two before, as it ſometimes happens, generally attend this Inflammation, with Thirſt, Reſtleſſneſs, and other Signs of a Fever. As the Fever in the Beginning occaſion'd the Pain, Swelling, and other Symptoms, (which, increaſing daily, terminate in a Gangrene) ſo in the Courſe of the Diſeaſe theſe Symptoms greatly conduce to the Increaſe of the Fever, till both are taken off by proper Remedies.

There is another Species of this Diſeaſe, though it happens leſs frequently. This attacks at any time of the Year, and is moſtly owing to too free an Uſe of ſubtle attenuating Wines, or ſome ſimilar ſpirituous Liquor. It begins with a ſlight Fever, which is immediately ſucceeded by an Eruption of Puſtules, almoſt over the whole Body, reſembling thoſe occaſion'd by the Stinging of Nettles; and ſometimes they riſe up into Bliſters, and ſoon after diſappear, and lie concealed under the Skin, where they cauſe an intolerable Itching, and, after gentle ſcratching, come out again. *Sydenham.*

An Eryſipelas is that Species of Inflammation, which, ariſing in the Skin, and its ſubjacent Fat, ſometimes ſpreads itſelf very far, and is accompanied with Redneſs, Heat, and Pain. The Part affected, when preſſed with the Finger, becomes remarkably white; but, ſoon after its Removal, reſumes its former Redneſs. Though Inflammations of this kind moſt frequently ariſe in the Arms and Legs, yet they ſometimes happen in the Neck, the Head, the Shoulders, the Noſe, and other Parts. Upon the firſt Approach of this Diſorder, the Patient is almoſt always ſeiz'd with a Shivering and Coldneſs, which are ſoon ſucceeded by a Degree of Heat, equal to that perceiv'd in burning Fevers: For this Reaſon, 'tis, both by antient and modern Authors, call'd *Ignis Sacer*. *Heiſter.*

An Eryſipelas is not always of the ſame Nature, and equally violent, in all Patients; for in ſome, eſpecially young Perſons, the Matter being neither very virulent, nor very large in Quantity, the Diſeaſe is but ſlight and benign; becauſe it neither poſſeſſes the Glands, nor excites an intenſe Fever, but appears on the ſecond Day, with Redneſs, Swelling, and Pain of the Feet; and, by means of a due Perſpiration, or the Uſe of gentle domeſtic Medicines, is quickly diſcuſſed. But, in old Perſons, and Patients of cacochymic and impure Habits, where the Matter is larger in Quantity, and of a worſe Quality, the Syſtem of the Nerves and Veſſels is more violently agitated, the Fever is more violent, the Pain and Uneaſineſs more intenſe, and, unleſs treated with ſuitable Remedies, afflicts the Patient for a long time, and proves very obſtinate. Eryſipelatous Diſorders are different, and attended with diſtinct Symptoms, according to the different Parts of the Body they ſeize. When this Diſorder ſeizes the Feet, it produces a ſhining Colour of the Shins; and, if it ſhould happen to be more violent, this Colour is propagated to the whole Legs, and accompanied with Pain, ſo that the Parts are exaſperated by the gentleſt Touch. When this Diſorder ſeizes the Face, it becomes gradually tumid and red, with a large Number of aqueous Veſicles interſperſed; the Eyes are cloſed up by the Swelling; the Patient breathes with Difficulty; the Noſtrils and Fauces are parch'd and dry; a Torpor and Drowſineſs generally accompany this Species of Eryſipelas; and, upon account of its Vicinity to the Brain, 'tis to be dreaded, leſt it degenerate into a Phrenitis, or a mortal Lethargy. When an Eryſipelas affects the Breaſts, theſe become tumid, often indurated like a Stone, exquiſitely painful, and a Suppuration eaſily enſues. An Eryſipelas appearing under the Armpits, and affecting the Glands lodg'd there, is attended with a moſt intenſe Pain, and generally terminates in an Abſceſs. This Diſorder in Infants frequently appears in the umbilical Region, and ſpreading thence over the Abdomen, produces violent Symptoms, and generally proves mortal.

There is a particular Species of Eryſipelas not very common among the Moderns, and but little adverted to by the Antients, call'd by *Pliny Zoſter*, and among us the *Girdle*, or Shingles. This diſcovers itſelf by violent Symptoms, and above the Navel ſpreads from the Præcordia round the Back like a Belt, for the moſt part, a few Inches broad, with an intenſe Heat, and highly acrid Puſtules, which burn, as it were, like Fire. This Species is of a pernicious, and ſometimes of a mortal Nature. But the moſt malignant Species of all is that, which after a great Languor of the Strength appears in old Perſons, and ſuch as are of highly cacochymic Habits, ſometimes, alſo, in malignant and peſtilential Fevers, under the Nipples, and on the Region of the Heart, or even on the Hands, and other Parts poſſeſs'd of a more exquiſite Senſation. This Species is, at firſt, of a livid Colour, and, afterwards becoming black, is ſoon ſucceeded by Gangrene and Death. *Platerus* has deſcrib'd it under the Name of *Macula lata*.

As for the Cauſes of this Fever: The material Cauſe does not at all ſeem to be of a ſimple, bilious, or ſaline, but rather of a cauſtic, acrid, and putrefying Nature; for it operates in a very violent manner, on the nervous Parts; ſurpriſingly diſturbs the Œconomy of the animal Functions, and induces Watchings, Deliriums, Reſtleſſneſs, Anxiety, Toſſings, Votings, and a Diſorder of the Senſes. It is ſtill more formidable, when the Matter returns backwards after it has been once expel'd, ſince in this Caſe, like as much Poiſon, it ſoon excites Deliriums, internal Inflammations, convulſive Aſthmas, and ſpaſmodic Strictures, which often prove mortal. Beſides, the Gangrene and Sphacelus, which readily ſucceed an ill-treated Eryſipelas, are ſufficient Proofs of the virulent Quality of the Matter which produces it: But whence this Matter draws its Origin, is not ſo eaſy to determine; I am, however, inclin'd to think, that it conſiſts of Bile corrupted, and render'd peccant by various Cauſes; which, ſtagnating long in the Flexure of the Duodenum, and there putrefying together with the pancreatic Juice, and aſſuming a cauſtic and acrid Quality, is thence gradually convey'd to the Maſs of Blood, and Membranes of the Brain and ſpinal Marrow, indiſpoſes the whole nervous and vaſcular Syſtems, and excites a Fever, till it is at laſt driven out to the Surface of the Body.

Perſons of ſanguine, ſanguineo-choleric, and plethoric Habits, young Perſons, Men, and pregnant Women, are more diſpos'd than others to generate this Matter of the Eryſipelas,

which in them, however, is generally of a pretty mild Nature: But in old Perſons, thoſe of a ſcorbutic or cacochymic Habit, as alſo in Women labouring under a total Suppreſſion, or an undue Retention, of the Menſes, it is of a far worſe Kind: Thoſe, alſo, are frequently and eaſily obnoxious to this Diſorder, who are born of Parents ſubject to it; as alſo thoſe, who, having been once ſeiz'd with it, have had frequent Returns of the Misfortune; and more eſpecially if they are old, or of ſcorbutic Habits. I myſelf, ſays *Hoffman*, have obſerv'd an Eryſipelas returning every Year, every Equinox, and alſo every Month: But, with reſpect to theſe, eſpecially in old Perſons, and thoſe of cacochymic Habits, I have obſerv'd that Aphoriſm of *Hippocrates* verified, where 'tis ſaid, that ſuch as are often ſeiz'd with an Eryſipelas, are at laſt deſtroyed by it.

But there are ſeveral of the Non-naturals, capable of unfolding and bringing this latent material Cauſe of an Eryſipelas into Action: But the moſt conſiderable of theſe are violent and exorbitant Paſſions, eſpecially Anger and Dread. Thus *Fallopius* furniſhes us with an Inſtance of a Woman, who, every time ſhe was vex'd, began to be ſeiz'd with an Eryſipelas, which was eaſily diſcuſs'd by drinking Barley-water. The Matter of an Eryſipelas is alſo put in Action by a too hot Atmoſphere, an intenſe Heat of the Sun, as alſo by a ſudden and alternate Heating and Cooling the Body or Feet: The ſame Effect is produc'd by hot Aliments, hot Drink, frequent Drinking to Exceſs, or the Uſe of too hot Baths. But nothing contributes more to the Production of this Diſorder, than the Omiſſion of artificial Evacuations of Blood, whether by Scarifications, or Veneſection, and the Suppreſſion of the natural Evacuations, whether from the Noſe, the Uterus, or the hæmorrhoidal Veins. An Eryſipelas of the Head, in a particular manner, happens moſt frequently to thoſe who remain long, eſpecially in the Night-time, under a moiſt and rainy Air, as alſo to old Perſons. This Diſorder frequently appears in the Breaſts of Child-bed Women, eſpecially if giving Suck, after any violent Fright; in which Caſe the Diſcharge of the Milk is forthwith ſtopt, and the Breaſts become hard, and are render'd tumid by the coagulated Milk. *F. Hoffman.*

The Cauſes of an Eryſipelas are the ſame with thoſe of all other Inflammations: But none have a more powerful and immediate Tendency to produce it, than a ſudden Cold, contracted after immoderate Heat, or profuſe Sweats; an obſtructed Perſpiration, Surfeits, the habitual Uſe of too ſtrong and generous Liquors, or a too hot and acrid State of the Blood; for all theſe things are of ſuch a Nature, that they eaſily inſpiſſate and coagulate the Blood, in ſuch a manner as to produce Stagnations of it. *Heiſter.*

When an Eryſipelas breaks out ſoon, and without any violent Commotion; when the Juices of the Body are not highly corrupted; when the Part affected by it is not of the more noble Kind, or does not communicate with nervous Parts, it is not highly dangerous: But by a free Perſpiration, and the Uſe of proper Remedies, the Tumor, after a Day or two, gradually ſubſides, the Heat and Pain vaniſh, the ruddy Colour is chang'd into that of yellow, the Skin breaks, is ſeparated in the Form of Scales, and the Diſeaſe has an agreeable Termination put to it. An Eryſipelas is, ſometimes a ſalutary Sign; and I myſelf, ſays *Hoffman*, have known Diſeaſes, eſpecially convulſive Aſthmas, and convulſive Colics, happily remov'd by a ſupervening Eryſipelas.

But when an Eryſipelas is large and deep, when the Juices of the Body are highly impure, or the Part affected poſſeſs'd of an exquiſite Senſation, the Diſorder is not without Danger; for, in this Caſe, either the rediſh Colour become livid and black, and ſoon degenerates into a fatal Sphacelus; or the Inflammation, becoming incapable of Diſcuſſion, is ſuppurated, and induces malignant Ulcers, Fiſtulas, and a Gangrene. After an Eryſipelas, in ſanguineo-phlegmatic and cacochymic Habits, there ſometimes remains a violent Swelling of the Feet, ſo that the Legs appear three times as large as in their natural State; and this Swelling is not, without great Difficulty, remov'd: But thoſe who die under this Diſorder, are cut off by a Fever, which, for the moſt part, is accompanied with a difficult Reſpiration, ſometimes with a Delirium, ſometimes with a Drowſineſs; and generally the fatal Cataſtrophe happens within the ſeventh Day.

An Eryſipelas, when prepoſterouſly treated, alſo, terminates in an unlucky manner; for 'tis an old and true Obſervation made by *Hippocrates*, in the twenty-fifth Aphoriſm of his ſixth Section, that if the Matter is repel'd, the Diſeaſe is not only pernicious, but fatal, which it frequently proves. I myſelf, ſays *Hoffman*, knew an Eryſipelas, retiring inwards after a Vomit, and a draſtic Purgative, ſucceeded by an Inflammation of the Stomach, and Death: I have alſo, ſays he, obſerv'd the Matter driven inwards by Veneſection, and the Diſeaſe afterwards render'd erratic, and more troubleſome than before. I have alſo, ſays he, obſerv'd, that an Eryſipelas repel'd in the Legs, by Camphire, Minium, and Bole, has been ſucceeded by an intenſe Fever, an intolerable Pain of the Stomach, and difficult Reſpiration, bilious Vomitings, Languor of the Strength, Loſs of Appetite; and that theſe Symptoms did not ceaſe, till antiſpaſmodic and gently diaphoretic Medicines were exhibited, and the Matter of the Eryſipelas was recal'd, by a Veſicatory, to its former Seat. I have known, from Experience, that the treating an Eryſipelas of the Head with Repellents, cold Medicines, Aſtringents, too ſpirituous Subſtances, and camphorated Liniments, has brought on Vertigos, lethargic Diſorders, Quinſeys, a Phrenitis, and Palſies of the Tongue; which Diſorders have frequently prov'd mortal to old Patients, and ſuch as were of ſcorbutic Habits: Cold Medicines, Preparations of Lead, oleous Subſtances, ſpirituous Liniments, and Medicines richly camphorated, when apply'd externally, produce equally unlucky Terminations of eryſipelatous Diſorders, ſince they make them degenerate into malignant Ulcers, Gangrenes, and Sphacelus; as is confirm'd by ſeveral Inſtances given by *Hildanus*, *Cent.* 1. *Obſ.* 82. *Moinichen. Obſ.* 2. and *Timæus a Guldenklee*, *Lib.* 6. *Caſe* 33. *Frederic Hoffman.*

With reſpect to the Termination of this Diſorder, 'tis to be obſerv'd, that it is accompanied with no great Danger, if the Inflammation is only ſlight, and proper Meaſures of Relief are ſeaſonably purſu'd: On the contrary, when the Inflammation is violent, the Conſtitution infirm, the Regimen faulty, the Part affected expos'd to the Cold, and the Cure negligently or unſkilfully manag'd, 'tis not to be wonder'd at, if it ſhould terminate in a burning Fever, a violent Exulceration, a Gangrene, or a Sphacelus. In this Diſorder, the external Application of ſuch Medicines as are cold, pinguious, or oleous, as alſo the internal Uſe of generous Liquors, Wine, Brandy, or hot Medicines, are productive of the moſt imminent Danger. *Heiſter. Chirurg.*

The moſt judicious Method of curing an Eryſipelas conſiſts in purſuing theſe three Intentions: Firſt, that the febrile Motion of Nature be by no means hinder'd, but rather promoted, if it is defective; and brought to a due Temperament, if it is exceſſive. Secondly, that the ſubtile cauſtic Matter lodg'd in the nervous Parts be corrected, and prepar'd for Secretion and Excretion: And, thirdly, that the inflammatory Stagnation of putrid and cauſtic Lymph in the external Parts be diſcuſs'd and perfectly expel'd.

Among the Remedies which excite and promote the febrile Motion of Nature when languid, the moſt conſiderable are, the *Mixtura ſimplex*, mix'd with the *Spiritus Nitri Dulcis*, or rather with the anodyne mineral Liquor, or the Eſſence of Germander or white Burnet, not very ſpirituous and concentrated, mix'd with an equal Quantity of the anodyne mineral Liquor, and twenty or thirty Drops exhibited for a Doſe: The Expulſion is, alſo, aſſiſted by an Infuſion prepar'd of Germander, Elder-flowers, and Fennel-ſeeds, as alſo by Bezoardic Powders. The exceſſive Commotions and Spaſms are mitigated by an Emulſion prepar'd with the Waters of the Flowers of Elder, the Lime, and the *Egyptian* Thorn, together with the Four greater cold Seeds, as alſo the Seeds of the *Napus Dulcis*, eſpecially when us'd as a Vehicle, with which the Bezoardic Powder, either alone, or with a few Grains of Nitre and Cinnabar, may be taken. The ſame Effect is produc'd, and the Expulſion promoted, by a Mixture prepar'd of one Part of the Bezoardic Spirit of *Buſſius*, and three Parts of the anodyne Liquor. When the febrile Motion is of the legitimate Kind, and neither too languid nor too impetuous, the following domeſtic Remedy is of excellent Service:

> Take of the Rob of Elder, one Ounce; and of calcin'd Hartſhorn, one Dram: Mix together, and exhibit in Elder-flower-water.

To this Preparation, when the Patient is very hot, I generally add, with Succeſs, ten or twelve Grains of pure Nitre.

In order to correct the Acrimony of the Humours, and duly prepare the Matter, beſides the Medicines already mentioned, Decoctions of the Shavings of Hartſhorn, the Roots of Vipers-graſs, Marſh-mallows, Liquorice, and China-root, with Fennel-ſeeds, as alſo Water-gruel, us'd as ordinary Drink, are of ſingular Service. The Diſcuſſion of the inflammatory Stagnation is to be obtain'd by Topics: But, among theſe, ſcarcely any can be applied without Danger, except a Powder prepar'd of Elder-flowers and Liquorice-roots, now-and-then ſprinkled on the Part, when it is moderately warm, either in Bed, or by means of a Stove. But all unctuous, ſpirituous, earthy, aſtringent Subſtances, as alſo all Preparations of Lead, are abſolutely to be rejected.

'Tis a perpetual Rule in Practice, that in Fevers of the acute and exanthematous Kind, the Body is always to be preſerv'd in a mild and continual Diaphoreſis, that by this means the Motion of the Blood to the Surface of the Body may be render'd equal, and the recrementitious Matter, being continually carried along with it, diſſipated, and carried through the Pores: Hence the ſame Rule is to be obſerv'd in an Eryſipelas, both with reſpect to the whole Body, and more eſpecially the Part affected; that by this means the Pain may be mitigated, and the Diſcuſſion of the Matter the better promoted.

Great

Great Caution is neceſſary in the Uſe of external Medicines, leſt they ſhould prove injurious, either by repelling or converting the Eryſipelas to an Ulcer: Beſides, as almoſt every Perſon has an Idioſyncraſy, or ſpecific and individual Senſibility, eſpecially in the Skin and nervous Parts, we are, for this Reaſon, to be highly cautious in the Application of Topics; becauſe every Remedy is neither ſuited to every Perſon, nor to every Part of the ſame Perſon; for I have often obſerv'd, that in an Eryſipelas of the Breaſts, by applying an innocent, and in other Caſes an approv'd Plaiſter, the Inflammation and Pain have been ſoon increas'd, tho' both forthwith remitted upon the Removal of the Plaiſter: Hence 'tis ſafeſt to apply nothing externally, except, perhaps, paregoric Species, conſiſting of the Flowers of Chamomile, Elder, and Melilot, Liquorice-root, and Bean-meal, either in the Form of a Bag, or a Powder.

If notwithſtanding the Exhibition of internal, and the Application of external Diſcutients, tho' of an highly efficacious Nature, the eryſipelatous Tumor ſhould ſtill remain, the red Colour begin to turn livid, and the Pain be lodg'd deep, as if it reach'd to the Perioſteum; the Eryſipelas has a Tendency to Exulceration: In this Caſe we are to have recourſe to ſuch Medicines as promote Suppuration, at the ſame time that they prevent putredinous Corruption. This Intention is excellently anſwer'd by ſimple Diachylon duly prepar'd, adding a ſufficient Quantity of Camphire and Saffron, or by the Emplaſtrum Saturninum of *Barbet*, made up with Soap, applying over them ſuch balſamic Epithems as prevent Corruption: When Pus is contracted and deep-ſeated, the Tumor is to be open'd with a Lancet, and the Pus to be evacuated gradually, and not all at once: But leſt the Abſceſs, eſpecially in glandulous Parts, ſhould degenerate into fiſtulous and malignant Ulcers, after the Evacuation of the Matter, a balſamic Liquor prepar'd of the Tincture of Flowers of St. John's-wort, Eſſence of Peruvian Balſam, the beſt Myrrh, and a few Drops of the Spirit of Turpentine, is to be injected.

When a deep and large Eryſipelas is threaten'd with a ſupervening Sphacelation, which may be known by the browniſh-red Colour, and the Continuance of the Symptoms after the Expulſion, beſides ſuch internal Medicines as reſiſt Inflammation and Putrefaction, Nitre with a little Camphire, ſpirituous and corroborating Liquors prepar'd of Quick-lime-water, camphorated Spirit of Wine, Wine Vinegar with Litharge mix'd with the Eſſence of Germander and Myrrh, are to be frequently apply'd warm with folded Linen Cloths externally.

Veneſection is ſometimes beneficial, and ſometimes hurtful, in an Eryſipelas. Leſt, therefore, the Practitioner ſhould commit a Miſtake in this reſpect, 'tis to be laid down as a Rule, that when an eryſipelatous Fever ſeizes Perſons of a plethoric Habit, or ſuch as are accuſtom'd to drink ſpirituous Liquors, a Vein is to be open'd in the Arm in the Beginning of the Diſorder; for by this means the Circulation of the Blood becomes more free, and the Expulſion of the Matter to the Skin is promoted. This Practice is ſo much the more uſeful when an Eryſipelas ſeizes the Head, ſince by its means violent Symptoms are prevented. 'Tis ſometimes expedient, inſtead of Veneſection, to uſe Cupping with Scarification in the Neck. But, after the Evacuation of Blood, we are always to be careful, that Perſpiration be kept free and equal.

In a ſcorbutic Eryſipelas of long ſtanding we are to uſe ſuch Medicines as purify the Blood, gentle Laxatives, and Diaphoretics, in ſuch a manner, that during a few Days the Inteſtines may be purg'd: Then, for ſome time, Diuretics and Diaphoretics are to be ſubjoin'd; and theſe are to be alternately repeated, whilſt for common Drink the Patient uſes a correcting Decoction, prepar'd of mucilaginous Woods and Roots, with Bitters, but eſpecially with the Roots of Succory and Dandelion, together with Raiſins.

An Eryſipelas which often recurs, is not without Danger; for which Reaſon the Phyſician is to be highly ſolicitous to free the Body from this Diſorder. For obtaining this End, I have found nothing more effectual than a due Uſe of mineral Waters, in Conjunction with a proper Regimen, after the Body has been previouſly prepar'd, either by Laxatives or Veneſection. This Intention is beſt anſwer'd by the Acidulæ of *Egra*, the hot Waters of *Embſen*, and the milder *Caroline* Springs: When theſe cannot be had, Veneſection, eſpecially in the Spring and Autumn, Purging, and ſuch Medicines as purify the Blood, together with a proper Regimen, are the moſt effectual Means of Relief. *Frederic Hoffman.*

The Cure of an Eryſipelas is moſt ſucceſsfully and happily attempted by diluting the inſpiſſated, and reſolving the ſtagnating Blood; which Intentions are moſt effectually anſwered by a frequent Exhibition of thin warm Sorbitions and Potions, by which a gentle and uninterrupted Sweat is excited: For by this means the inſpiſſated Blood is diluted; that which is acrid, corrected; that which is coagulated and ſtagnated, reſolv'd; and that which is ſuperfluous, or corrupted, eliminated by the ſmall cutaneous Emunctories; and conſequently a natural Perſpiration, the moſt ſafe and effectual Cure of an Eryſipelas, reſtor'd. Heating Medicines of all Kinds, eſpecially the Tinctura Bezoardica, the Spiritus antipeſtilentialis, and other Spirits of a like Nature, as alſo ſtrong and heating Eſſences, are, in my Opinion, ſays *Heiſter*, to be totally abſtain'd from in this Diſorder; ſince by theſe the Heat of the Blood is, generally, rather increas'd than diminiſh'd. On the contrary, we may with greater Propriety, Safety, and Efficacy, uſe temperating and moderately-cooling Medicines; the moſt valuable of which are, in this Caſe, Preparations of Elder: Thus 'tis expedient frequently each Day to exhibit half an Ounce, or a Spoonful, of the Rob of Elder, diluted with Elder-water, drinking at the ſame time a few Cups of Tea, Coffee, or an Infuſion of ſome proper Herbs: The Body is alſo to be carefully defended againſt the Influences of the Cold, and continually kept in a mild and uninterrupted Sweat. When the Patient is rack'd with a violent Thirſt, a Decoction of Barley, or warm ſmall Beer, may, with great Advantage, be exhibited; ſince by Warmneſs, and Draughts of thin diluting Liquors, the Diſorder is moſt generally remov'd, and the Patient ſav'd. If Rob of Elder ſhould happen to be ungrateful and diſagreeable to the Patient, in order to promote a gentle Sweat, we may chooſe for a Succedaneum, or at leaſt for a Medicine to be exhibited alternately with it, ſome diaphoretic Powder prepar'd of Shells, Crabs-eyes, and Mother of Pearl, or diaphoretic Antimony, or any other Medicine of a like Quality, mix'd with a ſmall Quantity of Nitre, and exhibited in Elder-water, not neglecting at the ſame time the liberal Uſe of warm, thin, and diluting Potions.

When, in an Eryſipelas, the Inflammation is very mild and gentle, it may be often remov'd only by external Warmth: But, if the Inflammation ſhould happen to be more violent, external Heat alone is not ſufficient, without the Concurrence of proper Topics: Rob of Elder may, therefore, be ſpread on coarſe Paper, or a Piece of Linen Cloth, and apply'd to the Part affected with warm Linen Cloths, or a Bag fill'd with reſolvent Ingredients over all. But this Medicine, as well as the Theriaca, mix'd with Salt of Wormwood, tho' highly efficacious in mitigating Inflammations, are yet rarely us'd in Caſes of this Nature, on account of the Sordes and Impurities they contain: For this Reaſon the digeſtive Powders are far more frequently us'd: Among theſe, the moſt valuable and effectual ſeems to be that prepar'd of Elder-flowers, triturated Liquorice, prepared Chalk, Ceruſs, and Myrrh, mix'd in equal Quantities, wrapt up in coarſe Paper, or a Linen Cloth, and apply'd warm to the Part affected; after which, the Whole is to be cover'd with proper Bags, or Cuſhions: To this we may add, the *Pulvis contra Eryſipelas Mynſichti*, (See PULVIS) which is not only well-known in the Shops, but alſo highly efficacious for anſwering Intentions of this Nature. 'Tis not neceſſary I ſhould here inſiſt upon the ſingular Virtues of the middle green Bark of Elder, in mitigating and allaying Inflammations, ſince the Efficacy of that Subſtance, in Caſes of this Nature, is long ago experimentally known to moſt Perſons.

Tho' ſome Authors in the Cure of an Eryſipelas pronounce liquid Medicines highly prepoſterous and improper, yet I myſelf can from Experience affirm, that in the Cure of this Diſorder excellent Effects are produced by warm and camphorated Spirit of Wine, either by itſelf, or mix'd with Saffron, or the Theriaca, and apply'd with a folded Linen Cloth, or coarſe Paper, as alſo by Quick-lime-water, mix'd with camphorated Spirit of Wine, and apply'd in the ſame manner. *Scultetus, in Obſervat.* 93. affirms, that he never found a more effectual liquid Remedy, than the following, againſt an Eryſipelas, complicated with an Œdema.

Take of a mild Lixivium of the Aſhes of the Vine, one Pound; of Nitre, one Dram and an half; of common Salt, one Dram; of the beſt Wine-vinegar, one Ounce: Mix all together.

After the previous Uſe of Univerſals, this Mixture is to be apply'd warm to the Part affected, with a double Compreſs, which is to be ſecur'd with a proper Bandage: When apply'd in this manner, it remarkably diſcuſſes Swellings of this Kind, even when a Gangrene is endanger'd. But all other liquid Medicines, which are either too acid, or of an obſtructing and aſtringent Quality, together with pinguious and oleous Subſtances, are, in this Caſe, to be carefully avoided; for 'tis ſcarce credible how powerfully theſe obſtruct the Pores, hinder the Elimination of the peccant Blood thro' them, and conſequently expoſe the Patient to more imminent Danger.

Veneſection and Purging do not ſeem ſo neceſſary in an Eryſipelas, as in a Phlegmon; for, as in an Eryſipelas the peccant and corrupted Humours are lodg'd contiguous to the Skin, they are moſt commodiouſly expel'd by a gentle Diaphoreſis; However, when the Pulſe is too violent, and the Patient either preternaturally hot or plethoric, Veneſection is by no means improper; and, in order to render the Body ſoluble, Clyſters are rather to be us'd, than Purgatives of any other Kind.

It frequently happens, that an Eryſipelas terminates in a Suppuration; and hence generally ariſe chronical and wide-ſpreading Ulcers. If a Misfortune of this Nature ſhould happen, the Ulcer is carefully to be cleans'd, and the Acrimony of the Serum corrected by Applications of the *Unguentum Saturninum*, the *Unguentum de Lithargyrio*, or the *Unguentum de Ceruſſa*, together with the *Emplaſtrum Saturninum*. 'Tis alſo expedient to uſe ſuch internal Medicines, as purify and correct the Blood; exhibiting now-and-then, in the Intervals, ſuch as eliminate the acrid Humours by Stool: A ſtrict and exact Regimen is alſo to be us'd, till theſe Ulcers are conglutinated; tho', at the ſame time, in old, valetudinary, and cachectic Patients, they ſcarce admit of Conſolidation, eſpecially when ariſing in the Legs and Feet. *Heiſter. Chirurg.*

In order to the Cure, I conceive that the peccant Matter, which is mix'd with the Blood, muſt be evacuated in a proper manner, that the Ebullition of the Blood muſt be check'd by cooling Remedies; and, laſtly, that the Matter, thrown out and fix'd upon the Skin, muſt be diſcuſſed. To anſwer theſe Purpoſes, as ſoon as I am call'd, I direct a ſufficient Quantity of Blood to be taken away from the Arm, which generally reſembles the Blood of Pleuritics: The next Day, I give my common purging Potion, and exhibit a paregoric Draught at Bed-time, in caſe it has operated briſkly; for Example, Syrup of white Poppies, in Cowſlip-flower-water, or ſomething of the ſame kind. After Purging, I order the Part affected to be fomented with the following Fomentation:

Take of the Roots of Marſh-mallows and Lilies, of each two Ounces; the Leaves of Mallows, Elder, and Mullein, of each two Handfuls; the Flowers of Melilot, the Tops of St. John's-wort, and the leſſer Centaury, of each one Handful; Linſeed, and Fenugreek-ſeed, each half an Ounce: Boil them in a ſufficient Quantity of Water to leave three Pints; ſtrain off the Liquor, and, when 'tis uſed, add two Ounces of Spirit of Wine to every Pint thereof. Let the Part affected be fomented twice a Day with ſoft Flannels dipt in this Fomentation hot, and wrung out; and, after fomenting, bathe it with the following Mixture:

Take of Spirit of Wine, half a Pint; *Venice* Treacle, two Ounces; long Pepper and Cloves, reduced to Powder, of each two Drams: Mix them together; cover the Part affected with brown Paper, moiſtened with this Mixture.

Moreover, I order the Patient to ſup only Barley-broth, Water-gruel, and eat roaſted Apples, to drink ſmall Beer, and to refrain from Bed ſome Hours every Day. By this Method the Fever, and other Symptoms, are generally ſoon taken off; if not, I repeat Bleeding; and ſometimes 'tis neceſſary to bleed a third time, interpoſing a Day between each Operation, that is, if the Blood be greatly vitiated, and the Fever high. On the intermediate Days of Bleeding, I order Glyſters made of the diſtilled Waters of Water-lilies, *&c.* to be uſed very often in a Day. But a ſingle Bleeding, and a Purge, generally effect the Cure, provided they be uſed in time. The ſame Method is to be uſed in that Species attended with Itching and a Redneſs, and reſembling the Stinging of Nettles; only external Applications are leſs neceſſary here. *Sydenham.*

In an Eryſipelas of the Head, which is a highly dangerous Diſorder, when the Fever does not abate, Purgatives are ſo ſurpriſingly beneficial, that ſometimes the Cure cannot be obtain'd without their Aſſiſtance. Tho' this Diſeaſe has been handled at great Length by ſeveral Authors, and eſpecially by *Hieronymus Fabricius*, yet all of them are ſo far from being diſtinct and intelligible with reſpect to the Uſe of Purgatives in the Violence of the Fever, that they are not only diffident of their own Sentiments, but alſo vary and diſſent from each other, ſince ſome do not approve of Purgatives, except when the Body abounds with Bile, and the Diſorder is violent; whilſt with *Tragaultius*, *in Inſtit. Chir. Lib.* 1. 8. they maintain, that the Phyſician, inſtead of evacuating, ought rather to refrigerate. Others, who agree in the Propriety both of Evacuations and Refrigeration, do nevertheleſs, with *Paré de Tumor. Lib.* 6. 15. maintain, that greater Relief is obtain'd by Sweats than by Purging. Others, who grant that Purgatives may properly be exhibited, yet aſſert, that when the Fever is ſo intenſe as to bring on a Delirium and Phrenitis, we ought rather to preſcribe ſuch Medicines as reſiſt Malignity; and that we are not to exhibit Purgatives till the febrile Heat is extinguiſh'd; or, at leaſt, that if Purgatives are at any rate to be us'd, Preparations of Scammony are abſolutely to be avoided, leſt they ſhould increaſe the Fever. *Sennertus* tells us, that as this Diſorder is highly familiar and endemial to the *Germans*, ſo we may more ſafely take the Methods to be obſerv'd in its Cure from the Experience and Practice of the *Germans*, than from the Works of Phyſicians of other Nations. But *Sennertus*, tho' himſelf a *German*, borrows moſt of what he ſays on an Eryſipelas, from *Fabricius* an *Italian*, but ſuppreſſes the Directions of that Author with reſpect to Purging, when the Increaſe of the Diſeaſe is at an End. *Ettmuller*, who was alſo a *German*, in his *Medic. Chirurg.* informs us, that, when an Eryſipelas ſeizes the Head, the Cure is to be accompliſh'd by internal Sudorifics and Cephalics, but that Purging of every Kind is to be carefully abſtain'd from. Thus, when the Diſorder is in its moſt dangerous State, Authors have either given no Directions at all with reſpect to its Treatment, or ſuch as are full of Cowardice and Heſitation; as if it was conſiſtent with Reaſon, and common Senſe, for a Phyſician to be leſs bold and hardy, when his Patient's Life is in the moſt imminent Danger, than when there is not the leaſt Suſpicion of Danger.

But I can from Experience affirm, that in an Eryſipelas of the Head, when the Brain being affected, a Coma, a Delirium, or Convulſions are brought on, there either remain no Hopes of the Patient's Recovery, or the moſt happy Effects will be produc'd by Purgatives. Nor are we in this Extremity, which alſo holds true in the Small-pox, to wait till the Fever is abated, or the Tumor quite ſubſided; for to encounter this Species of Fever with cardiac and refrigerating Medicines, or to apply Topics, is only to trifle, till at laſt the Patient falls a Sacrifice to the Phyſician's Cowardice or Folly. If, therefore, Purging is capable of removing this Diſorder, when arriv'd at its moſt dangerous State, the ſame, ſooner call'd in to the Patient's Aſſiſtance, muſt, *a fortiori*, prevent its Progreſs and Spreading. As a Confirmation and Illuſtration of this Truth I ſhall ſubjoin the following ſingular Hiſtory.

A young Lady of uncommon Diſtinction had her Face ſwell'd by an Eryſipelas. The Diſorder was, as uſual, preceded by a gentle Horror, and a ſlight Fever. Next Day, not only her Face, but alſo the Skin about her Ears and Neck, was become turgid and red. The Fever increas'd, and the Patient was ſomewhat delirious at certain Intervals. In this State of things a Veſicatory was apply'd to the Nape of her Neck.

Notwithſtanding this Step for her Relief, the Swelling became very large, and as it was intenſely red, appear'd to be an Eryſipelas of that Kind, which *Fabricius*, in Imitation of *Galen*, calls *Phlegmonodes*; for, according to this Author, an Eryſipelas of the ſimple or uncomplicated Kind is ſcarce ever to be found in the Face. Towards Night the Patient became quite delirious. Mr. *Burges*, the Apothecary, in the mean time, apply'd Veſicatories to her Arms, and injected Clyſters, which were diſcharg'd without any Advantage, ſince all the Symptoms were exaſperated, inſtead of being abated.

When I firſt ſaw her, which was in the Afternoon, her Delirium was very violent, and accompanied with a Fever: She ſpoke a great deal, but all her Words were incoherent and impertinent: Sometimes ſhe lay, as it were, like one in a Lethargy, and was now-and-then ſeiz'd with Convulſions, eſpecially about the Hands and Shoulders: The Swelling remained almoſt in the ſame State and Condition, only its Redneſs was ſomewhat abated: Her Pulſe was rather quick than ſtrong. I therefore order'd a Veſicatory to be apply'd to each Side of her Neck; and I am much ſurpris'd to find no mention of this Piece of Practice in the Authors already quoted, eſpecially as Veſicatories are of ſingular Efficacy in this, if in any Species of Diſorder whatever. But becauſe ſhe ſeemed to be in the moſt imminent Danger, and becauſe I concluded, that Veſicatories alone would not be ſufficient, unleſs another Means of carrying off the peccant Matter was alſo called in to their Aſſiſtance, ſhe had the following Purge exhibited at Three o' Clock:

Take of the *Decoctum Senæ Gereonis*, three Ounces; of the *Tinctura Sacra* prepar'd with White-wine, one Ounce; and of the purgative Syrup of Buck-thorn, ſix Drams; Mix all together.

By this Preparation ſhe was not in the leaſt purg'd; for which Reaſon, about the Middle of the Night, two Ounces of the *Tinctura Sacra* were exhibited to her; notwithſtanding which all her Symptoms remain'd the ſame, only ſhe lay more quiet, or rather more ſunk, by the Violence of her Diſeaſe; and, being as yet coſtive, about the Middle of the next Day the following Cathartic was exhibited:

Take of the *Tinctura Sacra*, two Ounces; and of the cathartic Syrup of Buckthorn, one Ounce: Mix together for a Doſe.

But neither was ſhe purg'd by this Medicine: Towards Evening Veſicatories were apply'd to both her Wriſts.

Notwithſtanding theſe Meaſures, all her Symptoms remain'd the ſame; only the Heat ſeem'd to be ſomewhat abated. Early in the Morning, the laſt-mentioned Cathartic was again exhibited, and procur'd a very ſmall Evacuation by Stool, which afforded her but little Relief: An acrid Clyſter was alſo, to no Purpoſe, injected. I order'd the Purgatives to be taken thus ſucceſſively, becauſe I had intimated, that the Uſe of this

Practice was not to be given over, till it anſwered the End; and, if it did not anſwer the End, there were no other Methods of relieving the Patient. For this Reaſon, though Purgatives had been four times exhibited to no Purpoſe, yet I was firmly reſolved to perſiſt in their Uſe; for in this State and Condition of the Diſeaſe, as in the Small-pox, the febrile Matter is neither diſſipated through the Tumor, nor can it be carried off by any other means, than by making a Way for it through the inteſtinal Glands.

Accordingly, the State of the Patient becoming ſtill worſe and worſe, ſhe had the following Medicine exhibited:

Take of the Pilulæ ex duobus, fifteen Grains, diſſolved in an Ounce of Treacle-water; and of the purgative Syrup of Buckthorn, half an Ounce. Mix all together for a Doſe.

By this Preparation having procured five Stools, ſhe recovered her Senſes, but remembred nothing of what had happened during the ſix preceding Days. The Tumor gradually ſubſided, and the Fever was ſo far removed, that, by twice exhibiting the ſame Cathartic, ſhe was entirely reſtored to her former State of Health.

This Medicine, a conſiderable Part of which conſiſted of Scammony, which is, by moſt, diſcarded, as abſolutely pernicious in this Diſeaſe, freed the Patient from the moſt imminent Danger; for which Reaſon, the Aſſertions of the moſt ſkilful and celebrated Phyſicians are not to be taken for Rules of Practice, unleſs they have a ſufficient Sanction from Experience. *Freind. Comment. in Hippocrat. Epidem.*

Riverius, as a Topic, recommends a Decoction of Sage, with Venice Soap diſſolved therein; and an Infuſion of Sage ſometimes ſupplies its Place, with the ſame Soap, and an Addition of a ſmall Quantity of camphorated Spirits.

Turner directs an Application of Oil of Elder ſhook up with Lime-water, with a little camphorated Spirits. And Ointment of Elder is mentioned, by the ſame Author, as an excellent Application, which is, alſo, a popular Remedy among the Country-people. *Turner*, alſo, in caſe of Exulceration, recommends his Cerate of Lapis Calaminaris.

An ERYSIPELAS *of the* LUNGS.

An Eryſipelas ſometimes affects the Lungs; in which Caſe the Patient is ſeized with a highly burning Fever, and an acute Pain, both in the anterior and poſterior Parts of his Body, but eſpecially about the Spine; for the Breaſt is not very violently oppreſſed and contracted. The Patient, alſo, breathes with an erect Neck; through an Exceſs of Heat dilates his Noſtrils, like a Horſe overheated by running; and, like a panting Dog, hangs his Tongue out at his Mouth. He vomits ſometimes a bloody Matter, and ſometimes one of a livid Colour; ſometimes Bile, and at other times Phlegm. He is alſo ſeized with frequent Faintings, the common and familiar Sign of this Diſorder. His Cough is either dry, or he expectorates a yellow Spit, not much tinged with Blood. This Diſorder ſcarce ever fails to prove mortal; only there is a Poſſibility of the Patient's being preſerved, if the Eryſipelas quits the internal Parts, and appears externally. *Lommii Medicinal. Obſervat.*

ERYSIPELATODES, ἐρυσιπελατώδης, from ἐρυσίπελας, an Eryſipelas, and εἶδος, a Form, or Likeneſs. A Tumor, reſembling an Eryſipelas, or a ſpurious Eryſipelas. *Blancard.*

ERYTHACOS, ἐρυθακὸς, from ἐρυθρὸς, Redneſs. The ſame as RUBECULA, which ſee.

ERYTHEMA, ἐρύθημα, the ſame as ἔρυθρα in *Hippocrates*. The Redneſs of the Face, or Cheek, under a violent inflammatory Fever. Ἐρυθήματα (*Eruthemata*) are, alſo, the red and fiery Tumors which ariſe from an Inflammation, or fervid Blood, as in an Eryſipelas.

ERYTHRINUS, ἐρύθεινος, ἐρυθεῖνος, from ἐρυθρὸς, red. A Fiſh, called, by *Pliny*, *Rubellio*. The Roach. See RUTILUS.

ERYTHRION, ἐρύθειον, from ἐρυθρὸς, red. The Name of a Malagma, deſcribed by *Ægineta*, *Lib.* 7. *Cap.* 18.

ERYTHRODANUM. A Name for the *Rubia Tinctorum*. Madder. See RUBIA.

ERYTHROEIDES, ἐρυθροειδὴς, from ἐρυθρὸς, red, and εἶδος, a Form, is an Epithet of the innermoſt Coat of the Teſtes.

ERYTHRONIUM, or ERYTHRAICUM, ἐρυθρίνιον, ἢ ἐρυθρεϊκὸν. A Species of Satyrion, in *Dioſcorides*, *Lib.* 3. *Cap.* 144. See SATYRION.

ERYTHROXYLON, ἐρυθρόξυλον, from ἐρυθρὸς, red, and ξύλον, Wood; a Name for the *Poinciana flore pulcherrimo*.

ES. *Johnſon* explains this by *Corpus*, Body.

ESAPHE, ἐσαφὴ, from ἐσαφάω, to feel with the Fingers. The Touch; that is, feeling the Mouth of the Uterus, in order to diſcover its State. *Hippocrates.*

ESCHARA, ἐσχάρα. An Eſchar, relative to Wounds, Ulcers, or Cauſtics. But

ESCHARA, alſo, imports a ſort of ſubmarine Plant, which grows in form of a Net, or Cobweb.

Boerhaave mentions three Species of this Plant; which are,

1. Eſchara Rondeletii, 133. *J. B.* 3. 809. *Retepora Eſchara marina*. Imper. 630. *Porus Reticulatus*; & *Eſchara marina*. Imper. C. B. P. 367.

2. Eſchara; marina; frondipora. *J. B.* 3. 809. *Frondipora Eſchara marina*. Imper. 631. *Frondipora*. Imper. C. B. 367.

3. Eſchara; qui Porus cervinus. Imper. 630. *Alga marina πολυπορος poroſa*. J. B. 3. 809. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 6.

In medicinal Virtues it reſembles Coral.

ESCHAROPEPA, ἐσχαροπέπτα, from ἐσχάρα, a Fire-place, and πέπτω, to bake. An Epithet in *Hippocrates*, *Epid. Lib.* 4. for coarſe Barley-meal, which has been torrefied over the Fire.

ESCHAROTICA. Eſcharotics, or Medicines which induce an Eſchar.

ESCHATIÆ, ἐσχατίαι. The Extremities of the Limbs. *Hippocrates.*

ESCHYNOMENOUS. See ÆSCHYNOMENOUS.

ESCULUS. A Name for the *Quercus parva*; *ſive Phagus Græcorum*, & *Eſculus Plinii*. See QUERCUS.

ESCURA. The ſame as Eſchara. *Rulandus.*

ESDRÆ *Antidotus*. The Name of an Antidote deſcribed in *Paulus Ægineta*, *Lib.* 7. *Cap.* 11.

ESEBON, or *Alſebon*. Common Salt. *Rulandus.*

ESOCHE, ἐσωχὴ, for ἐξωχὴ, from ἐξέχω, to protuberate. An Eminence, Excreſcence, or Tubercle, about the Anus.

ESPHLASIS, ἔσφλασις, from ἐσφλάομαι, to recede inwards, is an Intropulſion, or a Receſſion, of a Part inwards, from ſome violent outward Impreſſion. The Word is uſed by *Hippocrates*, *Lib. de Vuln. Capitis*, with and without ἔσω, "inwardly;" and ſpoken of Wounds in the Cranium, when, as *Celſus* expreſſes it, *Medium (os) deſidet, & intro deprimitur*, "the "Middle of the Bone ſubſides, and is depreſſed inwards."

ESSATUM *Potentiale*. The medicinal Power, or Virtue, which reſides in Vegetables and Minerals. *Rulandus.*

ESSATUM *Vinum*. Spirit of Wine impregnated with the medicinal Virtues of Vegetables. *Rulandus.*

ESSENTIA. The Eſſence of any thing; it is that which diſtinguiſhes it from every other thing. From Philoſophy the Word has been transferred to Chymiſtry, where it ſeems ſtrictly to import the Eſſence, or diſtinguiſhing Part, of medicinal Simples, ſeparated from all other Parts of the Body which contained it. Hence

ESSENTIALIS. Eſſential. An Epithet for Salts procured from vegetable Juices by Cryſtallization. I have given an Example of the Manner by which theſe Salts are procured, under the Article ACETOSA.

The Proceſs, however, may be performed upon the Juice of any other ſucculent Vegetable; but a different Salt will be always produced, according to the different Nature of the Plant employed. If the Juices were either manifeſtly and purely acid, or acid with ſome Degree of Auſterity, the Salt will reſemble the Tartar of acid auſtere Wines. If a perfectly ſucculent Plant were choſe, and neither acid or oily, as many medicinal ones are, the Salt will be of another particular Nature, perhaps, reſembling Nitre. Such a Salt is afforded by Brook-lime, Endive, Fumitory, Dwarf-elder, Graſs, Knot-graſs, Plantain, Self-heal, Succory, Water-creſſes, Water-lilies, *&c.* Whence the Juices of theſe Plants are greatly medicinal, as abounding with this Kind of nitrous Salt, ſo as to open inveterate Obſtructions, reſolve the black bilious Juice, and cure chronical Diſeaſes. But when the viſcous Juices of Vegetables are uſed in this Proceſs, as thoſe of Purſlain, Comfrey, or the like, their Salt cannot be obtained without a previous Fermentation, to diſſolve their Tenacity. In like manner, all the Juices abounding with Oil are unfit for this Purpoſe; for though they contain a Salt, yet it is ſo entangled with the tenacious Oil, as to prevent its uniting with the Particles of its own Nature, and forming Cryſtals; for Oil always prevents the Cryſtallization of Salts; and, again, Plenty of Oil occaſions a Loſs of Salt, and *vice verſa*, as well in Animals as Vegetables; on which account thoſe Salts are not eaſily obtained from ſuch aromatic Plants as abound with Oil and Balſam.

Hence we learn the Nature of the Salt, thus obtained, as it is in Plants. It is ſoluble in Water, compounded of Oil and Salt, frequently acid, and never alcaline; for when it is alcaline in the Boiling and Inſpiſſation, it is moderately fixed, and eaſily changed; it mixes with the Juices, and enters many of the fine Veſſels of the Body, where, therefore, it may exert its Virtue. When dried, it, in ſome meaſure, burns in the Fire, and is convertible into a fixed alcaline Salt. *Boerhaave's Chymiſtry.*

The Oils, alſo, peculiar to different Vegetables, are called Eſſential Oils. See OLEUM.

Some Fevers are, alſo, called Eſſential, by way of Diſtinction from ſymptomatic Fevers.

ESSERE. This is a Species of Tumor, not mentioned by the *Greek* and *Latin* Authors, but only by the *Arabians*, who call it *Eſſere*, *Sora*, and *Sare*. It frequently occurs in ſeveral Parts of *Europe*, and appears by the ſudden Eruption of ſmall Tubercles, of a rediſh Colour, all over the Body, and accompanied with an uncommon Itching, juſt as if the Patient had been ſtung by Bees, Waſps, or Gnats, or by Nettles. But ſoon after theſe Tubercles diſappear, and no Ichor, or Moiſture, being conveyed to them, the Skin recovers its former Smoothneſs. Some claſs theſe Tumors among the Epinyctides of the *Greeks*, but very improperly, ſince the Epinyctides and Eſſere are Tumors of a quite different Nature; for the former diſcharge an Humour from them; which the latter do not, but diſappear without the Diſcharge of any Humour. Beſides, the Epinyctides afflict the Patient principally in the Night-time, from which Circumſtance they derive their Name; whereas the Eſſere rarely appears in the Night-time, but, for the moſt part, in the Day. Theſe Tumors, alſo, require a different Method of Cure.

It is to be doubted, whether this Kind of Tumor was known among the *Greeks*, ſince no legitimate Species of it is mentioned in their Writings, unleſs we refer it to exanthematous Eruptions without Exulceration.

Serapio, in the eighth Chapter of his *Breviarium*, conſtitutes two Kinds of this Tumor, according to their different Cauſes. The one proceeds from a bilious Blood, and the other from a ſaline nitrous Phlegm; but this latter occurs more rarely than the former. Since no Moiſture is diſcharged, others affirm, that this Species of Tumor ariſes from Vapours of an intenſely hot Blood, or from a Mixture of bilious and ſaline Humours.

The Man who is acquainted with the Nature of ſerous Humours, cannot deny but ſuch Tumors may be produced by them, ſince they are acrid, moveable, and capable of being eaſily diſcuſſed. This is alſo confirmed by another Circumſtance, which is, that by Veneſection, which powerfully checks the Effervescence of the ſerous Part of the Blood, this Diſorder is removed: But that this ſerous Humour is of different Qualities, ſometimes mild, ſometimes acrid and hot, ſometimes thin, and ſometimes thick, is ſufficiently obvious from the Itching, which is ſometimes greater, ſometimes leſs. This is alſo certain from this Circumſtance, that I have often obſerved, that theſe Tubercles ariſe when the Patient is in a warm Bed; and diſappear when he is expoſed to a cold Air: That at other times they riſe in a cold Air, and diſappear in one that is warm. The former of theſe Phenomena ſeems to be produced for this Reaſon, that the Humour is highly fine and moveable, and, conſequently, capable of being forthwith drove inwards, by the cold Air: Whereas the latter ſeems to be owing to this, that the Humour is not ſo moveable and fine, but ſomewhat thicker, and, conſequently, cannot tranſpire in a cold Air, though it is capable of doing ſo in a warm Atmoſphere.

This ſerous and thin Humour is, for the moſt part, generated by ſome Diſorder of the Liver, which by ſome preternatural Cauſe is diſpoſed to generate this Humour. But this Humour is put into a State of Effervescence, by the procatarctic Cauſes which agitate the Maſs of Blood. This Diſorder is alſo more frequent in Winter than in Summer, in cold than in hot Climates.

This Diſorder is eaſily known by the Marks above laid down; for it is ſometimes preceded by a ſpontaneous Laſſitude, after which, itchy Puſtules appear over all the Body, as if the Patient was ſtung by Bees, or pricked by Nettles.

Theſe Tubercles, in a ſhort time, and without any Care, ſpontaneouſly diſappear, without coming to Suppuration, or diſcharging any Matter. And, if this laſt Accident ſhould at any time happen, it is rather owing to the Scratching, on account of the violent Itching, than to the Nature of the Tubercles themſelves.

Sometimes the Eſſere precedes bilious Fevers; and they who are frequently afflicted with this Diſorder, ought not to neglect its Cure, leſt they ſhould fall into Fevers, or ſome other violent Diſeaſe.

In the Cure of this Diſorder, there is, for the moſt part, no Neceſſity for Topics; but if, by Veneſection, and the Exhibition of Alteratives, the Heat of the Blood is abated, the Tubercles diſappear, and the natural Colour and Smoothneſs of the Skin return. The firſt Step to be taken is, to open a Vein, and take away as much Blood as the State of the Patient requires. After this, if it is found neceſſary, the bilious and ſerous Humour is to be evacuated by Tamarinds, Myrobalans, and Rhubarb. After this, let the Juices and Syrups of Pomgranates, red Currants, and unripe Grapes, as, alſo, Whey, ſour Milk, and Emulſions of the Four cold Seeds, be exhibited. The Patient may, alſo, be immerſed in a Bath of tepid Water; and the Diet ought, in this Diſorder, to be refrigerating and moiſtening. *Sennert.*

ESSODINUM. A certain Preſage of a future Event, drawn from the Signs which indicate it. *Rulandus.*

ESTHIOMENOS, ἐσθιόμενος, from ἐσθίειν, to eat. Deſcent, eating, corroding. An Epithet for ſome Sorts of ſpreading Ulcers.

ESULA. A Name for ſeveral Species of the TITHYMALUS, which ſee.

ESULA INDICA. Bont. 153. Raii Hiſt. 1. 873. *Eſula Indica Bontii, ſive Euphorbio affinis Indica Sedi folio.* Hiſt. Oxon. 3. 345. *Tithymalus Orientalis arboreſcens, triquetrus ſpinoſus, Yalukghaha.* Herm. Muſ. Zeyl. 56. *An Daluk. Eſula Indica.* Ejuſd. 67?

Of the Juice of the Eſula Indica is prepared an Extract, which is of good Service in the Cachexy, Dropſy, Palſy, and other cold and ſtupid Diſeaſes.

The Plant which produces the yellow Tear, corruptly called, in our Shops, *Gutta Gemou*, differs not at all from the abovementioned in Form, or Manner of Growth. But we are to obſerve, with Dr. *Sydenham*, that there are two Sorts of *Gotta Gumma*, or *Gutta Gamba*, ſold by the Merchants, which are, the common Sort, collected from a Plant, nearly reſembling the Eſula Indica, and called, by the *Indians*, *Lonan Cambodia*; and another, which is the beſt, and diſtils from a Tree in the *Eaſt Indies*, called *Codampulli*, and *Carcapuli*, or *Kanna Ghorika*. *Dale.*

The *Lonan Cambodia* is ſo called, becauſe it is produced in *Cambodia*, a Country near *China*, famous, alſo, for Plenty of hepatic Aloes. This Juice is much ſafer taken prepared, than crude; for in the Preparation it depoſites, in a great meaſure, its emetic and antiſtomachic Quality. The Way of preparing it is as follows: Take a Pound of *Gutta Cambodia*, bruiſe it groſsly, and then infuſe it in a large Glaſs Phial, in the ſtrongeſt diſtilled Vinegar, which muſt riſe above it by about three Fingers Breadth; then expoſe the Glaſs to the Sun's Rays, which, in many things, perform the Office of a chymical Fire. At the End of eight or ten Days, let it be paſſed through a very fine Strainer; and, after that, be inſpiſſated to the due Conſiſtence of an Extract; of which exhibit from twelve to twenty Grains, in the ſolid Form of Pills, or diluted with Wine; by which Method they will purge plentifully, without Gripings, only by Stool. And this Extract I ſhould prefer before Scammony, in theſe hot and moiſt Countries. *Ray, Hiſt. Plant.*

ESURINUM. Eſurine, or hungry. Vinegar, rectified by means of Verdegriſe, as deſcribed under the Article ACETUM, is called *Acetum Eſurinum.*

ETESIÆ, ἐτησίαι. Certain Winds, frequently mention'd by *Hippocrates.* They are cool Winds, which are ſaid to blow from the North-eaſt, and to temperate the Heat of the Atmoſphere. *Pliny* informs us, that North-eaſt Winds *(Aquilones)* blow eight Days before the Dog-ſtar riſes, and that theſe are called *Prodromi*; and that, two Days after the Riſing of the Dog-ſtar, the Eteſian, or North-eaſt, Winds ſet in, and continue for forty Days.

According to *Proſper Alpinus*, the Eteſian Winds begin to blow, in *Egypt*, when the Sun enters *Cancer*; and blow very conſtantly the whole Months of *July* and *Auguſt*, as well as almoſt all *June*. At the Riſing of theſe Winds, which happens nearly at the time when the *Nile* begins to increaſe, all peſtilential Diſtempers, which were before very common, while the contrary Winds blew, are extinguiſhed. For as, he ſays, the Southerly Winds, which the People of the Country call *Campſin*, (as he ſuppoſes, from *Campſis*, a General, who, with his whole Army, was ſuffocated in the Sand driven upon them by theſe Winds, as we read in the Life of *Alexander* the Great) induce a morbous and diſtemper'd Conſtitution of the Air; it is but natural to expect, that the Eteſian Winds, which are directly contrary to them, ſhould purge the Air, and render it wholſome. Beſides, the Nature of the Eteſian Wind is oppoſite to peſtilential Conſtitutions, as much as the Southerly Winds are obſerved to promote Putrefaction; agreeable to that of *Galen*, *Lib.* 1. *de Temp.* where he ſays, "that all "Things are preſerved for a very long time from Putrefaction "by the North Wind, which is cold and dry by Nature; but "are very eaſily putrefied by Southern Blaſts." And, in many Places, he affirms, that the former Winds induce a healthy and ſalubrious State of the Air; as in his *Com. in* 3 *Epid.* "If the Eteſian Winds, he ſays, blow in the Summer, they "prevent many Miſchiefs and Diſorders, which otherwiſe "would happen." And, ſpeaking of a peſtilential Air, he ſays, "If the Eteſian Winds had blown at this Seaſon, they "had cleanſed the Conſtitution of the human Body from all "Diſtempers." And he aſſures us, in ſeveral Places of his Writings, that the Summers in which the Eteſian Winds did not blow, were very ſickly. *Hippocrates*, alſo, deſcribing a peſtilential Summer, ſays, "the Summer was fair and hot, "and the Seaſon was very ſultry, the Eteſian Winds blowing only by weak and ſcattered Blaſts."

Proſper Alpinus, de Med. Ægypt.

All this is very conſonant to Reaſon, if we reflect, that the Winds which blow from the North and Eaſt, bring with them, in great Abundance, the Acid of the Air, the grand Reſiſter of Putrefaction. See ACIDA.

ETHEES, precious Gold. *Rulandus.*

ETHEL imports both Fire and Blackneſs. *Ethelia* is a dry aduſt Body, red and white. *Auricolla Ethela* is a red Tincture; and the white Flower of Gold. *Rulandus.*

Ethel, *Terra alba*, *Sulphur album*, *Fumus albus*, *Auripigmentum*, and *Magneſia*, in the Chymical Art, ſignify all the ſame Thing. *Dav. Lagneius*, *Harm. Chem.* in *Theat. Chym. Vol.* 4. *p.* 729.

ETHESIUS LAPIS, the *Chryſolith*. *Rulandus. Johnſon.*

ETHICA, the ſame as HECTICA; which ſee.

ETHMOIDES, ἠθμοειδὴς, from ἦθμος, a Strainer, and εἶδος, a Form, or Likeneſs, an Epithet apply'd to a Bone at the Root of the Noſe, the *Os Ethmoides*; for which ſee CAPUT.

ETNOS, ἔτνος, in *Hippocrates*, ſignifies, according to *Galen*, all Kinds of Food, whether ſolid or liquid, prepared of leguminous Fruits decorticated and bruiſed, and then boiled.

ETRON, ὕτρον, the HYPOGASTRIUM; which ſee.

ETTALCHE. A Name for the *Cedrus*, *Folio Cypreſſi*, *major*, *fructu flaveſcente*. See CEDRUS.

ETYMODRYS. A Name for the *Quercus*; *cum longo Pediculo*.

EVACUATIO, κένωσις, Evacuation, natural or artificial.

EUÆMIA, εὐαιμία, from εὖ, importing Good, and αἷμα, Blood; Goodneſs of Blood. *Fernel. Pathol.*

EUALTHES, εὐαλθὴς, from εὖ, importing Eaſe, and ἄλθω, to heal; eaſy to be healed. *Hippocrates de Articulis.*

EUANALEPTOS, εὐαναληπτὸς, (from εὖ, ſignifying Eaſe, and ἀναλαμβάνω, to amend, recover) is eaſily recover'd, or repair'd. *Hippocrates*, 6 *Epid. Sect.* 4. *Aph.* 7.

EUANASPHALTOS, εὐανάσφαλτος, from εὖ, importing Eaſe, and ἀνασφάλλω, to recover Strength, is one who eaſily recovers, or is ſoon reſtored to Health. *Hippoc.* περὶ τροφῆς, in Oppoſition to δυσανάσφαλτος, *dyſanaſphaltos*, one who is difficult to be reſtored.

EUANTHEMON, εὐάνθεμον, the ſame, according to *Galen*'s Exegeſis, as the *Anthemis* and *Chamæmelum*. The Word occurs *Lib.* 1. περὶ γυναικ.

EUANTHES, εὐανθὴς, from εὖ, well, highly, in a great Degree, and ἄνθος, a Flower, highly florid. Thus, *Coac.* 631. εὐανθεῖς θρόμβοι αἱματώδεις, are highly colour'd or florid grumous Concretions of Blood; and εὐανθὲς οὖρον highly florid Urine, ſeems to be what has a ſpumous Efflorescence on its Superficies. But ſome take εὐανθὲς οὖρον, to be pellucid and pure Urine, which comes nearly to the natural Colour of Urine, and, by its florid Brightneſs and Tranſparency, prognoſticates a ſafe and ſpeedy Criſis.

EUAPHION, εὐάφιον, from εὖ, denoting Eaſe, and ἁφὴ, the Touch; a Medicine for the Hæmorrhoids, ſo named for its Gentleneſs, mention'd by *Galen*, *de C. M. S. L. Lib.* 9. *Cap.* 7.

EVAPORATIO. Evaporation; that is, a Diſſipation of the finer Parts of any Fluid, by means of the Sun, or a Fire. Tho' Chymical Evaporation is always carry'd on by means of Heat, yet Cold and Winds cauſe Water to evaporate; and even the hardeſt Ice is not exempt from Evaporation, as Mr. *Gauteron* informs us, in the Memoirs of the Royal Academy of Sciences for 1709; and as we learn from Dr. *Halley*.

EUCARDIOS, εὐκάρδιος. Grateful to the Stomach.

EUCATASCEPTON, εὐκατάσκεπτον, from εὖ, importing Eaſe, and κατασκήπτω, to be incumbent. An Epithet in *Hippocrates*, *de Fract.* for a Wound, importing its being properly ſuſtain'd, or ſupported, by lying upon ſomething ſoft.

EUCHARISTOS. An Epithet for an Antidote in *Nicolaus Myrepſus*, *Sect.* 1. *C.* 278.

EUCHROEA, εὐχροια, from εὖ, importing Goodneſs, and χρόα, or χροία, Colour; Goodneſs of Colour, Floridneſs, a healthy Countenance. But *Euchroon* is the Name of a Plaiſter in *Scribonius Largus*, 203. and in *Galen*, *de Comp. Med. S. L. L.* 4. *C.* 7.

EUCHYLOS, εὔχυλος, from εὖ, importing Goodneſs, and χυλὸς, Humour, Juice; abounding with good Humours or Juices. *Euchymus*, εὔχυμος, has the ſame Signification.

EUCHYMIA, εὐχυμία, from εὖ, denoting Goodneſs, and χυμὸς, Humour, Juice, is Goodneſs of the Humours or Juices, as well in Aliments, as in the human Body.

EUCINETOS, εὐκίνητος, from εὖ, importing Eaſe, and κινέω, to move, is eaſy to be moved. *Hippocrates*, 3 *Aphor.* 17.

EUCOILIA, εὐκοιλία. An Epithet for Cherries, in *Dioſcorides*, *L.* 1. *C.* 1. 57. importing, that they render the Belly ſomewhat ſoluble.

EUCRASIA, εὐκρασία, from εὖ, good, and κεράννυμι, to mix. A good Temperament.

EUDIA, εὐδία, Serenity, Calmneſs, and Mildneſs of the Weather. *Hippocrates.*

EUELPIDIUM. The Name of a liquid Collyrium; call'd alſo *Diarrhodon*, and *Diaſmyrnon*.

EUELPISTI *Emplatrum*. The Name of a Plaiſter, deſcrib'd in *Scribonius Largus*, Nº 85. ſo call'd from *Euelpiſtes*, the Son of *Phleges*, a Surgeon mention'd in the Preface to the ſeventh Book of *Celſus*.

EUEMBOLOS, εὐέμβολος, from εὖ, well; and ἐμβάλλω, to put in. A Surgeon ſkilful at reducing luxated Bones.

EVENTUS, in Medicine, is generally underſtood of the Termination of a Diſeaſe, whether in Death, Recovery, or another Diſeaſe.

EUERES, εὐήρης, from εὖ, well; and ἐρετμὸς, an Oar. It imports, eaſy to be row'd, well-trim'd, relative to a Boat. But *Hippocrates*, who ſometimes makes uſe of naval Phraſes, applies it to Medicinal Inſtruments, in his Book *de Medico*; where it imports ready, or handy.

EVERRICULUM, in *Paré*, is a Sort of *Specillum*, or Spoon, us'd to clear the Bladder of Gravel, and Grumes of Blood, after Lithotomy.

EVERSIO. The ſame as *Ectropium*; which ſee.

EVESTRUM, in *Paracelſus*, ſeems to mean a prophetic Spirit, which preſages, with Certainty, future Events.

EUEXIA, εὐεξία, from εὖ, well, and ἕξις, Habit. A good Habit of Body.

EUGEOS. A Name by which the Uterus is ſometimes call'd, on account of its Fertility, from εὖ, well, and γῆ, the Earth; and ſometimes, the Hymen has this Appellation.

EVISTIOLA, in *Paracelſus*, ſeems to import a leprous Diſorder in the Nape of the Neck.

EULE, εὐλὴ, a Worm, properly one that is bred in Ulcers.

EULOGIUM, in *Foreſtus*, from *Rhaſes*, imports an exanthematous Diſorder, the Small-pox, or Meaſles. *Caſtellus.*

EUNUCHION. The Lettuce; ſo call'd from its being ſuppos'd to reſtrain Venereal Inclinations; becauſe, according to the Antients, *Venus* lay upon a Bed of Lettuces, after the Death of *Adonis*.

EVOMITIO. A Vomiting. I don't know that it occurs in any Claſſical Author.

EUONYMOIDES.

The Characters are;

The Leaves are alternate, not conjugate; the Pedicle ends in a monophyllous, quinquefid, ſtellated, Calyx. The Flower is roſaceous, pentapetalous, furniſhed with five Stamina, and the Flowers are diſpoſed in Spikes. The Ovary grows to the Placenta in the Bottom of the Calyx, is furniſh'd with a Pointal, having a rough Apex, and becomes a globous Capſula, with three Cells, each Cell containing two Seeds immers'd in a Pulp. *Boerhaave* mentions but one Species of this Plant, which is, Euonymoides; Canadenſis. *Saraz.*

EUONYMUS.

The Characters are;

The Calyx is monophyllous, and quinquefid, or quadrifid; the Flower roſaceous, tetrapetalous, and ſometimes pentapetalous, and furniſh'd with four or five Stamina. The Ovary, in the Bottom of the Calyx, is furniſh'd with a bifid Tube, or Pointal, and becomes an angulous, membranaceous Fruit, divided into four or five Cells, full of oblong Seeds. *Boerhaave*, *Index alter*, *Part* 2. *p.* 237.

Boerhaave mentions four Species of this Plant, which are;

1. Euonymus; vulgaris; granis rubentibus. *C. B. P.* 428. *Jonſ. Dendr.* 387. *Tourn. Inſt.* 617. *Elem. Bot.* 490. *Boerh. Ind. A.* 2. 237. *Dill. Cat. Giſſ.* 66. *Buxb.* 106. *Rupp. Flor. Jen.* 74. *Euonymus*, Offic. Chab. 62. Ind. Med. 49. *Euonymus*, *Fuſanus*, Mont. Ind. 42. *Euonymus Theophraſti*, Ger. 1284. Emac. 1468. Merc. Bot. 1. 34. Phyt. Brit. 39. Mer. Pin. 37. *Euonymus vulgaris*, Park. Theat. 241. Raii Hiſt. 2. 1621. Synop. 3. 468. *Euonymus multis*, *aliis Tetragonia*, J. B. 1. 201. THE SPINDLE-TREE. *Dale*, *p.* 321.

They ſay, its Fruit purges both upwards and downwards: The Peaſants make uſe of the Powder of its Fruit, to kill Lice; or elſe waſh their Hair with the Decoction of its Seeds. *Martyn's Tournefort.*

It grows frequently in the Hedges, and flowers in *May*. The Fruit is in Uſe, but of a noxious Quality, and not to be taken inwardly without Danger; externally uſed, it is an Emollient and Reſolvent, kills Lice, and deterges furfuraceous Heads. *Dale.*

Theophraſtus affirms, that it is noxious to Cattle; in Confirmation of which, *Matthiolus* and *Ruellius* both relate, from their own Experience, that neither Sheep, nor Goat, how greedy ſoever of young Sprouts of Trees, will ever touch this Plant. *Cluſius*, on the contrary, ſays, that in *Hungary* he has obſerv'd Goats to feed very greedily on the Leaves of this Tree, without receiving any Prejudice; which however, conſidering the ungrateful Smell, and cathartic Quality of this Plant, does not ſeem very probable. Three or four of the Berries purge upward and downward; boiled in a Lixivium, they dye Hair of a yellow Colour. Of the Wood, in *France* and *Germany*, are made the beſt Spindles: Whence it is call'd *Fuſanus* and *Fuſaria*. *Raii Hiſt. Plant.*

2. Euonymus, latifolius, *C. B. P.* 428. BROAD-LEAV'D SPINDLE-TREE.

3. Euonymus; Africanus Lycii craſſioribus foliis; ſempervirens; capſula triloculari, aſperata rubente. *Rhamno ſimilis, triſoculari*

Filetulari fructu, folio Pyracanthæ Africana, dicta. Lycium, Africanum, fructu rubro, potius Euonymo affinis. Ind. 246. *Lycium Æthiopicum, Pyracanthæ folio.* H. A. 1. 163. EVERGREEN AFRICAN SPINDLE-TREE, *commonly call'd* AFRICAN BARBERRY.

4. Euonymo affinis, Æthiopica; ſempervirens; fructu globoſo, ſcabro; foliis Salicis, rigidis, ſerratis. *H. L.* 239. *Pluk. Phyt.* 176. 3. *Lauro ſerratæ, odoratæ, Stapelianæ ſimilis, inodora, Capitis bonæ Spei,* Breyn. Prodr. 1. *Laurus non odorata, fructu globoſo, Africana.* Sterbeeck, Citric. 248. *Arbor, Africana, facie Loti Arboris vulgo. Evergreen* Ethiopian SPINDLE-TREE, *with a globular Fruit, and ſtiff ſerrated Willow-leaves. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 237.

EUPATORIOPHALACRON. *Naked-headed Agrimony.*

The Characters are;

It is a corymbiferous Plant, which in ſome Species have radiated Flowers, whoſe Flowers are Hermaphrodite, and the Half-florets are Female; but, in other Species, the Flowers are produced in a Diſk, and are for the moſt part Hermaphrodite. The Ovaries have naked Heads, and are placed on a woolly Placenta. All theſe Parts are contained in a Flower-cup, which is divided into many Parts to the Placenta. To theſe Notes muſt be added, the Leaves growing oppoſite on the Branches.

Miller, in his Dictionary, takes notice of ten Species of this Plant; none of which, at preſent, have any Medicinal Virtues attributed to them, that I know of.

EUPATORIUM.

The Characters are;

Its Root is fibrous and perennial; the Leaves grow two, three, or four together at Intervals; the Calyx is long, ſmooth, and ſcaly. The Flowers form an Umbella, furniſhed with many long bifid Capillaments, or Threads.

Boerhaave mentions four Species of this Plant; which are,

1. Eupatorium; cannabinum. *C. B. P.* 320. *Park.* 595. *Tourn. Inſt.* 455. *Boerh. Ind. A.* 118. *Dill. Cat.* 140. *Raii Hiſt.* 1. 293. *Synop.* 83. *Eupatorium Avicennæ, Eupatorium Cannabinum,* Offic. *Eupatorium canabinum alterum,* Ger. 574. *Eupatorium Cannabinum vulgare, foliis trifidis profundè dentatis.* Hiſt. Oxon. 3. 97. *Eupatorium adulterinum,* J. B. 3. 1065. Chab. 334. Schw. 69. HEMP AGRIMONY. *Dale, p.* 91.

This Species of *Eupatorium* has a ſpreading ſtringy Root; from which ariſe rediſh ſquare Stalks, two or three Foot high, ſomewhat woolly, having at each Joint two Leaves divided into three long narrow ſerrated Hemp-like Sections, green above, and whitiſh underneath. The Flowers grow on the Tops of the Stalks in Cluſters, Umbelwiſe, each being ſomewhat ſlender and naked, compoſed of ſeveral fiſtular Flowers, of a purple Colour, divided into five Parts at the Top, and paſſing away into Down. It grows by Rivers and Ditch-ſides, and flowers in *July*.

Schroder commends this as a very good vulnerary Plant, uſed inwardly, but eſpecially outwardly, and uſeful to correct an ill Habit of Body, and cure Coughs and Catarrhs; tho' *Geſner*, upon Trial, found the Root to be a ſtrong Purger. It is but ſeldom uſed. *Miller's Bot. Off.*

Two Ounces of the Juice of the Leaves of this Plant, or a Dram of its Extract, and a Ptiſan of it, drank by Glaſſfuls, are very good for Obſtructions of the Bowels, eſpecially thoſe which ſucceed intermitting Fevers, in which the Blood is very much deprived of its natural Balſam. A Tea, or Broth, of its Leaves, given after the Legs have been bathed with a Decoction of the whole Plant, affords great Eaſe in the Dropſy. For the Green-ſickneſs, Itch, and other cutaneous Diſeaſes, it is mixed with Fumitory in Whey, Broths, and Ptiſans: The Tops, charged with Flowers, are very vulnerary; the Roots purge conſiderably, both upwards and downwards. This Experience *Geſner* himſelf had of it: "I lately boiled, he ſays, "ſome Fibres of the Root of *Eupatorium aquaticum*, or *Avi*- "*cennæ quorundam*, in Wine, and drank the Decoction after "it was ſtrained: In an Hour after, it began to purge plenti- "tifully by Stool, Urine, and Vomiting; and work'd near "twelve times afterwards, evacuating vaſt Quantity of Phlegm "in a much eaſier and ſafer Manner, than is done by Helle- "bore."

The Leaves of this Plant are very bitter, and do not ſtain the blue Paper: It is probably endowed with the natural Salt of the Earth, with hardly any other Alteration, than being united with a great deal of Sulphur and Earth. *Martyn's Tournefort.*

Tragus ſays, that at *Straſburg*, they only uſe it for the Diſeaſes of their Cattle; and it appears, by *Geſner*'s Experiment, that its Operation is too violent to be truſted on a human Body, unleſs in ſmall Quantities, and mix'd with other Things to correct it. The People of the *Low-countries* uſe the Decoction of it with Succeſs in the Jaundice. A certain Perſon in an Hoſpital had his Inteſtines corroded to ſuch a Degree, that the Fæces came out at the Perforations; and, his Caſe being almoſt deſperate, he try'd a Decoction of this Plant, in Wine, drinking it, and infuſing it alſo into his Ulcers, the Effect of which was a perfect Conglutination and Cure. *Ray's Hiſt. Plant.* 293.

2. Eupatorium; Urticæ foliis; Canadenſe; flore albo. *H. L. App.* 667. *Eupatorium, Scrophulariæ foliis glabris, flore albo.* M. H. 3. 98. *Valeriana, Urticæ folio, flore albo.* M. H. 3. 97. Corn. 20. CANADA HEMP AGRIMONY, *with Nettle-leaves, and a white Flower.*

3. Eupatorium; Novæ Angliæ; Urticæ foliis; floribus purpuraſcentibus; maculato caule. *H. L. App.* 667. NEW ENGLAND HEMP AGRIMONY, *with Nettle-leaves, purpliſh Flowers, and ſpotted Stalks.*

4. Eupatorium; folio oblongo, rugoſo; caule purpuraſcente. *T.* 456. CANADA HEMP AGRIMONY, *with a long rough Leaf, and a purpliſh Stalk. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 117. See AGRIMONIA.

EUPEPSIA, εὐπεψία, a good Digeſtion; from εὖ, well, and πέσσω, to digeſt.

EUPETATON. A Name in *Oribaſius, Medic. Collect. L.* 7. *Cap.* 26. for the *Daphnoides*, which is the *Thymelæa*; *Laurifolia*; *Sempervirens*; *ſeu Laureola mas.*

EUPHORBIUM. The Name of a Plant, ſaid to be thus call'd from *Euphorbus*, Phyſician to the famous *Juba*, and Brother to *Antonius Muſa*. But *Salmaſius* proves this to be a Miſtake, by ſhewing, that this Plant was known by the Name of *Euphorbium*, many Ages before *Euphorbus* was born.

The Characters are;

The Flower, Fruit, and Milk, are like thoſe of the *Tithymalus*; the Form is angulous like the *Cereus*, prickly for the moſt part, and almoſt bare of Leaves.

Boerhaave mentions twelve Species of this Plant; which are,

1. Euphorbium; Cerei effigie; caulibus craſſioribus; ſpinis validioribus armatum. *Breyn. Prodr.* 2. *M. H.* 3. 344. *Euphorbium.* Dod. p. 378. *Euphorbium; cerei effigie.* H. A. 1. 21. *Tithymalus, Mauritanicus, aphyllos, anguloſus, ſpinoſus, ex quo Euphorbium Officinarum.* H. L. THICK-STALK'D CEREUS-LIKE EUPHORBIUM, ARM'D WITH STRONG SPINES.

2. Euphorbium; Cerei effigie; caulibus gracilioribus. *Tithymalus, Mauritanicus, aphyllos, anguloſus, ſpinoſus minor.* Ind. 107. *Tithymalus Africanus, ſpinoſus, Cerei effigie.* Excod. Compt. M. H. 3. 343. SLENDER-STALK'D CEREUS, SHAP'D LIKE EUPHORBIUM.

3. Euphorbium; heptagonum; ſpinis longiſſimis, in apice frugiferis. EUPHORBIUM, *with ſeven Angles, and long Spines, bearing Fruit upon the Tops.*

4. Euphorbium; Afrum; polygonum: ſpinoſum; caule tuberibus ornato. *Tithymalus, aizoides, Africanus, validiſſimis ſpinis ex tuberculorum internodiis provenientibus.* Comm. Præl. 59.

5. Euphorbium; tetragonum, & pentagonum; ſpinoſum; Canarinum. *Boerh. Ind. A.* 258. *Euphorbium.* Offic. Mil. Cat. 42. *Euphorbium tetragonum & pentagonum ſpinis geminis aduncis munitum.* Act. Reg. Par. anno 1720. Edit. 8vo. p. 500. *Euphorbium quadrangulare, ſive tetragonum,* Hort. Boſ. 47. *Tithymalus aizoides fruticoſus Canarienſis aphyllos, quadrangularis, & quinqueangularis, ſpinis geminis aduncis atronitentibus armatus.* Hort. Amſt. 2. 207. Raii Hiſt. 3. 429. Comel. Præl. Bot. 20. *Tithymalus aizoides lactiſluus, ſeu Euphorbia Canarienſis quadrilatera & quinquelatera Cerei effigie, ad angulos per crebra intervalla ſpinis vectis atronitentibus, Gazellæ Cornua referentibus armata.* Pluk. Phytog. 320. f. 3. Almag. 370. *Tithymalus quadrangularis ſpinoſus ſeu ſpinis geminis aduncis ex eadem ſede ortis armatus, ſucco lacteo acerrimo turgidus.* Hort. Beaum. 41. CANARY EUPHORBIUM. *Dale.*

6. Euphorbium; Afrum; caule ſquamoſo; tuberoſo. *Tithymalus aizoides, Africanus, caule ſimplici ſquamoſo.* Comm. Præl. 57. AFRICAN EUPHORBIUM, *with ſcaly Stalks, and a tuberoſe Root.*

7. Euphorbium; Afrum; caule ſquamoſo, tuberoſo; minus. *Ex horto ampliſſimi Simonis Beaumont.* LESSER AFRICAN EUPHORBIUM, *with ſcaly Stalks, and a tuberoſe Root.*

8. Euphorbium; Afrum; caule craſſo ſquamoſo, ramis in Capitis Meduſæ Speciem cincto. AFRICAN EUPHORBIUM, *with thick ſcaly Stalks, and branching at the Top like Meduſa's Head, commonly called* THE SNAKE EUPHORBIUM.

9. Euphorbium; Afrum; facie fructus Pini. *Tithymalus, Africanus, arboreſcens, ſquamato caule ſpinoſo.* M. H. 3. 344. *Planta lactaria, Africana, Pini fructuum facie.* Breyn. Prodr. 2. 100. AFRICAN EUPHORBIUM, *with the Face of the Pine-fruit, commonly called* LITTLE MEDUSA'S HEAD.

10. Euphorbium; verum; Antiquorum; ſcadida Calli. Hort. Malab. *Raii Hiſt.* 1. 873. *Volk. Flor. Nor.* 158. *Hort. Amſt.* 1. 23. *Boerh. Ind. A.* 259. *Euphorbium.* Offic. *Euphorbium verum,* Com. in Not. *Euphorbium antiquorum verum, ſive Scadidacalli.* Hort. Boſ. 47. *Euphorbium trigonum ſpinoſum rotundifolium.* Act. Reg. Par. anno 1720. Ed. 8vo. p. 500. *Euphorbium Indicum Opuntiæ facie caule geniculato, triangulari.* Breyn. Prodr. 2. 44. Flor. Mal. 108. Hiſt. Oxon. 3. 345. *Tithyma-*

lus aizoides nodosus & spinosus lacte turgens acri. Pluk. Almag. 370. Commel. Prælud. Bot. 21. *Tithymalus Indicus spinosus & angulosus lacte turgens acri.* Hort. Beaum. 118. *Schadida Calli.* Hort. Mal. 2. 81. THE EUPHORBIUM-TREE. *Dale.*

Euphorbium is the inspissated Juice, or Gum, of a thorny Plant, which grows in *Barbary*, and the *East Indies*. It is called, by *Herman*, *Tithymalus Mauritanicus aphyllus angulosus & spinosus, ex quo Euphorbium officinarum. Schadida Galli Horti Malabarici, Vol. 2. Tab.* 81. It is a different Plant from the Euphorbium of *Gerard*, *Parkinson*, and *Bauhine*, having several triangular, succulent, jointed, thick Stalks, beset with a double Row of small, stiff, hard Prickles, coming off in Pairs; and, if we compare small things with great, like the Horns of a young Steer join'd to a Piece of the Skull. On the Top of the Stalks grow pentapetalous Flowers, succeeded by triangular Seed-vessels, containing each three Seeds. The whole Plant is full of a caustic Milk, which, when dried, is the Euphorbium. It is brought over in small brown-yellow Drops, of a gummy resinous Substance, of little Smell, but burning the Nose, causing violent Sneezing, and inflaming the Mouth and Throat.

It is but little us'd inwardly, on account of its hot, caustic, acrimonious Quality; though it was given antiently to cure the Dropsy: But, we having safer and milder Remedies, it is now in Disuse. It is a violent Sternutatory, and is sometimes used in Apoplexies and Lethargies. It is used outwardly to clean foul and rotten Bones, and to be put into drawing Plaisters.

Officinal Preparations are the *Oleum Euphorbii simplex & compositum. Miller's Bot. Off.*

Geoffroy says, it is so violent a Purgative, that it cannot safely be taken inwardly; but, when dissolved in the Yolk of an Egg, and afterwards diluted with Oil of sweet Almonds, some venture to give it as a Clyster, in the Quantity of twelve Grains, in lethargic Cases, and stubborn Pallies. It is, likewise, used in some Snuffs, mixed with Tobacco; but it would be better to mix it with Juice of Liquorice. Euphorbium may, also, be used to separate the carious Parts of Bones. *Geoffroy.*

OLEUM EUPHORBII: *Oil of Euphorbium.*

Take six Drams of Euphorbium, five Ounces of the Oleum Cheirinum, and three Ounces of aromatic Wine; which boil together, in a double Vessel, till the Wine is wasted by Evaporation.

OLEUM DE EUPHORBIO COMPOSITUM:

Compound Oil of Euphorbium.

Take of Staves-acre, and Soapwort, of each half an Ounce; of Pellitory of Spain, six Drams; of dry mountain Calamint, one Ounce and an half; of Costus, ten Drams; and of Castor, five Drams: Bruise, and macerate these for three Days, in three Pints and an half of fragrant White-wine; and then boil with one Pound and an half of the Oil of Wall-flowers; adding, before the Wine is quite consumed, of Euphorbium, half an Ounce; and then finish the Boiling, *S. A.*

11. Euphorbium; angulosum, foliis nerii latioribus. *Tithymalus, aizoides, arborescens, spinosus, caule angulari, Nerii folio.* Comm. Præl. 56. ANGULAR EUPHORBIUM, *with broad Oleander-leaves.*

12. Euphorbium; quo Anteuphorbium. *Dod. p.* 378. *Lob. Obs.* 643. *Lugd.* 1692. *C. B. P.* 387. THE ANTI-EUPHORBIUM. *Boerh. Ind. alt. Vol.* 1. *p.* 258.

See CATHARTICA.

EUPHORIA, εὐφορία· from εὖ, well, and φέρω, to bear. The easy bearing a Disorder, or the Operation of a Medicine.

EUPHRASIA.

The Characters are;

The Leaves are small, conjugated, roundish, and serrated; the Flower monopetalous, anomalous, personated, bilabiated, the upper Lip erect, and multifid; the lower divided into three Parts, each bifid; the Fruit is an oblong bicapsular Pod.

Boerhaave mentions three Species of this Plant; which are,

1. Euphrasia; Officinarum. *C. B. P.* 233. *Hist. Oxon.* 3. 430. *Tourn. Inst.* 174. *Elem. Bot.* 142. *Boerh. Ind. A.* 235. *Rupp. Flor. Jen.* 195. *Buxb.* 107. *Euphrasia.* Offic. Ger. 537. Emac. 633. Dill. Cat. Giss. 138. Rivin. Irr. M. 90. J. B. 3. 432. Chab. 475. Raii Hist. 1. 771. Synop. 3. 284. *Euphrasia vulgaris, sive alba.* Merc. Bot. 1. 44. Phyt. Brit. 40. *Eupbragia vulgaris.* Park. Theat. 1329. *Euphragia, sive Eupbrasia.* Mer. Pin. 37. EYEBRIGHT. *Dale.*

Eyebright has a small woody Root, full of Fibres, from which springs, usually, one Stalk, branched out into several smaller, somewhat of a reddish brown Colour. The Leaves are small, set on by Pairs, opposite, without Foot-stalks, hard, and veiny, roundish, but indented at the Ends. The Flowers grow at the Tops, among the Leaves, small and white, and gaping, or galeated, with a yellow Spot in the Middle, and several black Stripes running lengthways; after the Flowers are fallen, come small, long, flattish Seed-vessels, containing very small Seed. Eyebright grows in Fields and Commons, and flowers in *July*. The whole Plant is used.

This is a Plant famous for all Disorders and Distempers of the Eyes, especially for Dimness of Sight, and to strengthen it when weak and decayed, either given in the Juice, or a Decoction of the Powder of the Leaves. A Powder, made of two Ounces of Eyebright, and half an Ounce of Mace, is very much commended for the same Purposes, especially after proper Evacuations. Some commend it as good against the Jaundice.

The only officinal Preparation is the *Aqua Euphrasiæ.*

Miller's Bot. Off.

It is very bitter, and gives a faint Tincture of Red to the blue Paper; which makes us conjecture, that the Sal Ammoniac, though involved in a great deal of Oil and Earth, may predominate in this Plant. It dissolves the Humours, disposes them to circulate, and carry off the obstructing Particles. Every body agrees, that it clears, strengthens, and even restores the Sight. The Powder is given from one Dram to three, in a Glass of Fennel, or Vervain-water. The Use of the Conserve, alone, or mixed with Wormwood-leaves, continued for a long time, is good for the same Purposes. *Arnoldus de Villanova*, in his Treatise, concerning medicinal Wines, very much commends that of Eyebright. In Vintage-time they put this Plant in Must, and drink it, when it is well clarified. *Penz* and *Lobel* prefer the Use of the Powder, to the Wine: They affirm, that one of their Friends in *Switzerland*, who had but a slight Defluxion in his Eyes, had like to have lost his Sight by drinking Eyebright-wine, for three Months.

Martyn's Tournefort.

PULVIS HELIDÆI.

Take of Mace, half an Ounce; of Eyebright, two Ounces; and reduce them to a very fine Powder. The Dose, after due Evacuations, is two Drams; it is effectual in a Scotomy, and Images dancing before the Sight.

Dodonæus adds the Seeds of Fennel, and Sugar: *Fuchsius* commends it in Cataracts.

Fabricius Hildanus, a celebrated Author, on whose Veracity we may depend, assures us, that so great is the Virtue of Eyebright against Weakness of Sight, that Persons of seventy Years of Age, who, by much Watching, and hard Study, had lost their Sight, have recovered it, in that decrepit Age, by the Use of this Plant. Dr. *Tancred Robinson* observes, that Oculists, both in *England*, and in foreign Parts, prescribe the Use of this Herb, in Sallads, and in Broths, baked in Bread, and infused in what we commonly drink; and apply it outwardly, in Collyria, and Fomentations. *Raii Hist. Plant.*

2. Euphrasia; pratensis; rubra. *C. B. P.* 234. *M. H.* 3. 431. *Euphrasia altera.* Dod. p. 55. Col. 1. 200. *Pedicularis, serotina, purpurascente flore.* T. 172.

3. Euphrasia; ramosa; pratensis; flore albo. *H. Eyst. Æst. & Aut. F.* 13. *F.* 3. BRANCHED MEADOW-EYEBRIGHT, *with a white Flower.*

Boerh. Ind. alt. Plant. Vol. 1. *p.* 236.

EUPHROSYNE. A Name for the *Euphragia.*

EUPHYIA, εὐφυΐα· from εὖ, importing Goodness, and φύω, to be born, or derive a Beginning. A good natural Disposition of the Parts, or Habit of the Body.

EUPNOIA, εὐπνοια· from εὖ, denoting Facility, and πνέω, to breathe. Easy Respiration.

EUPORIA, εὐπορία· from εὖ, importing Ease, or Expedition; and πορίω, to give, or afford. Easiness, Facility. Hence,

EUPORISTA. Medicines easily procured, or prepared.

EUROEOS, εὐροεὸς. A Name for the LAPIS JUDAICUS.

EUROS, εὐρώς. Rottenness, Filthiness, or Putrefaction.

EURUS, εὖρος. The East Wind. It was, among the Antients, and still is, in warm Climates, esteemed salubrious; and very justly, because it cools the Air, and prevents Putrefaction.

EURYCHORIA, εὐρυχωρία· from εὐρὺς, wide, capacious, and χωρίον, a Region, or Place. An internal Sinus, or Cavity.

EURYTHMIA, εὐρυθμία· from εὖ, importing right, or just, and ῥυθμὸς, Order and Harmony, properly in Music. It either imports a Dexterity in a Surgeon, with respect to the handling of his Instruments; or a Fitness, or Aptness, of the Pulse, proportioned to Ages, Natures, or Constitutions.

EUSCHEMOSYNE, εὐσχημοσύνη· from εὖ, importing Ease and Propriety, and σχῆμα, the outward Form, or Habit. The Elegance of Behaviour, Dignity, and Decorum, which a Physician ought to observe in his Conduct. It includes all the Qualities and Qualifications necessary to constitute a

fine Gentleman. *Hippocrates* thought this of ſo much Importance, that he wrote a Treatiſe expreſly on the Subject, in which ſome excellent Maxims are contain'd.

EUSTATHES, εὐσταθὴς· from εὖ, ſignifying well, juſt, right, and ἵστημι, to ſtand, or be eſtabliſhed. Conſtant, regular, preſerving the natural Tenor. It it applied to the Seaſons, and to Diſeaſes; and, in the laſt Caſe, it implies ſomewhat of Mildneſs.

EUTAMIEUTOS, εὐταμίευτος. Ready, eaſy, prompt. *Hippocrates.*

EUTHENIA, εὐθενία. Vigour, Fulneſs of Health.

EUTHESIA, εὐθεσίη· from εὖ, importing right, juſt, well, and θέσις, Situation, Order, and the like. An innate ſtrong Habit of Body, as explained by *Galen.*

EUTHYMIA, εὐθυμίη· from εὖ, well, right, and θυμὸς, the Mind. Serenity or Tranquillity of Mind. *Hippocrates, Epidem. Lib.* 5.

EUTHYORIA, εὐθυωρίη· from εὐθὺς, ſtrait, direct. The ſame as Ixis, which ſee.

EUTHYPNOUS, εὐθύπνους. This Adjective, according to *Galen*, imports Breathing eaſily. It occurs in *Hippocrates, Epid. Lib.* 6. *Sect.* 2. 8.

EUTHYPOROS, εὐθύπορος, from εὐθὺς, ſtraight. Direct. It is an Epithet of Extenſion, made with a View to reduce a fractured Limb, in *Galen, Method. Medendi.*

EUTROPHIA, εὐτροφία· from εὖ, importing good, and τροφὴ, Nutriment. Good and plentiful Nutrition.

EVULSIO. Evulſion, or Drawing out. Applied to the Hairs, Teeth, or Fragments of Bones.

EUZOMON. A Name for the Eruca, Rocket. *Aetius Tetrabib.* 1. *Serm.* 1.

EXACERBATIO. The ſame as PAROXYSMUS; which ſee.

EXÆRESIS, from ἐκ, out of, or away, and αἴρω, to remove. That Part of Surgery which conſiſts in removing Superfluities.

EXALIPTES. The ſame as *Aliptæ.* See ALIPTÆ.

EXALLAGE, ἐξαλλαγὴ, from ἀλλάσσω, to change, of ἄλλος, another, with the Addition τῆ χροὸς, "of Colour," is a Mutation of Colour; and reckoned among the Diſorders of the Eye, from a Depravation of the Humours, as in the Jaundice.

EXALMA, ἔξαλμα, from ἐξάλλω, of ἐκ, out, and ἄλλω, to leap; is a leaping, or ſtarting; and is applied, in particular, by *Hippocrates, de Artic.* to the Starting or Expulſion of the Vertebræ out of their proper Places.

EXALSIS, ἔξαλσις. The ſame as EXALMA.

EXALTATIO. Exaltation is a Word in Uſe among the Chymiſts, and ſignifies an Operation by which a Subſtance has its Properties changed, and raiſed to an higher Degree of Dignity and Virtue. Of Exaltation there are two Kinds; firſt, *Maturation*, which is nothing but the raiſing and promoting a thing from a crude to a mature and perfect State; and this is ſubdivided into four Species, *Digeſtion*, *Circulation*, *Fermentation*, and *Projection*, which ſee under their ſeveral Articles. The ſecond Kind of Exaltation is *Gradation.* Exaltation is otherwiſe defined, a micro-chronic [μικροχρονικὴ] Subtilization, by which a thing, by a gradual Diſſolution, is tranſpoſed into a pure and more exalted Degree of its Virtue; and this is effected either by *Circulation* or *Ablution. Rulandus.*

EXAMBLOSIS, or EXAMBLOMA, ἐξάμβλωσις, or ἐξάμβλωμα, from ἀμβλόω, to miſcarry. A Miſcarriage. See ABORTUS.

EXANASTOMOSIS. The ſame as ANASTOMOSIS, which ſee.

EXANASTROPHE, ἐξανατροφὴ. Reconvaleſcence, or Recovery of Health.

EXANGUIS. Without Blood. The white Parts of the Body, as the Bones and Cartilages, are called the exanguious Parts.

EXANIMATIO. Exanimation. It ſignifies either Death, or a Syncope.

EXANTHEMATA, ἐξανθήματα, from ἐξανθέω, to ſpring forth, or blow like a Flower. Puſtules, or Eruptions.

EXANTHISMATA, ἐξανθίσματα. Small Puſtules, or Eruptions.

EXANTHROPIA. The third Degree of Melancholy, according to *Wedelius.*

EXAPSIS, ἔξαψις, from ἐξάπτω, to kindle. An Accenſion. *Hippocrates* applies it to Aliments, eſpecially Cheeſe, which, when corrupted in the Stomach, raiſe a Heat, and excite Thirſt.

EXARAGMA, ἐξάραγμα. A Colliſion, Attrition, or Breaking. *Galen. Exegeſ.*

EXARMA, ἔξαρμα, from ἐξαίρω, to be elevated. An elevated Tumor.

EXARSIO. A hot Intemperature, attended with Drineſs; ſuch as happens in hectic Fevers. *Fallopius, de Tumoribus.*

EXARTEMA, ἐξάρτημα, from ἐξαρτάω, to be ſuſpended. An Amulet.

EXARTHREMA, ἐξάρθημα, ἐξάρθρημα, or ἐξάρθρωσις, from ἐξαρθρόω, of ἐκ, out, and ἄρθρον, a Joint. A ſimple Luxation of a Joint, without Fracture.

EXARTHROS, ἐξάρθρος, in *Hippocrates*, is an Epithet for a Perſon, whoſe Joints are naturally large and prominent.

EXARTICULATIO. The ſame as EXARTHEMA.

EXASPERATIO, Exaſperation. It imports either rendering the Skin rough, or the Increaſe or Augmentation of a Diſorder.

EXASTIAS, ἐξαστίας. Flocks, Threads, or Eminences, upon Linen Cloth; or the Ravelings (as the Women call them) of Linen Cloth, when cut.

EXCATHISMA. The ſame as SEMICUPIUM; which ſee.

EXCESTRENSE OLEUM. *Exeter* Oil.

Take of Wormwood, the Leſſer Centaury, Eupatorium, Fennel, Hyſſop, Bays, Marjoram, Savine, Sage, and Thyme, of each four Ounces; of Southernwood, Betony, Ground-pine, and Lavender, of each ſix Ounces; of Roſemary, one Pound; of Chamomile, and Broom-flowers, of Cumin, and Fenugreek-ſeeds, of black and white Hellebore-root, and of Lemon-peels, of each four Ounces; of Euphorbium, Muſtard, Caſtor, and Pellitory, of each one Ounce; of Oil, two Gallons; and of Wine, three Pints. Let the Herbs, Flowers, Seeds, and Euphorbium, be bruiſed; the Roots, Peels, and Caſtor, ſliced, and macerated together twelve Hours, in a Bath-heat, with the Wine and Oil: Then, after a gentle Boiling, till the Wine is all conſumed by Evaporation, let the Oil be ſtrained out, and kept for Uſe.

EXCIPIENS. In Preſcriptions that is call'd the Excipient, which receives the other Ingredients, and gives them a proper Form; as officinal Electuaries, Conſerves, Confections, Robs, or Honey.

EXCIPULUM. A Receiver, in Chymiſtry.

EXCLUSORIUM. A Medicine which cauſes Abortion.

EXCORTICATIO. The ſame as DECORTICATIO; which ſee.

EXCREMENTUM. An Excrement. It is applied to whatever requires to be diſcharged out of the Body.

EXCRESCENTIA. An Excreſcence; that is, any thing which grows preternaturally upon any Part of the human, or any other Body.

EXCRESCENTIA FABA BENGALENSIS, Offic. Raii Dendr. 134. BENGALA BEAN.

It is round, flat, wrinkled, hollow'd in manner of an Umbilicus, large, brown on the Outſide, and blackiſh within, of a ſtyptic and aſtringent Taſte, and no Smell.

It is a powerful Aſtringent, and highly ſerviceable in repreſſing all Sorts of Hæmorrhages, particularly a Spitting of Blood, moderately incraſſating the Blood, and ſhutting the Mouths of the Veins and Arteries, conſolidating Ruptures, and tempering and allaying acrimonious and corroſive Humours.

D. *Marloe*, who gives the foregoing Account of its Virtues, was the firſt, as far as I know, ſays *Dale*, who communicated this exotic Medicine, with its Uſes, to the learned World, under the Name of *Faba Bengalenſis.* Hence ſome took it for a Fruit which comes from *Bengal*, others for a Species of Myrobalans, and others again for the Flower of the Citrine Myrobalan; becauſe it is very often found among thoſe Fruits. But to me, ſays *Dale*, it ſeems to be a kind of Excreſcence excited by the Puncture of a certain Inſect, or more properly the wounded Fruit itſelf of the Citrine Myrobalan, which, from the Venom of the Stroke, aſſumes this monſtrous Form. I have very often myſelf, he ſays, obſerv'd Plums depriv'd of their natural Shape by a Wound of this Nature inflicted by an Inſect, and render'd hollow, without any Stone. *Dale.*

EXCRETIO. Excretion. It either imports the Action of Excretion, or the Excrement excreted.

EXCUSSIO. A Term uſed by *Bonetus. Sepulchret. Anat. L.* 2. *Sect.* 8. *Obſervat.* 31. ſpeaking of a Palpitation of the Heart, he ſays, it proceeds either from Oppreſſion or Excuſſion. That from Oppreſſion is, when it is cauſed by ſomething which reſides in the Heart itſelf; that from Excuſſion, when it proceeds from ſome other Part.

EXCUTIA VENTRICULI.

This is a Name, by modern Surgeons, given to that Inſtrument repreſented in *Tab.* 42. *Fig.* 11. It is generally made of ſoft Briſtles form'd into a Bundle, and fix'd to a flexible braſs or iron Wire BBB, which may have flaxen or ſilken Thread cloſely wrapt about it. Authors of very conſiderable Note aſſert, that this Inſtrument is highly commodious, not only for removing ſmall Bones from the Fauces, but alſo for cleanſing the Stomach. When 'tis to be uſed for this latter Purpoſe, they lay down the following Directions, as neceſſary to be obſerved:

obſerved: A ſmall Draught of warm Water, or, according to others, of Brandy, is to be taken before the Inſtrument is uſed; ſince, by this means, the Mucus and Sordes are the more eaſily reſolv'd and attenuated in the Stomach. Then the Excutia A is to be immers'd in ſome proper Liquor, and, by means of the Wire B B, gently paſs'd through the Oeſophagus, as far as the Stomach. Then it is to be mov'd up and down through the Fauces, like the Sucker of a Siphon or Pump, but muſt be ſoon totally extracted. Theſe Authors order the Excutia, and repeated Draughts of the above-mentioned Liquor, to be uſed, till no more Sordes can be brought away from the Stomach. This Practice is, according to them, ſo highly beneficial, that by its means the Lives of Men may be protracted to an uncommon Age, eſpecially if it is repeated every Week, every Fortnight, or every Month. However great the Encomiums beſtow'd on this Practice may poſſibly be, yet, 'tis certain, we have very few Inſtances of Cures happily brought about by its means; ſince the Senſe of Pain, and the Danger of Suffocation, attending the Uſe of this Inſtrument, muſt certainly create a juſt Averſion to it. But theſe Points are at greater Length diſcuſſed by *Wedelius*, and *Teichmeierus*, in their *Diſputationes de Ventriculi Excutia*. Theſe Authors have alſo ſhewn, that this is not altogether an Inſtrument of modern Date, but long ago deſcrib'd by ſome Authors. With reſpect to this, the Reader may conſult a ſmall Book, intituled *Sorberiana*. *Heiſter, Chirurg.*

EXECHEBRONCHOS, Ἐξεχέβρογχος, from Ἐξέχω, to jut out, or be prominent, and βρόγχος, the Throat. An Epithet for a Perſon who has a prominent Throat. *Hip. de Artic.*

EXECHEGLUTOS, Ἐξεχέγλυτος, from Ἐξέχω, to jut or ſtand out, and γλουτὸς, the Nates; one who has prominent Nates, as when there is a Luxation of both the Thighs outwardly. *Hip. de Artic.*

EXEGESIS, Ἐξήγησις, from Ἐξηγέομαι, to expound; an Expoſition or Declaration. Ἐξήγησις, as *Galen* ſays, *Com.* 2. *in* 1 *Epid.* is properly concern'd about obſcure Words; but Interpreters have abuſed the Word to ſignify an Expoſition of the Cauſes of Obſcurities in Words.

EXELCOSIS, Ἐξέλκωσις, from ἕλκος, an Ulcer; an Exulceration. *Moſchion, C.* 135.

EXELCYSMUS, Ἐξέλκυσμὸς, from ἑλκύω, to draw, in the *Definitiones Medicæ*, is the Depreſſure of a Bone or Bones from the Superficies inwards; but the Author here ſays, that the true Reading is εἰσέλκυσμὸς.

EXENTHROPISMENOS, Ἐξενθρωπισμένος, from Ἐξανθρωπίζομαι, (of ἄνθρωπος, a Man) to be accommodated to the Nature and Uſe of Mankind. The Word is applied to Food, and occurs *Lib. de Octimeſt. Partu.*

EXERAMA, Ἔξέραμα· from Ἐξεράω, to eject by Vomit; is the Matter diſcharg'd by Vomiting. The Verb is us'd by *Hippocrates*, *Lib.* 4. *de Morbis*. It ſignifies, alſo, to exhauſt, *Lib.* 2. *de Morbis.*

EXERCITATIO, ἄσκησις, Exerciſe, is either of the Body or Mind; both are neceſſary to be known in Medicine, and of Service, tho' ſometimes, by Abuſe, injurious. Exerciſe of the Body conſiſts in an uncommon Exertion of the natural Forces in the local Motion of the Body and its Members. The ſeveral Kinds of it with reſpect to Medicine are called Gymnaſtics, and may be found under their proper Articles. Acute Exerciſe, γυμνάσιον ὀξὺ, whoſe Motions are ſwift, extenuates the Body; the contrary increaſes its Bulk; much Exerciſe dries the Body, moderate induces an Obeſity. *Galen. de Sanit. tuend. Lib.* 5. *Cap.* 3. The Exerciſe of the Mind conſiſts in Cares, and the diligent Study of ſome Art or Science.

EXERRHOSIS, Ἐξέρρωσις· EXERRHYESIS, Ἐξερρύησις· EXERRHEUSIS, Ἐξέρρευσις· from Ἐξ, out, and ῥέω, to flow; is an Efflux, Effluvium, or Evaporation by inſenſible Perſpiration; and is much the ſame as Ecrhoe, which ſee. The Word ἐξερρώσιες occurs in 6 *Epid. Sect.* 6. *Aph.* 27.

EXFOLIATIVUM. A Rugine, or Raſpatory.

EXHALATIO. Exhalation. It either imports the Action of exhaling, or the Matter exhal'd.

EXINANITIO. See Cenosis.

EXIPOTICOS, ἐξιπωτικὸς, from ἐξιπόομαι, to preſs out, or filtre. An Epithet for digeſting or deterging Medicines. *Galen, de Comp. Medic. P. G. L.* 7. *C.* 9. calls them the ſame as Drawers, or Epiſpaſtics.

EXISCHIOS, ἐξίσχιος, from ἐξέχω, or ἐξίσχω, to ſtand out, or be prominent; ſignifies jutting out, or prominent; and in that Senſe *in Mochlico*, is apply'd to Joints; for there are ſome Perſons who have their Joints naturally protuberant or prominent, as if out of their Place, whom *Hippocrates* calls ἐξαρθρους, and charges the Surgeon to be very careful in his Obſervations on this Head, when he is concern'd in reducing a Fracture or Luxation. Ἐξίσχιος, *in Mochl.* is alſo the ſame as ἐξεχέγλυτος. See Exechelutos.

EXITELOS, ἐξίτηλος, ſlight, weak, ſlender, ſoon vaniſhing: Apply'd by *Hippocrates*, *Lib.* περὶ τροφῆς, to ſlender and weak Aliments, which afford little or no Nouriſhment, or ſuch as is ſoon diſſipated.

EXITURA. By ſome of the barbarous Writers this Word is us'd to expreſs a ſuppurated Abſceſs. But *Paracelſus* applies it to all Sorts of putrid Excrements.

EXMIRALDUS. The Name of a precious Stone, the Compoſition of which is obſcurely deſcrib'd by *Raymond Lully*.

EXOCHE, or EXOCHAS, Ἔξοχὴ, or Ἐξοχὰς· from Ἐξέχω, to protuberate. A Tubercle or Condyloma of the *Anus*.

EXOMPHALOS, Ἐξόμφαλος· from Ἐξ, out, and ὀμφαλὸς, the Navel. It ſignifies any Protuberance of the Navel; as an *Omphalocele*, or a Perſon labouring under ſuch a Diſorder. See Hernia.

EXONCOMA, Ἐξόγκωμα· from Ἐξ, out, and ὄγκος, a Tumor. A very large Swelling or Protuberance.

EXONEIROSIS, Ἐξονείρωσις, from Ἐξ, out, and ὄνειρος, Sleep. A nocturnal Pollution. This, if rare, may be a Sign of redundant Vigour; if frequent, it proceeds from Weakneſs of the ſeminal Veſſels, which is moſt frequently the Caſe.

EXOPHTHALMIA, Ἐξοφθαλμία, from Ἐξ, out, and ὀφθαλμὸς, the Eye. A Protuberance of the whole Eye, out of the Orbit.

EXORESCENTIA. Exacerbation.

EXOS. A Leech; and the Name of a Fiſh. See Exossis.

EXOSIS, Ἔξωσις, from Ἐξ, out, or from, and ὦθω, to remove by Force. Expulſion.

EXOSSIS. A Name for the Iſinglaſs-fiſh. See Ichthyocolla.

EXOSTOSIS, Ἐξόστωσις· from Ἐξ, off, or out; and ὀστέον, a Bone. A preternatural Excreſcence of a Bone. See Os.

EXOTICOMANIA.
A mad Fondneſs for exotic Medicines.

EXPECTORANTIA. Medicines which promote Expectoration, or a Diſcharge of any thing which is offenſive to the Lungs, and Aſpera Arteria.

Among the ſeveral Species of Evacuants, none are, perhaps of more Importance than thoſe which eliminate the viſcid Lymph ſecreted from the arterial Blood, and remaining in the Glands, or rather the glandulous Coats and Emunctories. But in no Part of the Body is there a larger Secretion of mucous Lymph than in the internal Ducts of the Aſpera Arteria, and the Bronchia of the Lungs, which are internally lin'd with a glandular Coat: Hence very often a ſerous, pituitous, viſcid, and, ſometimes, a purulent Matter, is, in Coughing, expectorated, and eſpecially in Diſorders immediately affecting the Lungs, whether of the acute or chronical Kind. The Medicines which promote this Evacuation from the Cavity of the Thorax are call'd *Expectorants*; of which the moſt conſiderable in the Vegetable Kingdom are, the Roots of Elecampane, Arum, Florentine Orris, and Liquorice; the Herbs Paul's-betony, Chervil, Scabious, Mouſe-ear, Germander, Hyſſop, and the Tarragon; the Flowers of Violets, Mallows, red Poppies, and Saffron; the Seeds of Aniſe, and Fennel; the Bark of Saſſafras; and, among reſinous Gums, Benjamin, and Gum Ammoniac; among Fruits, Raiſins, Figs, Jujubes, and Pine-kernels; Honey, Liquorice-juice, and Oil of ſweet Almonds; among animal Subſtances, Sperma Ceti, and Fats; among mineral Subſtances, Sulphur, together with its Flowers and Milk; among compound Subſtances, the aniſated Balſam of Sulphur, the aniſated Spirit of Sal Ammoniac, the *Lohoch Sanum*, the Syrup prepar'd of the Lungs of a Fox, the pectoral Elixir, the pectoral Balſam of *Meibomius*, and the aſthmatic Spirit of *Michaeli*.

As all Subſtances which promote Excretion do not operate in the ſame manner, ſince ſome render the Matter moveable, and diſpoſe it for Evacuation; others open the Emunctories, that it may be ſeparated from the Juices, and others ſtimulate the Veſſels and Ducts to an excretory Motion; ſo Expectorants operate pretty much in the ſame manner; for if the Humour ſecreted is thin and acrid, and the Ducts and Pores of the Glands from which it is to be thrown, too much conſtricted, thoſe Subſtances are moſt properly exhibited, which ſoften the Paſſages, obtund the Acrimony, and coagulate the too thin and fluid Parts of the Humours. Theſe Intentions are beſt anſwer'd by the Juice of Liquorice-root, Saffron, Sperma Ceti, the Flowers of Violets, Mallows, and red Poppies, Cream, Oil of ſweet Almonds, Fats of Animals, the Syrup prepar'd from the Lungs of a Fox, the Syrup of Violets, the Syrup of white Poppies, and the *Pilulæ de Styrace*, eſpecially exhibited with ſome diluting Liquor, ſuch as a Decoction of Oats, or of the Shavings of Hartſhorn in the Form of a Jelly. But when a large Quantity of thick and viſcid Matter is lodg'd in the Bronchia of the Lungs, it proves prejudicial to Reſpiration; and when, for this Reaſon, ſome Stimulus to Expectoration becomes neceſſary, the tough and viſcid Matter is exceellently reſolv'd by Infuſions of Paul's-betony, Hyſſop, Scabious, and Germander; as, alſo, by the *Terra foliata Tartari*, a Solution of Crabs-eyes, and antimoniated Nitre. The nervous Coats of the Bronchia are ſtimulated to an excretory Motion by a certain acrid, ſubtile, and oleous Principle, found in Gum

Ammo-

Ammoniac, and its Eſſence, the aniſated Spirit of Sal Ammoniac, Myrrh, Benjamin, Powder of the Roots of Elecampane, and Florentine Orris, Flowers, Milk, and Balſam of Sulphur. When a ſtronger Stimulus is requir'd, as in a pituitous Aſthma, and a ſuffocative Catarrh, Oxymel of Squills, or the *Spiritus Aſthmaticus* of *Michaeli*, which is prepar'd of Gum Ammoniac, and the green Cryſtals of Copper, may be exhibited.

In the Exhibition of Expectorants, great Caution is to be us'd on account of their different Methods of Operation; and the Phyſician who preſcribes them promiſcuouſly, without any Regard to Time, or the State and Condition of the peccant Matter, certainly does more Harm than Good: Hence, when in epidemical Coughs, raging in the Spring and Autumn, highly ſtimulating Expectorants are exhibited, before the thin acrid Matter is corrected; or, on the contrary, when after the Matter is concocted and prepar'd, emollient and relaxing Medicines are exhibited; more Harm than Good is produc'd by ſuch Pieces of Practice.

In Coughs of the moiſt and chronical Kind, as alſo in a pituitous Aſthma, in which large Quantities of Phlegm fall into the Bronchia of the Lungs, ſweet Subſtances, Linctuſes, Syrups, and oleous Medicines, weaken the Stomach, whoſe Strength and Tone are already too much impair'd, diminiſh the Appetite, Digeſtion, and Chylification, and not only promote the Generation of more recrementitious Matter, and the Increaſe of the Diſeaſe, but alſo diſpoſe the Patient to a Cachexy, œdematous Tumors, or even a Dropſy. In theſe Caſes 'tis therefore more expedient to uſe balſamic Pectorals, which are grateful to the Stomach, ſuch as the pectoral Elixir, the Eſſences of Myrrh, Gum Ammoniac, and the Tincture of Tartar.

Expectorants ought alſo to be cautiouſly us'd in a Phthiſis, and Spitting of Blood; as alſo in dry Coughs, Difficulties of Breathing, and oppreſſive Pains of the Breaſt, which rather ariſe from a Congeſtion of Blood, than Matter to be expectorated; ſince, in theſe Caſes, Expectorants, either by ſoftening or ſtimulating, augment the Congeſtion of Blood and Humours, inſtead of removing it.

In acute Diſorders of the Breaſt, ſuch as a legitimate Pleuriſy, and a Peripneumony, Expectorants are alſo to be cautiouſly us'd, eſpecially in the Beginning, leſt by their means the inflammatory Stagnation of the Blood ſhould be increas'd. But when theſe Diſorders are on the Decline, and when the greater Part of the Inflammation is diſcuſs'd, they are very properly and commodiouſly us'd, in order to draw the concocted and viſcid Matter out of the pulmonary Canals. *Frederic. Hoffman. Medicina Rationalis Syſtematica.*

EXPIRATIO. Expiration. That Part of Reſpiration, in which the Air is forc'd out of the Lungs.

EXPLORATIO. Exploration, in Surgery, is the probing a Wound, or Ulcer.

EXPLOSIO. Exploſion. In Chymiſtry it is call'd Detonation, or Fulmination.

EXPRESSIO. Expreſſion. In Pharmacy, is the Squeezing, or Preſſing out the Juice from moiſt Subſtances, either by the Hands, or Inſtruments.

EXSUCCATIO. An Ecchymoſis, or Sugillation. See ECCHYMOSIS.

EXTASIS. A Species of CATALEPSIS (which ſee); when a Perſon remembers perfectly, after the Paroxyſm is over, the Ideas he conceiv'd during the Time it laſted.

EXTENSOR. A Name given to ſeveral Muſcles, by Anatomiſts. Thus there is the

EXTENSOR CARPI RADIALIS;

By ſome called *Bicornis*, and *Radiæus Externus*. It hath two Beginnings, and, indeed, ſeems to be two diſtinct Muſcles; the outermoſt ariſing fleſhy above the external Protuberance of the Os Humeri, immediately below the *Supinator Radii longus*, in its Deſcent becoming a fleſhy Belly, and growing tendinous above the Middle of the *Radius*: The other Beginning of this Muſcle is partly fleſhy, and partly tendinous below the former, either from the Apex of the outward Extuberance of the Os Humeri, or the ſuperior Part of the *Radius*; and continues fleſhy ſomewhat lower than the other, both Tendons marching under the *Extenſores Pollicis*, run under the *Ligamentum Annulare*, and are inſerted into the ſuperior Parts of the Oſſa Metacarpi of the fore and middle Fingers.

EXTENSOR CARPI ULNARIS.

This hath an acute tendinous Beginning from the outward Extuberance of the Os Humeri, and becomes fleſhy, as it deſcends according to the Length of the Cubit, growing tendinous again as it marches over the inferior Part of the Ulna; and, paſſing under the annular Ligament, it is inſerted into the ſuperior Part of the metacarpal Bone of the little Finger.

If this Muſcle and the *Ulnaris Flexor* act, they move the Hand ſideways towards the Ulna; and, in like manner, if the *Radialis Flexor* and *Extenſor* act, they move it towards the *Radius*. It is well obſerved by moſt Authors, that the Extenders, whether belonging to the Fingers or Carpus, ariſe from the outward Extuberance of the Os Humeri, and their Antagoniſts the Flexors from the internal Protuberance of the ſame Bone, as alſo from the ſuperior and external Part of the Ulna, next the *Anconæus*.

EXTENSOR DIGITORUM COMMUNIS, SEU DIGITORUM TENSOR.

This has an acute tendinous Origination from the outward Extuberance of the Os Humeri, between the *Extenſores Carpi*; and becoming fleſhy, in leſs than half its Progreſs is divided into three Portions, which become ſo many Tendons, (of which the middlemoſt is the longeſt) paſſing under their annular Ligaments between the lower Parts of the Ulna and Radius; then marching ſeparately over the Back of the Hand, and remitting tendinous Filaments to each other, before they paſs the firſt Internodes of each Finger, they are afterwards inſerted into the ſuperior Parts of the firſt, ſecond, and third Bones of the fore, middle, and third Fingers.

There being little Force required in the Extenſion of the Fingers, we need not wonder that the Muſcles, employed in that Office, are no longer, in proportion to their Antagoniſts.

EXTENSOR DIGITORUM LONGUS.

This is a long Muſcle, fleſhy in the upper Part, and tendinous in the lower, lying between the *Tibialis Anticus* and *Peronæus Maximus*.

It is fixed above by fleſhy Fibres, in the Outſide of the Head of the Tibia, and Inſide of the Head of the Fibula, in the upper Part of the interoſſeous Ligament, thro' three-fourths of the Length of the Fibula, and through the ſame Space, in the tendinous Septum belonging to the anterior Angle of that Bone.

It ſeems to mix ſome Fibres on each Side, with the two firſt *Peronæi* and *Tibialis Anticus*; and it is very cloſely united with the Peronæus Minimus, which has for that Reaſon been looked upon as a Portion of this Extenſor.

It contracts in Breadth a little above the annular Ligament, and, in paſſing through it, is divided into three Tendons, the firſt of which is afterwards divided into two. Theſe four Tendons are inſerted along the upper or convex Side of the four ſmall Toes.

EXTENSOR DIGITORUM BREVIS.

This is a ſmall complex Muſcle, lying obliquely on the convex Side of the Foot, being alſo termed *Pedicus*.

It is fixed in the upper and outer Side of the anterior Apophyſis of the Aſtragalus, and in the neighbouring Part of the upper Side of that Bone. From thence it runs obliquely from without inwards, under the Tendons of the Peronæus minimus, and Extenſor Digitorum longus, being divided into four fleſhy Portions, which terminate in the ſame Number of Tendons.

The firſt Tendon is inſerted in the upper or convex Part of the firſt Phalanx of the great Toe: The other three, joining with thoſe of the *Extenſor longus*, are inſerted along the convex Sides of all the Phalanges of the three following Toes; and when there is a fifth Tendon, which happens very ſeldom, it goes in the ſame manner to the little Toe.

As this Muſcle is ſituated obliquely, its Tendons, and thoſe of the Extenſor longus, croſs each other a little; and, after their common Inſertion in the firſt Phalanges of the Toes, thoſe of the ſhort Extenſor run along the two other Phalanges, almoſt on the Outſide of the others. All theſe Tendons communicate by Aponeuroſes, in the ſame manner as thoſe of the Hand.

EXTENSOR INDICIS, SEU INDICATOR,

Ariſes fleſhy from the Middle of the external Part of the Ulna next the Radius, immediately below the *Extenſores Pollicis*; and, deſcending obliquely, becomes tendinous, as it paſſes under its annular Ligament, at the lower Part of the Radius and Carpus; then, paſſing over the Os Metacarpi Indicis, and joining with the Tendon of the *Extenſor Communis*, it is inſerted with it into the ſuperior Part of the third Bone of the fore Finger. The Tendon of it is ſometimes divided. Its Name declares its Uſe.

EXTENSOR MINIMI DIGITI.

This ariſes partly tendinous at the Extremity of the external Apophyſis of the Os Humeri, and partly fleſhy from the ſuperior Part of the Ulna, between the *Extenſor Communis Digitorum*, and *Muſculus Ulnaris Extenſor*; and, becoming tendinous as it paſſes under the *Ligamentum Annulare* at the *Carpus*, it is there divided into two, ſometimes three Tendons, which are united into one at its Inſertion into the ſuperior Part of the third Bone of the little Finger. Its Name declares its Action.

Extensor primi Internodii Pollicis.

This ariſes partly tendinous, but chiefly fleſhy, from the upper Part of the Ulna, immediately below the *Supinator Radii brevis*, ſoon growing fleſhy, and becoming tendinous again, as it deſcends obliquely over the Tendons of the *Radialis Extenſor*, and is inſerted into the lower Part of the firſt Bone of the Thumb. This we have ſometimes found divided into two, and ſometimes three diſtinct Muſcles.

Extensor secundi Internodii Pollicis.

This ariſes broad and fleſhy, from that Part of the Radius next the Ulna; and becoming tendinous, paſſes under the ſame Involucrum with the Tendons of the preceding, to its Implantation at the lower Part of the ſecond Bone of the Thumb.

Extensor tertii Internodii Pollicis.

This has a broad, partly tendinous, but principally fleſhy Origination from the Ulna, immediately below the Beginning of the *Extenſor primi Internodii*, or between it and the *Indicator*, as alſo from the Ligament between the laſt-named Bone and the Radius; whence deſcending obliquely, it becomes tendinous, as it marches in a proper Sinus on the inferior Appendix of the Radius, wherein it is incloſed by its annular Ligament, and paſſes over the two Tendons of the *Radialis Extenſor*, to its Inſertion at the lower Part of the third Bone of the Thumb.

When this acts, it does not only extend the Thumb, but brings it ſomewhat backwards, inſomuch that ſome Perſons can bring it over the ſuperior and back Part of the Oſſa Metacarpi.

Extensor Pollicis longus.

This Muſcle doth not ariſe, as moſt deſcribe it, from the Tibia, or from the Ligament between it and the Fibula. Its Beginning is large and fleſhy from the fore Part of the Fibula, from immediately below its ſuperior Appendix, to four Fingers-breadth above the inferior one; and, deſcending under the annular Ligament of the Tarſus, between the Tendon of the *Tibialis Anticus*, and thoſe of the *Extenſor Digitorum Pedis longus*, and marching along the ſuperior Part of the Foot, it is inſerted into the upper Part of the ſecond Bone of the great Toe.

Its Name intimates its Uſe.

This Muſcle, juſt where it paſſes under the annular Ligament, ſends off a ſmall Tendon, which is inſerted into the upper Part of the firſt Bone of the great Toe externally and laterally, as has been frequently obſerv'd and demonſtrated by that inquiſitive and accurate Anatomiſt, Mr. *Joſeph Tanner*.

Extensor Pollicis brevis.

Though this Muſcle is not mentioned by Anatomiſts, yet we conſtantly obſerve it in Diſſection. It hath been commonly taken for Part of the *Extenſor Digitorum brevis*, but we frequently find it diſtinct.

It ariſeth fleſhy from the fore Part of the *Os Calcis*, and, being dilated into a fleſhy Belly, ſoon becomes a long ſlender Tendon, paſſing obliquely over the upper Part of the Foot; and is inſerted into the ſuperior Part of the firſt Bone of the great Toe, which it extends, or pulls upwards.

EXTENUATIO. Extenuation.

Diſeaſes are ſometimes obſerved to cauſe a remarkable Leanneſs, or Extenuation, and ſometimes a Tumefaction of the Body, the Knowledge of which Habits is of great Importance towards predicting the Fate of the Patient. We ſhall therefore firſt ſhew what a lean, ſqualid, and waſting Habit of Body ſignifies in Diſeaſes: Now it is certain, that Bodies become lean or extenuated for want of Nutrition: This the *Greeks* call ἀτροφία, "an Atrophy;" and we in *Latin*, *Innutritio*, "Innutrition," or Want of Nutrition; in which, as *Galen* ſays, *de Sanit. tuend. Lib.* 3. *Cap.* 13. Bodies receive no Benefit from Aliments. This is what is meant by *Hippocrates*, 2 *Aph.* 8. where he ſays, "That if a Perſon juſt out of a Diſeaſe receives no Strength from the Aliments he takes, it indicates that he uſes too much Aliment; but if the Caſe be the ſame, when the Party takes no Food, Evacuation is indicated." And to the ſame Purpoſe he ſpeaks afterwards, 2 *Aph.* 31. "If, after a Sickneſs, the Body receives no Benefit from Food taken with a good Appetite, it is a bad Sign." And this is the Atrophy, or Innutrition, which is obſerv'd in Bodies free from febrile Heats, or labouring under a long, but ſlow Fever: Wherefore in long and tedious Diſtempers, tho' it be natural for the Body to be emaciated, and the Fleſh to be very much waſted; yet if, in the Decline of the Diſeaſe, the Strength and bodily Habit of the Patient receives no Improvement, tho' he eats with an Appetite, it predicts a Relapſe. In an hectic Fever, Phthiſis, or Peripneumony, an incurable Leanneſs and Emaciation is a very bad Prognoſtic; but, when it proceeds from a Spitting of Blood, attended with a ſlow, but continual Fever, it portends nothing but Death: And where a Phthiſis is ſuſpected, what principally abates the Hopes of the Phyſician, is the obſtinate Leanneſs and Extenuation of the Patient, and his labouring continually under a Fever. They, alſo, who have long labour'd under burning Fevers, and are very much emaciated, and falling into a Maraſmus, are incureable. We may conclude, therefore, that an inveterate Leanneſs, Thinneſs, or Extenuation of Body under a Pleuriſy or Peripneumony, where the peccant Matter is not duly diſcharged by Expectoration, is a mortal Sign, as indicating a Phthiſis.

But we ſhall proceed to treat of *Extenuation* in acute Diſeaſes, and particularly at their Commencement, which is of great Moment in Prognoſtics, according to the Judgment of *Hippocrates*, 2 *Aph.* 28. where he pronounces it "a bad Sign "for the Body, under a conſiderable Fever, not to be waſted "at all, or to an immoderate Degree, that is, beyond what "Reaſon requires; for the latter indicates a great Decay of "Strength, and the other prognoſticates the long Duration of "the Diſeaſe." Now it is no more than what Reaſon requires, that a violent Fever ſhould cauſe a ſpeedy Extenuation, like that from long Diſeaſes, and moſt eaſily in Children and old Perſons; in theſe, becauſe of the Weakneſs of the Faculty; and in the others, from their hot and moiſt Temperament; whence they ſuffer under a profuſe Colliquation, and are ſoon extenuated. We may add, as Cauſes, the Climate, with an hot and dry Seaſon of the Year. In theſe Circumſtances there is Reaſon for the Patient's Extenuation, as well as from a copious preceding Hæmorrhage, much Sweating, Plenty of Urine, Vomiting, or Looſeneſs, long Faſting, Want of Sleep, and Solicitude of Mind: *Galen* adds to theſe Cauſes the Laxneſs of the Body, and the Thinneſs of the Humours, which occaſion an extraordinary Diaphoreſis and Extenuation: All theſe Things waſte and extenuate the Body, without enabling us to pronounce any thing with Certainty, on the Event of the Diſeaſe. But for the Patient, in the Beginning of the Diſtemper, on account of none of theſe external Cauſes beforementioned, but with a cold and dry Body, in the Winter Seaſon, and a cold Conſtitution of the Air, in the Vigour of his Age, with groſs Humours, and a denſe Skin, ſpeedily to fall away, and be emaciated, muſt be a very bad Sign. *Galen*, commenting on this Aphoriſm, gives a Reaſon why the Continuance of the Body in the ſame State, without Exhauſtion or Diminution, ſhould be reckon'd a bad Prognoſtic; which is, he ſays, becauſe ſuch a Diſpoſition indicates a Groſſneſs of the Humours, and a Denſeneſs of the Skin.

Of all the Parts of the Body, the Face is the firſt extenuated in acute Diſeaſes, becauſe the acrimonious Heat, aſcending like a Flame, conſumes the ſmall Parcels of Fleſh which are incumbent on the Bones and Cartilages; and the Leanneſs appears more conſpicuous in the Face, becauſe that Part is leſs furniſh'd with Fleſh. A Face which threatens the greateſt Danger is deſcribed by *Hippocrates Prognoſt.* in the following Manner: "The Noſe is ſharp, the Eyes hollow, the Tem"ples depreſs'd, the Ears cold and contracted, and their Lobes "inverted; the Skin about the Forehead hard, tenſe, and "dry, and the whole Face of a pale-green, black, livid, or "leaden Colour." This Sort of Face, which commonly goes, among Phyſicians, by the Name of *Facies Hippocratica*, is uſually ſeen in hectical and phthiſical Patients, who are very much extenuated; and if it appears in two or three Days from the Commencement of the Diſtemper, without any preceding extrinſic Cauſe, as from ſome remarkable Evacuation by an Hæmorrhage, Sweats, Stool, or Urine, or from Want of Sleep, Faſting, or Trouble of Mind, nor has for its Subject a Child, or decrepit Perſon, whoſe Habit of Body is eaſily diſſoluble by a ſlight Cauſe, but happens to one of adult Age, of a denſe Habit, and, what is principally to be regarded, in a frigid and dry Temperament, in the cold and moiſt Seaſon of the Winter, and a ſuitable Conſtitution of the Air, prognoſticates the worſt of Events: For, as *Galen* ſays, in his Comment on the Place, ſuch Symptoms proceed either from ſome Cauſe which corrupts and conſumes the fleſhy Parts, or from the Defect of the natural Heat, which is too weak to extend itſelf to the extreme Parts of the Body, but keeps its Reſidence in a feeble State in the Viſcera; whence thoſe Parts are deprived of their uſual Supplies of Blood and Spirits. This Extenuation of the Face then proceeds from an intenſe Heat, which ſpeedily conſumes the natural Moiſture, or corrupts the ſame by its Malignity, and from a Decay and Languiſhment of the natural Heat, thro' the Force of the Diſeaſe: And if there be no Reaſon to be given for this Symptom, ſuch as a preceding Abſtinence, Want of Sleep, or Solicitude of Mind, this Habit of Face is a mortal Indication. *Hippocrates* has expreſs'd himſelf to this Purpoſe, in the following Manner, *Prognoſt.* "If ſuch be the Countenance of the Patient," [as before deſcrib'd] "and we have no other Signs by which to "form a Judgment, it will be proper to inquire of the ſick "Perſon,

" Perſon, whether he has been affected with Want of Sleep, " or a violent Flux of the Belly, or has faſted a conſiderable " time; and, if he confeſſes any of theſe Circumſtances to " have preceded, his Caſe is leſs dangerous; and, if ſuch a " Viſage be owing to any of the forementioned Cauſes, we " may paſs a Judgment on them in a Day and a Night; but " if none of theſe appears to be in the Fault, and the Face " continues under the ſame Aſpect, during the time juſt men- " tion'd, it is a mortal Prognoſtic." But how we may know, without interrogating the ſick Perſon, whether there has been any preceding Watching, Faſting, or immoderate Evacuation, we are taught by *Galen*, in his Comment on the Place, as follows: " You may know at firſt Sight of the Patient, whe- " ther he has been long without Sleep; for you may obſerve " his Eyes to be very ſqualid, and to a greater Degree than " they are from an evident and immoderate Evacuation: Be- " ſides, he will hardly be able to lift up his Eyelids, but will " wink, and move his Eyes in the ſame unſteady and irregular " Manner, as in a Coma: And tho' you have never ſeen the " Patient before, you will be enabled to form ſome Judg- " ment of him from the Pulſe, which will always preſerve " ſome Indication, however ſmall it be, of an immoderate " Evacuation, if that be the Caſe; but, if Want of Sleep " be the Cauſe of ſuch an Aſpect, the Pulſe will reſemble " the Vibrations of an extended Cord. But if ſuch a " Countenance proceed only from Abſtinence, or Want of " Food, none of the Signs which indicate an immoderate " Evacuation, or Want of Sleep, will appear; for which Rea- " ſon there will be more Grounds to judge from accidental " than proper Signs, that the Patient is affected in this man- " ner for Want of Food, eſpecially when the Fever, upon " due Conſideration, does not appear, in the leaſt, to have the " Property of a colliquative Heat; for, if that were the Caſe, " this Extenuation of the Countenance might be owing to the " Fever, rather than any extrinſic Cauſe. You ought, there- " fore, to be the longer in feeling the whole Hand of the " Patient, and not only the Wriſt, but the Parts above it; " and carefully obſerve, whether the Parts you touch, emit " not only an acrimonious, but a ſubſtantial Plenty of Effiu- " via, which like a Flame pervade the Skin of your Hand, " with which you touch the Skin of the Patient, and infinuate " themſelves deeply therein; for ſuch are the Fevers, which " render the Face of ſuch an Aſpect."

From a due Conſideration of the Premiſſes you will be enabled to pronounce, whether the *Facies Hippocratica* proceeds from Watching, Faſting, or evident and immoderate Evacuation; and if, in the Beginning of acute Fevers, the Face appears extenuated, in the manner deſcribed, it predicts nothing but Death: But in ſome chronical Diſeaſes, as in hectic Fevers, and a Phthiſis, not only the Face, but the whole Body, is render'd ſqualid and dry, and reduced to Skin and Bone.

But we ſhall now briefly conſider, what may be infer'd, or prognoſticated, from a Tumidneſs of the Body: For the Body to be inflated and tumefy'd, is never a good Sign, ſince in acute Diſeaſes the Face is ſwelled, either by the Redundance of the Blood in the Veſſels diſtending the Veins, and by the Vapours, whence proceeds an Heavineſs of the whole Body, as in continual Fevers; or from an Inflammation with an Afflux of Humours, as in the Parotides; or, laſtly, on account of a windy and vaporous Crudity, from a vitiated Sanguification, as in pituitous Fevers, and the Leucophlegmatia, or Anaſarca: A Tumefaction from the two firſt Cauſes is not ſo very bad, nor can any thing, with Certainty, be prognoſticated from it; but in the laſt Caſe, where there is a Tumidneſs or Bloatedneſs from a groſs Vapour diſtending the Skin, and occaſion'd by a refrigerated Liver, and a vitiated Sanguification, the Deſtruction of the Patient may be often prognoſticated. To this Purpoſe, the Author of the *Coac. Præſag. T.* 139. ſays, that thoſe who labour under a Lethargy, are ſwelled, or bloated, and have their Cheeks inflated. From the ſame Cauſe, that is, a Refrigeration of the Liver, under a very hot and acute Diſtemper diſſolving the natural Heat of that Part, the Hypochondria, Belly, Feet, Hips, and Face, are œdematouſly affected, not without great Danger of Life: This is the Caſe of thoſe who fall into a Dropſy, and what is meant by *Hippocrates*, *Prognoſt.* when he ſays, " that all Dropſies pro- " ceeding from acute Diſeaſes are bad; for they allay not the " Fever, and are, beſides, very painful and mortal, and gene- " rally commence at the Ilia and Loins, and ſometimes at the " Liver." In many Perſons affected with an *Empyema*, or *Phthiſis*, at the Approach of Death, the Feet, Legs, and Face appear ſwell'd and cadaverous, from no other Cauſe than the extreme Decay of Heat in the Liver; and I have known ſeveral Inſtances of Perſons, who, at the Approach of Death have had the whole Bulk of their Bodies tumefy'd and inflated.

Hence we conclude, that an Inflation of the Body under acute Diſeaſes is never good; but in an *Empyema*, or *Phthiſis*, mortal to the laſt Degree. However, for the Parts to appear tumid, is not always a bad Sign in acute, and much leſs in chronical Diſtempers; for in many of theſe latter, the natural Heat being debilitated by the long Courſe of the Diſeaſe, the Feet are tumefy'd; which afterwards, as the Heat recovers Strength, from a Diſcuſſion of the Vapours, and a Deſiccation of the Humours, are reſtored to their former Habit; and in acute Diſeaſes Nature often, by way of Criſis, throws off the Humours on the Legs and Feet: Sometimes it happens, that, in acute Diſorders, the Face, as we ſaid, ſwells, from Vapours excited by the febrile Heat, and not diſcuſſed; but, on their Diſcuſſion, is ſoon afterwards freed from the Inflation. We muſt be cautious therefore in our Predictions from Tumefaction of the Face in Diſeaſes, and not preſume to prognoſticate from it, without a thorough Inſpection and Conſideration of the other Signs which appear in the Countenance. *Proſper Alpinus de Præſag. Vit. & Mort.*

EXTIRPATIO. Amputation.

EXTRACTIO, Extraction, in Surgery, is the drawing from, or out of the Body, any thing which is offenſive. In Pharmacy, Extraction is the Separation of the pure from the impure Part of a Body, by means of a proper Menſtruum. See DECOCTIO.

EXTRACTUM, an Extract, in Pharmacy, is uſually underſtood to mean a Solution of the purer Parts of a mix'd Body, inſpiſſated by Diſtillation, or Evaporation, nearly to the Conſiſtence of Honey.

The Directions given by the College for preparing Extracts, are thus:

Extracts may be made almoſt of any Part of the *Materia Medica*, or from any Medicine, (whether ſimple, as Herbs, Flowers, Seeds, and the like; or compounded, as Species, Pills, and the like) that is ſuited to give Tincture to any Menſtruum, in which it is cuſtomarily infuſed: And therefore take any thing within this Compaſs, which cut, bruiſe, or any other way manage, as the Nature of it requires for Infuſion: Pour upon it Spirit of Wine, or any diſtilled Waters, moſt accommodated to the Preſcriber's Intention, a ſufficient Quantity: Let it continue in Infuſion in a Bath, or any other ſlow Heat, for two Days or more, according as the Hardneſs or Softneſs of the Matter requires, until the Liquor is impregnated with the Tincture of the Thing infuſed. Then let the tinged Liquor be ſeparated by Inclination, pouring on freſh Menſtruum, infuſing and ſeparating as before, as long as any Tincture can be obtained. Let all the Tinctures be put together, and filtred through Cap-paper; and then in a Bath Heat evaporate the Humidity, until the Matter left is of the Conſiſtence of Honey; which muſt be kept for Uſe: And to this Extract, for the ſake of preſerving it moiſt, may be added ſome Portion of Salt, or ſome other thing ſuitable alſo to the main Intention; as two Scruples, for Inſtance, or half a Dram, to every Ounce of Extract.

The *Extractum Thebaicum* conſiſts only of Opium, diſſolv'd in Water, ſtrain'd and evaporated to a Conſiſtence.

The *Extractum Rudii* is the ſame as the *Pilulæ Rudii*.

EXTRAVASATUS. Extravaſated. This is apply'd to any Sort of Fluid, which is got out of the Veſſels, in which it ought to be contain'd. Thus, in an Ecchymoſis, Sugillation, or Aneuryſm, the Blood is ſaid to be extravaſated.

EXTRAVERSIO, Extraverſion, in Chymiſtry, is the rendering manifeſt any thing ſaline, alcaline, or acid, conceal'd in mix'd Bodies; and is juſt the Reverſe to one Species of Concentration.

EXTREMITATES. The Extremities, or extreme Parts.

The extreme Parts, according to *Galen*, in his Comment on the *Prognoſtics*, are the Ears, Noſe, Hands, and Feet; and theſe Parts, in acute Diſeaſes, often afford great Matter for Prognoſtication, ſince Death never happens without ſome Alteration in thoſe Parts from their natural State: For, in dying Perſons, the extreme Parts are neceſſarily refrigerated, and turn livid and black; and oftentimes the Hands and Feet are ſubject to odd and irregular Motions. An Heat of the Extremities, therefore, is never a bad Sign; but their Coldneſs is always bad, and worſt of all when the inward Parts are hot, and parch'd with Drought. This is well expreſs'd by *Celſus* from *Hippocrates:* " When the outward Parts, he ſays, " are cold, and the inward Parts ſo hot, as to cauſe a Thirſt, " the Fever not at all remitting, it is a mortal Prognoſtic." And, tho' a Coldneſs of the extreme Parts in continual Fevers be always a formidable Symptom, it is moſt pernicious when it continues with little or no Abatement; and, if theſe Parts at the ſame time appear livid or black, mortal in a very high Degree.

Hippocrates, ſpeaking of Patients under acute Fevers, from a predominant Conſtitution of the Air, 1 *Epid. Sect.* 1. tells us, " that their extreme Parts were very much refrigerated, " ſo that it was ſcarce poſſible to provoke any Heat in them." And, a little after, *Sect.* 2. deſcribing the Symptoms of a continual Fever, from a particular Conſtitution of the Seaſon, he ſays, among the reſt, " that the Extremities were remarkably " cold, and it was very difficult to recal the Heat into them." The ſame was obſerv'd of *Philiſcus*, when given over, 1 *Epid.*

Sect. 1. *Ægr.* 1. " His extreme Parts were every-where refri-
" gerated, and the Heat never returned into them."

The ſame Prognoſtics are to be drawn from the Colour of the Extremities; for their beſt Colour is the ſame as when the Patients were found in Health; tho' it may perhaps, under a Criſis, be ſometimes red and inflamed, from the Blood then ſettling in thoſe Parts; but the worſt and moſt fatal Colour is the livid and black.

In acute Diſeaſes, then, for the extreme Parts to appear black or livid, is a mortal Prognoſtic, as indicating either an Extinction of the Heat, or the Height of Putrefaction in the Humours. Theſe Colours of the Extremities were obſerv'd by *Hippocrates* in *Philiſcus* and *Silenus*, when dying; of the former of whom he ſays, 1 *Epid. Ægr.* 1. " that he was in
" a cold Sweat, and his extreme Parts were livid;" and of *Silenus*, *ibid. Ægr.* 2. " that he ſweated a little about his
" Head; that his Extremities were cold and livid; and that he
" was very reſtleſs."

For the Hands and Feet to be moved and agitated after an odd and diſorderly Manner, is condemn'd by *Hippocrates*, *Lib. Prognoſt.* where he ſays, " that they who under an
" acute Fever, Delirium, Peripneumony, or Cephalalgia,
" wave their Hands at every turn before their Face, or pick
" Motes, or pull Hairs out of the Clothes, or pick Straws
" from the Wall, are all in a bad and very dangerous State." It is a Symptom no leſs to be dreaded, for the Patient to have his Feet uncover'd, and not warm; of which we read, *ibid.*
" If the Sick have his Feet naked, without any conſiderable
" Heat, and throws about his Hands, Neck, and Legs, in a
" looſe diſorderly manner, it is a bad Sign, as indicating an
" Anxiety." *Proſper Alpinus de Præſag. Vit. & Mort.*

EXUBERES. Children which are wean'd, are thus called.

EXULCERATIO. Exulceration.

EXUMBILICATIO. A Protuberance of the Navel.

EXUNGULATIO. Exungulation. Is cutting off the *Ungues*, or white Part, of the Petals of Roſes.

EXUROS, ἔξυρος, from ξύω, a Tail. Taper, in the Form of a Tail; in which Shape *Hippocrates* directs Peſſaries to be made, *de Morb. Mulier. L.* 2.

EXUVIÆ. The Sloughs of Serpents; that is, the Skins which they caſt in the Spring. Theſe, when tied to the Abdomen, or Loins, are thought to facilitate the Delivery of Women in Labour; and, when form'd into Gargariſms, to alleviate the Tooth-ach. They cure the Impetigo, when reduc'd to a Powder, or burnt to Aſhes, and applied to the Part affected. If the Head is rub'd with them, they prevent a Falling off of the Hairs, and make them grow. *Schrod. Pharmacop. Med. Chym.*

EZEPH. The Sun. *Johnſon.*

EZEZICH. Salt. *Rulandus.*

EZULA. The ſame as ESULA.

F.

F, In the chymical Alphabet, ſignifies, as it is explain'd *Luna clara*; probably relative to Silver.

FABA. The Bean.

Faba, was called by the *Greeks* κύαμος, by the *Faliſci*, a People of *Hetruria*, now *Tuſcany*, *Haba*; whence the Name *Faba* ſeems to be taken. *Martinius* derives the Word from πάω [*pao*], to feed; as if it were *Paba*; *Iſidorus*, from φάγω [*fago*], to eat. *Dodonæus* gives this Kind of Puls, or leguminous Fruit, a Name with a *Latin* Termination, and calls it *Boona*, from the *High-Dutch Boon*, to ſhew his Learning, as *J. Bauhine* ſays; but this Name *Boon*, as well as *Bean*, ſeem both deriv'd from the *Italian* Word *Baiana*, by which Name young Beans are cry'd to be ſold all over *Lombardy*, and the State of *Genoa*, as *Hermolaus* aſſures us. The *Greek* Name κύαμος is ſuppoſed to be given them, becauſe they are εἰς τὸ κύειν δεινοί, καὶ ἄγριοι τῷ κύειν, potent Stimulators to Venery.

The Characters of the Bean are;

It has a long unicapſular Pod, full of reniform Seeds: The Stalks are firm, and the Leaves grow in Pairs, and, as it were, conjugated to a Rib, which ends in a Point. *Boerhaave*, *Pars* 2. *p.* 45.

Boerhaave mentions ſix Species of this Plant; which are,

1. Faba, *Offic. C. B. Pin.* 338. *Raii Hiſt.* 1. 909. *Synop.* 3. 323. *Boerh. Ind. A.* 2. 45. *Faba hortenſis major*, Ger. 1036. Emac. 1209. Mer. Pin. 38. Park. Theat. 1054. *Faba, Cyamus leguminoſa*, J. B. 2. 278. *Faba, Bona major*, Hiſt. Oxon. 2. 83. *Faba, flore candido, lituris nigris conſpicuo*, Tourn. Inſt. 391. Rupp. Flor. Jen. 212. Buxb. 107. *Faba major recentiorum*, Elem. Bot. 312. *Faba major vulgaris, ſive Phaſeolus major*, Merc. Bot. 1. 35. Phyt. Brit. 40. GARDEN-BEANS.

Garden-beans are known to every body to have hollow, angular, pretty firm Stalks, growing to be two or three Foot high, ſet alternately with Leaves compoſed of ſeveral large oval Pinnæ, which uſually, though not always, ſtand oppoſite; at the Foot of the Leaves grow the Flowers, ſeveral together, which are large and papilionaceous, or like a Pea's Bloſſom, white, with two large black Spots in the under Leaves: Theſe are ſucceeded by large, erect, ſomewhat flat Pods, woolly within, in each of which lie two or three flatiſh Beans, moſtly white, but ſometimes red, having the Head a little compreſs'd, with a little Hilus, or Spot: They are ſown in Gardens, flowering in *May*; and the Beans are ripe in *June* or *July*.

They are frequently eaten for Food, in the Summer-time, while they are young, being a pleaſant, and to moſt People a grateful Diſh; and, though ſomewhat windy, are not more ſo than moſt other Puls. The diſtil'd Water from the Flowers is uſed by many as a Coſmetic; and that from the Pods is accounted good for the Wind and Gripes in Children. The Bean-meal or Flour is rarely us'd inwardly, though commended by ſome for a Looſeneſs and the Bloody-flux; but it is frequently made uſe of in outward Applications, in Cataplaſms, againſt Inflammations, and to diſſolve Swellings or Tumors.

Officinal Preparations are, *Aqua Florum, & Siliquarum Fabarum. Miller's Bot. Off.*

Beans, in many Countries, are a great Part of their Food, during Spring, and throughout the Summer. We are of Opinion, with *Tragus*, that the young Beans are wholſome Aliment, and generate good Juices. The Antients, with *Dodonæus*, *Caſp. Hoffman*, and ſome others of the Moderns, tell us, that Beans are flatulent, and the greener they are, the more flatulent, and, conſequently, the more difficult of Concoction: " However, we, ſays *Ray*, do not find this to be
" true, tho' we frequently feed upon Beans in the Summer:
" Nor do we approve of the Opinion of *Dodonæus*, who pre-
" fers the old and dry Beans before the green ones, becauſe
" he thinks them leſs flatulent; but, with *Tragus*, leave them
" to our Horſes: Nor do I ſee why they ſhould not fatten
" Men, as well as a Swine, and other Animals."

Dr. *Mundy*, in his Treatiſe of Foods, ſays, that he knew a Peaſant, who, in a great Dearth of Proviſions, fed his Children with nothing but boil'd Beans; and yet you ſhould hardly ſee Boys of a better Colour, or Habit of Body; which proves, that dry Beans afford a copious Nutriment, when the Stomach is once accuſtom'd to bear them.

As to the aſtringent Quality of Bean-flour, and its conſequent medicinal Uſes in the Dyſentery, Authors, I find, differ. *Caſp. Hoffman* ſays, it would be vain to expect aſtringent Effects from the Flower of Beans, which the Antients called *Faba freſa*, and *Lomentum Fabæ*, becauſe it is prepared without the Cortex, or Skin, in which lies all the Aſtringency. And hence it appears, he ſays, how much they are in the wrong, who aſcribe the Uſe of Bean-flour, boiled in Vinegar alone, or in Vinegar and Water, for Fluxes proceeding from a Debility of the retentive Faculty; for, unleſs you boil them whole, they ſignify nothing.

Dodonæus, on the contrary, ſays, that Beans, with their Skins, or Huſks, are neither ſlow, nor very quick, in paſſing through the Body; but that without their Huſks they are binding. " We, ſays *Ray*, incline to *Dodonæus*'s Opinion; ſince
" we find, that in Wheat the Flour, ſeparated from the Bran,
" binds the more powerfully; and that the Bran is deterſive,

" and

"and promotes the Paſſage of the Flour. However, we "leave the Matter to be decided by Experience."

Bean-flour is not only good internally in Diarrhœas and Dyſenteries, but outwardly for Sun-burning, and other cutaneous Deformities, and for obliterating the Marks of Sugillations. The diſtilled Water of the Flowers is diuretic, and of very great Uſe in clearing the Face of all Kinds of Spots or Blemiſhes, being an excellent Coſmetic. The Flowers have a moſt fragrant Smell, ſo that a Field, or Garden, ſet with Beans, when in Bloſſom, may be ſmelled at a good Diſtance.

Whether the *Boona*, or *Bean*, be the *Faba* of the Antients, is much diſputed among Botaniſts. It is certain, that the *Faba* of the Antients was ſmall and round, as appears from an infinite Number of Places in *Theophraſtus*, *Dioſcorides*, and others. On the other Side, it ſeems impoſſible, and is hardly credible, that a leguminous Fruit, ſo common, and of daily Uſe, ſhould have grown into Diſuſe, or have changed its Name; and that the *Boona* ſhould come to ſucceed it, without any Perſon's Knowledge: The Arguments, ſays *Caſpar Hoffman*, of thoſe who oppoſe this Opinion, are faulty in this, that they inſtitute the Compariſon between the *Faba* of the Antients and our larger Bean, whereas the Compariſon ought to be inſtituted between that and our ſmaller Bean.

For Diſorders of the Kidneys: Take the Aſhes of Bean-ſtalk, make a Lixivium of them; ſtrain through *Hippocrates*'s Sleeve, and edulcorate the ſtrained Liquor with Sugar, and Cinnamon: Of this Preparation ſix Ounces are to be taken for a Doſe.

Guido de Cauliaco informs us, that by means of this Remedy he was freed from a violent Pain of the Kidneys, in the Beginning of a double tertian Fever; for it provokes Urine, cleanſes the Paſſages, expels Pus and Gravel, and promotes the Menſes. Dr. *Hulſe* juſtly thinks, that this Effect is to be aſcribed to the Salts contained in the Lixivium: For, ſays he, I myſelf, for a Woman much ſubject to nephritic Pains, and whoſe Legs were conſiderably ſwelled, ordered a Diet-drink, in which a large Quantity of the Aſhes of Broom was boil'd. By this means a great Number of ſmall Stones were diſcharg'd from her Kidneys, but with ſo intenſe a Pain, that ſhe was forced to deſiſt from the Uſe of it.

Hence, in order to provoke Urine, Mr. *Cheſneau* recommends eight Grains of the Salt, extracted from the Stalks of Beans, to be exhibited in ſome proper Liquor; or, if this Salt cannot be had, he orders ſix Ounces of the Lixivium, prepared of the Aſhes, and clarified, to be mixed with one Ounce of the Syrup of Marſhmallows.

Simon Pauli, in his *Botan. Quadripartit.* informs us, that he knew a Perſon, who, for four Months, had voided bloody Stools, perfectly cured only by the Uſe of red Beans, boiled by way of Pudding, and taken every Night and Morning, after all other Medicines had proved entirely ineffectual.

The Precept of *Pythagoras*, which injoins Abſtinence from Beans, is variouſly interpreted by antient and modern Writers. Some underſtand it ſimply of Beans; Abſtinence from which, they ſuppoſe, *Pythagoras* injoined, becauſe they were flatulent, and a Stimulus to Venery, deſtructive of the Tranquillity of the Mind, and productive of turbulent Dreams. Others, according to *Pliny*, in the 12th Chapter of his 18th Book, think, that *Pythagoras* diſcharged the eating of Beans, becauſe the Souls of the Dead were lodged in them, and becauſe on their Flowers there were found unlucky Letters. Others are of Opinion, that Teſticles are ſymbolically and enigmatically called Beans, becauſe the one reſembles the other; and that for this Reaſon *Pythagoras* did not condemn the Uſe of Beans, which he eat frequently himſelf, but the immoderate Uſe of Venery. Some others, and, among the reſt, *Plutarch*, think, that *Pythagoras* injoined to abſtain from bearing any Offices of State; for, in the Choice of Magiſtrates, the antient *Greeks* uſed Beans inſtead of Stones. *Ray*, *Hiſt. Plant.*

The young Leaves, boiled in Broth, are eſteemed highly emollient.

2. Faba. *C. B. P.* 338. *Siliqua, & ſemine, latiore.* K. a.

3. Faba; minor; ſeu Equina. *C. B. P.* 338. THE SMALL, or HORSE-BEAN.

Theſe grow, in all reſpects, like the Garden-beans, ſaving that they are leſs in all the Parts; the Pods, as well as the Beans, being rounder as well as ſmaller. They are ſown in the Fields, flowering and ripening ſomewhat later than the Garden-bean.

They are uſed outwardly for the ſame Purpoſes as the above-mentioned; but are moſtly ſpent in Food for Horſes.

Miller's Bot. Off.

4. Faba; rotunda, oblonga, ſeu cylindracea; minor; ſeu Equina, nigra. *M. H.* 2. 85.

5. Faba; rotunda, oblonga, ſeu cylindracea; minima; pluribus, quinis, ſenis ſiliquis uno pediculo exortis, ſeu Hattoniana. *M. H.* 2. 86.

6. Faba; fructu ex rubicundo colore purpuraſcente. *C. B. P.* 338. *Var.* 1. *a. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 45.

FABA STI. IGNATII. Offic. *Nux Pepita, ſeu Faba Sancti Ignatii.* Act. Philoſ. Lond. N°. 249. p. 44. *Igaſur, ſeu Nux Vomica legitima Serapionis.* Ejuſd. 88. Fig. 4. 5. 6. *Igaſur, ſeu Nux Vomica legitima Serapionis Camelli, Faba Sancti Ignatii vulgo.* Raii Dendr. 118. *Cucurbitifera Malabathri foliis ſcandens Catalongay, & Contara Philippinis Orientalibus dicta, cujus Nuclei Pepitas de Byſayas, aut Catbalogan & Fabæ Sancti Ignatii ab Hiſpanis, Iſagur & Mananaog, i. e. Victorioſi, Inſulanis nuncupati.* Pl. Mant. 60. ST. IGNATIUS'S BEAN.

Of this Fruit Sir *Hans Sloane* gives us the following Account:

It is about the Bulk of a Nutmeg, and triangular. The Shavings of it, drank in cold Water, are highly beneficial for evacuating Poiſons by Vomit, as alſo for the Cure of Bites inflicted by venomous Animals, if, at the ſame time, a few of the ſame Shavings are applied to the Bite: Theſe Shavings, alſo, afford great Relief, when applied to a Part ſpaſmodically conſtricted, and ſtop Hæmorrhages when applied to Wounds. In the Year 1692. a Woman, who had, for a long time, been afflicted with Floodings, was reſtored to perfect Health, by drinking theſe Shavings in ſome proper Liquor. The ſame Year, an Infant, labouring under an highly intenſe Fever, by drinking theſe Shavings, had its Diſorder forthwith removed in my Preſence. They, alſo, afford Relief to Women in Labour, and facilitate their Delivery. I myſelf have found from Experience, that this Bean is of ſingular Service in all Kinds of Repletion, and Crudities of the Stomach, as, alſo, in a Dyſentery and Teneſmus.

Divide each Bean into three Parts; and, when there is a Neceſſity, put one of theſe into the Mouth, for a Quarter or half a Quarter of an Hour, ſwallowing the Saliva diſcharged. Then drink about two or three Ounces of cold Water, and the Effects of the Medicine will be ſenſible.

Another Manner of uſing this Bean is to put it into the concave Part of a hard Shell with a little Water, and rub it up and down. This Water is to be put into a Veſſel with ſome of the Shavings; and the like is to be done, till you have two Ounces of the Water thus prepared, which are to be taken for a Doſe.

When this Bean, divided into Pieces, is rubbed in the concave Part of a Shell, with Oil, eſpecially that of Olives, this Oil produces the ſame Effects with the former Preparation, when drank; and is an excellent Medicine when applied to Wounds, or Members ſpaſmodically conſtricted.

The moſt ordinary Method of uſing this Nut is to put it entire into a little warm Water, till the Water is rendered bitter; and this Infuſion is afterwards to be exhibited. Others uſe a little of the Powder in Subſtance; others ſwallow a Piece of the Bean; and others wear a whole Bean, hung about their Necks, by way of Amulet.

When Poiſon is ſuſpected, and, in Caſes where there is an immoderate and tumultuous Conflict of the Spirits, it is to be uſed without any Regard to Time. In other Diſeaſes, it is to be uſed in a Morning, faſting. But when the Intention is to vomit, it is moſt conveniently exhibited an Hour or two after Eating: The Doſe is half a Scruple, in Conjunction with other gentle Emetics.

The Powder, an Infuſion, or the Oil, of this Bean are exhibited in tertian and quartan Fevers. It is alſo uſed for provoking Urine, the Menſes, and ſuppreſſed Labonrs; for facilitating the Birth, expelling the Secundines, the Fœtus when dead, and Worms; in all which Caſes I have found it effectual. It is alſo exhibited in Colics, Crudities of the Stomach, an injured Concoction, Diarrhœas, Teneſmus, Obſtructions of the Liver and Spleen.

It is produced in the *Philippine* Iſlands, and thoſe adjacent to them; but we are ignorant what Kind of Plant it grows on; only I learned, from *Raphael de Roa*, a learned *Spaniard*, who lived long in theſe Iſlands, that it was a convolvulous Plant, twiſted itſelf round the talleſt Trees, and bore a Fruit as large as a Nutmeg. *Philoſ. Tranſact.*

The *Egyptian* Bean, by ſome called the *Pontic* Bean, is not only copiouſly produced in *Egypt*, but, alſo, in ſome marſhy Grounds of *Aſia* and *Cilicia*. It has a very large Leaf, a Stalk a Cubit long, as thick as one's Finger, and a Flower whoſe Colour reſembles that of a Roſe, and which is as large again as a Poppy-flower. But, when the Flower falls, it bears ſmall Pods, almoſt reſembling little Bladders, and in which the Bean is ſomewhat prominent above its Covering, in the Form of a Bubble. They call it *Ciborium*, or *Cibotium*, from the Manner of Planting it; which is, firſt, to lodge it in a moiſt Clod, by way of a Caſe, or Box, which is afterwards immerſed in Water. Its Root is thicker than that of the common Reed. This Root is eaten, both raw and boil'd, and is called *Colocaſia*. The Bean itſelf is, alſo, eaten green; but, when dry, becomes black, and in Bulk exceeds the *Grecian* Bean. It is of an aſtringent Quality, and good in Diſorders of the Stomach. In conſequence of its aſtringent Nature, an Inſperſion of its Flower, inſtead of Polenta, is highly beneficial to dyſenteric Patients, and ſuch as labour under the Cœliac Paſſion. This Flower is, alſo, uſed by way of Poultice: But the Huſks, made into a Decoction, with Mulſum, prove more effectual, if three Cyathi of the Mulſum are exhibited for a Doſe. This Bean, if boil'd in Oil of Roſes, relieves Pains of the Ears, if dropt into them; becauſe, in the Middle of the Bean, there is a green Subſtance, highly bitter to the Taſte. *Dioſcorides*.

The Root of this Bean, triturated, and made up, with Sugar, in form of a Preſerve, is exhibited for the Hæmorrhoids. The Juice, extracted from the Flowers, ſtops immoderate Diſcharges of the Menſes. *Dale* from *Henricus Adrianus Van Rheede*.

FABACIUM. A ſort of Cake, made of Bean-meal, us'd as an Aliment.

FABAGO. The Name of a Plant; called, alſo, *Fabago, ſive Leguminoſa*. Park. *Capparis Portulacæ*. C. B. *Fabaginea, ſive Peplios Lutetianorum*. J. B. *Telephium Dioſcoridis & Plinii*. Col. *Capparis, Fabago*. I find no medicinal Virtues attributed to this Plant, except, that the *Syrians* uſe it to kill Worms, on account of its Bitterneſs.

FABARIA. A Name for the ANACAMPSEROS, Orpine; which ſee.

FABER. The Name of a Fiſh mentioned by *Columella*, and *Aldrovandus*. *Fabrorum aqua* is Water in which the Smiths quench their Iron.

FABRILIS RUBRICA. See RUBRICA FABRILIS.

FACH. The Name of a *Turkiſh* Medicine, celebrated for its Efficacy againſt Poiſons.

FACIES. The Face. See CAPUT.

PROGNOSTICS *from the* FACE.

Hippocrates, in his Book of *Prognoſtics*, directs us, "in "acute Diſeaſes, to conſider, firſt, the Countenance of the "ſick Perſon, as whether it be like that of Perſons in Health, "or, what is more to be regarded, the ſame as when himſelf "was in a ſound State; for, if it appears in this Manner, it "affords the moſt hopeful Prognoſtic; as the very Reverſe to "this carries the moſt Danger in it." *Galen*, commenting on this Paſſage, ſays, "that the Parts affected are to be com-"pared with the ſame when ſound, and, if they appear alike, "it is a good Sign; if otherwiſe, the contrary." In ſhort, if the Face, in acute Diſtempers, appears like that of ſound Perſons, we have good Grounds to hope for a Recovery, becauſe it ſignifies, that the Diſeaſe is neither violent, nor very malignant. But from an Alteration of the Countenance, as to a State of Extenuation, and that not in the Beginning, but in the gradual Progreſs, nothing of Certainty can be predicted, any more than if ſuch a Change ſhould be effected, not by the Diſeaſe, but by ſome other extrinſic Cauſe; as, for Inſtance, by an immoderate Paſſion of the Mind, Want of Sleep, Flux of the Belly, Abſtinence, or the like; which frequently cauſe an Extenuation of the Face; which, for that Reaſon, in ſuch Caſes, can afford no certain Prognoſtic.

As to the Colour; a florid Colour of the Face is ſometimes good, as when it indicates a future Hæmorrhage at the Noſe; and is the more to be depended upon, if attended with other Signs prognoſticating the ſame Event, according to the Judgment of *Hippocrates*, *Coac. Prænot.* 142. "Perſons under a "Fever, ſays that Author, if they appear red in the Face, and "are, beſides, moleſted with a violent Pain of the Head, accompanied with an high Pulſe, are generally ſeized with an "Hæmorrhage."

But all the other concomitant Symptoms deſerve, alſo, our Attention; ſuch as Splendors, Flaſhes of Light, or Miſts, paſſing before the Eyes; beſides a Redneſs of the Face, and, frequently, a tenſive and gravative Pain of the Head, a Tenſeneſs of the Hypochondria without Pain, and a Difficulty of Reſpiration. From ſuch Signs *Galen* predicted an Hæmorrhage in a young Man at *Rome*, in the Preſence of many *Roman* Phyſicians, as he relates, *Lib. de Præſag. ad Poſthum.* "While the "Phyſicians, ſays he, were in Surprize, the Patient raiſed "himſelf up; as though he would throw himſelf out of Bed; "and being aſked, why he would attempt to run out of Bed, "when there was nothing preſent to excite him, he anſwer'd, "that he was frighted at the Sight of a Serpent, of a red Co-"lour, creeping over the Cieling, which, if it ſhould chance "to ſlip, would tumble down upon him; and, for that Rea-"ſon, he was eager to fly out of Bed. The reſt, who attended him, did not imagine, that this Phænomenon was of "any Signification towards a future Hæmorrhage; but I, ſeriouſly conſidering every other Symptom, and particularly "perceiving the Redneſs, which before, though obſcurely, extended from the Right Side of the Noſe to the Cheek, to be "very much increaſed, regarded the ſame as a manifeſt Indication of an approaching Hæmorrhage at the Right Noſtril." But, in predicting an Hæmorrhage, we are to conſider all the other Signs, as well as Redneſs of the Face, and eſpecially thoſe of Concoction. For, in a crude Diſeaſe, there rarely happens an Eruption of Blood, but what diſtils by Drops; which Kind of Evacuation in burning Fevers, and moſt of all in Fevers attended with a Phrenſy, is much ſuſpected. To this we may add, that a Redneſs of the Face is, ſometimes, a Prognoſtic of an Abſceſs behind the Ears, or the Parotides; of which *Hippocrates*, according to *Galen*, is to be underſtood, 6 *Epid. Sect.* 2. *T.* 11. where, after deſcribing ſome Symptoms, which prognoſticated a Defluxion on the Limbs, he ſays, "that moſt of thoſe [*whoſe Caſe was before deſcribed*], who "were, by Nature, of a pretty white Skin, were intenſely "red in the Face, and yet had little or no Hæmorrhage from "the Noſe." *Galen*, commenting on this Place, ſays, that "an intenſe Redneſs of the Face, under a long and favourable "Illneſs, gives Expectations of a Criſis, by an Abſceſs, or "Defluxion upon ſome of the Limbs, unleſs prevented by a "copious Hæmorrhage from the Noſe." In the ſame Senſe are we to underſtand the Author of 1 *Prorrhet.* 165. when he tells us, "that they who labour under a Coma, with a Reſt-"leſſneſs, a Pain in the Hypochondria, and ſlight Vomitings, "give Indications of ſucceeding Parotides; but firſt we are "to conſider the Habit of the Face." Here *Galen*, in his Comment, ſays, "Before the Generation of the Parotides, "we are to regard the Signs afforded by the Face; ſuch are "Redneſs, a preternatural Tumor, Humidneſs of the Eyes, "Dimneſs of the Sight, and the like." From the Premiſes, we may infer, that a Redneſs of the Face is often good by Accident; and may be called a critical Sign, whenever it precedes an Hæmorrhage from the Noſe. But this Habit of the Face appears principally in the Height of the Fits, and eſpecially in a Synochus, and a burning Fever, or where there is an Inflammation of the Lungs, in which the Cheeks, according to *Hippocrates*, in his *Prognoſtics*, contract a Redneſs. However, there is nothing to be predicted, with Certainty, from this Habit of the Face alone; unleſs its Indication be confirm'd by ſome other Signs, either good or bad. What has been ſaid, relates to a good Face: We now proceed to inquire, what bad Prognoſtics may be drawn from an Alteration in that Part.

Firſt, then, *Hippocrates*, in his *Prognoſtics*, aſſures us, that, in the Beginning of a Diſeaſe, a Face which, without the Concurrence of ſome external Cauſes, becomes unlike what it was in Health, is a bad Sign, and, if it be quite the reverſe, a pernicious one; and in acute Diſtempers portending nothing but Deſtruction. Such is that Habit of Face, in which, as *Hippocrates*, in the Beginning of his Prognoſtics, deſcribes it, "the "Noſe is ſharp, the Eyes hollow, the Temples ſunk, the Ears "cold and contracted, and their Lobes inverted, the Skin "about the Forehead hard, tenſe, and dry, and the whole "Countenance of a pale, greeniſh, black, livid, or leaden Co-"lour." This is what Phyſicians juſtly call a *cadaverous* Face; and if it appears in the Beginning of an acute Diſeaſe, that is to ſay, within three Days, it indicates nothing but Death.

The Face, in ſome chronical Diſtempers, from a Refrigeration of the Liver, and a depraved Sanguification, is obſerved to be tumid, juſt as it is in a Phthiſis, and an Empyema; in which Caſes it generally appears in that manner on the Patients, when dying. As to a red Face, when of bad Indication, the Author of the *Prorrhetica*, *Lib.* 1. *T.* 49. ſays, "that a good "Colour in the Face, accompany'd with a ſorrowful Aſpect, "is a bad Sign," as it indicates, according to *Galen*, in his Comment on the Place, a hot Affection ſcorching the Blood;

whence ſuch a Floridneſs of the Countenance is, by ſome, ſuppoſed proper to a melancholy Affection. But, in this Redneſs of the Face, we are to have regard to other concomitant Signs; and, if they are bad, it is pernicious; for a red Face, attended with bad Signs, ſometimes indicates a Phrenſy, and ſuch a one as is fatal, and ends in Convulſions: Thus a Redneſs of the Countenance, with a fierce Look, a Delirium, or ſome phrenetic Symptom, is mortal. Of ſuch Patients we read, *Coac.* 162. "They, ſays the Author, who labour under a Cephalalgy, and "a Catochus, accompany'd with a Delirium, a Conſtipation "of the Belly, a fierce Look, and a florid Countenance, are "affected with an Opiſthotonos;" which is a ſort of Convulſion that draws the Head backwards, and fixes it on the Scapulæ, and is a mortal Symptom. But if the Face be not only hot, but of a fiery Red, it is ſtill worſe, if attended with bad Signs. Of this Caſe, alſo, the Author of the *Coac.* 7. ſpeaks in the following Manner: "A Rigor, attended with a Coma, is "not without Danger; and if the Face be alſo of a Flame-"colour, and in a Sweat, it indicates a Malignity." And more fully to the Purpoſe is it expreſs'd, 1 *Prorrhet.* 67. "A "comatous Rigor carries Danger in it, and, if attended with a "Flame-colour of the Face, and a Sweat, is deſtructive." *Galen*, in his Comment hereon, ſays, "We know, that a "Flame-colour of the Face, attended with a Sweat, though "without a Rigor, is a bad Indication, becauſe a Sweat is one "of the critical Signs; and therefore, if it determines nothing, "ſhews the Malignity of the Diſeaſe." A fiery Face then, with ſome critical Sign, as a Sweat, Vomiting, Flux of the Belly, or an Hæmorrhage, indicates Malignity, and is generally mortal. We are to obſerve alſo, on this Head, that the Face appears red in pulmonary Diſorders, but in theſe the Cheeks principally contract a Redneſs; for which Reaſon, when this Symptom appears in Fevers, we juſtly ſuſpect a Peripneumony, or an Empyema. Hence, we are told by *Hippocrates*, *Prognoſt.* that a Redneſs of the Cheeks is one Sign of an Empyema. And this Colour, attended with bad Signs, and eſpecially bad critical Signs, that is, ſuch Signs as determine nothing, preſages Death. The Fate of the Patient, under ſuch Circumſtances, is pronounced by the Author of the *Coac.* 67. in the following Words: "They, ſays he, who in a Fever labour under an "Averſion to Food, with Sweats, and have a good Colour in "the Face, accompany'd with a Looſeneſs, and a Cardialgia, "after a long Illneſs, die after the Manner of thoſe who are "affected with a Peripneumony, or other pulmonary Diſor-"ders." Such was the Fate of the Wife of *Polycrates*, 7 *Epid. Text.* 9. "Who, under a Fever, was affected from the very "Beginning with a Cough, and Spitting, like thoſe in an Em-"pyema, accompany'd with a Hoarſeneſs and Wheeſing in the "Aſpera Arteria, and Fauces. Her Face was of a good Co-"lour, and there was a Redneſs in her Cheeks, tho' not in-"tenſe, but moderately florid." This Woman was firſt affected with a Peripneumony, then with an Empyema, and dy'd at laſt of a Phthiſis. A Redneſs of the Cheeks, therefore, in long and ſlow Fevers, is an Indication either of a Peripneumony, or an Empyema, which end in a Conſumption, if attended with a dry Cough, tho' never ſo ſlight; provided, alſo, that the Patient be ſubject to Exacerbations or Inequalities of Heat in the Fever, tho' never wholly free from it.

FACINUM is Metal, or Metallic Ore. *Rulandus.*

FACULTAS, a Faculty, is the Power of performing any Action. Thus Medicines are ſaid to have a Faculty of Purging, Vomiting, or of performing any Action in the Body. In Phyſiology it imports juſt the ſame. Thus the Animal Faculty is that Power in the Body by which all the Animal Actions are perform'd; the Vegetative Faculty is that Power by which Generation, Nutrition, and Accretion are carried on; and the natural Faculty is that, by which the natural Actions are perform'd. Every particular Organ is alſo ſaid to have their Faculties, or Powers of Acting; as the retentive, expulſive, attractive, and many other Faculties.

FÆCULA is a Medicine which conſiſts of the Fæces of Vegetable Juices, principally thoſe of Roots. The Manner of making a Fæcula may be readily comprehended by the following Example from the College Diſpenſatory.

Fæcula Bryoniæ.

The Fæcula of Bryony.

Take of the Roots of Bryony, any Quantity: Let them be ſcraped ſmall with a Knife, and ſqueeze out their Juice with a Preſs, after a few Hours, in Veſſels that are without any Motion: There will be a very white Sediment like Starch, and it muſt be dried in glazed Pans, after the watery Part is poured off by Inclination.

After the ſame Manner is prepared the Fæcula of Arum, wild Radiſh, Orrice, and the like.

FÆX is properly the Sediment, Lees, or Grounds, of any fermented Liquor; but in Medicine, it is generally underſtood of Wine; tho' the Sediment of any Fluid is ſometimes call'd *Fæx*, or *Fæces*, by which, alſo, ſometimes the Excrements of the Belly are underſtood.

As to the Medicinal Virtues of the Fæces or Lees of Wine, *Dioſcorides*, *L.* 5. *C.* 132. ſays, that thoſe of old *Italian* Wine are to be prefer'd; for the Sediments of Vinegar are poſſeſs'd of ſtronger Qualities. Theſe Fæces are to be burn'd like the Alcyonium, after they are diligently dried. Some put them into a new earthen Pot, and burn them over a briſk Fire, till they are red-hot. Others cover a Lump of them over with live Coals, till they are alſo red-hot. 'Tis a Sign, that they are ſufficiently burnt, when they aſſume a light whitiſh Colour, and ſeem to burn the Tongue, when apply'd to it. The Lees of Vinegar are to be burn'd in the ſame manner. The Lees of Wine are highly cauſtic, detergent, cicatrizing, aſtringent, corroding, and drying. They muſt be us'd recent, becauſe they quickly evaporate, and loſe their Strength; for which Reaſon they muſt be kept in a cloſe-ſtopt Veſſel. Thoſe Lees which have not been burn'd, either by themſelves, or in Conjunction with Myrrh, check œdematous Swellings, if apply'd to them, as alſo Defluxions of the Stomach, and Inteſtines. If apply'd to the Abdomen and Pudenda of Women, they ſtop immoderate Diſcharges of the Menſes. They diſcuſs thoſe Tumors call'd Pani, which are not exulcerated, as alſo Tubercles. Breaſts render'd turgid, and painfully diſtended, with Milk, are reliev'd by being anointed with them, in Conjunction with Vinegar. But the burn'd Lees, in Conjunction with Reſin, remove Roughneſs of the Nails; and the Hairs, if anointed with them, together with a little of the Oil of Maſtich, become yellow in a Night's time. When waſh'd, they are mix'd with Medicines for the Eyes, ſuch as Spodium; and, when us'd for this Intention, remove Films and Specks.

FAGARA, Offic. Ger. 1365. Emac. 1548. *Fagara major*, J. B. 1. 350. Chab. 26. Raii Hiſt. 2. 1814. *Fagara ſeu Cayutana Luzonis*, Camel. Syllab. 74. *Cubebis affinis Fagara major*, C. B. Pin. 412. *Dale.*

It is found in the *Philippine* Iſlands. The Part uſed in Medicine is the Berries, and eſpecially their outer Rind, which is tender and blackiſh, and of an aromatic, and ſomewhat acrimonious Taſte. Theſe Berries, when mature, break, and yield a black, ſhining, and pretty ſolid Kernel, void of Taſte and Smell.

The Berries are heating and drying, and are good for a cold Stomach and Liver, help to promote Concoction, and bind the Belly. *Dale* from *Avicenna.*

FAGONIA. This Plant was ſo named by Dr. *Tournefort*, in Honour to Dr. *Fagon*, who was Superintendant of the Royal Garden at *Paris.*

The Characters are;

The Flower conſiſts of many Leaves, which are placed orbicularly, and expand in form of a Roſe; out of whoſe Centre riſes the Pointal, which afterward becomes a chaneled round pointed Fruit, conſiſting of many Cells, and compoſed of many Huſks, each containing one roundiſh Seed.

Miller takes notice of two Species of this Plant, neither of which has any Medicinal Virtues aſcrib'd to it at preſent.

FAGOPYRUM.

The Characters are;

The Root is fibrous and annular; the Calyx conſiſts of five Petals, which by their Colour, and radiated Expanſion, reſemble the Petals of Flowers; the Calyx, when ripe, forms Capſules for the Seed. The Flowers grow in Spikes, or Tufts, or Bunches, and are furniſhed with eight Stamina. The Ovary grows in the Bottom of the Calyx, in a Placenta elegantly adorn'd with Globules rang'd in a Circle; and is of a triangular Figure, producing three Pointals, and becoming a triangular, blackiſh, farinaceous Seed.

Boerhaave mentions two Species of this Plant; which are,

1. Fagopyrum; vulgare; erectum, *Elem. Bot.* 412. *Tourn. Inſt.* 511. *Boerh. Ind. A.* 2. 88. *Buxb.* 108. *Fagopyrum*, Offic. Raii Hiſt. 1. 182. Synop. 57. Schw. 273. *Fagopyrum*, Hiſt. Oxon. 2. 590. Volck. 160. *Fagotriticum*, J. B. 2. 993. Chab. 312. *Fagopyron*, Ger. 82. Emac. 89. Park. 1141. *Frumentum Saracenicum*, Herm. Hort. Lugd. Bat. 263. *Eryſimum Theophraſti folio hederaceo*, C. B. 27. BUCKWHEAT, OR BRANK.

It is ſown in Fields, and flowers in *July.* It is leſs nutritive than Barley or Rye, tho' more than Panic or Millet. Ptiſan and Broths prepared of the ſame, unhuſked, are eaſily digeſted, and generate a moderate Quantity of Blood, and are good for thoſe who are afflicted with a Cough, or a Dyſury. *Dale* from *Schroder.*

It is not certain where it grows ſpontaneouſly: It is ſaid to be originally of *Africa*, but it thrives in almoſt every Soil, delights in wet Weather, ſoon ſprings up, and quickly ripens. The moſt ſkilful Botaniſts are of Opinion, that this Plant was unknown, and conſequently unnamed, by the Antients. The Peaſants, ſays *Matthiolus*, make Bread of this Grain, and thick Broths, which are not ungrateful when well made. *Dodonæus* ſays, that Puddings and Cakes, made of the Flour of *Fagopyrum*, are

are eaſily concocted, are quick in Paſſage, and afford, tho' very little, yet not bad Nutriment. Bread, which ſometimes in a Dearth is made thereof, or with a Mixture of it, is of a humid Quality, and quicker in Paſſage, but more flatulent, than Rye. The green Herb, before the Seed is ripe, is good to feed Cattle; and the Seed very ſoon fattens Poultry. *Ray, Hiſt. Plant.*

2. Fagopyrum; vulgare; ſcandens. *T.* 511. COMMON CREEPING BUCKWHEAT. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 88.

FAGOTRITICUM. See FAGOPYRUM.

FAGUS.

The Characters are;

The Leaves much reſemble thoſe of the Hornbeam; the Flower is maſculine, amentaceous, glomerated, conſiſting of Stamina, which ariſe from a Bell-ſhaped Calyx. The Fruit is produced at a remote Diſtance from the Flower, on the ſame Tree; and is a callous Subſtance, acuminated, gaping with a quadrifid Apex, and incloſing two triangular Seeds, or Nuts. *Boerhaave, Index alter, Pars* 2. *p.* 178.

Boerhaave mentions but one Species of this Plant; which is;

Fagus, *C. B. Pin.* 419. *Raii Hiſt.* 2. 1381. *Synop.* 3. 419. *Ger.* 1255. *Emac.* 1444. *Park. Theat.* 1403. *Aldrov. Dendr.* 240. *Jonſ. Dendr.* 207. *Mont. Ind.* 42. *Tourn. Inſt.* 584. *Elem. Bot.* 456. *Boerh. Ind. A.* 2. 178. *Mer. Pin.* 38. *Merc. Bot.* 1. 35. *Phyt. Brit.* 40. *Dill. Cat. Giſſ.* 55. *Rupp. Flor. Jen.* 264. *Buxb.* 108. *Chab.* 57. *Fagus Latinorum, Oxya Græcorum*, J. B. 1. 117. THE BEECH-TREE.

Tragus affirms he has cured Scabs, Itch, Tetters, and other Itchings of the Skin, with the Water found in the Clefts of old Beech-trees. *Martyn's Tournefort.*

It grows frequently in the Woods and Hedges in the Southern Parts of *England*, and the Maſt is in Uſe, which agrees in Properties and Virtues with the Cheſnut. Its Fruit and Seeds are good to expel Gravel and Mucus from the Kidneys.

Bellonius, Dalechampius, and *J. Bauhine*, very fully prove, that this Tree, and not the *ἄγνος*, *Phege*, is the *Oxyas* of the *Greeks*. This they infer from comparing the Deſcription of the *Oxyas* in *Theophraſtus*, with that of the *Fagus* in *Pliny*; which agree in ſo many Things, that there is no Doubt, but the latter tranſcrib'd his Deſcription from the other; to which, for a further Proof, we may add, that *Bellonius* obſerves, that the *Fagus* in Mount *Athos* is ſtill to this Day called *Oxya*, and, in *Macedonia, Oxyas*. It delights to grow on Hills, but ſuch as are moiſt; and loves a chalky and rocky Soil; and is found as frequently in *England*, as in *Germany*; which makes it the more ſurpriſing, that *Cæſar*, in his Commentaries, ſhould deny the Beech to be of *Britiſh* Growth.

The freſh Leaves of the Beech, bruiſed, and apply'd to hot Tumors, diſcuſs them, and corroborate the Limbs, affected with a Numbneſs, as we are aſſured by *Matthiolus*, who alſo affirms, that, being chewed, they are an excellent Remedy for the Diſeaſes of the Lips and Gums. The Maſt of Beech, burnt, and mixed with the Fat of Swine, and apply'd hot to the Loins, is affirm'd by ſome to be good for the Stone. Eaten plentifully, eſpecially green, and before it is dry'd, it is obſerv'd to diſturb the Head, like Solium, or Darnel; and it is affirm'd, that Swine, by eating it, are much diſorder'd, till at length they fall aſleep; and the Fat of thoſe which are fed with the Maſt is commonly thought to be the ſofter, and more ſubject to be liquefy'd in the Dreſſing; and the ſame Effect is ſaid to follow from their feeding on Acorns. *Ray, Hiſt. Plant.*

FALCANOS. Arſenic. *Rulandus.*

FALCIFORMIS. An Epithet for a Proceſs of the *Dura Mater*, call'd, alſo, *Falx*. See CAPUT.

FALCINELLUS, or *Falcata*. A ſort of Bird mention'd by *Johnſon*, which is ſo call'd from the Curvature of its Beak. It is a ſort of Heron. The Fat is recommended as good to fortify the Nerves, as a Reſolvent, and proper to cure *Nubeculæ* of the Eyes.

FALCO. The Falcon. A ſort of Hawk. The Fat is of Uſe in Diſtempers of the Eyes, to diſſolve Tumors, and to mollify and ſtrengthen the Nerves. The Dung is a Diſſolvent, being apply'd to the diſeaſed Part; it may alſo be taken inwardly, in order to provoke Sweat; its Fleſh is eſteemed good againſt Diſtempers of the Brain. *Lemery des Drogues.*

FALDELLA. Contorted Lint, us'd by way of Bolſter, or Compreſs.

FALERNUM. Falernian Wine, the ſame as AMINÆUM; which ſee.

FALSODICTAMNUM. See PSEUDODICTAMNUS.

FALTRANC, from the *High-Dutch, fallen*, to fall, and *Tranck*, Drink, that is to ſay, a Drink for ſuch as have receiv'd a Fall, is a Drink prepared of the principal vulnerary Herbs, pitch'd and dry'd for Decoction, or Infuſion, particularly the Leaves of Periwincle, Sanicle, Paul's Betony, Bugle, Lions-foot, St. John's-wort, Harts-tongue, the different Sorts of Maidenhair, Lungwort, Mugwort, Betony, Vervain, Figwort, Agrimony, the leſſer Centaury, Mouſe-ear, Mint, and the like; for there is a very great Number of vulnerary Herbs. The choiceſt are thoſe which grow on the *Alps*, and the Mountains of *Switzerland*, becauſe they are moſt expoſed to the Sun; and they ought to be gather'd when in Flower, and in their Vigour. The beſt way to dry them is, firſt to diſtribute them into ſmall Parcels, then wrap them in brown Paper, and hang them up againſt Boards, and there let them dry; by which means they will preſerve their Colour, and their Virtues, againſt the Injuries of the Air, and be ſecur'd from Duſt, and the Dung of Flies.

Faltranc is proper for thoſe who have fallen from an Eminence, for the Aſthma, Phthiſis, intermittent Fevers, to remove Obſtructions, provoke Urine, for inveterate Rheums, and the Jaundice. Some add Wormwood, and the Root of Gentian; to make it the more bitter, and to excite an Appetite. Others, in order to communicate to it a cephalic Virtue, mix therewith the Leaves of Tea-ſage, Cowſlips, Marjoram, and Baſil; it is drank hot after the manner of Tea, firſt putting therein a little Honey or Sugar. *Lemery des Drogues.*

FALX. See FALCIFORMIS, and CAPUT.

FARCIMINALIS. The ſame as ALLANTOIS; which ſee.

FARCTURA, in Pharmacy, is the ſtuffing any exenterated Animal, or excavated Fruit, with medicinal Ingredients.

FARFARA. A Name for the *Tuſſilago*; *vulgaris*.

FARFARUS. A Name for the white Poplar. *Blancard.*

FARINA. Meal.

Rye-meal well dry'd, mix'd with common Salt, and apply'd warm with Elder-flowers to an Eryſipelas, is an excellent Diſcutient; and the ſame Meal, mix'd with Honey, contributes effectually to the Maturation of Apoſtems, and is daily us'd with ſingular Succeſs for that Purpoſe. Bran is principally commendable for its abſterſive Quality; and its Power of removing Sweat and Sordes of the Head. A Bath, prepar'd of Bran and ſweet Water, adds freſh Degrees of Strength to the Joints, when weaken'd by whatever Cauſe; and, if Chamomile-flowers are added, it may be us'd as an *Exporiſton*, or Remedy eaſily prepar'd, in all Caſes where Bathing is neceſſary. I have ſeen a heavy Pain of the Head, accompany'd with Tenſion, and a Ringing of the Ears, remov'd by rubbing the Head with warm wheaten Bran. Barley boil'd in Water till it burſts, with an Addition of the Roots of Vipers-graſs, and Citron-Juice, affords an excellent Decoction for allaying Heat, and quenching Thirſt in Fevers, eſpecially of the bilious Kind. This ſame Decoction, with an Addition of Figs, is of ſingular Efficacy in almoſt all acute Diſorders, and Indiſpoſitions of the Breaſt, where the Acrimony of the Humours is to be corrected, and Expectoration promoted. Beſides, of this Decoction of Barley, and ſweet Almonds, ſome prepare an Emulſion, which in the Small-pox, even of the confluent Kind affords ſingular Relief, and comes next to the *Hydrogala*, or Preparation of Milk and Water, liberal Draughts of which *Sydenham* found ſo beneficial in the Small-pox of a confluent Kind from the Beginning accompanied with a copious Diſcharge of Saliva. But this Decoction of Barley is ſtill more efficacious and beneficial in the Small-pox, and other Diſorders, if proper Quantities of calcin'd Hartſhorn, and Syrup of Orange-juice, are added to it. Of how great Importance *Hippocrates* thought Ptiſan in the Cure of acute Diſorders, is ſufficiently obvious from his Writings, and eſpecially from his Book *de Ratione Victus in Acutis*, where he uſes theſe Words: "Ptiſan ſeems juſtly "preferable, in all acute Diſorders, to all other frumentaceous "Preparations; and I approve of the Practice of thoſe who "give it the Preference; for it is gently viſcid, pleaſant, lubri-"crating, moderately moiſtening, proper for extinguiſhing "Thirſt, and eaſily carry'd off, and waſh'd away, if there "ſhould be a Neceſſity for it. Beſides, it neither renders the "Patient coſtive, excites Gripes, nor diſtends and tumefies the "Abdomen." Hence 'tis obvious, what happy Effects the Antients expected from Ptiſan, in the Cure of acute Diſeaſes. But they prepar'd their Ptiſan ſometimes in one, and ſometimes in another manner; for ſometimes they us'd decorticated Barley, boil'd for a ſufficient time; and this they call'd the Whole of the *Ptiſan*: At other times they ſupt the ſtrain'd Liquor, or, as *Celſus* calls it, the Cream of Ptiſan: Sometimes, alſo, they render'd the Body ſoluble, by injecting this Cream by way of Clyſter. According to *Galen*, they took ten Parts of Water to one of Ptiſan; and, after theſe were boil'd, they added a little Oil, Vinegar, and Salt. But the Method in which the Antients us'd their Ptiſan, is a Circumſtance, with reſpect to which we are pretty much in the Dark, if we may believe *Langius*, in *Epiſt. Med. Lib.* 1. *Epiſt.* 57. As for Oats, a Decoction of them with Water, adding the Roots of Succory, Poppy-flowers, Nitre, and Honey, us'd as common Drink, is of ſo great Efficacy in all acute Diſorders, and eſpecially in arthritic Pains, that it produces far happier Effects than the moſt celebrated Medicines. Beſides, a Decoction of decorticated Oats is of ſingular Service, as common Drink, in all thoſe Diſorders where the Blood, or Humours, in the Primæ Viæ, are of too acrimonious a Nature, ſuch as Coughs, Catarrhs, Coryzas, Purple-fevers, Small-pox, Meaſles, choleric bilious Fevers, Fluxes ariſing from a Redundance of acrid Bile,

and

and Corroſions of the Inteſtines. In this Decoction I often boil a few Pugils of common Chamomile-flowers, adding Sugar, and Oil of ſweet Almonds. This Preparation I have with great Succeſs recommended in the foregoing Diſeaſes, not only to be drank, but alſo to be injected by way of Clyſter, ſince by its viſcid Nature it excellently obtunds the Acrimony of the Humours. *Hoffman de Præſtantia Remediorum Domeſticorum.*

FARRA. The Name of a River Fiſh, mentioned by *Johnſton*, *Rondeletius*, and *Lemery*. It is ſomewhat like a Trout, is eſteem'd nutritive, and good for Diſorders of the Lungs and Breaſt.

FARRAGO. A Name for the ſecond Species of ALCYONIUM; which ſee.

FARREA NUBES. The Name of a cutaneous Diſtemper, call'd alſo PITYRIASIS, or FURFUR.

FASCIA LATA. The Name of a Muſcle, or muſcular Ligament.

The *Faſcia Lata* is a muſcular Ligament, very conſiderable both for its Extent and Strength, being made up principally of two Planes of Fibres, of which the external are more or leſs longitudinal; the internal more or leſs tranſverſe. It is further ſtrengthened in ſome Places by a great Number of other Fibres, which augment its Thickneſs, and form particular Expanſions. The tranſverſe Fibres are much ſtronger than the longitudinal.

It is fixed above to the Edge of the *Criſta* of the *Os Ilium*, from the large Tuberoſity, to the anterior ſuperior Spine, to the Ligamentum Fallopii, and to the Aponeuroſis of the Obliquus Externus of the Abdomen, on which it runs up by a thin Lamina. It is likewiſe fixed in the lateral inferior Part of the *Os Sacrum*, and to the neighbouring Parts of the Ligaments, by which that Bone is connected to the Bones of the *Ilium* and *Iſchium*.

From thence it advances over the Glutæi and Thigh, between the Membrana Adipoſa, and Muſcles, all the Way to the anterior and outer Parts of the Knee. It is very thin on the Patella, but may be ſeparated from it. It is alſo continued over the external anterior Part of the Tibia, covering the Muſcles which lie there; and is ſtrongly inſerted in the Head and Criſta of that Bone, and in the upper Part of the Fibula.

It ſends off Elongations, which, like ſo many Septa, run in between the Muſcles, and ſometimes meet in ſuch a manner, as to form Vaginæ. It is ſtrongeſt on the anterior and outer Parts of the Thigh, growing gradually thinner on the inner and back Parts.

It is ſtrongly inſerted in the Linea Femoris Aſpera, between the Vaſtus externus, and Biceps, forming a ſort of Septum between theſe Muſcles. It furniſhes particular Vaginæ to the Muſcles, which lie on the Inſide of the Thigh; and, tho' theſe Vaginæ are thin, they are nevertheleſs pretty ſtrong, being principally made up of tranſverſe Fibres.

The *Muſculus Faſciæ Latæ* is a ſmall and pretty long Muſcle, ſituated a little obliquely upward and downward, on the fore Part of the Hip.

It is fixed above to the Outſide of the anterior ſuperior Spine of the Os Ilium, between the Inſertions of the Glutæus Medius, and Sartorius. From thence its fleſhy Fibres run down a little obliquely backward, forming a very flat Body, four Fingers-breadth in Length, and two in Breadth.

This Body lies between two Laminæ of the Faſcia Lata, and is inſerted therein by ſhort tendinous Fibres, which diſappear at that Place where the Faſcia adheres to the great Trochanter and Tendon of the Glutæus Maximus. We ought by no means, therefore, to look upon the Faſcia as a tendinous Expanſion of this Muſcle. *Winſlow's Anatomy.*

FASCIA, in Surgery, is a Fillet, Roller, or Bandage. It is extremely difficult to form an Idea of Bandages, without ſeeing them made. Learners, however, may reap ſome Advantages from Deſcriptions and Figures. I have treated of Bandages in general, under the Article DELIGATIO, and now proceed to particular Bandages.

Of Bandages belonging to the Head; and, firſt, of the triangular Bandage.

It is plain from the Writings of *Galen* and others, that the Antients had a ſurpriſing Variety of Bandages, for the various Diſorders of the Head. But, as ſo great a Number ſeemed uſeleſs; *Verduc*, *Le Clerc*, and other Moderns, have, for the greater Eaſe of Learners, recommended ſuch only as are adapted to the ſeveral Diſorders and Operations of the Part, and rejected moſt of thoſe that are obſolete and unneceſſary. The firſt is the *triangular* Kerchief: This is made of a ſquare Handkerchief, Napkin, or any other Piece of ſquare Linen, folded in the Form of a Triangle, and the Middle of it applied to the Forehead, bringing the two Ends round the Head, and tying them behind, as is commonly practis'd by Men in hot Weather. See *Tab.* 58. *Fig.* 1. *a*, *a*, *b*. The *French* call it the *Couvre chef en triangle*. As the Application is eaſy, ſo are the Uſes numberleſs: Nor is it ſerviceable in Wounds only, but may be ſucceſsfully applied to almoſt any Diſorders of the Head; and ſerves, alſo, to retain any Dreſſings put to the Eyes. But if the Knot *b*, at the Occiput, proves troubleſome, it may be brought round to the Forehead, and there pin'd.

Of the grand Kerchief.

The next and larger Bandage, belonging to the Head, is termed the *Grand Kerchief (le grand Couvre-chef)*. This is generally uſed after trepanning, or boring the Cranium; and, in dangerous Wounds of the Head, defends it from the Cold. See *Tab.* 24. *Fig.* 1. A.

It is commonly made of a Napkin, or ſome ſoft Piece of Linen, in a ſquare Form: It is doubled in ſuch a Manner, that the lower Part is about four Fingers-breadth wider than the upper: The middle Part of this Cloth is placed ſo upon the Head, that the fore Part may reach almoſt as far as the Eyes; the four Extremities or Corners of it hanging over the Cheeks; the two Corners of the upper, or narrower Part, are to be tied under the Chin, at the ſame time the Corners of the lower or wider Part are to be brought towards the back Part of the Head, and tied together, or faſtened with a Needle and Thread: The fore Part, which was extended towards the Eyes, is turned back as far as the Crown of the Head; the two Parts that hang over the Neck, almoſt to the Shoulders, are alſo to be turned back, and faſtened behind the Ears, with a Needle and Thread. This Kind of Bandage, when it is neatly made, ſticks cloſe to the Head, and is an excellent Contrivance to preſerve it from the Injuries it might receive from cold Air; for which Reaſon it is, at preſent, in great Uſe and Eſteem: You may, in ſome meaſure, form an Idea of the Appearance it makes upon the Head, by conſulting *Tab.* 24. *Fig.* 1. A. But the Method of applying it muſt be learnt from ſome ſkilful Artiſt; for it will eaſily appear from this one Inſtance, how difficult it is to deſcribe the Art of applying Bandages by Words, and how impoſſible it is to learn this Art from ſuch Deſcriptions.

Of the Sling with four Heads.

The third is termed, *The Sling with four Heads*, *Tab.* 23. *Fig. d.* Its Length, in my Opinion, ought to be four Feet, and its Breadth ſix or eight Fingers; though ſome will allow it to be but three Feet long; but this depends upon the Size of the Head, and Method of applying it. Its Uſe is to retain the Dreſſings on a Wound of the Head, more particularly in hot Countries and Seaſons, where the other two, eſpecially the *grand Kerchief*, would be troubleſome to the Patient, and ſtill more ſo, if it was prepared and bound in the Manner deſcribed by ſome. This ſhould be ſlit at each End, ſo as to leave only one or two Hands-breadth in the Middle undivided. (See *Tab.* 23. *Fig. d.*) If it is to be applied, for Example, to a Wound in the upper Part of the Head, the middle or entire Piece muſt be fix'd upon the Dreſſings, and there held by the Hand of an Aſſiſtant, to prevent its ſlipping: Then the two poſterior Heads muſt be brought under the Chin, and tied, as in *Tab.* 24. *Fig.* 1.; or, if it be long enough, carried back from thence to the Neck, and there tied or pin'd: The two foremoſt Heads muſt be tied under the *Occiput*; or, if there is Length enough, they may croſs each other there, like an X; and then be carried up over the Ears to the Forehead, or brought back again to the Chin, and there faſtened by a Knot.

Of the Sling with ſix Heads.

Some uſe *a Sling with ſix Heads*, about three Feet long, and twelve or fourteen Inches broad, which takes in the whole Head. You may form ſome Idea of this, from *Tab.* 58. *Fig.* 19. ſuppoſing there were no Apertures. The Middle of this is applied to the Vertex, and held by an Aſſiſtant: Then the two middle Heads are to be tied under the Chin, (ſee *Tab.* 58. *Fig.* 2. *a*, *a*, *a*) the two anterior tied or pin'd under the Occiput *b*, and the poſterior upon the Forehead *c*, *c*, *c*, with a Knot *d*. Some will have it larger, and chuſe to begin with the poſterior Heads; but this is not material. As this Bandage is ſo ſerviceable in retaining the Dreſſings upon any Part of the Head, and ſticks ſo cloſe, I think it ought not to be rejected.

Of the uniting Bandage.

The fourth is the *uniting* or *incarnating* Bandage. It is about eight Feet long, and two Inches broad: It has in the Middle a ſtraight Slit, about the Length of three or four Fingers-breadth. (See *Tab.* 23. *Fig. f.*) It is rolled up at each End. The principal Uſe of it is, to cloſe the Lips of a rectilinear Wound in the Forehead, Vertex, or any other Part, as in *Tab.* 58. *Fig.* 3. and 4. *a*, *a*; but more particularly in the Eyebrows, when it muſt be narrower. The Method of applying it is this: The Wound being dreſſed with proper Balſams, and Plaiſters, and a narrow Compreſs laid on each Side, the ſlit Part of the Bandage *b* muſt be fixed near the Wound, in ſuch a Manner, that one of its Ends *c* being carried round the Head, and its Roller paſſed through the Slit, both of them

d d are drawn tight, and the Lips of the Wound cloſed. Each Roller being then exchanged, and croſſed upon the Forehead and Occiput, as in *Fig.* 3. and under the Chin, and upon the Vertex, as in *Fig.* 4. as long as the Bandage will permit; each End muſt be ſew'd or pin'd: If the Lips of the Wound cannot be thus drawn together, it will not be amiſs to make another Slit in a convenient Part, exchanging and paſſing your Rollers as before; this will greatly conduce to the Cloſure of the Wound, and Uniformity of the *Cicatrix*. This ſhould not be remov'd for ſix or eight Days, or longer, unleſs any extraordinary Symptoms require it.

N. B. In *Tab.* 58. *Fig.* 3. and 4. at *a*, *a*, a rectilinear Wound ought to have been expreſs'd, reaching from the Forehead towards the Noſe, which the Engraver has omitted.

Of the Bandage after Bleeding in the Forehead.

The Bandage uſed after Bleeding in the Forehead, is about twelve Feet long, and two Fingers broad. It has one Head, but there are two Ways of applying it; the firſt called *Diſcrimen*, the other *Scapha*.

The *Diſcrimen* is thus: The Bandage is held with the Left Thumb, upon a Compreſs, covering the Wound *a*, *Fig.* 5. ſo that about a Foot of it hangs down from the Forehead over the Face; then the Roller is carried round the Temples and *Occiput*, in the circular Direction *b*, *b*, till it returns to *a*; then the Part, which hung down, is turned back upon the Forehead, *Vertex*, and ſagittal Suture *c*, and brought to the Occiput; and there, after rolling it ſeveral times about the Head, pin'd or ſew'd.

The *Scapha* is carried round the Head in an oblique Circle; from the Forehead it paſſes between the Ear and *Vertex*, as *Fig.* 6. *a*, *b*, to the Occiput, and then returns by the oppoſite Side, under the left Ear *b* to the Forehead; then the Part, which hung down, is obliquely reflected on the other Side *c*, forming a kind of Angle there, and upon the Forehead, ſo that the Parts *a*, *b*, *c*, inveſt the Head like a Boat: Hence it is termed *Scapha*. The Remainder muſt be carried circularly round the Temples and *Occiput*, and then faſtened.

Of the Bandage for Arteriotomy.

This Bandage for the Head is called *Knotted*, from its many Croſſings on the Temples, likewiſe *Stellar* or *Solar* (*Gall. le Solaire*) from its Reſemblance of the Sun or a Star. It is very ſerviceable when the temporal Artery is divided, either in *Arteriotomy*, or by an accidental Wound, and ſeldom fails to ſuppreſs an Hæmorrhage. It ſhould be twenty or twenty-four Feet long, two Fingers broad, and double-headed. The Method of applying it is thus: The Wound muſt be covered with three thick Compreſſes, each larger than the other; then the Middle is to be placed in ſuch a Manner upon the ſound Temple oppoſite to the Wound, (*Tab.* 58. *Fig.* 7.) that one Head of it muſt be brought round the Forehead *a*, the other round the *Occiput b*, till they meet at the Part affected *c*; and there croſſing each other, and forming a ſort of Knot, one is to be carried under the Chin *d*, and the other over the *Vertex e*, croſſing again upon the ſound Temple, whence they are carried round the Forehead and *Occiput* to the Compreſſes on the Wound *c*: This is to be repeated as long as your Bandage will permit, when the Ends muſt be ſewed.

The Bandage proper after an Extirpation of the Parotis.

Almoſt the ſame Kind of Bandage may be uſed to the neighbouring Parts, which ſeldom fails of Succeſs in ſuppreſſing an Hæmorrhage, after Wounds in, or an Extirpation of, the parotid and maxillary Glands, when they are ſcirrhous. In theſe Caſes, the Wound being dreſſed with a large Quantity of Lint, and thick Compreſſes, the Bandage is to be fixed on the ſound Side, as after Arteriotomy. (See *Fig.* 8. *a*, *b*, *c*, *d*, *e*.) When the firſt Circumvolution is made, the Folds *d*, *e*, over the *Vertex*, and under the Chin, muſt be repeated oftener than in the foregoing Caſe, and thoſe round the Forehead and *Occiput* ſeldomer: And in this Bandage, different from the Method of the preceding, the Knots muſt be upon the Part wounded *f*, under the Ear: By this means, the Lint and Dreſſings are ſo cloſely preſs'd upon the Part, that there is very little Danger of an Hæmorrhage: The Extremities ſhould be ſewed. *Heiſter* ſays he contrived this Bandage, when he firſt made an Extirpation of the fore-mention'd ſcirrhous Glands; and from its many Croſſings called it *Knotted*.

The Capeline for an Hydrocephalus.

The reflex Bandage of the Head, (by the *French* call'd *Capeline de la Tête*) for an *Hydrocephalus*, is a double-headed Roller, about twenty-four Feet long, and two Fingers broad. The Middle is fixed to the *Occiput*; and, after two or three circular Rounds, the Rollers interſect each other upon the Forehead and *Occiput*: Then one Roller being reflected over the *Vertex*, or ſagittal Suture, to the Forehead, *Fig.* 9. *a*, the other continued in a circular Tract *b*, *c*, they croſs each other upon the Forehead: After which Croſſing, the firſt Head is carried back obliquely towards the *Occiput c*, *d*, and reflected by the Side of the other *a*; the laſt is continued in the circular Direction *b*, *c*; but the firſt is brought again from *e* to *f*, then from *g* to *b*, the other ſtill continuing its circular Courſe. This is to be repeated, till the Head is entirely covered; and, when your Bandage is almoſt ſpent; that you may faſten the oblique Reverſions *c d*, *e f*, *g b*, you muſt bring one End over the ſagittal Suture *a*, and the other circularly round the Head *b*, *c*. Some recommend this Bandage for the Head-ach. *Nuck, in Exper. Chirurg.* 17. has obſerved, that it is of very little Service in an *Hydrocephalus*.

The Monoculus.

We come now to theſe Bandages of the Head, which are proper for the Eyes. Of theſe there are two Kinds: The firſt is called *Monoculus*, or rather *Monophthalmus*; the other *Binoculus*. The Monoculus is ten or twelve Feet long, and two or three Fingers broad, according to the Size of the Patient: It retains the Dreſſings either on one Eye or Eyelid. The End of this Bandage, for it is ſingle-headed, is fixed upon the *Occiput*, and from thence carried obliquely round the Head and Ear of the wounded Side, till it croſſes the Compreſs and Dreſſings upon the Eye, (See *Fig.* 10. *a*, *a*) and ſo obliquely over the Forehead *b*, till it returns to its Beginning: Having thus carried it thrice obliquely round, the Remainder is to go circularly *c c c*, about the Temples, *Occiput*, and Forehead, as long as the Bandage will permit, and then ſew it. A clean Napkin or Handkerchief (See *Fig.* 11.) will anſwer the End of a *Monoculus*.

Of the Binoculus.

The *Binoculus* retains the Dreſſings on both Eyes: It is twelve Feet long, and about two or three Fingers broad. It is variouſly applied, as it is either double or ſingle-headed: 1. If it is ſingle-headed, the End is held upon the *Occiput*; from thence it is carried round obliquely by the Ear, (*Fig.* 12. *a*) and the Eye *b*, to the Right Side of the Forehead *c*, and then back again to the Place where it began; from whence it aſcends to the Forehead *d*, then deſcends to the Eye *e*, traverſing the Noſe in the Shape of an X, and terminates once more in the *Occiput f*. When you have repeated theſe oblique Circles thrice, the reſt of the Roller is to be ſpent in plain Circles round the Head, Temples, and Forehead, *g*, *g*, *g*; then faſten it. 2. If it is double-headed, the Middle is fixed upon the *Occiput*, and the Ends carried round on each Side by the Ears, and over the Eyes, (*Fig.* 12. *a*, *b*, *f*, *e*) to the Forehead, when they croſs one another upon the Noſe like an X; and then changing the Rollers, they return over the Temples *d*, *c*, to the *Occiput*; where being changed and croſſed again, they return by the Ears, Eyes, and Forehead: Having repeated theſe Turns likewiſe three times, the reſt muſt be carried round the Head in circular Directions *g g g*, that the Bandage may adhere more ſtrongly. But here we muſt obſerve, that this Bandage may be very well ſupplied by the Napkin (*Fig.* 11.) even when both Eyes are affected, if the Ends are tied in a Knot upon the *Occiput*, or, croſſing each other there, pin'd near the Ears or Temples.

Of the Sling for the Noſe.

The Bandage for the Noſe has *four Heads*, and is eight Feet long, and two or three Fingers broad. It is ſlit at each End, and left entire about two Fingers-breadth. Between the two Slits there is a ſmall Aperture to receive the *Apex* of the Noſe, and keep the Bandage firm, *Fig.* 13. *a*. This is generally applied to a fractured Noſe, or to retain the Dreſſings in a Wound, or Inflammation, or after the Extirpation of a *Polypus*, or making a Perforation when the Noſtrils are obſtructed. The Method of uſing it is, to fix the Middle upon the *Apex* of the Noſe, and carry its two upper Heads *b b* backwards to the Neck on each Side; there croſſing, they are brought up round the Forehead *c c*, and tied with the Knot *d*, or pin'd to the Patient's Cap; but the lower Heads *e e* are carried a little upward over the Cheek and Temples *f*; and, like the former, tied upon the Head and Forehead *g g*. Here we may obſerve in general, that in all Bandages of four Heads, the two uppermoſt are never to be carried directly backwards, but a little obliquely downward, and the lower a little obliquely upward, ſo as to croſs at *e e*, and hold the Parts more firm.

The ſingle Bridle.

The ſingle *Bridle* is of Service, when the lower Jaw is fractured or luxated on either Side. It is a ſingle-headed Roller, about ſixteen Feet long, and two or three Fingers broad. After reducing the *Maxilla*, and applying an adheſive Plaiſter with a ſtiff Paſteboard Splint (See *Tab.* XXIX. *Fig.* 9.) to the affected Part,

Part, first covering this Splint with several Folds of Linen, and moistening it in warm Wine, invest the Whole in the Manner directed under the Article FRACTURA, for Fractures of the Jaws; then the loose End is to be applied to the Occiput, and there fastened, after rolling it twice round the Forehead, *Fig.* 14. *a b*, *Tab.* LVIII. then the Remainder being pin'd or sewed to the other Part upon the Temple of the affected Side *b*, which we here suppose to be the Left, is carried down over the Left Cheek *c*, and under the Chin *d*, and then it is carried up again near the Cheek and Temple of the sound Side to the Vertex *e*, from whence it is convey'd down to the affected Side *b c d*. When these Circles have been repeated thrice, your Bandage must be carried from the Throat to the Neck, and from thence under the Ear to the fore Part of the Chin, and the affected Jaw *f g*, from thence under the Ear on the sound Side round the Neck, and so over the Chin once more. Lastly, the remaining Part, if there is any, must be conveyed from the Occiput to the Forehead, falling into the Circle *a b*. Observe, the Crossings of this Bandage at *b f* ought to be pin'd or sewed together, to prevent its slackening. This Bandage, which we have propos'd for Fractures of the Jaw-bones, is also highly proper in Luxations thereof.

Of the double Bridle.

If both Sides of the Jaw are fractured, after the Reduction, you must use the *double Bridle:* This is twenty-four Feet long, and two or three Fingers broad. In every Fracture and Dislocation, the Part must be reduced, and immediately a proper Plaister applied; and some recommend (though that indeed is unnecessary) a *Ferula* of Pasteboard in the Shape of the Jaw, covered with Linen, and perforated in the Middle to receive the fore Part of the Chin. (See *Tab.* XXIX. *Fig.* 10.) This *Ferula* is to be held by an Assistant, and the Middle being put under the Chin, the Rollers are conveyed up on each Cheek, and the Temples (*Fig.* 15. *a b. Tab.* LVIII.) to the *Vertex c*; there crossing each other, they are carried down again under the Chin, where they begun: You must repeat this thrice; then, having exchanged the Heads, they descend from the *Vertex* to the Neck; and from thence, after crossing, are conveyed on each Side, so as to pass round the anterior Part of the Chin, and lower Jaw *d e*, and then again to the Neck; from whence, after crossing, they proceed to the Forehead, where, when they have formed the circular Directions *b*, *f*, *f*, not only the Extremities, but every Crossing, should be fastened either by pinning, or sewing. The *simple Bridle* will answer every End proposed as well.

Of the Sling with four Heads for the Jaws.

Some Surgeons, instead of either of these Bridles, use a four-headed Bandage, a little above four Feet long, and four, five, or six Fingers broad, being perforated in the Middle, which, though it is more simple, is equally serviceable. (See *Tab.* LVIII. *Fig.* 16.) For when they have reduced the Fracture or Luxation, and apply'd proper Dressings, they let the Chin into the Aperture *a* in *Fig.* 17.; and then the upper Heads are carried back to the Neck, and being crossed and exchanged there, ascend to the Forehead *c c*, where they are tied with the Knot *d*. But the two lower Heads *e* are convey'd upwards by the Cheeks *f* to the *Vertex*, and there tied in a Knot *g*; or else, if the Bandage will permit, carried down again, and tied under the Chin.

Of the Bandage for the Lips.

Surgeons likewise apply a four-headed Bandage, not unlike the Sling described for the Nose, about an Inch broad, to Hare-lips, and Wounds in those Parts, to retain the Dressings. The Middle, which is not to be perforated, is fixed upon the Lip *a*. (See *Fig.* 18.) The upper Heads are first brought to the Neck *b b*, from thence to the Forehead *e*, where they are tied in a Knot, or pin'd: The lower *d d* ascend upon the Cheeks *e e* up to the *Occiput*; from thence are brought round to the Forehead, where they are fastened in the same Manner. I know it has been the Practice of some, to use the uniting Bandage for the Hare-lip, *Tab.* XXIII. *Fig.* F, about four Feet long, and one Finger broad, with a Slit in the Middle about two Fingers-breadth: Almost the same we described above (*Fig.* 3. *Tab.* LVIII.). This, as it presses the Needles too close, is not only inconvenient, but Reason and Experience also assure us, that it is frequently hurtful and improper.

Of the Mask.

If the whole Face is burnt by Gun-powder, or any other Fire, the Application is a kind of Linen Mask, with Slits for the Eyes, Nose, and Mouth. This Cloth, moistened with proper Remedies, is put upon the Face. It is tied behind the *Occiput* with six Tapes, or Pieces of the same Linen. (See *Tab.* LVIII. *Fig.* 19.) This will also retain the Dressings for a *Phlegmon*, or an *Erysipelas* of the Face.

Of Bandages for the Neck.

The Divider.

Among the Bandages proper for the Neck, the principal is that called the Dividing Bandage, twenty-four Feet long, and two or three Fingers broad, rolled into two Heads. This is generally applied to a burnt Neck, especially if it happens in the fore Part, to prevent the Head from growing to the Breast, or being contracted forwards. After having dressed the Wound, the Middle is placed upon the Forehead, and, forming two circular Directions round the Head, (see *Tab.* LVIII. *Fig.* 20. *a a*) one Roller is conveyed under the Right Armpit *b*, the other under the Left *c*, and two Circles made round the Breast *d d*, to keep the Head erect. Each Crossing upon the Head must be fastened together, either with Pins, or to the Cap (*Fig.* 21. *a*). When this is done, the two Rollers are carried again to the Neck, and from thence, crossing, like an X, to the Forehead; and from the Forehead they return to the Neck, and so under the Arms, and thus keep the Head upright. The Remainder may be spent in plain Circles about the Forehead and Occiput. This Bandage must be continued, or, if necessary, renewed, till there is no Danger of Distortion. Some recommend it for a Weakness in the Muscles of the Heads of Children. But it is to be observed, that when Bandages are passed under the Armpits, these Parts ought to be previously guarded by thick Compresses; otherwise, the Skin is easily ruffled, and great Pain, by that means, created to the Patient.

Of the Retentive Bandage for the Neck.

The next Bandage for the Neck is called the Retentive, as it keeps on the Dressings after Bleeding, Burns, or any chirurgical Operation. This is generally made of two simple Bands, one four, the other six Feet long, the first a Thumb or two Fingers-breadth, the last three. Having applied the Dressings, the shorter is laid over the Head, cross the Vertex, in such a Manner, that the two Extremities hang down over the Shoulders (see *Fig.* 22. *a a*); the longer is conveyed circularly round the Neck *b b*, and retains the Dressings and the other Band *a a*, but not so tight as to obstruct the Breath; then fasten it with a Pin. Lastly, the two Heads of the first Band *a a*, which hang on the Shoulders, are to be brought back over the Circles *c*, and pinned by the Ears, to prevent the circular Bandage from descending. But, to confess the Truth, this shorter *a c* is of very little Service; for the Shoulders, as Experience proves, will keep the circular Bandage from slipping.

Of the Bandage for Tracheotomy.

The third Bandage for the Neck is usually applied after the Operation of Tracheotomy. This is the Method: A proper Tube is placed in the Aperture made in the Aspera Arteria, and then a common simple Bandage, two Feet long and two Fingers broad, perforated in the middle, with a Plaister and Compress, likewise perforated, is drawn circularly round the Neck, and tied in a Knot. Or you may use a single-headed Bandage, three Feet long, and two Inches broad. The End is to be fixed upon the Neck; then make two circular Rounds about it; but, as often as it comes to the Canula, inserted in the Trachea, it must be perforated, to give free Admission to the Air: The Extremity must be pinned. This Bandage should not be removed, till the Patient has recovered his Respiration; then, the Wound being dressed with a vulnerary Balsam, and adhesive Plaisters, the Lips should be brought together by an Uniting Bandage (*Tab.* XXIII. *Fig. f*) four Feet long, and two Fingers broad, as in oblong Wounds of the Forehead, &c. (*Tab.* LVIII. *Fig.* 3. *a.*)

Bandages for the Clavicles are described under the Article CLAVICULÆ.

Of Bandages for the Humerus and Scapula.

Simple Spica.

For a Luxation of the Shoulder, after it is reduced, you must apply the Simple Spica, with a Ball under the Axilla, to prevent its slipping. The Compress must be a Foot in Length, and an Hand in Breadth, slit at each End, so as to have four Heads (see *Tab.* XXIII. *Fig.* 18.); and being expressed out of warm Wine, Spirit of Wine, or Oxycrate, is placed under the Arm with its Middle upon the Ball; the Heads come up over the Shoulder, which they are to invest. Then the Simple Spica is fixed upon a square thick Compress, under the Axilla of the sound Side, to prevent the Skin from chafing. See LUXATIO.

The Double Spica.

If both Shoulders are dislocated, the double Spica will be most commodious. A Ball, or Pellet, of Linen being fixed (as I have already directed) under each Axilla, with a proper Compress,

Compreſs, you are to take a Band, twenty-eight or thirty-two Feet long, and three or four Fingers broad, double-headed; and, placing its Middle under either Arm, for Inſtance, at *d*, (*Tab.* LVIII. *Fig.* 25.) you croſs the two Heads upon the Shoulder *e*, and carry one over the Breaſt *b*, the other over the Back, to the oppoſite Arm *a*. From hence, after croſſing them, you convey them up, over the other Shoulder, as before; from whence they return, over the Back and Breaſt again, croſſing each other, like an X, to *d*, where they began. This Proceſs is to be continued two or three times; then the Remainder may terminate either in plain Circles round the Body, or one of the Arms, faſtening the Ends with Pins. The Double Spica is, alſo, of ſingular Service, not only in Luxations of the Humerus, but, alſo, in Caſes where the Scapulæ, or both Clavicles, are fractured near the Humerus, and when there is a Neceſſity for applying Bandages to both Shoulders at one and the ſame time, for any Reaſon whatever.

Of Bandages for fractured Scapulæ.

When the fractured Scapula is replaced, and ſecured by Compreſſes, and Splints of Paſteboard, you may apply either of the three following Bandages: I. Double Spica, deſcribed in the laſt Paragraph. II. The Capeline. Or, III. The Stellate. Which laſt is generally uſed; but obſerve, that the Scapulæ and Dreſſings are to be retained in their proper Place: Tho', when both Scapulæ are fractured, it muſt be acknowledged, that the Double Spica is moſt advantageous, becauſe it covers and ſecures them both.

An Explanation *of the* Fifty-eighth Plate.

Fig. 1. Denotes the *triangular*, or ſimple, *Kerchief* for the Head, *Gall. Couvre-chef en triangle*; *n a a*, the Middle of it, which inveſts the Forehead, Vertex, and Occiput; *b*, its Corners, tied upon the Occiput.

Fig. 2. Shews the Manner how the ſix-headed Bandage is applied; *a a a*, the middle Corners, hid under the Chin; *b*, one of the anterior Corners, which, with its Companion, is carried round the Occiput, and faſtened near the Ear; *c c*, the poſterior Heads, brought from the Occiput to the Forehead, and there tied in the Knot *d*; *e e*, the Middle, which inveſts the Head.

Fig. 3. Exhibits the Uniting Bandage for the Forehead; *a*, the longitudinal Wound in the Forehead; *b*, the Slit in the Bandage, upon the Wound, through which the other Part, *c*, is paſſed; *d d*, the two Heads of the Bandage, by drawing which the Lips are joined; and ſo kept, by forming Circles round the Head, with the Remainder.

Fig. 4. Repreſents the ſame Bandage, on a longitudinal Wound, near the Vertex.

N. B. In *Fig.* 3. and 4. the Engraver has omitted expreſſing the Wound, which ſhould have been at *a a*.

Fig. 5. Shews the Diſcrimen; *a*, the Place where it begins; *b b*, the circular Directions round the Head; *c*, the Part reflected back from the Forehead to the Occiput.

Fig. 6. Repreſents the Scapha; *a*, the Beginning of the Bandage; *b b*, its firſt oblique Round, about the Neck; *c*, the Beginning of the ſecond Round, which is reflected back to the Left Side of the Occiput, and there forms the Shape of a Boat; *a d d*, the Circles about the Head, where it terminates.

Fig. 7. Demonſtrates the Knotted or Solar Bandage, for Arteriotomy in the Temples; *a b*, the firſt Round made by the two Heads from the ſound Temple to *c*, when they are croſſed upon the divided Artery; *d e*, the other Round, under the Chin, and over the Vertex, to the oppoſite Temple, where they croſs again, in the ſame manner as at *c*.

Fig. 8. *a*, *b*, *c*, *d*, *e*, exhibit the ſame Bandage; but *f*, the Part where the Knot is to be made after the Extirpation of the ſalival Gland.

Fig. 9. Shews the Capeline for an Hydrocephalus; *a*, the depending Head, reflected back to the Occiput; *b c*, the circular Round, about the Head; *d*, *e*, *f*, *g*, the other reflex Turns, inveſting the Head.

Fig. 10. Repreſents the Monoculus, a Bandage uſed for the Deligation of one Eye; *a a*, the firſt Round, which paſſes from the Occiput, by the Ear and Cheek, over the Left Eye, and from thence, by *b*, to the Occiput, where it began; *c c c*, the circular Turn about the Temples, where it ends.

Fig. 11. Demonſtrates how the Monoculus, made of an Handkerchief, or Napkin, may be commodiouſly tied about the Head.

Fig. 12. Exhibits the Method of binding both Eyes. This Bandage is carried from the Forehead, by the Direction *a b c*, over the Left Eye, to the Occiput; and from thence returns there again, over the Right Eye, in the Courſe *d*, *e*, *f*. *g g g*, the circular Turns, which are made round the Eyes, till the Whole is ſpent.

Fig. 13. Shews the Manner of applying the Sling for the Noſe; *a*, the Middle, which receives the Tip; *b b*, the upper Heads, which are carried round the Occiput and Temples, to the Forehead *c c*; and tied by the Knot *d*; *e e*, *f f*, *g g*, denote the ſame, with reſpect to the lower Heads.

Fig. 14. Repreſents the Single Bridle; *a b*, the Circles round the Head, where the Bandage begins; *b*, the Part where it is faſtened, and then, by the Direction *c d e*, is carried about the Cheeks, Chin, and Vertex; *f g*, the Turn from the Neck, over the Jaw.

Fig. 15. Demonſtrates the Double Bridle. This is formed with a double-headed Roller; the Middle is fixed under the Chin, and, then, ſeveral times conveyed on each Side, in the Direction *a b*, to the Vertex *c*; from thence to the Neck, and over the Jaw, *d e*, where the Heads are croſſed at *e*; Then they return to the Neck and Occiput, and from thence to the Temples and Forehead, *f f*, *h*.

Fig. 16. Repreſents the four-headed Sling for the Chin; *a*, the Aperture, which intercepts the Chin; *b b b b*, the four Heads.

Fig. 15. Shews the Method of fixing it upon the Chin and Lower Jaw, and the Ends tied about the Head.

Fig. 18. Exhibits the Manner of uſing the Sling for the Upper Lip; *a*, the Middle, without a Perforation; *b b*, the two Heads, tied at *c*; *d d*, the two lower Heads, which are carried up over the Cheeks *e e*, to the Occiput, and then tied upon the Forehead.

Fig. 19. Denotes the Maſk for the Face; *a b*, the Maſk itſelf, which inveſts the Face, and is tied by the ſix Ends *c*, *c*, *c*, *d*, *d*, *d*, upon the hinder Part of the Head.

Fig. 20. Demonſtrates the anterior Part of the Dividing Bandage; *a a* are the Circles ſurrounding the Head, where it begins; *b*, the Direction, which paſſes under the Right Arm; *c*, that which paſſes under the Left, to the Back, where the Heads are exchanged, and then brought, circularly, about the Breaſt *d d*.

Fig. 21. Repreſents the poſterior View of the ſame Dividing Bandage; *a*, the Parts where the Heads interſect each other like an X; *b*, *c*, the circular Turns, which paſs under the Arms; *d d*, the Circles which inveſt the Breaſt and Back.

Fig. 22. Shews the Capeline for a fractured or diſlocated Clavicle; it has two Heads; *a b*, the firſt Round of the anterior Head; *c*, *d*, *e*, the Rounds of the poſterior; *f*, *g*, *h*, ſecures thoſe, reflected before and behind.

Fig. 23. Denotes the Stellate Bandage, for the Clavicle and Scapula. It may begin under the Arm *a*; then *a b* repreſents its firſt Progreſs; whence it returns under the Arm *c*, and then over the Shoulder *d*, to *a*, where it began; *e*, the Croſſings, whence it is called *Stellate*, from its imaginary Reſemblance to the Rays of a Star. You may begin either at *b*, or *c*, or *d*, as you pleaſe, carrying the Rollers in the ſame manner.

Fig. 24. Exhibits the Simple Spica, for the Axilla. It begins under the ſound Arm *a*; then aſcends in the Direction *b c*; then is reflected back, under the Arm *d*; from whence it aſcends again to *e*, and from thence, over the Back, to its Beginning; the ſame Courſe muſt be repeated often.

Of the Bandages for the Præcordia and Breaſts.

The Bandage after Amputation of the Breaſt.

The Bandage to be applied, after the Amputation of a Breaſt, is twenty-four Feet long, three or four Fingers broad, and double-headed. After proper Dreſſings, you fix its Middle under the Right Arm (for we ſuppoſe the Left Breaſt taken off, or a large Scirrhus extirpated from it); ſee *Tab.* LIX. *Fig.* 1. A. You then carry the two Rollers upwards, and croſs them upon the Shoulder B; from thence the anterior Head paſſes obliquely over the Breaſt C; and the poſterior over the Back, to the Left Axilla D; where they are again croſſed, and drawn tight upon the Compreſſes of the Breaſt: Hence the poſterior paſſes in the Direction C, to B; the anterior, under the Arm D, over the Back, to the ſame Letter B, where they interſect each other once more. Theſe Turns muſt be often repeated; only remember, in uſing the reſt of your Bandage, to be more frequent in the Croſſings upon the Wound, than under the Axilla D; for, by this, your Dreſſings will be more ſecure, and an Hæmorrhage, perhaps, prevented. Laſtly, ſome circular Rounds ſhould be made about the Thorax, from D to A, to ſecure the firſt; and, then, ſome oblique ones from D to B; but obſerve to terminate your Bandage in Circles about the Breaſt, and lower Part of the Dreſſings; then pin or ſew it.

Of the Bandage of Heliodorus, *commonly called the* T *Bandage.*

In moſt Diſorders of the Breaſt, the Bandage of *Heliodorus* is commonly uſed. It is formed of two ſimple Bands, one joined, perpendicularly, to the Centre of the other, reſembling the Letter T, whence its Name; though the perpendicular Part is ſlit up almoſt to the End, (as *Fig.* 11.) ſo that it forms a four-headed Bandage, *a a*, *b b*; or two diſtinct Pieces may be ſewed on, (as *Fig.* 10.) which makes it reſemble the *Greek* Π. The tranſverſe Part *a a* (*Fig.* 10, 11.) muſt be long enough

enough to go round the Body, and tie upon the Back, or Side; and two or three Inches broad: The direct muſt be long enough to paſs over the Shoulder, and tie round the circular Band, upon the Back, and broad enough to retain the Dreſſings upon the Breaſt. In an Inflammation, Tumor, Abſceſs, Gangrene, or any ſuch Diſorders of the Breaſts, it is thus applied: You place the tranſverſe Part under the Breaſts, round the Thorax, (*Fig.* 2. *a a*) ſo that its two Extremities may be tied on the Back; then you paſs the two ſlit Ends over the affected Breaſts, Dreſſings, and Left Shoulder, provided the Left Breaſt is affected, and tie them with the circular Round on the Back. Some apply the two Heads *b b* in a croſs Manner, in order to retain the Dreſſings more firmly; they proceed in the ſame Method with the Bandage (*Fig.* 11.). But it is certain, that what we propoſe, (*Fig.* 12.) of paſſing the two Heads *b b* on each Side the Neck *d*, will anſwer the Purpoſe as well; for this prevents their ſliding off the Shoulders; and they may be tied behind the Neck, without laying the Patient's Back naked, which is often diſagreeable to weak or modeſt Perſons, and the cold Air may prove very prejudicial.

Slings for the Breaſts.

As I obſerved theſe Inconveniences in *Heliodorus*'s Bandage, and that it was not proper for an ulcerated Cancer, extending itſelf towards the Axilla; I contrived a four-headed one, which has anſwered my Expectations. I made a Sling, four Feet long, and about ſix Inches broad, unſlit about a Foot in the Middle. This entire Part (*Tab.* LIX. *Fig.* 3.) I applied to the Compreſſes, on the affected Breaſt, which is here ſuppoſed the Left; then carried the two upper Heads *b b* over the Right Shoulder, and the two lower *c c* under the Left Arm, towards the Right Scapula, on the Back; and there tied them in two Knots, near *d*. I have found this a convenient Bandage, as it retains the Dreſſings more firmly, and is leſs troubleſome to the Patient; while *Heliodorus*'s, by making the Skin chafe about the Breaſt and Thorax, gives a great deal of Pain. Sometimes I have, with good Succeſs, uſed a Napkin, or Towel, in the manner directed for the Eyes, *Tab.* LVIII. *Fig.* 11.

The Napkin and Scapulary.

The Bandage which the Surgeons call the *Napkin and Scapulary*, is very commodious (*Gall. la Serviette avec le Scapulaire*). This is applicable in Wounds, Ulcers, Fiſtulæ, and a Paracenteſis of the Breaſt; likewiſe in Fractures of the Sternum, or the Spina Dorſi, and in fractur'd or diſlocated Ribs. It is made of two Pieces of Linen: The firſt is like a Napkin, four Foot long, for Adults, but, for fat Perſons, it may be ſix, or more, folded together four or ſix times, till it is about the Breadth of eight or ten Fingers, according as Circumſtances require. Then it is applied to the Dreſſings on the affected Part, and pin'd upon the Breaſt, if the Diſorder is before; if behind, to the Back (ſee *Tab.* 24. *Fig.* 1. B). Then, leſt this Band ſhould ſlip or fall off, apply the Scapulary, a Piece of Linen three Feet long, and four or ſix Fingers broad, ſlit in the Middle enough to let the Head through, (ſee *Tab.* XXIII. *Fig.* 9.); then bring the two Ends, one over the Breaſt, the other upon the Back, in ſuch a manner, that they may reach the circular Band, both before and behind, to which you pin them (ſee *Tab.* XXIV. *Fig.* 1. B, C). This laſt is called *Scapulary*, becauſe a great Part of it is ſuſtained by the *Scapulæ*. Some ſlit this Bandage at one End, almoſt up to the Middle; then fix the entire Part on the Back, and the two Heads on the Side of the Neck, croſſing them upon the Sternum (ſee *Tab.* LIX. *Fig.* 4. F); and faſten them, as before, on each Side of the Breaſt, to the Napkin.

Of Bandages for the Sternum and Ribs.

The Quadriga.

From what has been already ſaid, it is ſufficiently manifeſt, that you may apply the Napkin and Scapulary to a fractured Sternum after the Reduction, and dreſſing with an adheſive Plaiſter, Compreſſes dipt in Spirit of Wine, and Splints of ſtiff Paſte-board. But the more general Method is, to uſe a peculiar and ſtronge Bandage, termed *Quadriga*, or *Cataphracta*, twenty-four Feet long, and three or four Fingers broad, with two Heads; this binds up the Sternum and Thorax more firmly. The Middle of this Bandage is fixed under either Arm, for Inſtance, the Left (*Tab.* LIX. *Fig.* 4. *a*). The two Heads are carried upwards, and interſect each other, upon the Shoulder *b*; then they deſcend obliquely, one croſs the Breaſt *c c*, the other over the Back to the oppoſite Axilla *d*; here, being croſs'd, they aſcend to the Right Shoulder *e*, where they are croſs'd again; and then the anterior Head is convey'd over the Breaſt *e f*; the poſterior over the Back, to the Left Arm *a*, where it began. The Remainder is ſpent in circular, or, rather, obtuſe ſpiral, Directions *g*, round the Thorax, traverſing each other, either before or behind, more firmly to bind the Sternum, (ſee *Tab.* LVIII. *Fig.* 21, *d d*) till the whole diſorder'd Part of the Thorax is thus inveſted. The ſame Kind of Bandage may be applied after the Amputation of a cancerous Breaſt: But obſerve to fix it upon the Wound and Dreſſings in ſuch a manner as to prevent an Hæmorrhage; which may be done by changing the Ends, and croſſing them upon the affected Breaſt, after the firſt Round.

Bandage for the Ribs and Spine.

As to Fractures and Diſlocations of the Ribs and Spina Dorſi, after Reduction, and ſecuring with Splints of Paſte-board, and Compreſſes dipt in warm Spirits of Wine, you may uſe the Sling for the Breaſt, or the Scapulary with the Napkin, deſcribed above.

Of Bandages for the Abdomen, and Private Parts.

The Napkin and Scapulary are, at this time, the moſt uſual Bandage for the Abdomen, after a Wound, Suture, or Paracenteſis, and, indeed, the moſt commodious, applied in the Manner we have already deſcrib'd (ſee *Tab.* XXIV. *Fig.* 1. B, C). But the Scapulary muſt be longer for the Abdomen, than the Thorax; as is evident from the Make of the Body.

Circular Bandage of the Abdomen.

The Antients, and ſome Moderns, uſe a ſingle or double-headed Bandage, about twenty-four Feet long, and four Fingers broad, for Diſorders in the Abdomen. They begin upon the upper Part, and continue two or three circular Rounds, and then go downwards ſpirally, till they have ſecured the affected Part and Dreſſings: They pin, or ſew, the End; and then faſten it to a Scapulary, that it may not ſlip. The Quadriga (*Tab.* LIX. *Fig.* 4.) may be commodiouſly applied on theſe Occaſions, with this Difference, that, after making the Turns *a*, *b*, *c*, *d*, *e*, *f*, the Round *g* muſt be circular, or ſpiral, about the affected Part of the Belly; ſo that there is no Neceſſity for a Scapulary, as the Circles ſupply its Place.

Uniting Bandage of the Abdomen.

Longitudinal Wounds of the Abdomen, if not very large, are often ſucceſsfully healed by the Uniting Bandage, without Suture. This Bandage ought to be twenty-four Feet long, and four Fingers broad. In the Middle there is an Aperture, about four Fingers-breadth long; the Ends are rolled up with two Heads (ſee *Tab.* XXVI. *Fig.* 8.). The Method of uſing it may be very eaſily learn'd from what has been ſaid of the Uniting Bandage for the Forehead (*Tab.* LVIII. *Fig.* 3.). The Slit is plac'd upon the Wound; one Head carried round, and then paſſed round the Aperture, and drawing the two Heads tight, the Lips of the Wound are joined; then conveying them both to the Spine, they are there croſs'd, and brought round again to the Wound, where they traverſe each other, and approximate the Lips. This Bandage is continued till the Whole is ſpent; then it is pin'd or ſew'd.

Bandage for the Omphalocele.

For the Umbilical Hernia, take a Leathern or Cotton Belt, either round, (as in *Tab.* XLV. *Fig.* 6. A) or ſquare (as *Tab.* LIX. *Fig.* 5. *a*); after reducing the Hernia, place it upon the Navel; then faſten it round the Abdomen, either by the Strings B B, or the Buckle C, (*Tab.* XLV. *Fig.* 6.) or any other Way. But leſt the Belt B B, (*Tab.* LIX. *Fig.* 5.) eſpecially in fat Perſons, ſhould ſlip, you muſt faſten it, both before and behind, to the Scapulary C, made of ſtrong Linen; and, to prevent its ſliding upwards, faſten it with a Piece of Linen, or Calicoe, with two Heads, under the Compreſs A; this, being brought round the Nates, on each Side of the Scrotum, is faſtened to the Belt B B, near the Groin, by Pins, or Suture.

The T *Bandage for the Scrotum*, &c.

The uſual Bandage for Fiſtulæ, or Abſceſſes of the Anus, a Fracture of the Os Sacrum, a Diſlocation of the Os Coccygis, violent Hæmorrhoids, after cutting for the Stone, or any other Wound or Diſorder of the Perinæum, is the T Bandage of *Heliodorus* (See *Tab.* XXIII. *Fig. h.* and *Tab.* LVIII. *Fig.* 10, 11.). After having applied proper Dreſſings, the tranſverſe Head of the Bandage (*Fig.* 14. *a a*) is carried round the Belly; and the perpendicular Part hangs down upon the Os Sacrum *b*, and betwixt the Thighs *d d*, and from thence aſcends to the tranſverſe Part, to which it is tied in a Knot, near the Groin. This Bandage is, alſo, ſuitable to the Hydrocele, Sarcocele, and other Tumors of the Scrotum and Groins, or an Inflammation of the Teſticles, where, however, the tranſverſe Part (*Fig.* 7, 8, 12. *a a*) muſt be fixed in ſuch a Manner, that the Perpendicular *b b* (*Fig.* 6, 7, 8, 9, 10, 11, 12.) may retain the Dreſſings upon the Groin, (*Fig.* 7. *b*) or upon the private

yate Parts (*Fig.* 8, 12. *b b*); and then, being brought between the Thighs, be tied, either on the hinder Part of the Body, (as in *Fig.* 7.) or the Side of the Thigh, (as in *Fig.* 8, 12. *b b*) or the anterior Part of the Belly (as in *Fig.* 12. *c c*, *d*). In many Caſes it may be proper to apply the Scapulary, without the Napkin, for the better Security of this Bandage. The Figure of the T Bandage varies, according to particular Uſes: For that of *Fig.* 6. is proper for the Groin (ſee *Fig.* 7.); that of *Fig.* 9. for the Scrotum; that of *Fig.* 10, 11. for any Diſorders in the Breaſt, Anus, Scrotum, and Perinæum; and that of *Fig.* 13. is generally uſed for Tumors of the Scrotum; and, therefore, called *Bourſe*, or *Sacculus*, for the Scrotum.

Arnaud's *Bandage for the Anus.*

There is a new Bandage for Fiſtulæ and Abſceſſes of the Anus, invented by *Arnaud*, a *French* Surgeon, and recommended by *Garengeot*. Firſt, the Scapulary, (as in *Tab.* XXIV. *Fig.* 1. *c*) but longer, ſo that it may reach down to the Bottom of the Belly, is applied round the Body, with the Napkin B; then, near the Joining of the Napkin and Scapulary, upon the Back, (ſee *Tab.* LIX. *Fig.* 14.) in the Interſtices *a a*, you muſt ſew three or four Strings of Tape. Then take another Band, of more than four Feet long, and ſix Fingers broad; ſlit this up, ſo as to leave not above two Hands-breadth whole at one End, like *b* in the ſame Figure; upon the Sides of this *c c* ſew three or four other Pieces of Tape, which are to be tied in ſingle Knots, to the Strings of the Napkin *a a*; theſe the Patient may untie, and renew the Bandage, at his Pleaſure, without any Trouble. After proper Dreſſings, the before-mentioned Strings of each Bandage are to be tied in Knots about the Back *a a* and *c c*; then the two ſlit Ends *d d*, being paſs'd over the Anus, betwixt the Thighs, aſcend, and join the Napkin, one on the Right, the other on the Left Side of the Abdomen. Laſtly, if there be a profuſe Diſcharge of Blood after the Inciſion, which ſometimes happens, let an Aſſiſtant preſs the Part cloſely, with his Hand, for an Hour or two. The chief Advantage, aſcribed to this Bandage by *Garengeot*, is, that it adheres ſtrongly to the Body, and retains the Compreſſes firmly, by means of the Scapulary, upon the Shoulder. But I think the T Bandage (*Fig.* 11.) will anſwer all the ſame Purpoſes; eſpecially if the Whole, or, at leaſt, the tranſverſe Part, which is fixed upon the Abdomen, be made of Ticking.

The Knotted Bandage for the Perinæum.

As few of the preceding Bandages ſeemed to me, ſays *Heiſter*, capable of checking an *Hæmorrhage*, after cutting for the *Fiſtula* of the *Anus*, or a Stone, and none of our Writers, tho' there are frequent Inſtances of Patients being loſt by it, have propoſed any, I thought it might be worth while to contrive one; and, upon mature Deliberation, I think the following will prove effectual. Take a double-headed Bandage of twenty-four Feet long, and three Fingers broad. After Dreſſing the Wound with Doſſils of Lint, and thick Compreſſes dipt in *Alcohol of Wine*, as in other profuſe Bleedings, fix the Middle of it upon the *Perinæum*; then bring the anterior Head over the Left Groin, (*Tab.* LVII. *Fig.* 15.) from *a* to *b*, over the *Os Ilei c*, and the poſterior between the *Nates*, to the ſame Place, where you muſt tie and croſs them; then bring the anterior Head over the *Abdomen d*, and the poſterior directly croſs the Back or Loins to the Right *Ileum e*; and there croſſing them again, the anterior muſt deſcend over the Right *Inguen f*, and the poſterior over the Right Buttock to the *Perinæum*; here they traverſe each other, and are exchanged, ſo as to form a kind of Knot, like the Bandage for *Arteriotomy* (ſee *Tab.* LVIII. *Fig.* 7. *c*). Hence they aſcend again over the Left Groin and Buttock, *a*, *b*, *c*, continuing in the ſame Direction, as before, always obſerving to fix your Knots upon the *Perinæum*, after cutting for the Stone; and upon the *Anus*, after cutting for a *Fiſtula* in the *Anus*. This may properly be denominated the *Knotted Bandage* for the *Perinæum*, as it inveſts the Part ſo cloſely. If a tighter Bandage be thought neceſſary, after the firſt Circle over each *Inguen* and *Ileum*, and a ſecure Knot upon the *Perinæum*, the anterior Head may be carried obliquely from the Left Groin *a*, over the *Abdomen* and Right Shoulder, in the Courſe of the prick'd Line, and the poſterior brought over the Back to the ſame Place: They are there decuſſated, and carried down again, in the ſame Direction, to the *Perinæum*; and there again they form a Knot, after which they aſcend in the ſame manner by the prick'd Line *g*, *d*, *i*, to the Left Shoulder; there they are exchanged, and go, in the ſame Direction as before, to the *Perinæum*, where they are formed in a Knot, the better to compreſs the bleeding Veſſels. Laſtly, you muſt continue thoſe Circles, which go only from the *Perinæum*, to the *Ilea*, and round the Belly, till the Whole is ſpent; then faſten it well. But, if you follow the laſt Method, you ought to have a Roller thirty-two Feet long, to allow for thoſe large Turns.

Spica Inguinalis.

There is a peculiar Kind of Bandage, called *Spica Inguinalis*, for the Cure of Inteſtinal *Hernias*, the *Bubonocele incarcerata*, a Diſlocation of the Thigh, and a Fracture of the *Os Ilei*. It may be differently uſed, like the *Spica* for the Shoulder, and is either ſingle or double-headed. The ſingle-headed Roller muſt be twenty-four Feet long, and three Fingers broad. The End is placed on the *Os Ilei* of the ſound Side (*Tab.* LIX. *Fig.* 16 *a*). Hence the Head of the Roller paſſes round the Bottom of the Belly *b b*, and the Hip *c*; then, going to the back Part of the Thigh, comes up between the Thighs at *d*, and is conveyed over the Compreſs at the Groin *e*. When this is done, you muſt carry it over the Back to its Beginning. This muſt be repeated, as often as the Bandage will permit; or, after three Repetitions of the firſt Courſe, you may ſpend the reſt circularly about the *Abdomen* for Security; then faſten it with a Suture, and pin the Bandage and Compreſs together, on the Groin, with two or three Pins, leſt the Compreſs ſhould ſlip, or the X, made there, change its Poſition, which it will do, unleſs you pin it very well. But after an Operation for the *Hernia incarcerata*, if by any means you have wounded the *Scrotum*, or were oblig'd ſo to do, having repeated the firſt Courſe three times, you may pin the Bandage at the Left Groin; then bring it up under the *Scrotum f*, by the Right *Inguen g*, to the Left *Inguen d*, *e*; then pin it once more. This muſt be frequently repeated to retain the Dreſſings. This Bandage, when applied to one Groin only, is called the *Spica inguinalis ſimplex*.

Simple Spica with two Heads.

This *Spica* may be made commodiouſly with two Heads, twenty-four Feet long, and three Fingers broad. Its Middle is placed upon the Right Hip *a*, *Fig.* 16. From thence the two Heads are carried round, one before, and one behind, to the other Hip *c*; there they are croſſed, and paſſed down to the *Perinæum d*, where, being changed again, they are brought to the Hip *c*, and there croſs'd a ſecond time, and from thence round the Back and Abdomen, to the other Hip *a*. This is to be continued, till the Bandage is ſpent; or you may place the Middle at the *Perinæum d*; from hence the Heads aſcend obliquely to the Hip *c*, from whence they paſs before and behind to the other Hip *a*, repeating the ſame Courſe, till your Roller terminates; then faſten it by Pin or Suture.

The double Spica Inguinalis.

The *double Spica Inguinalis* is applied on each Side, when there is a Diſorder in both Groins. This Bandage is double-headed, twenty-four Feet long, and three Fingers broad. Its Middle is generally fixed to the Back upon the Loins, and brought round the Body to the anterior Part of the *Abdomen*, where the Ends are changed; then they go round the Outſide of the Thighs, paſs under the Buttocks, and aſcend on each Groin; there, having ſecur'd the Dreſſings, they aſcend over the *Oſſa Ilia* to their Beginning, where the Heads are again changed, and brought round to the *Abdomen*, where they are again changed, and then they deſcend on each Side of the *Scrotum*, and go round the Buttocks to each Groin, and ſo to the *Abdomen*, where they are again changed; and then they aſcend the *Oſſa Ilia*, as before, to their Beginning. This Direction muſt be repeated often, and the Ends faſtened with Suture. This Bandage may alſo be uſed in the ſame manner as the knotted Bandage deſcribed above for the *Perinæum*, omitting the Knot between the Thighs. Its Middle is then applied to the *Perinæum* (ſee *Tab.* LIX. *Fig.* 15. *a*); the Heads aſcend on each Side in the Courſe *b*, to the Hip *c*; then croſſing, they paſs round the Body to the oppoſite Hip *e*, and from thence deſcend by the *Inguen*, *f*, *g*, to the *Perinæum*, where croſſing again, they return in the ſame Courſe *f*, *g*, to the Hip *e*, and from thence round the Body to the other Hip *c*, till at laſt they return over the Left Groin *b*, to the Place where they began. Repeat this till your Bandage is ſpent; then faſten it. The *double Spica Inguinalis* may be applied for a Diſlocation of both the Thigh-bones, or a Fracture of both their Necks, or after the Operation for Ruptures on both Sides.

Bandage for Bubos.

The T Bandage is uſually applied to *Bubos*, and other Tumors, in the Groins, or elſe that deſcribed (*Tab.* LIX. *Fig.* 6.) uſed much after the ſame manner. But as one of the tranſverſe Heads *a a* is ſhort, it is fixed in ſuch a manner upon the Belly, that it faſtens on one Side, that the Patient may tie or untie it without any Trouble. The largeſt Part *b* deſcends over the *Inguen*, betwixt the Thighs, and is reflected back over the *Nates*, to the tranſverſe End, to which it is tied upon the Loins on one Side. We have (in *Tab.* LIX.) repreſented only the Bandage adapted to the Left Groin; but this, if turned on the other Side, will be proper for the Right. The ſame Courſe is to be obſerved as before.

Bandages for the Scrotum.

There are frequent Occaſions for Bandages to the *Scrotum*, not only to retain Cataplaſms on an *inflam'd Scrotum*, or ſwell'd Teſticles, but alſo, in many *Hernias*, the Cure principally depends upon a proper Application of them. The Surgeons uſe three Sorts: 1. The moſt commodious is the T Bandage. The perpendicular Part muſt be about two Hands broad, with an Aperture to receive the *Penis* (ſee *Tab.* LIX. *Fig.* 9.) *c*, and the End ſlit up, till it reaches within two Hands-breadth of the tranſverſe Part, ſo as to form the two Heads *b b*. When therefore the tranſverſe Part has been brought round the Body, the *Penis* tranſmitted through the Hole *c*, and the two Heads *b b* have interſected each other on the *Perinæum*, the *Scrotum* and Dreſſings are retained ſecurely, if the Extremities *b b* are reflected back over each Thigh, and tied on the Hip (ſee *Fig.* 8. *c*). 2. Sometimes a four-headed Bandage, of four Feet long, ſix Fingers broad, and ſlit up at each End, is proper to retain the Dreſſings and Compreſſes on the *Scrotum*. The entire Part is placed upon the *Scrotum*, with two Heads tending upwards; the other two downwards. Let the *Penis* be tranſmitted between the two ſuperior Heads, which come upon the ſound Part, and then, going round the Body, are tied upon the Loins; while the inferior, traverſing each other upon the *Perinæum*, are brought forward over the Buttocks; that of the Right Side to the Left Groin, and that of the Left to the Right, (ſee *Fig.* 12.) and then tied. Laſtly, ſome Surgeons make uſe of a Bandage reſembling a Purſe (*Gall. la Bourſe*). It is made of ſtrong Linen, with four Heads, proper Strings, and Holes to receive thoſe Strings (ſee *Tab.* LIX. *Fig.* 13.); A A is the Purſe for the *Scrotum*; B B is the two Swaths, which, ſurrounding the Body, are tied by the Strings *b*; the *Foramen* C tranſmits the *Penis*, and the two inferior Heads D D are convey'd between the Thighs, and by the *Nates*, up to the Hips, where they are tied by the Strings E E, in the Eyelet-holes *d d*, and are thus faſten'd to the ſuperior Part B B. Some term this the *Suſpenſor* of the *Scrotum*. *Gall.* SUSPENSOIRE.

All the Bands here, except the Bag-truſs, ſeem to be very ill adapted; and as that is ſubject to gall, none is found ſo uſeful as the Purſe, which is a Piece of Linen or Woolen Cloth, according as the Caſe requires, made round, to receive the *Scrotum*, with the Dreſſings, if any be, and a Perforation for the *Penis*: To each Side of this is ſewed a Piece of broad Filleting, about a Yard and half long, each End paſſing from the Purſe over the *Oſſa Ilia*, croſſing on the Back, then brought forward, and tied on the *Abdomen*; with this you may ſuſpend the *Scrotum* much higher than you can with the others; and it has this Advantage, of ſitting eaſy, and not galling in walking, as the other always does.

As to Bandages for Ruptures, ſee BUBONOCELE and HERNIA.

Bandage for the Penis.

The little Bandage uſually applied to the *Penis* for Wounds, Abſceſſes, Phlebotomy, a *Phimoſis*, and other Diſorders, is about two Feet long, and an Inch broad; one End is perforated about an Inch long, and the other is ſlit up about the Diſtance of two or three Inches, according to the Size of the *Penis* and Dreſſings; then the ſlit End is tranſmitted through the oblong Aperture, which we ſuppoſe to lie on the upper Side of the *Penis*; and theſe Ends, coming one on one Side, and one on the other, from below, inveſt the *Penis* and Dreſſings in a kind of Sling; then roll up the two Ends moderately round, in oppoſite Directions; and faſten them, where they terminate, with a Knot or Suture. For an Abſceſs of the *Glans*, or *Præputium*, it is propereſt to apply a Compreſs and Plaiſter, in the Shape of a *Malta* Croſs, with an Aperture for emitting the Urine, large enough to contain the *Glans* and Dreſſings. Laſtly, in a preternatural Rigidity and Inflammation of the *Penis*, which often happen in a *Priapiſm*, *Paraphimoſis*, and *Gonorrhœa*, ſome very juſtly recommend the putting the *Penis* in an oblong Linen Bag fitted to it, which may be tied by two long Strings, either round the Waiſt, or upon the Groins.

Of Bandages for the Arm.

A Bandage for a fractur'd Humerus.

We have hitherto treated of Bandages adapted to the Head, Neck, and Trunk; now we ſhall deſcribe thoſe for the extreme Parts of the Body, the Arms and Legs. In a Fracture of the *Os Humeri*, after Reduction, apply a Linen Cloth, an Hand's-breadth, and a Span long, ſlit into four Heads, (ſee *Tab.* XXIII. *Fig.* 18.) expreſs'd out of warm Wine or *Oxycrate*, ſo that the Heads may exactly meet, the one oppoſite to the other, on the Fracture; then take a Bandage twenty-four Feet long, and about three Fingers broad, with one Head; paſs this thrice round the fractur'd Part, immediately above the former; then aſcend, by degrees, in obtuſe ſpiral Directions, (*Gall. Doloires*) up to the Shoulder; and, after making a Circumvolution round the *Thorax*, and under the Arm of the ſound Side, (which ſome omit) return to the affected Shoulder; then deſcend gradually in the like ſpiral Courſe, till your Roller again forms three Circles upon the fractur'd Part. Before Application moiſten your Bandage with warm Wine, *Spirit of Wine*, or *Oxycrate*, in order to retain the Fracture more firmly. The Roller at laſt muſt deſcend ſpirally to the Elbow, ſo as to form two or three ſpiral Circumvolutions round it below its Flexure, leaving the *Olecranum* diſengaged, and free for Motion; by which means it will adhere more firmly to the Part. After this you lay four Splints, ſix or eight Fingers long, and two broad, according to the Length of the Bone, upon the Fracture, at equal Diſtances, firſt moiſtening them with warm Wine or *Oxycrate*; then you proceed again ſpirally from the Elbow to the fractur'd Part, where having form'd three Circles, your Bandage muſt aſcend in ſpiral Directions to the Shoulder. If the Splints are well cover'd, and there is ſtill a Remainder, that muſt deſcend ſpirally, though at greater Diſtances, upon the Arm, for the better Security of the former Rounds, pin it where-ever it terminates. Laſtly, it is uſual to apply three or four Plates, of about a Span long, and two or three Fingers broad, made of Wood, Steel, or thin Braſs, though commonly of ſtiff Paſteboard, according to the Length of the fractur'd Arm (ſee *Tab.* LII. *Fig.* 17. *a a a*); theſe Plates are tied with three Tapes, about two Feet long, beginning firſt with the middle String; let the Knots be upon the external Part of the Arm, for the greater Conveniency of tying and untying them. See *Tab.* LIX. *Fig.* 17. *b b b*.

Treatment after the Bandage.

Having thus completed the Deligation, the Arm is to be ſuſpended in a Sling, (*Gall. Eſcarpe*) and inflected ſo that the Hand may come over the *Scrobiculum Cordis*. If the Fracture be oblique, it is more proper for the Weight of the Arm to be leſs ſupported, leſt the lower Fragment ſhould ride over the upper; but, if it is tranſverſe, the Sling ſhould be ſhorter: For this Uſe, a large fine Napkin is proper, folded in ſuch a manner, that the Middle *c c c* may ſuſtain the Elbow of the fractur'd Shoulder, and its Extremities be tied about the Neck at the Knot *d* upon the ſound Shoulder. Some Surgeons, inſtead of one long Roller, uſe three ſhort ones, for a fractur'd *Humerus*: The firſt eight Feet long, or, according to ſome, but ſix; the next ſix; and the other ſix and an half. The firſt is ſpent in aſcending Revolutions, the ſecond in deſcending, and the third in Circles about the Fracture itſelf. This Method is convenient enough. Some apply the Plates deſigned for retaining and ſtrengthening the Bone, upon the Compreſſes; and ſpend the third Bandage, or laſt Part of the long one, in ſecuring them upon the Part. This likewiſe will anſwer the End propoſed. Obſerve, the firſt Bandage ſhould not be taken off, unleſs upon ſome extraordinary Occaſion, before the fourth or fifth Day; nor the ſecond till the eighth; nor the third till the twelfth or fourteenth, when the Fragments of the Bone may be ſuppoſed to cohere firmly; which, as Experience ſhews us, is completed in this Bone within forty Days.

How to prevent an Anchyloſis.

After the Bandage has been renew'd a third time, the Arm muſt be gently bent, to prevent an *Anchyloſis*, or Stiffneſs of the Elbow. If it has already contracted any Degree of this Diſorder, uſe proper Ointments, Fomentations, or Cataplaſms, move the Joint often, and let the Patient ſwing round a Weight every Day in his Hand. It is very ſerviceable, in this Caſe, to put the Arm into the Belly of an Animal juſt kill'd; becauſe this Warmth will conduce very much to reſtoring its Mobility; but, for the Uſe of aſtringent Spirits, which ſome recommend, they are very injurious.

When the Fracture is near the Humerus.

If the Fracture of the *Os Humeri* is in its Neck, or near the Shoulder, the Caſe is dangerous, and the preceding Bandage will be of little or no Service. Apply therefore the *ſimple Spica* recommended above, with this Difference, that the Deligation about the Shoulder be more exact and firm. PETIT, *Lib. de Morb. Oſſ.* thinks the Bandage of eighteen Heads (ſee *Tab.* XXX. *Fig.* 9.) adapted to this Fracture; but this will not ſufficiently retain the fractur'd Parts.

Bandage for a fractur'd Cubit.

For a Fracture of the lower Arm or Cubit after Reduction, according to the Directions given under the Article *Fracture*, apply cloſely round the Fracture a Linen Cloth of a Span long, and an Hand's-breadth, ſlit on each Side, as we deſcribed for a fractur'd *Humerus*, (ſee *Tab.* XXIII. *Fig.* 18.) dipt in *Oxycrate*, or Spirit of Wine; after this apply two thick Compreſſes, in Length almoſt equal to the *Ulna*, one on each Side over Splints of equal Length, made either of Wood or thick Paper: Then fix a ſingle-headed Roller, of about eight Feet long, and three Fingers broad,

board, upon the Compreſſes and Splints, or, if you omit the Splints, upon the Compreſſes only; which, after forming two or three circular Rounds about the fractur'd Part, muſt aſcend gradually in a ſpiral Direction above the *Cubit*, and there form two or three more Circles, before it terminates; then, upon the End of this, you fix another Roller, faſtening it by a circular Turn or two, which deſcends by degrees ſpirally down to the Hand; and, taking in the Thumb, as in a Loop, is drawn back to the *Carpus*; and there, after forming a Circle or two, is pin'd. You are next to take two Splints of thick Paſteboard, almoſt the Length of the *Ulna*, and broad enough to inveſt the Part; and, dipping them in *Spirit of Wine* or *Oxycrate*, place them, one on the Outſide, and the other on the Inſide, of the Elbow; theſe are to be retain'd by a Bandage twelve Feet long, and almoſt three Fingers broad, which is fix'd to make ſome circular Rounds about the Middle; then aſcend ſpirally to the Flexure of the *Cubit*, and then deſcend again. The Extremity muſt be pin'd or ſew'd; though there is no Objection againſt retaining this Bandage by three or four Strings, as repreſented (*Tab.* LIX. *Fig.* 17. *bbb*) for the *Os Humeri*. There are Surgeons, who, after the Deligation, uſe but one Paſteboard-ſplint, in which they place the Arm, as in a Trough. This, they think, promotes Agglutination (ſee the Repreſentation, *Tab.* XXIX. *Fig.* 8. and the Application, *Tab.* LIX. *Fig.* 17. *e e*). When theſe Directions have been follow'd, the Arm muſt be ſuſpended in a Sling about the Neck (ſee the ſame *Fig. cccc*). Thus a Fracture of the *Cubitus* may be perfectly cur'd within thirty Days.

Bandage for a fractur'd Carpus.

For a Fracture of the *Carpus*, after Reduction, apply round the Part, in three circular Turns, a ſingle-headed Roller, twenty or twenty-four Feet long, and two Fingers broad; then carrying it between the Thumb and fore Finger, from the Back of the Hand into the Palm, from thence reflect it over the Ball of the Thumb, and back Part of the *Carpus*, (by which Turn the Bandage reſembles the Letter X, immediately above the Thumb) rolling it thrice round the *Carpus* again; after this, it muſt aſcend ſpirally above the Juncture of the Elbow; then, having fix'd two Compreſſes, one on the Outſide, and the other on the Inſide of the *Carpus*, equal to its Breadth, it deſcends to the Hand, to retain the Compreſſes firmly. Laſtly, you place two Paſteboard-ſplints over the Compreſſes, which muſt be bound very exactly by the Remainder. The Arm is to be carried in a Sling, as at *Fig.* 17.

Bandage for the Metacarpus.

After the Reduction of any of the metacarpal Bones, the preceding Bandage for the *Carpus* may be applied in three circular Rounds about the injur'd Part; then, paſſing it between the Thumb and fore Finger, it is carried round the *Carpus*; after which it returns to its former Courſe, by croſſing over the Back of the Hand like an X. This being thrice repeated, it is brought ſeveral times round the *Metacarpus*, and then by degrees aſcends ſpirally above the Elbow, as we ſaid. After this, you apply two Compreſſes, with Paſteboard-ſplints, one to the Palm, the other to the Back of the Hand, (ſee *Tab.* LVII. *Fig.* 5.) which are bound tight by the Remainder.

Bandage for a Luxation of the Cubit.

For a Diſlocation of the Elbow, after reducing it, a Linen Cloth dipt in *Wine*, *Spirits of Wine*, or *Oxycrate*, and ſlit, (as in *Tab.* XXIII. *Fig.* 18.) muſt be applied round the Flexure of the Elbow. Then take a ſingle-headed Bandage, about twenty Feet long, and two Fingers broad; with that make two Circles above the Bending of the *Cubit*, as after Phlebotomy, and likewiſe two under it; then let your Roller aſcend again obliquely up the Inſide of the Arm, and interſect the former; after which, make two more circular Rounds about the lower Head of the *Humerus*, ſo that your Bandage may reſemble the Figure of 8. This done, the whole Arm is to be rolled up in a large Linen Cloth dipt in warm *Spirit of Wine* or *Oxycrate*, and inveſted ſpirally by a Roller. Though ſome are of Opinion, that this long Linen Cloth is entirely needleſs, ſince the Cure may be performed by a ſimple ſpiral Bandage continued up and down the Arm, after it is moiſten'd with the forementioned Liquors; but it may be of Service to prevent Tumors and Inflammations. Laſtly, after this Deligation, the Arm ſhould be ſuſpended in a Sling; but, to prevent a Stiffneſs, let it be ſometimes gently bent and extended.

Bandage for a Luxation of the Carpus.

For a Diſlocation of the *Carpus* after Reduction, the preceding Bandage, carried thrice round the affected Part, will prove commodious; then paſſing it between the Thumb and fore Finger, go backwards round the Ball of the Thumb, traverſing it on the Back of the Hand, and carrying it in a circular Turn round the *Carpus*; after repeating this ſeveral times, bind the *Carpus* with two thick Paſteboard-ſplints, about two Hands-breadth long; then put a Ball in the Patient's Hand, to extend his Fingers; all which are to be ſecur'd by ſpiral Turns above the Elbow, to prevent Tumor and Inflammation.

Bandage for Bleeding in the Arm.

After bleeding in the Arm, the Bandage ſhould be four, or rather ſix Feet long, and two Fingers broad: It is variouſly applied; but, in my Opinion, the beſt way is, to fix its End upon a ſquare Compreſs, which covers the Orifice; and let about a Span of it hang down above the Outſide of the Flexure of the Elbow; then it deſcends obliquely over the Inſide of the Arm, and, forming a Circle below the Bending of the *Cubit*, aſcends again obliquely to the ſame Place, and reſembles a Figure of 8: The Turns interſect each other in the Middle of the Flexure: This Courſe of the Figure of 8 is to be repeated, till the Bandage is near ſpent; then the Ends are to be tied on the Outſide above the Elbow (ſee *Tab.* XXIV. *Fig.* 1. D). If a String is faſten'd to each End, as is frequent in *Germany*, the Deligation may be very neat; for they make but a very ſmall Knot, and the Roller need not be above four Feet long. The Method of Application is the ſame.

Bandage for a Puncture of the Artery in Bleeding.

For a Puncture of the Artery in opening the Vein of the Arm, let the Patient bleed *ad deliquium*; then fix two or three Compreſſes, in one of which put a Piece of Money, for the greater Preſſure of the Bandage upon the affected Artery; after this, take a ſingle-headed Bandage, of twenty or twenty-four Feet long, and two Fingers broad; and, rolling it two or three times above the Elbow, you proceed as after Phlebotomy, but bind it ſomething tighter. Having made five or ſix Turns like a Figure of 8, apply a narrow oblong Compreſs from the Bending of the Elbow to the Axilla, on the Inſide of the Arm, ſo as to lie exactly on the primary brachial Artery; then your Roller muſt aſcend gradually, by pretty thick ſpiral Turns, to the Top of the Shoulder, to ſuppreſs the Flux of Blood through that Artery; from thence paſs it obliquely over the Breaſt, under the oppoſite *Axilla*; and, bringing it round again to the Shoulder of the injur'd Arm, deſcend upon the Arm in ſpiral Turns, contrary to the preceding. Faſten it where-ever it terminates. If you have not a Bandage of a proper Length ready, apply a ſhorter, and let an Aſſiſtant compreſs the Wound and brachial Artery with his Hand; for too long Delay would expoſe the Patient to a dangerous Hæmorrhage; for there is no Objection to applying the long Roller over the ſhort one, with proper Compreſſes, and in the manner directed. After Deligation, the Arm muſt be ſuſpended in a Sling about the Neck, (as at *Tab.* LXI. *Fig.* 17.) without the Trough *e e*. Let the Patient abſtain from Motion, heating Diet, and ſpirituous Liquor.

Bandage for an Aneuriſm.

The preceding Bandage may be applied to ſmall *Aneuriſms*, both where the Operation is neceſſary, and alſo where Bandage alone is ſufficient. Firſt compreſs the Tumor with your Finger, ſo that the extravaſated Blood may return to the Artery; then apply an aſtringent Plaiſter, and a thick Compreſs, with a Piece of Money, or other hard Subſtance, included in it; theſe muſt be proportionable to the Size of the Arm; upon this firſt Compreſs, fix ſeveral others, in the manner deſcribed under the Article ANEURISMA. This Bandage muſt be worn a conſiderable time. *Hildanus* has given us Inſtances of Cures perform'd in this manner, in *Centur.* III. *Obſ.* 43, 44.

Bandage for Phlebotomy in the Hand.

After opening a Vein in the Hand, particularly the *Salvatella*, apply two ſmall Compreſſes, and carry your Roller above four Feet long, without any Strings, in two Circles, round the *Carpus*; then over the Back of the Hand, between the Ring and little Finger; next reflect it back again, between the firſt and middle Finger, to the other Side of the *Carpus*, croſſing like an X. This Direction round the Ring Finger and *Carpus* muſt be thrice repeated; and then, making as many Circles round the latter, as the Bandage will permit, faſten it.

Bandage for a burnt Hand.

After the Application of Remedies proper for a Burn, take a Bandage, twenty-four Feet long, and an Inch broad; carry it in two Circles round the *Carpus*; hence croſs the Palm of the Hand to the little Finger, which is firſt to be inveſted by ſpiral aſcending Turns; and then, by deſcending from thence, paſs it to the Ring Finger, which is to be cover'd in the ſame manner; and then to the middle and fore Finger (ſee *Tab.* LIX. *Fig.* 18. *a*, *b*, *c*, *d*). After this, convey it in ſeveral Circles round the *Metacarpus*, betwixt the Thumb and fore Finger *e e e*; having thus involved the *Metacarpus*, inveſt the Thumb *f*, as you did the Fingers; then the inferior Part of the *Metacarpus* is to be inveſted in ſpiral Circles *g g g*, and the Remainder to terminate circularly upon the *Carpus h*, where it began.

Bandage for a Fracture of the Thumb.

For a Fracture of the Thumb after Reduction, take a ſingle-headed Roller, an Inch broad, and ſix or eight Feet long; faſtening this with two circular Turns round the *Carpus*, carry it to the fractur'd Part, and inveſt that by three Circles; then fixing two Splints of thick Paſteboard, one on the Inſide, the other on the Outſide of the Thumb, form three more Circles upon that. Laſtly, bring your Bandage to the *Carpus*; and, after two or three Rounds, faſten it. If both Internodes of the Thumb are fractured, uſe the ſame Roller, with this Difference only, that you repeat the Circles on each Fracture ſeparately, and extend the Splints over each Joint.

Bandage for a fractur'd Finger.

For a Fracture of the Finger, apply the preceding Bandage in the ſame manner, only obſerving to bind the next ſound Finger to the fractur'd, which will ſupport it, till the Fragments are united.

Bandage for ſeveral fractur'd Fingers.

For a Fracture of ſeveral Fingers, after Reduction, with a Bandage twelve Feet long, and two Fingers broad, make two circular Turns about the *Carpus*; from hence carrying it over the Back of the Hand to the fractured Fingers, bind it round each Finger ſeparately, as in the preceding Bandages, and afterwards bind it round them all, ſo as to leave no Part uncovered; then put a proper Piece of that thick Paſteboard into the Palm of the Hand (ſee *Tab.* LVII. *Fig.* 5.) and bind it tight: Though ſome direct to retain the Fingers a little inflected, by putting a Ball into the Patient's Hand, which is alſo to be bound tight. But whatever Method you take for ſupporting the Fingers, the Roller muſt always paſs from each Finger, after it is rolled up to the Carpus, round which give it a Turn, and then proceed and roll up the next, and then place the Hand in a Sling, faſtened about the Neck.

Bandage for diſlocated Fingers.

Diſlocated Fingers in general may be eaſily cured by Extenſion, without any Bandage. But if, through Neglect or Weakneſs of the Joint, a Bandage ſeems requiſite, uſe the following Method: Take a Roller, ſix Feet in Length, and a Finger in Breadth, and make two circular Rounds about the *Carpus*, as in Fractures; then bring it over the Back of the Hand to the luxated Finger; there bind it about the affected Joint, and, croſſing it, let it return to the *Carpus*; this being thrice repeated, faſten it about the *Carpus*, where it terminates. If more Fingers than one are diſlocated, let each be bound up ſeparately, in the ſame manner. The *French* call this Kind of Bandage, *le demi Gantelet*, the half Glove, as it covers the Hand only, without the Fingers.

Bandage for an amputated Finger.

When Part of a Finger has been cut off by Accident, or on account of a Mortification, *Sphacelus*, or *Caries* of the Bone, after the Application of proper Remedies, uſe the Bandage directed for the Penis, *viz.* firſt ſome ſcraped Lint, then a Plaiſter and Compreſs in the Form of a *Malta* Croſs (ſee *Tab.* XXIII. *Fig. e*); then bind a Fillet a Foot long, and a Finger broad, (ſee *Tab.* XXIII. *Fig. e*) round the affected Part.

Bandage for an Amputation of the Hand or Cubit.

After an Amputation of the Hand or Elbow, having applied proper Remedies, Lint, and Compreſſes, a Bandage, with two unequal Heads, twenty or twenty-four Feet long, and three Fingers broad, muſt be fixed about an Hand's-breadth above the mutilated Place *c* (*Tab.* LIX. *Fig.* 19.): then make three or four Circles, to ſecure the Dreſſings *a* upon the Wound; next carry one of the Ends from *c* over *d*, and aſcend on the other Side, croſſing it by the other End, which binds it down, and continues moving round the Limb; after this, the firſt Head is returned obliquely over the Stump to its Beginning, as in the *Capeline* for the Head and Clavicle. This Courſe muſt be repeated, till the affected Part and Dreſſings are well-covered and ſecured; the Extremity of the ſhorter Head muſt be faſtened by the ſpiral Rounds upward and downward of the longer, faſtening the laſt, where-ever it terminates, by Suture. Always obſerve to tighten this Bandage, which will retain the Dreſſings more firmly upon the affected Part, and, by its Compreſſure, prevent Bleeding. When the Surgeon has performed his Office, let the Patient be put into Bed, and the affected Limb laid upon a Pillow: Further, an Aſſiſtant ſhould hold the Parts with his Hand, till there is no Danger of an Hæmorrhage. Laſtly, when the Patient is allowed to leave his Bed, the affected Arm ſhould be ſuſpended in a Sling about the Neck, (ſee *Fig.* 17. *c c*) till the Wound is healed.

Bandage for an amputated Arm.

When the Arm is cut off above the Elbow, after tying up the Arteries, the Deligation muſt be performed almoſt in the preceding Manner: But, in this Caſe, your Roller muſt be twenty-four Feet long, and fixed upon a narrow, thick Compreſs, which is placed on the Inſide of the Arm, upon the brachial Artery. If the Arm happens to be taken off near the Shoulder, the Remainder being but three or four Fingers-breadth long, after tying up the Blood-veſſels, you muſt uſe a Bandage thirty-two Feet long, and three Fingers broad, ſo that the Head, which, in the former croſſed over the Stump, may be brought round the *Thorax* under the ſound *Axilla*, to the amputated Part, and cloſely inveſt it; for otherwiſe the Roller will not adhere firmly, but eaſily ſlip off the Shoulder. If there is little or no Stump left, it will be proper to follow the Method we ſhall preſently lay down for an Amputation of the Arm in its Articulation with the *Scapula*.

Bandage for an Amputation at the Joint of the Shoulder.

After an Amputation of the Arm in its Articulation with the *Scapula*, proceed thus: Take a ſingle-headed Roller, forty or forty-eight Feet long, and two Fingers broad; place it under the ſound Arm, and let an Aſſiſtant hold it with his Fingers; from thence carry it over the *Thorax* to the amputated Shoulder; over that bring it back to the ſound *Axilla*: This Courſe muſt be repeated again; after which, the Roller paſſes from under the ſound Arm, over the ſame Shoulder, to the Back and affected Part; from thence over the Breaſt under the ſound Arm, and paſſing round the ſame *Humerus*, returns and croſſes upon the Breaſt: After a frequent Repetition of this Courſe, the Remainder is ſpent in Circles about the *Thorax*, and amputated Part, to retain the Dreſſings; ſew it where it terminates.

Of Bandages for the Leg and Thigh.

Bandage for a fractured Thigh.

For the Fracture of the Thigh, the Bandage muſt be different, according to the different Circumſtances, as it happens ſometimes in the Neck of the Bone, ſometimes in the lower, middle, or upper Part of it; beſides, it may be tranſverſe, or oblique, and then the Application muſt be different. If the Fracture is below the Neck of the *Femur*, either in the Middle, or towards the Knee, after following the Method propoſed under the Article FRACTURA, you muſt apply three Bandages, two of which muſt be ſixteen Feet, and the other twelve in Length; each three, or, if it is neceſſary, four Fingers broad, all of them ſingle-headed: But, before the Application of the Roller, dip a ſingle Piece of Linen, ſlit into four Heads, (as in *Tab.* XXIII. *Fig.* 18.) in warm Wine, Spirit of Wine, or *Oxycrate*; fix it round the fractured Part with the Heads croſſing each other; then a thick Compreſs of a proper Length muſt be laid upon the Thigh, to fill up the poſterior natural Cavity of the Bone, leſt without this the Bandage ſhould ſtraighten and elongate the Bone too much: Afterwards two Aſſiſtants, holding the Thigh above and below the Fracture, ſhould elevate it, while the Surgeon proceeds in the following Method: He muſt firſt fix the ſhorteſt Roller in three tight Circles round the fractured Part, as we directed for the Arm; then it aſcends ſpirally towards the Groin, and is there faſten'd, after ſome circular Turns. Next he takes one of the long Rollers, and forming three Circles more, but in an oppoſite Direction, and fixing a Compreſs thick enough to make the inferior Part equal to the ſuperior, he deſcends ſpirally to the Knee, where, after three circular Rounds, the End is to be faſten'd. It is neceſſary to obſerve, that an oblique Fracture requires a tighter Bandage than a tranſverſe. Further, he applies four Compreſſes of a Span long, and three Fingers broad, each covered with a Splint of the ſame Length and Breadth, for retaining the Fragments of the Bone, as we have directed in a Fracture of the Arm. In the next Place, the third Roller, twelve Feet long, muſt be faſtened, beginning with three circular Rounds over the Fracture, from thence aſcending by ſpiral Turns upwards, and then deſcending in the ſame manner, till the Splints are covered. The End muſt be well faſtened where-ever it terminates. Laſtly, the whole Thigh muſt be inveſted by two larger Splints of thick Paſteboard, dipt in warm Wine or *Oxycrate*, and tied with three or four Strings, as we directed for the Arm (ſee *Tab.* LIX. *Fig.* 17. *a a a*, *b b b*).

Poſition of the Femur after the Bandage.

When the Deligation is thus perfected, the next Conſideration is a convenient Poſition of the Thigh. A Linen Mattreſs, with two cylindrical Sticks covered with Straw, which the *French* call *Fanons*, the *Germans Strohlade*, and ſome a Straw-bed, ſeems to me the moſt commodious for this Purpoſe (ſee *Tab.* XXX. *Fig.* 5.). But here the two Sticks A, A, A, A, muſt

muſt not be of the ſame Length, as for the *Tibia* or Leg, for which (*Fig.* 5.) is adapted; for that which is put within the Legs, ſhould reach from the inner Ancle to the Groin, and the external one from the outward Ancle to the Hip, or, according to ſome, up to the *Axilla*; for if they are too ſhort, eſpecially in an oblique Fracture of the Thigh, it is more than probable the Patient will be lame. When the Limb is thus carefully extended, ſo that the great Toe lies in a direct Line with the *Patella*, or a little more outward; the intermediate Spaces between the Ancle and Ham muſt be filled up with Lint or Tow. Some Surgeons inveſt the whole Thigh and Leg with large Compreſſes, to ſecure the Bandage more firmly, and prevent any Injuries from the external Ligatures: Others think this ſuperfluous, and it is moſt uſual to faſten the Straw-caſe about the whole Leg and Thigh, with ſeven Strings, each a Yard long, three upon the *Tibia*, (ſee *Fig.* 20. A, B, C) three upon the Thigh, and the ſeventh, which muſt be the longeſt, upon the *Abdomen*; though, inſtead of this laſt, ſome fold a Napkin round the Belly. I ſhall obſerve with regard to theſe, not only that they ought to be put under this Straw-caſe, before the Leg is put into it, to prevent Danger by moving, but alſo the middle String ſhould be tied firſt; and laſtly, that the Knots ſhould be on the Outſide of the Bed, both for Neatneſs and Conveniency. Place the Sole of a Slipper or Paſteboard, cut into a proper Shape, (ſee *Tab.* 30. *Fig.* 6. 7.) at the Bottom of the Foot; tie it on by the three Strings *a*, *a*, *a*, ſo that thoſe two on the Sides may interſect each other (ſee *Tab.* 59. *Fig.* 20. *e*, *f*); then pin them to the Roller; but the third and and uppermoſt *g* may be faſtened to the moſt convenient Part of the Straw-caſe: Thus may the Limb be retained in its natural Poſture, and, after the Completion of the Cure, the Patient be capable of ſtanding upon his Leg. It may be proper, for preventing too hard a Preſſure of the Foot-board, to put a convenient Compreſs between that and the Sole. (See *Tab.* 30. *Fig.* 7.) Likewiſe fix a large Bolſter of Tow, made in the Form of a Ring, to admit the Calcaneum (ſee *Fig.* 8. *a*); and tie it round the Tarſus, with the Strings *b b*, to prevent an Inflammation, which often ariſes from a long Preſſure of the *Calcaneum* againſt the Bed. If this Contrivance does not ſucceed, and the inferior Part of the *Tendo Achillis* is hurt by this Sling, you muſt take a Roller, about five Fingers broad, roll'd up into two large Heads, which Heads fix with Suture about an Inch Diſtance from each other; then place them under the Ancle, ſo as the Ancle may reſt upon the Habena, between the two Heads, which will ſuſpend the Calcaneum, and keep it from preſſing upon the Bed, which is a thing of great Conſequence. Laſtly, if this ſhould prove troubleſome, as it ſometimes happens, you may put ſome ſoft Lint between them; after this, place a ſoft Pillow under the Leg and Thigh, but lower under the Thigh than the Leg. Some put a ſmooth Board under this Pillow, to keep the whole Limb, from the *Calcaneum* to the Hip, in its natural Poſture; and, leſt it ſhould decline to either Side, you muſt faſten theſe Ligatures to the middle String on the Leg, and to Nails drove on each Side of the Bedſtead; then roll up a Pair of large Sheets, and lay them on each Side of the Limb. This Method is equally adapted to Fractures of the Thigh, as well as the Leg. Laſtly, ſome apply a kind of Arch, made of a Portion of ſmall wooden Hoops, which *Scultetus* repreſents *Tab.* LVI. or half a Drum, or of a Sieve, that the Bed-clothes may not preſs upon and hurt the Part affected. For what further concerns the Poſture of the Patient, conſult the Rules we have already laid down.

Bandage for an oblique Fracture of the Thigh.

In an oblique Fracture of the *Femur*, the Surgeon ought to take particular Care, that the Deligation is tighter, and the Limb kept duly extended. Let a large Linen Cloth be placed between the Thighs in ſuch a manner, that one Part may be brought over the Groin of the affected, the other under the Buttock of the ſound Thigh, both faſtened with Nails to the Bedſtead, that the Patient's Body may not ſlip. Likewiſe, a ſtrong Ligature muſt be made above the Knee, and faſten'd to the Bottom of the Bedſtead, to keep the injur'd Limb from ſlipping upwards. If theſe prove troubleſome, you are to change them, by paſſing the upper one under the Buttock of the affected, and over the *Inguen* of the ſound Thigh. As to the Stay above the Knee, it will certainly prove troubleſome; but, before you undo it, a ſtrong Ligature muſt be made above the Ancle, (with a Piece of Cloth under it to keep it from galling) and faſten'd to the Bottom of the Bed; and this may be done alternately, till the Fragments may be judged to be firmly united, always obſerving to fix the one before you undo the other. Beſides, it will be very proper to fix a little Block covered with Linen, at the Bed's Feet againſt the ſound Foot, that the Patient may raiſe himſelf, and extend the other, when he finds he has ſlipt down. This Method is as convenient for the Cure of tranſverſe, as oblique Fractures of the Thigh.

Method of renewing the Bandage.

This Bandage, without an extraordinary Occaſion, ſhould not be taken off before the eighteenth or fourteenth Day: But if it proves too tight, too lax, or any other unforeſeen Accident renders it neceſſary, remove and renew the upper Bandage with the utmoſt Caution. It is no leſs hazardous to take off the ſecond or third, within a Fortnight; and indeed the laſt ſhould continue till the Cure is complete, which is generally ſix Weeks, tho' in Patients of a bad Habit of Body, or advanced in Years, it is ſometimes eight, nine, or ten Weeks, before the Fragments of this large Bone are agglutinated: And, when the Cure ſeems to be accompliſhed, the Patient ſhould not, for ſome time, walk without Sticks or Crutches, leſt the Bone, ſo lately reduced, ſhould relapſe into a ſecond Fracture.

Bandage for a Fracture in the Neck of the Femur.

For a Fracture in the Neck of the *Femur*, apply the *ſimple Spica inguinalis*, deſcribed above (*Tab.* 59. *Fig.* 16.). But your Roller muſt be ſixteen or twenty Feet long, and three or four Fingers broad; bind it very tight, and keep the Limb well extended downward; for otherwiſe the ſtrong femoral Muſcles will draw the lower Part of the Bone above the upper, and ſo prevent the uniting with the Head; conſequently that Leg will be ſhorter than the other, and the Patient be lame. Terminate the Roller by Circles round the Thigh, and then pin or ſew it. The Limb muſt be put into a Straw-caſe, as before, and the Patient ordered to lie very quiet.

Bandage for a Luxation of the Femur.

A Diſlocation of the Thigh, contrary to the common Opinion, very ſeldom proceeds from any external Violence, but generally from ſome internal Diſorder, *viz.* a Collection of viſcid Humours. Therefore, when the Head of the Thigh is thruſt out of its Socket, and its Ligaments debilitated by the Humours, it is very difficult to diſperſe them, and the Patient generally halts afterwards. However, to give the beſt Aſſiſtance we can, firſt moiſten a Compreſs in warm Wine or *Oxycrate*; then lay it round the Joint of the affected Thigh, and ſecure it by the *Spica Inguinalis* (*Tab.* 59. *Fig.* 16.). Let the Patient keep his Bed for a whole Month. If it proceeds from a Diſtortion of the Ligament, you ſhould repeat, ſeveral times in a Day, Fomentations of rectify'd Spirit of Feverfew, Roſemary, or Lavender, to the Part; or cheriſh it with Baths, and comforting Vapours; or cover it with ſtrengthening Plaiſters.

Bandage for a direct Fracture of the Patella.

We have already obſerv'd, that a Fracture of the *Patella* may be tranſverſe, or direct: For a direct Fracture, after Reduction of the Fragments, and defending the Tendons in the Ham with a thick Compreſs, apply the *uniting Bandage*, (ſee *Tab.* XXIII. *Fig. f*) of twelve Feet long, and two or three Fingers broad, ſlit in the Middle longitudinally, about three Fingers-breadth, and rolled up with two Heads: It is uſed much after the ſame manner, as that for perpendicular Wounds in the Forehead (*Tab.* LVIII. *Fig.* 3.). The Middle of the Aperture is laid on the *Patella*, and one of the Heads, being brought round the Ham, paſſes through the Slit; then they are both to be drawn tight, and inveſt the Fragments; then each is carried above and below the Knee, till the Bandage is ſpent. In the mean time, examine with your Finger, whether the fractured Parts are duly conjoin'd: After this, you fix on the *Patella* a Compreſs, and under the Ham a ſtrong Paſteboard-ſplint, both dipt in warm Wine, and ſecured by a Bandage eight or twelve Feet long, in ſpiral Turns, that the Knee may be properly extended, till the Fracture is conjoined, and has acquired an equal *Callus*. Laſtly, the Straw-caſe (ſee *Tab.* XXX. *Fig.* 5.) is apply'd, and ty'd with three or four Strings, as at *Tab.* LIX. *Fig.* 20.

Bandage for a tranſverſe Fracture of the Patella.

When the *Patella* is fractur'd in a tranſverſe Direction, which is the moſt common Accident, after the Extenſion of the Limb, and Reduction of the Parts, with the uſual Plaiſter, you take a Bandage twelve Feet long, and three Fingers broad, which is either double or ſingle-headed: The firſt is apply'd juſt above the Knee (ſee *Tab.* LIX. *Fig.* 22. *a*) by making a circular Round about the Thigh *d*; then croſſing them at the Ham, you bring them obliquely below the Knee at *e*; they are then reflected back, and the ſame Direction repeated above and below the *Patella*, as long as the Roller laſts: Be very careful to keep the fractured Parts together, in their due Poſition.

2. If the Bandage is ſingle-headed, fix its End above the *Patella a*; then make ſome Circles round the Thigh *b*, to faſten the End *d*; from hence you convey it obliquely under the Ham, to the upper Part of the Leg, where you form the cir-

cular Turn *e*, close to the lower Half of the *Patella*; thence bringing it obliquely cross the Ham, and intersecting the former, you go round the Bottom of the *Femur d*. Continue this Course as long as your Bandage lasts. Observe to keep the fractur'd Parts adequately together, during the Operation; and, when it is performed, place upon the *Patella* a Compress moisten'd with warm Wine or *Oxycrate*, and upon the Ham a Splint; these must be retained by another Bandage carry'd spirally, that the Knee may not have the least Motion, which would be very prejudicial. Some use a peculiar Instrument to keep the Leg extended, and from moving, and not without Success. Lastly, you may use the Straw-case (See *Tab.* LIX. *Fig.* 20.). But, since the Limb must be kept thus extended and bound for nine or ten Weeks, so that it may not be inflected before a complete Conjunction, the Patient must necessarily have more or less of a Rigor or Anchylosis; which will render him lame on that Leg, and which you must endeavour to mitigate, by frequently applying emollient Topicals, as Ointments, Fomentations. We shall conclude with the common Observation, that Men, who have once fractured this Bone, will, from the Weakness of the Joint, be ever afterwards liable to fall, and break it again, which is attended with a continual Halting.

A third Bandage for a fractur'd Patella.

As it is so difficult a Task to retain the Fragments of a transverse Fracture of the *Patella*, there is a third Bandage contrived, which is made of Linen thrice folded, about two Feet long, and eight Inches broad. One End A (see *Tab.* LIX. *Fig.* 23.) is left entire; they cut a Piece C D, two Inches broad from the other B B; the entire End is fixed upon the anterior Part of the *Femur*, (see *Fig.* 22. *d b*) in such a manner, that the excavated Part invests the *Patella*; then they apply the single-headed Roller, as before, in three Circles, round the Thigh, over the Compress, in the Direction *d*, *Fig.* 22. over these Circles they reflect the entire End of the Linen, and then repeat the Round at *d*, three times more, to fasten it. In the next place, an Assistant draws the two Heads B B, *Fig.* 23. tight, so as to bring the superior Half of the *Patella* to the inferior; then the Roller, crossing over the Ham, makes three Circles below the *Patella e*; after this, the two Heads are reflected upwards over these Circles, and secur'd by several other Rounds. The Remainder is spent in circular Turns above and below the *Patella*, and fasten'd by a Pin or Suture. Observe the former Directions for keeping the Patient quiet. You may also use the double-headed Roller.

Another Bandage for a transverse Fracture of the Patella.

In a transverse Fracture of the *Patella*, the Dressings are these: First, fold a Napkin in three; and, rolling it up at both Ends, you put a Piece of Pasteboard in the Middle, which is to be applied to the Ham, to keep the Leg from being bended; the two roll'd Ends are apply'd to the Sides of the Joint; a Sling, with four Tails, with a Hole in its Middle for the *Patella*, is apply'd along the Thigh and Leg; then, pressing down the superior Part of the *Patella*, you put a very thick Compress above it; and, pressing up the inferior Part, you put such another Compress below it; then you take a double-headed Roller, and begin on the superior Compress, cross in the Ham, (where you must also have a Compress) and upon the inferior Compress, and so on, until the two Pieces of the *Patella* be secur'd in mutual Contact; and, after applying a square Compress, dipt in a proper Liquor, to the bare *Patella*, you bring down one of the Tails of your Sling, laying the Tail at the opposite Corner above it, and so of the other two Tails; then fix them, and apply the Napkin, as before directed, making it fast with the same Band as for the Luxation of the *Cubitus*. The Advantage of this way of Dressing is, that you can have a View of the *Patella* at Pleasure, without being in Danger of disturbing the Fracture, it being secur'd by the first double-headed Roller; and if you find any Distance betwixt the two Pieces of the *Patella*, you can bring them nearer, by pulling the two Tails of the Sling in opposite Directions.

Bandage for a Luxation of the Knee.

There can be no Bandage more commodious for a Dislocation of the Knee, than those directed for the *Patella*, especially that for the transverse Fracture of the *Patella*. In this Case, the Patient should remain quiet for eight Days, till the Ligaments are supposed to be sufficiently firm.

Bandage for a Fracture of the Tibia.

For a Fracture of the *Tibia*, two Bandages are requisite, one twenty, the other twelve Feet long, each three Fingers broad; to these add four Compresses, and as many Splints, each a Span long; and, lastly, every thing order'd above for a fractur'd Femur. First, apply a Piece of slit Linen, (see *Tab.* XXIII. *Fig.* 18.) dipt in *Oxycrate*, or *Spirit of Wine*, to the fractur'd Part, so that the Heads may cross each other; then form three circular Turns with the first Bandage over this Linen; from whence gradually ascend in spiral Rounds above the Knee, without covering it; then return in the same manner; and, having form'd three Circles upon the affected Part, descend upon the *Calcaneum*, reinversing the Roller, by reason of the unequal Thickness of the *Tibia*. You next apply the same Compresses and Splints as for a fractur'd Arm; but the Compresses must be folded together towards the Bottom, in such a manner, that the *Tibia* may be equally bound every-where (see *Tab.* XXX. *Fig.* 13.). Lastly, apply two Pasteboard-splints, dipt in warm Wine or *Oxycrate*, and tied with three or four Strings; then put the Limb into a Straw-case, (see *Tab.* XXX. *Fig.* 5. and *Tab.* LIX. *Fig.* 20.) which must reach not much below the Ancles, nor more then an Hand's-breadth above the Knee, which is likewise tied with three or four Strings *a*, *b*, *c*, *d*; the vacant Spaces must be fill'd with Lint or Tow. And lastly, a Foot-board, with its Sling for the Heel, (*Tab.* XXX. *Fig.* 6, 7, 8.) must be plac'd at the Bottom of the Foot, as represented *Tab.* LIX. *Fig.* 20. C.

Bandage for a Fracture of the Tarsus *and* Metatarsus.

For a Fracture of the *Tarsus* and *Metatarsus*, you may use either a single or double-headed Roller; if you apply the latter, it must be twelve Feet long, and two or three Fingers broad. It is put round the Ancle (see *Tab.* LIX. *Fig.* 24. A) over a Compress slit at both Ends, (see *Tab.* XXIII. *Fig.* 18.) dipt in *Oxycrate*; and having there form'd a Circle, the two Heads cross over the Juncture of the Foot, are carried down round the *Tarsus* and *Metatarsus* B; then, crossing again under the Sole of the Foot, they ascend, and traverse each other upon the *Tarsus*, till the whole Foot is duly cover'd; then they go again round the Ancles, and, after two or three circular Turns, are fasten'd.

A single-headed Roller must be used in the following manner: After having fasten'd the Head by two or three circular Turns about the Ancle, descend obliquely over the *Tarsus* to the Bottom of the Foot; from thence ascend, and renew the former Course, crossing upon the *Tarsus* up to the Ancles, so that it resembles a Figure of 8 about the Foot and Ancle. When you have invested the affected Part by some spiral Turns, the Roller must be carried two or three times round the Ancle, and there fasten'd. If the Fracture is very bad, a Straw-case, with its Foot-board, *Fig.* 20. will be very serviceable. The same Deligation is proper for Fractures of the Toes, provided you invest them with spiral Turns. This Bandage is termed by the Antients *Sandalina* or *Sandalium*, a kind of Slipper worn by them.

Bandage for a Luxation of the Foot.

For a Luxation of the *Tarsus* or Ancle, you proceed in your Deligation as for a Fracture. The Patient ought to keep his Bed for some Days, and bathe the Part with some strengthening Spirit, till the Ligaments recover their antient Vigour, and the Pains cease.

Bandage for Phlebotomy in the Foot.

The Bandage for Phlebotomy in the Foot is made of a single-headed Roller, six Feet long, and two Fingers broad. The End is laid on the Outside of the Foot, so that about a Span hangs down, as we directed in the Deligation after Phlebotomy in the Arm: It is held on a Compress by the Left Thumb; then it is carried twice or thrice circularly like a Stirrup over the Wound and Compress, and from thence obliquely over the *Tarsus* to the Ancle; after this, it passes again obliquely over the Compress, under and round the Foot, and returns once more to the Ancle. Having repeated this, till your Bandage is almost spent, fasten it on the Outside of the *Tibia* (see *Tab.* XXIV. *Fig.* 1. E). Some begin their Bandage round the Ancle, then carry it obliquely over the *Tarsus* to the Bottom of the Foot, and from thence again to the *Tarsus*, where they make several circular or spiral Turns, which invest the Compress almost in the same manner, as in *Tab.* LIX. *Fig.* 24. A, B. They fasten the End with a Pin, or rather with a Suture. There are several other Methods; but, as in all of them there is some Resemblance of a Stirrup, this Bandage is call'd *Stapes*.

Bandage for an Amputation of the Leg or Thigh.

It is superfluous to be very exact in the Explanation of Bandages for an Amputation of the Leg or Thigh; for, after suppressing the Blood, the Capeline describ'd above, and represented *Tab.* LVIII. *Fig.* 19. is proper; except that the Leg and Thigh require a longer Roller than the Arm.

Bandage for a Fracture of the Tibia *with a Wound.*

After reducing the Fragments, cleansing the Wound, and laying on proper Remedies, the Surgeon's next Care is a convenient Bandage: And there is one peculiarly adapted to a compound Fracture, with eighteen Heads or Leaves, like a Book, (see *Tab.* XXX. *Fig.* 4. B B) by the *Germans* call'd a

Book-

Book-band. It is inconceiveable how commodious this is, as it may be open'd and bound up again, without moving the Limb, while thoſe long ones, uſed in ſimple Fractures, would prove very incommodious and hurtful, as they oblige you to agitate it ſo often. We ſhall therefore be very exact in our Deſcription of this Bandage.

Previous Diſpoſition of the Bandage.

When a Fracture of the *Tibia* is attended with an external Wound of the Skin, as *Tab.* XXX. *Fig.* 4. A, after Reduction, cleanſing the Wound, and dreſſing with Lint, and proper Remedies, take the Straw-caſe, *Fig.* 5. A A, B B; put three or four Pieces of Tape, each a Yard long, under it; then lay as many tranverſely over it, and upon them the eighteen-headed Bandage, as at *Fig.* 4. B B; and *Tab.* LIX. *Fig.* 25. C C, D D, E E. Thus you have the whole *Apparatus* for the Reception of the Leg.

The Application.

In the next Place, while an Aſſiſtant holds up the Leg in a convenient Poſture, you apply two middle Leaves tranſverſely over the fractur'd Leg and Dreſſings, firſt having dipt them in warm Spirit of Wine or *Oxycrate*, (ſee *Tab.* XXX. *Fig.* 4. and *Tab.* LIX. *Fig.* 25.) then the two lower, and then the two upper, of the firſt Order, not in an exact circular Direction, but ſomewhat obliquely, and acroſs each other, as at *Tab.* LIX. *Fig.* 25. *c c c*, *d d d*. Proceed then with the Leaves of the following Order in the ſame manner, beginning with the middle ones, and ending with the uppermoſt, which muſt be drawn round the Leg, as at *Fig.* 25.

Application of the Splints and Compreſſes.

After the Application of this Bandage, you lay two Compreſſes, of a Foot long, and two or three Fingers broad, folded towards the Ancle, as before directed (ſee *Tab.* XXX. *Fig.* 13.) and dipt in warm *Spirit of Wine*, on each Side of the *Tibia*, to which they muſt be equal in Length; one muſt be laid at C C C, *Fig.* 25. *Tab.* LIX. the other on the oppoſite Side at D D D; over theſe you place the ſix largeſt Leaves of the laſt Order E E, F F, G G; then you apply two Compreſſes, with a Splint of thick Paſteboard, which are tied round the *Tibia* on the Outſide, with three Tapes put under it, for that Purpoſe.

Poſture of the Leg after Deligation.

After the Deligation is completed, your next Care ought to be, to diſpoſe the Leg in the moſt convenient Poſture for Reſt. The Antients faſten'd a Pillow round the *Tibia*, as appears from the Writings and Figures of *Solingius*, *Purmannus*, and others. But, as this does not ſeem adapted to retain the Leg firmly, I would adviſe the Uſe of the Straw-caſe. As for what regards the quiet Poſture and Support of the Leg, conſult what we propoſed, where we treated of the Bandage for a fractur'd *Femur*; and ſee the Repreſentation, *Tab.* LIX. *Fig.* 20.

Renewal of the Dreſſings.

As to the Renewal of the Dreſſings, it may be done daily, or every other Day, according to the Quantity of the Diſcharge: During the Performance of this, an Aſſiſtant muſt hold the Leg up, that the Fragments may not be diſturb'd; and, after cleanſing the Wound, proceed as directed above. This muſt be repeated, till the Wound is entirely heal'd; and, if that happens before the Fragments are well united, you may apply a common Bandage, as in ſimple Fractures. Laſtly, if the Bandage and Dreſſings are foul, they may be changed, while two Aſſiſtants hold the Leg up carefully; but let your clean Band be ſew'd at one End, to the End of the foul one, before the Limb is remov'd, that at the ſame time you take out one, you may gently draw the other into its Place. As to the wooden Caſe of SCULTETUS, (*Tab.* LVI.) there are two ſufficient Objections againſt it: For, firſt, it is very troubleſome to the Patient; and, next, it is difficult to be procur'd in Camps, where theſe Fractures are very frequent; otherwiſe it is no contemptible Machine.

Machines for a fractur'd Tibia, *with a lacerated or contuſed Wound.*

As a fractur'd *Tibia*, with a lacerated or contuſed Wound, requires a more exact Reſt than the Straw-caſe will afford, there is a peculiar Machine contriv'd, which conſiſts of three braſs Plates joined together with Hinges, *Tab.* XXX. *Fig.* 9. theſe are uſed with the Foot-board, *Fig.* 6, 7, 8. Yet ſome prefer the Straw-caſe. But PETIT has contriv'd a curious Machine, not only for this, but all other Fractures, which is accurately deſcrib'd both in the Author's Treatiſe on Diſeaſes of the Bones, and in the Hiſtory of the Royal Academy of Sciences at *Paris* for the Year 1718. We have repreſented it *Tab.* XXX. *Fig.* 11, 12. and deſcrib'd it in the Explication of that Table.

Treatment of other compound Fractures.

If a Fracture of the Thigh is accompanied with an external Wound, apply the Bandage recommended for the *Tibia*. But both that, and the Straw-caſe, muſt be larger; and, though you may conveniently inveſt a compound Fracture of the Shoulder or Elbow with it, yet there is no Reaſon, why you ſhould not uſe the ſame Deligation, as in ſimple Fractures; becauſe, as the Bones are pendulous, they may be better ſecur'd by the common Roller, ſeeing it often happens, that the eighteen-headed Bandage cannot be apply'd to theſe Parts with ſo great Advantage as to the Leg and Thigh.

An Explanation of the Fifty-ninth Plate.

Fig. 1. Repreſents the Bandage for an Amputation of a cancerous Breaſt, where A, B, C, D, point out the firſt Courſe of the Roller; E E, the Compreſſes applied to the Breaſt.

Fig. 2. Shews the Method of applying the T Bandage for Diſorders of the Breaſt; *a a*, the Part which goes round the Body under the Breaſts; *b b*, the two Heads, which paſs over the Shoulders; *c*, the Part covering the Breaſt; *d*, the Neck, contain'd by the Slips *b b*.

Fig. 3. Denotes the four-headed Bandage for Diſorders of the Breaſts; *a*, the entire Part covering the Breaſt; *b b*, the two ſuperior; *c c*, the two inferior Heads; *d*, the ſound Shoulder, where they are tied together.

Fig. 4. Gives a View of the *Quadriga*, where the Letters *a*, *b*, *c*, *d*, *e*, *f*, *g*, ſhew the firſt Turns of the Roller.

Fig. 5. Repreſents the Bandage for an umbilical Rupture; A, the Compreſs to prevent a Falling out of the Inteſtines and *Omentum*; B B, the Girdle inveſting the Body; C, the *Scapulary* which ſecures the other; *d d*, the two Leaves of the Bandage which paſs between the Thighs, and are faſten'd with Strings at B B, that the Compreſs may be retain'd ſecurely upon the Navel.

Fig. 6. Denotes the Bandage for the *Inguen*; *a a*, its tranſverſe Part ſurrounding the Body; *b b*, its perpendicular Part going between the Thighs; *c*, its ſuperior and larger Part, which inveſts the Groin.

Fig. 7. Shews the ſame Bandage applied to the Body.

Fig. 8. Gives you a View of the Method of applying the Bandage for Diſorders of the *Scrotum*.

Fig. 9. Repreſents the Bandage itſelf; *a a*, the tranſverſe Part; *b b*, the perpendicular Slit in the Middle; *c*, the *Foramen* to tranſmit the *Penis*.

Fig. 10, and 11. Repreſent the different Forms of the double T Bandage for different Uſes.

Fig. 12. Shews the manner of applying the laſt to the Body for inveſting the *Scrotum*.

Fig. 13. Exhibits a compound Bandage for the *Scrotum*, called the *Suſpenſor* (*Gall. la Bourſe*); A A, the Part which receives the *Scrotum*, like a Purſe; *b b b*, the tranſverſe Part ſurrounding the Body; one End whereof *a* is tied to the other *b*; C, the Aperture for tranſmitting the *Penis*; B B, the two Heads which paſs betwixt the Thighs, and, being carried round them, are faſten'd by the Holes *d d*, with the Strings E E.

Fig. 14. Shews the manner of applying the T Bandage, repreſented by *Fig.* 11. for Diſorders of the *Anus*; *a a*, the tranſverſe Part faſten'd round the Body; *b*, the entire End of the perpendicular Part, retaining the Dreſſings on the *Anus*; *c c*, the Place where it is join'd to the other Part; *d d*, the two lower Heads carried between the Thighs, and faſten'd at the *Pubes*, or on each *Inguen*, as in *Fig.* 12.

Fig. 15. Repreſents the *double inguinal Bandage* for various Uſes, eſpecially to prevent profuſe Bleedings after Lithotomy, or the Operation for Fiſtulas; *a*, *b*, *c*, *d*, *e*, *f*, *g*, ſhew the principal Turns; but the prick'd Lines ſhew two Directions from *a* to *b*, and from *g* to *i*, which croſſing the *Abdomen*, are reflected under the *Perinæum*, and over the Shoulders, to compreſs the Parts more effectually. This I call'd the knotted Bandage for the *Perinæum*.

Fig. 16. Is the ſimple inguinal Bandage, which begins at *a*, and continues its Courſe by *b* to *c*, from thence by *d e* to *c*, and again to its Beginning *a*.

Fig. 17. Denotes a fractur'd Arm A, ſecur'd with Splints and Compreſſes *a a a*, and tied over the Bandage on the Outſide of the Arm with three Strings *b b b*; *c c c c* is the Sling hung about the Neck, and tied on the ſound Shoulder by the Knot *d*; *e e* is the Caſe for a Fracture of the *Cubitus*; but this is needleſs in a Fracture of the Shoulder or Clavicle.

Fig. 18. Shews the Bandage for a burnt or ſcalded Hand.

Fig. 19. Repreſents the Method of binding the Stump of an amputated Hand; *a a*, the Arm, with Part of the *Cubitus*; *a*, the Stump and Dreſſings; *b b*, the two Ends carried round the Compreſs in the Direction *c*; then one of them croſſes over the Stump *d*, the other continues in Circles: Hence termed *the Bandage with two reflected Heads*.

Fig. 20. Exhibits a Straw-caſe, and the Method of applying to the Leg; *a a*, two cylindric Bundles of Straw, with a Stick

in

in the Middle of each; *b b*, the ſubjacent Pillow; C, the Foot-board; *a*, *b*, *c*, *d*, four Strings, which tie the Whole together on the Outſide; *e f*, the two Strings which faſten the Foot-board to the Straw-caſe; *g*, the uppermoſt String, faſtening the Foot-board a little higher to the outer Cylinder.

Fig. 21. Is a double-headed Roller, whoſe Ends *a a* are ſew'd together, ſo as to leave an Inch in the middle *b*, where the *Calcaneum* in Fractures may be commodiouſly placed.

Fig. 22. Exhibits the Bandage for a tranſverſe Fracture of the *Patella*; *a*, the *Patella*; *b*, the Thigh; *c*, the Leg; *d*, the Circles above the *Patella*; *e*, thoſe below.

Fig. 23. A peculiar Bandage for the ſame Fracture; A, the upper and entire Part; *b b*, the two inferior Heads; *c d*, the Part where the Linen is cut out; C covers the ſuperior Part of the Patella.

Fig. 24. Shews the Deligation for a Fracture, Diſlocation, or Phlebotomy of the Foot; A, the circular Rounds, above the Ancles; B, the ſpiral and circular Turns about the Tarſus and Metatarſus.

Fig. 25. Teaches the Manner of inveſting a compound Fracture of the Tibia with the eighteen-headed Bandage; A, the Thigh; B, the lower Part of the Leg; C C C, D D D, the oblique Poſition of the Leaves acroſs each other, on the Fracture; E F G, the ſix outermoſt Leaves, to be laid over the Compreſſes, obliquely, in that Order.

FASCICULUS. An Handful; or, according to others, as much as can be taken up with two Fingers and the Thumb.

FASDIR. Jupiter; that is, Tin. *Rulandus.*

FASTIDIUM *Ciborum.* An Averſion to, or Nauſeating of, Aliment.

FASTIGIATI *Furni*, in Chymiſtry, are Furnaces furniſhed with ſeveral Aludels. *Caſtellus.*

FATUITAS. The ſame as MOROSIS; which ſee.

FAUCES, φάρυγξ. The Space about the Mouths, or Extremities, of the Gula and the Larynx, or the Gullet and the Wind-pipe; which expoſes itſelf to View when the Mouth is open, and the Tongue depreſs'd.

FAUFEL. The ſame as ARECA; which ſee.

FAVIFORMIS, κηριώδης. Honeycomb-like. An Epithet beſtow'd on ſome putrid Abſceſſes, or Ulcers, which, being preſſed with the Finger, emit a ſanious Mucus through a Multiplicity of Perforations, as Honey comes from the Comb.

FAULEX. Steel. *Rulandus.*

FAUNORUM LUDIBRIA IN QUIETE. An Expreſſion in *Pliny*, *Nat. Hiſt. Lib.* 25. *Cap.* 4. by which he means that nocturnal Diſorder which we call the INCUBUS.

FAVONIUS, ζέφυρος. The Weſt Wind, which is generally cold and humid.

FAUSTINI PASTILLI. Fauſtine Troches, are of ſeveral Sorts: The firſt is for Dyſenteries, and the Cœliac Paſſion, and is thus prepar'd:

Take of burnt Paper, ſeven Drams and an half; Quick-lime, ſix Drams and a Quarter; Arſenic, three Drams; Sandarach, one Dram and an half: Triturate and ferment them with Lentils, and a ſufficient Quantity of a Decoction of Myrtle-berries.

Another Preparation of Fauſtine Troches is as follows:

Take of Quick-lime, two Drams and an half; Sandarach, one Dram and an half; Arſenic, two Drams; burnt Paper, ſeven Drams and an half: Triturate and ferment them in a Decoction of Myrtle-berries; and then make them into Troches, for Uſe.

The way of making the Fauſtine Troches, in *Alexandria*, is thus:

Take of Arſenic, and Sandarach, each two Drams; Quick-lime, ſeven Drams; Acacia, ſix Drams: Triturate and work them in Wine; after which, form them into Troches. *Myrepſus*, *Sect.* 4. *Cap.* 99, 100.

FAVUS. The ſame as CERION; which ſee.

FEBRIFUGA, Febrifuges, are ſuch Medicines as mitigate or remove a Fever; they are otherwiſe call'd ANTIFEBRILIA. *Febrifuga* is alſo a Name for the CENTAURIUM MINUS.

The *Febrifugum Concharum Crollii* is much the ſame as the *Concharum Antifebrile* of *Bates*. See CONCHA.

Under the Article DUODENUM, I have ſpecified one Method of preparing the celebrated Febrifuge of *Riverius*; but our Countryman, *Bates*, gives the Preparation in a ſomewhat different manner, thus:

Take of the Flowers of Antimony, thrice ſublim'd with Sal Ammoniac, and edulcorated, of Glaſs of Antimony, precipitated in four Ounces of Aqua-fortis prepar'd of Nitre and Alum, each half an Ounce; of Mercury, precipitated with Aqua-fortis prepar'd of Nitre, Vitriol, and Alum, ſix Ounces; of Gold, diſſolv'd in Aqua Regia, one Ounce: Mix, and diſtil gradually to Dryneſs, from a Retort, uſing twelve Cohobations. To the Powder, when five times waſh'd, and dried, add two Pints of the Alcohol of Wine; and diſtil from a new Retort, uſing ſix Cohobations. Pour out the Alcohol of Wine, and put the Maſs of the Calx into a cloſe-ſtopt Crucible, which is to be placed in a rotatory Fire, for three Hours; then kindle the above-mention'd diſtil'd Spirit of Wine upon it, according to Art. The Doſe is from ſix Grains to half a Scruple, with an equal Quantity of ſulphurated Scammony.

FEBRIS. A Fever. See the Articles CATHARTICA, DEPURATORIA, MILIARIS, and PYRETOS.

FECULA. The ſame as FÆX; which ſee.

FEDUM. Crocus. *Rulandus. Johnſon.*

FEGOPYRUM. See *Fagopyrum vulgare ſcandens.*

FEGOTRITICUM. A Name for the *Fagopyrum vulgare ſcandens.*

FEL. Gall. See BILIS.

FELILECH, *Faulis.* Iron. *Rulandus.*

FELIS. See CATUS.

FELLA. Sulphureous or ſulphurated Water. *Rulandus.*

FELLETIN. Plates of Iron. *Johnſon.*

FELLIFLUA *Paſſio.* A Name in *Cœlius Aurelianus*, *Acut. Morb. Lib.* 3. *Cap.* 19. for the *Cholera Morbus.*

FEMUR. See CRUS.

FENESTRA. A Name for two Foramina, or Openings, within the Ear; one call'd *Feneſtra Ovalis*, and the other *Feneſtra Rotunda*; for which ſee AURIS.

FERINUS, θηριώδης, properly ſavage, brutal; but in a medicinal Senſe, importing noxious, or malignant. Hence it is applied to Diſeaſes remarkable for their Malignity, as proceeding from an extraordinary Depravation of the Humours. *Galen. Com. in 6 Epid.* On this Account we find it given to Worms, a Cough, a raging Delirium, and Ulcers of a bad kind. 1 *Prorrhet.* and *Coac.* Patients, alſo, labouring under ſuch malignant Diſtempers, are called θηριώδεις, *Ferini*, 4 *Epid. Ferinus*, θηριώδης, is, alſo, an Epithet beſtowed by *Hippocrates*, *Lib. de priſca Medicina*, on ſuch Food as was the Suſtenance of Mankind, in the firſt Ages of the World, being chiefly Acorns, and other Fruits and Roots, which they had in common with the wild Beaſts.

FERION. A fictitious ſpagiric Term, occurring in *Theat. Chym. Vol.* 5. *p.* 159. but, what it means, is impoſſible to be learn'd from the Deſcription there given.

FERMENTATIO. Fermentation. See ALCOHOL and ACETUM.

FERMENTUM. Ferment, Leaven, Barm, Yeſt. The Ferment moſt uſed in *England* is the Spume or Froth of Beer, concreted; and we ſeldom uſe any other, where that is to be had: And this Sort of Ferment, *Pliny* tells us, was in Uſe among the Northern Nations, in former Ages: "In *Spain* "and *Gaul*, he ſays, after they have reſolved their Corn into "Drink, the concreted Spume of the Liquor ſerves them for "Ferment; whence their Bread is lighter than that of other "Nations." *Nat. Hiſt. Lib.* 18. *Cap.* 7. This concreted Spume of Beer, then, is, in the Judgment of *Pliny*, a moſt laudable and wholſome Ferment. See ALCOHOL.

FERRAMENTUM. A common Name for all Inſtruments made of Iron or Steel, particularly in Surgery.

FERRATUS. An Epithet for an Inſtrument, arm'd, or fortified, with Iron or Steel. Applied, alſo, to Waters impregnated with Iron; whence *Aquæ ferratæ* are the ſame as ACIDULÆ.

FERRETUM, *Ferreto*, that is black or burnt *Cyprian* Copper; made uſe of in making Glaſs. It is now made in *Spain.*

FERRUGO, ἰὸς σιδήρου, Ruſt of Iron, is a Reſtringent: Applied by way of Peſſary, it repreſſes the Fluor Uterinus; and, drank, it prevents Conception; it cures the Eryſipelas, and exanthematous Eruptions, if it be rubbed on the Parts with Vinegar. It is of good Uſe in a Paronychia, Roughneſs of the Eyelids, and a Condyloma; it alſo ſtrengthens the Gums, relieves under the Gout, being rubbed on the Part affected; and makes the Hair grow after an Alopecia. Wine, or Water, in which red-hot Iron has been quenched, being drank, is good for the Cœliac Paſſion, Dyſentery, Diſorders of the Spleen, Cholera Morbus, and Relaxations of the Stomach. *Dioſcorides*, *Lib.* 5. *Cap.* 98. See MARS.

FERRUM, σίδηρος. Iron. See MARS.

FERRUM EQUINUM.

The Characters are;

It has a flat Pod, diſtinguiſhed by lunated Joints, reſembling an Half-moon, and full of Seeds of the ſame Shape.

Boerhaave.

Boerhaave mentions three Species of this Plant; which are,

1. Ferrum equinum ſiliqua ſingulari. *C. B.* 349. *M. H.* 2. 117. HORSESHOE-VETCH WITH A SINGLE POD.

2. Ferrum equinum; ſiliqua multiplici. *C. B. P.* 349. *M. H.* 2. 118. HORSESHOE-VETCH WITH MANY PODS.

3. Ferrum equinum; Germanicum; ſiliquis in ſummitate. *C. B. P.* 349. *Raii Hiſt.* 1. 930. *Synop.* 3. 325. *Ger. Emac.* 1236. *Tourn. Inſt.* 400. *Elem. Bot.* 319. *Boerh. Ind. A.* 2. 52. *Ferrum Equinum.* Offic. *Ferrum equinum ſiliquis in ſummitate.* Merc. Bot. 1. 35. Phyt. Brit. 40. *Ferrum equinum ſiliquis in ſummitate multiplicibus Germanicum.* Buxb. 109. *Ferrum equinum comoſum.* Park. Theat. 1091. Rupp. Flor. Jen. 215. Mer. Pin. 38. Rivin. Irr. Tetr. *Ferrum Equinum capitatum, vel comoſum.* Col. Ecphra. 1. 301. Hiſt. Oxon. 2. 118. *Solea equina & Ornithopodio affinis Herba.* Chab. 155. *Ornithopodio affinis, vel potius Soleæ, aut Ferro Equino Herba.* J. B. 2. 348. TUFTED HORSESHOE-VETCH.

It grows in chalky Grounds in ſeveral Places, and flowers in *June*. The Herb is in Uſe, which is an Aſtringent, and ſtops Bleeding. *Dale.*

FERSÆ. A Name for the MORBILLI, or Meaſles. *Caſtellus.*

FERU. Tin. *Rulandus. Johnſon.*

FERULA, *νάρθηξ.*

The Characters are;

It has a large, ſucculent, and milky Root; the Stalks are fungous, full of Pitch, and diſpoſed to take Fire. The Seeds are very large, oval, and thin; they throw off their Involucrum, and, for the moſt part, turn black, when ripe.

Boerhaave mentions thirteen Species of this Plant; which are,

1. Ferula; durior; ſeu rigidis & breviſſimis foliis. *Barrel. Ic.* 77. *Obſ.* 61. *Pag. N°.* 638. *Boccon. Muſ.* 2. 84. *Tab.* 76.

2. Ferula; major; ſeu fœmina Plinii. *Boerh. Ind. A.* 64. *Ferula.* Offic. Ger. 898. Emac. 1056. *Ferula tenuiore folio.* Park. Theat. 875. *Ferula major, ſeu fœmina.* Mor. Umb. 35. *Ferula fœmina Plinii.* C. B. Pin. 148. Tourn. Inſt. 321. Elem. Bot. 271. *Ferula tenuiore folio, ſeu fœmina Plinii,* Hiſt. Oxon. 3. 309. *Ferula folio fœniculi, ſemine latiore & rotundiore.* J. B. 3. 43. Chab. 388. Raii Hiſt. 1. 420. FENNEL-GIANT.

It is ſometimes cultivated in the Gardens of Botaniſts, and flowers in *July*. The Parts in Uſe are the medullary Subſtance of the Stalks, the Seed, and the Juice or Gum, which is the Sagapenum of the Shops. *Dale.* See SAGAPENUM.

The Medulla, or Pith, of the green Ferula, being drank, is good for Spitting of Blood, and the Cœliac Paſſion. It is preſcrib'd in Wine, for the Bite of the Viper; and, intruded into the Noſtrils, ſtops Bleeding at the Noſe. The Seed, drank, relieves under the Gripes; and, uſed in Unction with Oil, provokes Sweat. The Stalks, taken as Food, cauſe Headach; they are uſually pickled. The Ferula often produces a Stalk three Cubits long; its Leaves reſemble thoſe of Fennel, but are much larger and thicker. The Sagapenum diſtils from the Stalk, wounded near the Root. *Dioſcorides, Lib.* 3. *Cap.* 91.

3. Ferula; glauco folio; ſemine lato, oblongo; quibuſdam Thapſia ferulacea. *J. B.* 3. 45. *Chab.* 388. *Raii Hiſt.* 1. 420. *Tourn. Inſt.* 321. *Boerh. Ind. A.* 64. *Libanotis altera,* Offic. *Libanotis fœniculi folio, ſemine foliaceo.* C. B. Pin. 158. *Panax aſclepium anguillariæ & Camerarii.* Park. Theat. 883. CANDY ALL-HEAL.

It grows in the Iſland of *Candy*, and flowers in Summer. The Parts in Uſe are the Root, Herb, and Seed.

The Herb, bruis'd and applied, ſtops the Bleeding of the Hæmorrhoids, mitigates Inflammations of the Parts about the Anus, and Condylomas. The Roots, dried, cleanſe Ulcers, and provoke Urine, and the Menſes; the Seed, drank, has the ſame Effects. *Dale* from *Dioſcorides.*

4. Ferula; galbanifera. *J. B.* 3. 52. *Lob. Icon.* 779. *Tourn. Inſt.* 321. *Elem. Bot.* 271. *Boerh. Ind. A.* 64. *Till. Hort. Piſ.* 60. *Chab.* 388. *Ferula latiore folio.* Park. Theat. 875. Hiſt. Oxon. 3. 309. *Ferula altera.* Ger. 899. *Ferulago.* Ger. Emac. 1056. *Ferulago latiore folio.* C. B. Pin. 148. Commel. Plant. uſu. SMALL FENNEL-GIANT.

It grows in the Gardens of Botaniſts. *Lobel* ſays, it was produced from Seed found at *Antwerp*, in the Tears of the Galbanum. *Dale.*

5. Ferula; Africana; galbanifera; folio & facie liguſtici. *Par. Bat.* 163. *Raii Hiſt.* 3. 252. *Boerh. Ind. A.* 65. *Till. Hort. Piſ.* 61. *Galbanifera Planta.* Offic. *Ferula fruticoſa ſempervirens, foliis Aniſi, Galbanifera, ex qua Galbanum Officinarum,* Parad. Bat. Prod. 334. Pluk. Almag. 144. *Aniſum Africanum fruticeſcens, folio & caule vere cæruleo tinctis.* Pluk. Phytog. 12. f. 2. *Aniſum fruticoſum Africanum Galbaniferum.* Hiſt. Oxon. 3. 297. *Oreoſelinum Africanum Galbaniferum fruteſcens Aniſi folio.* Tourn. Inſt. 319. *Oreoſelinum Aniſoides arboreſcens Liguſtici foliis & facie flore luteo Capitis Bonæ Spei.* Breyn. Prod. 2. 79. THE GALBANUM-PLANT.

The Stalks are three or four Cubits high, and an Inch thick; they are not annual, like thoſe of the reſt of the *Ferulæ*, but perennial, ligneous, ſmooth, cover'd with a glaucous Dew, as are the Leaves, geniculated, and divided into Branches, on the Tops of which grow ſmall yellow Flowers like thoſe of the Ferula, and conglobated into the Form of an Umbella; theſe are ſucceeded by oblong, flatiſh, ſtriated Seeds, of a dark-red Colour, and incloſed within a thin membranaceous Involucrum: They reſemble the Seeds of Lovage, in every reſpect; only they are not ſo deeply furrow'd, and are, beſides, furniſh'd with a membranaceous Margin. The Leaves are equal to thoſe of Lovage, but ſtiffer, and of a more lively green, having the Edges of their Lobes cut, or jagged, like thoſe of Aniſe. The Root is thick, ligneous, pale, branched, of an acrid, aromatic Taſte; being wounded, it yields a Milk, but diluted, and little in Quantity, and concreting into a Tear, in all reſpects anſwering to the Galbanum; and this Liquor, ſometimes, diſtils ſpontaneouſly from the Joints of the Stalks, when of three or four Years Growth. It is an Ever-green, and is preſerved with no great Trouble in Stoves, with us, during the Winter. For the Virtues, ſee GALBANUM.

6. Ferula; Tingitana; folio latiſſimo, lucido. *H. Edinb. Broad-leav'd ſhining* FENNEL-GIANT, *from* Tangier.

7. Ferula; Tingitana; lucida; folio anguſto. *H. L. Narrow-leav'd* FENNEL-GIANT, *from* Tangier.

8. Ferula; foliis capillaceis, erectis, cachryos; ſemine glauco.

9. Ferula; Africana; galbanifera fruteſcens, folio Myrrhidis. *C. Comm. Hort. Amſt.* 2. *p.* 115. *Till. Hort. Piſ.* 60. ANOTHER GALBANUM-PLANT. *Dale.*

This laſt, with the fifth Species, as D. *Commeline* writes, being wounded, yields a lacteous Juice, which concretes into a Tear, in all reſpects like GALBANUM, which ſee.

10. Ferula; foliis libanotidis brevioribus; Alpeſtris; umbella ampliſſima.

11. Ferula; Alpeſtris; foliis ſeſelios Maſſilienſis. *Libanotis, Alpeſtris, minor, foliis Seſeli Maſſilienſis.* H. Maur.

12. Ferula; quæ Libanotis; folio fœniculaceo; ſemine folioſo. *C. B. P.* 158.

13. Ferula; minor; ad ſingulos nodos umbellifera. *Tourn. Inſt.* 321. *Boerh. Ind. A.* 65. *Panax Aſclepium.* Offic. Mor. Umb. 33. *Panax Aſclepium Ferulæ facie.* Ger. Emac. 1057. *Libanotis Ferulæ folio & ſemine.* C. B. Pin. 158. *Libanotis quibuſdam, flore luteo, ſemine Ferulæ.* J. B. 3. 41. Chab. 386. Raii Hiſt. 1. 421. *Libanotis Ferulæ folio & ſemine, ſive Panax Aſclepium Ferulæ facie Lobelii.* Park. Theat. 881. *Ferula minor.* Elem. Bot. 271. THE ALL-HEAL OF ESCULAPIUS.

Its Leaf is nearly of the Size of the Leaf of the Ferula, but more finely divided, ſtiffer, and of no unpleaſant Smell. They grow on Pedicles which are ſolid, and not at all fungous. The Stalk is tall, ramous, and ſtriated; the Flowers ſmall, yellow, and diſpoſed in an Umbella; the Seed looſely ſcattered over the Umbella, foliaceous like that of the Ferula, long, double, whitiſh, eſpecially what is foliaceous in it, ſtriated, remarkably bitter, and, as it were, reſinous: The Stalk and Root, in Size and Shape, reſemble thoſe of Dill. *Raii Hiſt. Plant.*

It grows in *Iſtria*, and flowers in Summer; the Flowers and Seed are uſed in Medicine, and, if bruiſed and applied with Honey, are effectual againſt phagedenic and other Ulcers, and Tubercles; being drank in Wine, they are good for the Bites of Serpents. *Dale* from *Dioſcorides.*

FERULANA. *Boerhaave.* A Name for the *Ferula, foliis Libanotidis brevioribus; Alpeſtris; umbella ampliſſima.*

FERULACEA *Raii.* A Name for the *Ferula Galbanifera.*

FESTUCA. See ÆGILOPS.

FIATOLA. A Sea-fiſh, ſo call'd at *Rome*, where it is very common. It is broad, flat, and almoſt round, with Scales of the Colour of Gold and Silver; it has much of the human Shape, and is very good to eat, but not uſed in Medicine. *Lemery des Drogues.*

FIBER. See CASTOR.

FIBRA. A Fibre. *Boerhaave* takes a moſt excellent Method in treating Diſeaſes of the human Body. He begins with thoſe of the moſt ſimple and uncompounded Parts, and thence proceeds to thoſe of the more compounded. The firſt thing he treats of is a ſimple Animal Fibre; and the Diſeaſes it is ſubject to, as ſuch.

Thoſe Parts, which being ſecreted from the Fluids contained in the Veſſels, and, by the vital Powers, together with a highly fine aqueous, or pinguious Glue, mutually applied and united to each other, conſtitute the ſmalleſt Fibre, are themſelves highly minute, ſimple, terreſtrial, and ſcarce capable of undergoing a Change, by the Cauſes which ſubſiſt in an human Body, whilſt alive.

The moſt ſimple Fibre conſiſts of Parts ſtill more minute, longitudinally applied to each other; and theſe conſtituent Parts of a Fibre, which can no longer be divided into Parts ſtill more ſmall and minute, are called the Elements, or firſt Principles, of the Fibres. Now *Galen, de Hippocratis & Platon. Placit. Lib.* 8. *Cap.* 2. informs us, "that the Element of any thing "is the ſmalleſt and moſt minute Part of that thing, whoſe "Element it is." The ſmalleſt Fibre is that which conſiſts of two of theſe Elements, longitudinally applied to each other; ſince one ſuch Element, conſider'd by itſelf, and abſtractedly, does not conſtitute a Solid, but is a Part of the Fluids; ſo that a Combination of theſe Elements, or firſt Principles, conſtitutes what we call a Fibre.

As for the Method in which the Fibres are form'd and produced, it is certain, that an Adult, weighing two hundred Pounds, lay originally conceal'd in the ſeminal Matter of his Father; that, from ſo ſmall a Molecule, he gradually increas'd to ſo large a Weight; and that this Increaſe of the ſolid Parts was produced by the Fluids. This is confirm'd by the Experiments of *Malpighi*, made on an incubated Egg; and which were before tried by *Hippocrates*, as we find in his Book *de Natura Pueri*, where we are told, that, by an Attenuation of the White of an Egg, by means of Incubation, a Chick, with firm Solids, was, in twenty-one Days, produc'd from an inviſible Molecule.

But this White of the Egg muſt have been farther attenuated and elaborated, by means of the Organs of the Chick, before it could have poſſibly paſs'd through thoſe Veſſels, which are ſo ſmall as not to be ſubjected to our Senſes.

The Elements, however, of the ſolid Parts were contain'd in this highly ſubtile Fluid.

Hence we may juſtly conclude, that the Parts, which conſtitute a ſolid Fibre, are, themſelves, extremely ſmall and minute.

Theſe Parts are, alſo, of a highly ſimple and uncompounded Nature; ſince, according to the Definition already given, from *Galen*, they could not be call'd Elements, if any thing of a more ſimple Nature could be conceiv'd.

Theſe Parts are, alſo, of a terreſtrial Quality. It may, perhaps, at firſt appear preſumptuous thus poſitively to determine and aſcertain the particular Nature of thoſe Corpuſcles, which conſtitute a Fibre. But we call that a terreſtrial Subſtance, which can neither be diſſolv'd by Water, nor fus'd by Fire, but remains invariably fix'd. Now the ſolid Parts of Animals, when ſubjected to a chymical Analyſis, yield Remains of this Kind, abſolutely deſtitute of every volatile Principle. This is, alſo, confirm'd by Putrefaction, which ſeparates Earth from all other Principles; for, upon viewing an human Body, which has lay buried in the Earth for ſeveral Years, unleſs it become dry and indurated, which ſometimes happens, all the Parts are found to retain their former Figure, ſo that the Perſon's Face may be known, from the Reſemblance it bears to his Countenance, when alive; but, upon the ſmalleſt Concuſſion, the Parts collapſe, and a ſmall Quantity of ſubtile Earth is found to cover the Bones, which, for the moſt part, are, as yet, ſufficiently firm; theſe very Bones, when, for a conſiderable time, expos'd to the open Air, or calcin'd in an open Fire, are found, after an Expulſion of all other Principles, to conſiſt purely of Earth.

In the laſt Place, theſe Elements, or minute conſtituent Parts of a Fibre are ſcarce capable of undergoing any Change. When Eſſay-maſters, by an highly intenſe Degree of Fire, try their Metals fus'd with Lead, the beſt Copels they can uſe are thoſe which, like a Sieve, ſuffer the Lead to paſs through them, but retain the more precious Metal. Now, it is by no means probable, that, ſince the Parts of theſe Metals remain unchang'd by ſo briſk a Degree of Fire, the Elements, or component Parts, of Fibres ſhould undergo a Change by the Action of Cauſes ſubſiſting in the human Body whilſt alive. Theſe Elements, or component Parts, may cohere, and have that Coheſion again deſtroy'd, but they remain immutable and unchangeable in every other reſpect.

It may, poſſibly, appear ſurpriſing, that an Earth of ſo fix'd and indiſſolvable a Nature ſhould be lodg'd in the moſt fine and ſubtile Fluids: But of the Truth of this we are ſufficiently convinced by Chymiſtry; for the ſaline, alcaline, and highly tranſparent Spirits, obtain'd from animal Subſtances by Fire, contain an Earth. The pureſt Oils, alſo, diſtil'd from the Parts of Animals, contain an Earth, after repeated Diſtillations, till, at laſt, being entirely freed from the Earth they contain, they become volatile, and are evaporated in the Air; for the Earth ſeems to give a fix'd Nature to the other Principles of theſe Oils.

But as the ſolid Fibres of the human Body conſiſt of theſe terreſtrial Elements, 'tis neceſſary they ſhould cohere with each other. This Coheſion is produc'd by the vital Powers applying to the already form'd Fibres, freſh or additional Elements, in order to ſupply the Places of thoſe before loſt; and this is what we call Nutrition. Tho', in conſidering various Phenomena, we are frequently ignorant of the particular Manner in which they are produc'd, 'tis yet probable, that this Coheſion of the Elements of Fibres is owing to the Interpoſition of an aqueous or pinguious Glue; for Water is poſſeſs'd of an incredible Power of uniting and cementing Bodies. The Calx of burnt Alabaſter, which may be ſcatter'd by blowing upon it, by the Addition of Water becomes a ductile Paſte, which, being ſoon concreted into a ſtony Hardneſs, is call'd Plaiſter of *Paris*. Sea-ſhells, burnt to a Calx, afford an highly fine Powder, which, by its light and volatile Nature, often proves hurtful to the Lungs. This Powder, when mix'd with Water, yields a Paſte, which by means of Fire is converted into the hardeſt Stone. Beſides, in the hardeſt Parts of Animals, where no one would ſuſpect there was any Water, a large Quantity of that Fluid is found; for when the drieſt Ivory, or Hartſhorn, which have lain in the Shops for many Years, are diſtil'd from Glaſs Retorts, the greater Part of them becomes volatile, and paſſes into the Receiver: Thus a great Quantity of Water is obtain'd, whilſt what remains in the Retort is friable. Perhaps the judicious *Homer* had this Doctrine in his Eye, whilſt, at the time the *Greeks* ſtood mute, when *Hector* challeng'd their Army to a ſingle Combat, he makes the enrag'd *Menelaus* wiſh their Annihilation in the following Words:

Ἀλλ' ὑμεῖς μὲν πάντες ὕδωρ καὶ γαῖα γένοισθε.

May all of you be transform'd to Earth and Water.

That a pinguious Glue alſo makes earthy Parts cohere, is ſufficiently evident from chymical Experiments; for ſo long as this oleous Matter, which can only be ſeparated by the Force of Fire acting in an open Air, adheres to the Parts of Animals, theſe Parts cohere; but when this pinguious Matter is expel'd, they become Aſhes. Bones calcin'd to the higheſt State of Friability, when immers'd in Oil, become again coherent.

For this Reaſon, in theſe moſt ſimple Elements, conſider'd abſtractedly and in themſelves, there is no Diſeaſe hitherto obſerv'd, or ſaid to be cur'd by Phyſicians.

When the moſt minute Elements, from the Union of which the moſt ſimple Fibre is produc'd, are conſider'd ſeparately and apart, we can affirm nothing poſitive concerning them; and they who, indulging themſelves in ſubtile Speculations, have attempted to inveſtigate their Diſorders, have ſaid nothing of any real Uſe to Mankind and Medicine. 'Tis eaſy to conceive, that they may be tranſpos'd, and have their mutual Coheſion deſtroy'd; but that the Elements, or firſt Principles, of Bodies are abſolutely immutable, is confirm'd by the whole Frame of Nature, for ſix thouſand Years paſt.

For theſe moſt minute Elements of the ſolid Parts are either to be conſider'd, whilſt, being lodg'd in the Fluids, they are carried through the Veſſels; but, in this State, their Diſorders, tho' known, would be only Diſorders of the Fluids: Or they are to be conſider'd as united, and conſtituting a ſolid Part; and, in this Caſe, they are no longer Elements, but a Solid, compounded and made up of theſe.

But in the ſmalleſt Fibre form'd by the Union of theſe Elements, the following highly ſimple Diſeaſes deſerve our careful Attention, ſince they frequently occur; and, tho' overlook'd, or little adverted to, yet lay a Foundation for underſtanding the Nature and Cauſes of others.

The moſt ſimple Diſeaſes are not, therefore, to be ſought for in the Diſorders of the Elements, which perhaps will remain eternally in the Dark, but in the ſmalleſt Fibre, form'd by the Union and Conjunction of theſe; for when only two Elements cohere with each other, their unnatural Coheſion is capable of producing a Diſeaſe; for 'twill be ſufficiently evident from what follows, that either too ſtrong, or too weak, a Coheſion in the ſimple ſolid Fibres, and the Veſſels and Viſcera form'd of them, may give Birth to an infinite Number of Diſorders.

But theſe Diſorders have been almoſt entirely overlook'd and neglected; for the *Methodics*, to whom the Doctrine of Stricture and Relaxation is aſcrib'd, have not treated of theſe moſt ſimple Diſeaſes, ſince, according to *Celſus*, in the Preface to his firſt Book, "They thought it ſufficient to inquire "into the common Nature of Diſeaſes, of which they eſta- "bliſhed three Kinds; one ariſing from Stricture, another "from Relaxation, and a third of a mix'd Nature; ſince the "Excretions of Patients were ſometimes too ſcanty, and at "other times too copious; ſometimes, alſo, too ſmall in one "particular Part, whilſt they were too large in another."

Diſeaſes of a Fibre from Laxity.

The moſt minute and ſimple Fibre is ſaid to be weak, when the Union of its moſt minute Parts, and their Tendency to Coheſion, are ſo ſmall, that they may be ſeparated by that gentle Motion produc'd in a State of Health, or, at leaſt, by a Motion not much greater.

From

From whatever Cauſe the mutual Coheſion of the Elements, which conſtitute a Fibre, proceed, 'tis no hard Taſk to conceive, that the Power or Force, by which they cohere, may be either augmented or diminiſh'd. Our Veſſels, which are compos'd of Fibres, muſt be capable of yielding to the Impulſes of a Fluid, and of being diſtended, but not too much: The Coheſion alſo of theſe Veſſels ought to remain without a Rupture: Hence a fix'd and determin'd Degree of Coheſion is requiſite in our Fibres; and either a Defect or Exceſs in this Coheſion will produce a Diſeaſe.

The Weakneſs of a Fibre can, therefore, only be defin'd in a relative Senſe: For ſome Weeks immediately after Conception, the Rudiments of the Fœtus become liquid when touch'd, and, unleſs they were ſuſtain'd by the equable Preſſure of a circumambient Fluid, would fall into a ſmall mucous Maſs, entirely void of Shape and Form. During this State, ſo ſmall a Coheſion of the Fibres is requiſite, but a far ſtronger Degree of Coheſion is neceſſary in the Fibres of Adults.

Different Degrees of Coheſion are, alſo, requiſite in different Parts of one and the ſame Perſon: Thus the Coheſion of the minuteſt Solids, which conſtitute the ſoft Pulp of the auditory Nerve, ſeem to be far leſs than the Coheſion of thoſe which conſtitute that hard Tendon which receives its Denomination from *Achilles*.

Hence a ſolid Fibre is ſaid to be too weak, when its Coheſion is not ſo ſtrong as to ſuſtain that Motion, which, in a State of Health, is requiſite for the due Performance of the animal Functions.

Nor is this ſufficient; for the Fibres ought always to be capable of ſuſtaining a ſomewhat greater Force; for if the Coheſion of theſe moſt minute ſolid Parts was only able to bear a gentle Motion of the Fluids thro' the Veſſels in a State of Health, and no more, it would be immediately deſtroy'd, when, in conſequence of an increas'd Circulation, the Fluids were carried thro' the Veſſels with a greater Force. Now the Velocity of the Circulation is increas'd by the ſlighteſt Cauſes, and ſuch as can neither be foreſeen, nor prevented, by human Sagacity: Thus, upon the Hearing of a ſudden Noiſe, the Palpitations of the Heart, and the Strokes of the Pulſe, become preternaturally quick: Laughing, Coughing, and Sneezing, alſo, conſiderably accelerate the Circulation of the Blood.

In certain Diſeaſes it ſometimes appears, how miſerable the Condition of the Patient is, whoſe ſolid Fibres are ſo weak, that they are only capable of ſuſtaining an highly mild and gentle Motion.

Thoſe who, having weak Lungs, ſpit Blood in conſequence of the Rupture of an Artery, live pretty comfortably, if they remain in a State of Reſt, if, by Veneſection, the Quantity of the Blood diſtending the Veſſels is leſſen'd, and if they uſe no Aliments of a ſtimulating and irritating Nature: But if they are ſeiz'd with a violent Cough, cry aloud, or are agitated by the Workings of ſome tempeſtuous Paſſion, the tender Veſſels of the Lungs, in conſequence of the Impetus of the Blood carried thro' them, being enlarg'd, are broken, and ſo violent an Effuſion of Blood is often brought on, as ſuddenly to deſtroy the Patient.

This Debility or Weakneſs of the moſt ſimple and minute Fibres is caus'd, firſt, by an obſtructed Aſſimilation of the Aliments to the Nature of the ſound vital Juices, which is owing to an exceſſive Loſs of the laudable Humours, and the Want of a due Action of the Solids upon the Liquids: Or the Aliments themſelves are of too tenacious a Nature to be chang'd by the Powers appointed for that Purpoſe. Secondly, this Weakneſs of the Fibres is caus'd by the too faint and languid Application of one Part to another, which ariſes from a too weak Motion of the Fluids, which again is for the moſt part produc'd by a Defect of muſcular Motion. Thirdly, this Weakneſs of the Fibres may be produc'd by ſuch a preternatural Diſtraction of them, as almoſt amounts to a Rupture.

'Tis moſt certain, that we conſiſt, and are made up, of thoſe Parts, by which we are nouriſhed. But the Matter which nouriſhes is prepar'd, ſo that it may acquire a nutritive Quality in the Body. Hence Aliments alone are not ſufficient for Nutrition; but the Soundneſs and Perfection of the natural Actions are requiſite, to aſſimilate the Aliments to the natural Juices, and reſtore what has been exhauſted, by whatever Cauſe. When Phyſicians preſcribe the beſt and moſt laudable Aliments for highly phthiſical and conſumptive Patients, they are ſurpris'd to find no happy Effects produc'd by them; but, in theſe Perſons, this aſſimilating Power, without which there can be no Nutrition, is wanting. *Galen*, therefore, *de Ratione Victus in Acutis*, juſtly condemns thoſe Phyſicians, who do not advert to this Circumſtance, in the following Words: "Tho' theſe Phyſicians aſſume the Name of Methodics, yet "they are in reality Strangers to all Method [ἀμεθόδους], ſince "they exhibit Wine and Fleſh, pouring, as it were, Nou-"riſhment into an unanimated Veſſel [εἰς ἄψυχον ἄγγος]."

This Obſtruction of the Aſſimilation of the Aliments to the Nature of the ſound vital Juices is owing to too great a Loſs of the laudable Humours. If we conſider what happens to the crude Aliments before they are converted into our Humours, we perceive that an incredible Quantity of the human Fluids is mix'd with them: Thus, in Maſtication, the Saliva and Mucus of the Mouth, Tongue, Palate, and Fauces, are mixt with them; in the Stomach, the gaſtric Juice is mixt with them; and, when they paſs from thence, they are mixt with the cyſtic and hepatic Biles, as alſo with a large Quantity of the pancreatic Juice. Beſides, in every Part of the Inteſtines they are mixt with additional Juices, previouſly elaborated by the curious Structure of the Body. The Chyle, when receiv'd into the minute lacteal Veſſels, is diluted by a large Quantity of Lymph. In the thoracic Duct it is mixt with the Lymph, returning almoſt from all the Parts of the Body: At laſt, falling Drop by Drop from the thoracic Duct into the ſubclavian Vein, it is abſorb'd and carry'd off by the common Torrent of the Blood: Hence we may juſtly conclude, that the due Mixture of a ſmall Quantity of crude Aliments, with ſo large a Quantity of concocted Humours, is one of the moſt conſiderable Cauſes of this Aſſimilation, ſo neceſſary to Nutrition.

This is ſufficiently confirm'd by Experience; ſince in the moſt robuſt and hardy Soldiers, who by Wounds have loſt almoſt the Whole of their Blood, the Aliments, tho' devour'd with a keen Appetite, are not digeſted and converted to a laudable Blood; but the Patients become dropſical, and the whole Frame of their Bodies weaken'd. Thus, alſo, an inſupportable Languor remains for a long time with Women, who, in conſequence of Miſcarriages, have loſt large Quantities of Blood: All other Evacuations, whether by Stool, Urine, or Sweat, when exceſſive, produce the ſame Effect.

This Aſſimilation is, alſo, obſtructed by the Want of a due Action of the Solids upon the Fluids. When the Chyle juſt convey'd to the Maſs of Blood, has for ſome little time been acted upon by the pulmonary, and all the other Arteries of the Body, it partakes of the Nature of Milk, and approaches nearer to our Nature than crude Chyle; and, after ſome time, it is converted into Serum, loſing its white Colour, as *Lower* obſerves. But all this while it is ſubjected to the Action of the Veſſels upon the Fluids, which is no more than that Effort by which our Veſſels repreſs the Fluids which diſtend them: The firmer, therefore, theſe Veſſels are, provided they are not too rigid for yielding to the Impulſes of the Fluids, the more powerfully they act, and, conſequently, the Aſſimilation of the Aliments to the ſound and vital Juices is the ſooner and the better carried on.

A weak and languid Girl, labouring under a *Chloroſis*, takes her Aliments, which, however, do not produce a laudable Blood, but only a kind of Milk, as it were. Hence her whole Body becomes pale, and, when a Vein was unſkilfully open'd in a Caſe of this Nature, I myſelf ſaw white Blood diſcharg'd. If in Patients of this Kind the digeſtive Powers are ſomewhat ſtronger, the Aliments are proportionably more chang'd, but not totally perfected. In this Caſe, a yelloviſh or greeniſh Colour is produc'd; for in theſe a due Action of the Solids upon the Fluids is wanting, in conſequence of which, the Patients are render'd tumid, and full of Crudities; but a laudable Nutrition is not, at the ſame time, carried on.

But if, by means of chalybeate Preparations, and due Exerciſe, the Action of ſuch a Patient's Solids upon her Fluids ſhould be increas'd, her tumid Face begins to ſubſide, a roſy grateful Colour adorns her Cheeks and Lips, and a due Vigour is reſtor'd to all the Parts of her Body.

The Aliments themſelves may be of ſo tenacious a Nature, that they cannot be chang'd by the ſeveral Powers appointed for that Purpoſe. The due Mixture of a large Quantity of concocted Humours with a ſmall Quantity of crude Aliments, and the Action of the Solids upon the Fluids, are the two Cauſes concurring to transform and convert the crude Aliments into the Subſtance of the human Body. But tho' theſe Actions are ſo powerful, that, from ſo many and ſo various Aliments, they at laſt produce the human Blood, yet 'tis requiſite the Aliments themſelves ſhould be of ſuch a Nature as to be capable of being chang'd by the Powers appointed for that Purpoſe; for, according to *Galen*, in his Commentaries on the Epidemics of *Hippocrates*, "Concoction is a certain "Conveyance of that which is concocted into the Subſtance "[οὐσίαν] of the Perſon by whoſe Powers it is concocted: "When, therefore, the Body is in a natural State, and when "the Subſtance to be concocted is ſuited to the Perſon by "whoſe Powers it is to be concocted, the Whole, or, at "leaſt, the greater Part, of the Subſtance to be concocted is "chang'd, ſo that a very ſmall Quantity of it remains half "concocted."

When, in beſieged Towns, a Scarcity of Proviſions forces the Inhabitants to devour every thing which comes in their way, they all become highly weak and languid: And *Dodonæus*, in his *Stirp. hiſtoria*, informs us, "That when the Inhabitants "of *Middelburg* in *Zeland*, for want of other Proviſions, "eat Bread prepared of Lint-ſeed, their Hypochondria were "ſoon

" ſoon diſtended, their Faces and other Parts render'd tumid, " and many of them deſtroy'd." In this Caſe, the ſtrong Glue of the Linſeed could not be converted into a laudable Nouriſhment.

When Girls of a deprav'd Appetite eat Sand, Lime, Wool, and ſeveral other unaccountable Subſtances, they become weak and pale. The tenacious Nature, therefore, of the Aliments ought to be duly proportion'd to the aſſimilating Powers; otherwiſe the Body is ſo far from being recruited, that it is rather oppreſs'd by them. When the common People ſtuff their Children with Gruels prepar'd of unfermented farinaceous Subſtances, or with Potatoes, the poor Infants have their Abdomens render'd immenſely tumid, whilſt the other Parts of their Bodies decreaſe.

Hippocrates, well appris'd of theſe things, in the eighth Aphoriſm of his firſt Section, orders, that, when a Diſeaſe is at its Height, the Patient ſhould uſe highly light and fine Aliments; ſince Nature, being at this time oppreſs'd with the Force of the Diſeaſe, is of courſe unfit for changing ſtrong Aliments: And from this Poſition he afterwards deduc'd many excellent and ſalutary Rules with reſpect to the dietetic Part of Medicine.

In thoſe Diſeaſes in which the Circulation of the Fluids is languid, the Aliments are of no Service. Patients of this Claſs may be ſtuff'd till they become tumid, oppreſs'd, or even almoſt ſuffocated, but they can never be duly nouriſh'd, as we obſerve in dropſical Perſons.

A diminiſh'd Velocity in the Circulation of the Fluids is the principal Cauſe why there is not a due Application of the Elements to the Fibre to be nouriſh'd.

The Source and Spring of the vital Motion ſeems to be lodg'd in the Heart. By this Motion driving the Blood out of the Ventricles of the Heart, all the Arteries are dilated, and, being afterwards contracted, by that means continue the Motion of the impel'd Blood.

Among the various Cauſes producing the Motion of the Heart, the principal is, perhaps, the Influx of the venous Blood into its Cavities; for long after Death, when the venous Blood is protruded to its Right Ventricle, the Motion of the Heart returns, as is certain from various Experiments. Now the Muſcles becoming turgid when they act, compreſs the adjacent Veins in ſuch a manner, as to accelerate the Motion of the venous Blood to the Heart; which, being ſtimulated by this means, is more quickly contracted. Hence the Circulation of the Blood is render'd quicker.

This is ſufficiently confirm'd by Experience; ſince there is a great Difference between the Strength of two Brothers ſprung from the ſame Parents: If one of them leads a ſtudious and ſedentary Life, whilſt the other accuſtoms himſelf to Hunting, Riding, and the more hardy Exerciſes; the former is weak, like a Girl, and enjoys but a frail State of Health; whilſt the latter, by Exerciſe, acquires an almoſt *Herculean* Strength.

When an Horſe daily accuſtom'd to Running, is ſuffer'd to reſt in the Stable, he ſoon becomes fat and plump; but at the ſame time he is render'd far weaker, and entirely unfit for his uſual Labours. *Hippocrates*, in the ſecond Book of his Treatiſe *de Ratione Victus*, informs us, that Eaſe moiſtens the Body, and renders it weaker, whereas Exerciſe dries and renders it ſtronger.

Nothing more evinces the Impoſſibility of explaining the Nature of particular Bodies by mechanical Principles, than Coheſion, that ſurpriſing Property of Bodies: The Parts of Iron cohere with each other: This Iron is drawn out into fine Wire for ſome muſical Inſtruments: Upon twiſting about the Key, this Wire is render'd longer, and more ſlender, whilſt fewer of its Particles come into mutual Contact with each other. At laſt the Wire, when further drawn, breaks; and the Extremities of the Part, where the Rupture happens, tho' mutually apply'd to each other, will yet never again cohere: Hence Coheſion may be gradually ſo diminiſh'd, as at laſt to become none at all; and about the Moment the Rupture happens, the Parts ſcarce cohere any longer; or, at leaſt if they do, 'tis in ſuch a manner, that the Rupture may be produced by the ſlighteſt Accident. This holds equally true in the ſolid Fibres of our Bodies.

When Criminals are rack'd, in order to extort a Confeſſion, after they are ſuſpended, 'tis cuſtomary to fix to their great Toes Weights, which are gradually increas'd; and they who have been rack'd in this manner, can ſcarce move their Members for ſome Days, ſince they are render'd, as it were, paralytic, by no other Cauſe than the Violence of the Diſtention.

'Tis perhaps poſſible, that the Bladder may be ſo diſtended by a too long Retention of the Urine, as totally to loſe the Power of contracting itſelf for the future. In pregnant Women the Skin and Membrana Adipoſa are ſo diſtended, as after Delivery to remain flaccid and corrugated during all their Lives.

This Weakneſs of the Fibres produces an eaſy Diſtention and Rupture of the Veſſels compos'd and made up of them, together with their too faint Action upon their contain'd Fluids. Hence ariſe Tumors from the diſtending, and Putrefactioms from the ſtagnating or extravaſated, Fluids, together with all the Train of Calamities ſubſequent to theſe two Misfortunes.

This is ſufficiently obvious, if we ſuppoſe, that a perfectly ſound human Body ſhould ſuddenly have all its ſolid Fibres render'd too weak; for all our Veſſels conſiſt of Fibres mutually join'd and interwoven with each other: Hence the Strength of all the Veſſels depends upon the Strength of the Fibres; but the greater or ſmaller Capacity of each Veſſel is in a *Ratio*, compounded of the direct *Ratio* of the *Impetus* of the impel'd Fluid, and the inverſe *Ratio* of the Reſiſtance made by the Sides of the Veſſel. Since, therefore, when the Fibres conſtituting the Sides of the Veſſels are weaken'd, the Reſiſtance of theſe Sides muſt be impair'd; it follows of courſe, that the Impetus of the impel'd Fluid remaining the ſame, the Veſſels muſt neceſſarily be diſtended.

When, for Inſtance, any Part of the Body is long expos'd to the Steam of tepid Water, than which nothing more effectually weakens the Part thus expos'd, it will ſoon after become tumid, and œdematous.

Whilſt the ſame Cauſe continues to weaken the Fibres, upon the Application of the ſmalleſt Force the Coheſion will be deſtroy'd, and a Rupture produc'd; of which we find many mournful Inſtances, ſince tender Men by coughing, ſinging, and bawling aloud, have often had an Artery in their Lungs ruptur'd.

The Weakneſs of the Fibres produces too faint an Action of the Veſſels upon their contain'd Fluids. When the Arteries are diſtended by an impel'd Fluid, they, by the Energy of their conſtituent Fibres, repreſs this Fluid. Whilſt the Fibres endeavour to leſſen the Cavity of the Veſſel they compoſe, they compreſs and change the contain'd Fluids. Upon theſe two depend all the Functions of the Body. Thus, when the Strength of the Fibres is impair'd, 'tis ſufficiently obvious, that the Veſſels compos'd of theſe muſt act leſs powerfully upon their contain'd Fluids.

Tumors from the diſtending Fluids muſt conſequently be produc'd: This is confirm'd by Experience; for, when a tender Girl begins to be weaken'd by a *Chloroſis*, thoſe looſe Parts under the Eyelids, call'd by the antient *Greeks* ὑπώπια and ὑποφθάλμια, begin forthwith to ſwell; then the whole Face appears ſomewhat turgid and white; and whilſt the Load of Humours to be mov'd daily increaſes, without a proportionable Increaſe of the moving Cauſe, ſhe begins to have almoſt all the Parts of her Body render'd tumid. Thus, alſo, in the Beginning of a leucophlegmatic Cacochymia, Men often rejoice, whilſt they falſly imagine, that they are in good Health, and becoming fat. When the Atmoſphere continues foggy for a conſiderable Number of Days, our Bodies appear inflated, becauſe their external Parts are plac'd, as it were, in a continual Bath: Hence they are weaken'd by the diſtending Fluids.

As to Putrefactions from the ſtagnated or extravaſated Fluids; ſo long as the Humours are by an equable Motion carried thro' the Veſſels, no Putrefaction ariſes in the Body, ſince every thing which begins to have a Tendency to Putrefaction, is eliminated through the uſual Emunctories of the Body: But when the weaken'd Solids cannot ſufficiently propel the diſtending Fluids, a Stagnation enſues: And in the Heat of the common Air, all the Fluids of the human Body, thoſe of a pinguious Nature excepted, if left to themſelves, become putrid, except Milk, which is not poſſeſs'd of all the Qualities of the Fluids of the human Body. This Accident muſt much more happen in our Bodies, the Heat of which is far greater than that of the common Air. The ſame holds true, when the Veſſels, in conſequence of their exceſſive Tenderneſs, break, and diſcharge their Humours: Now if theſe Obſervations are apply'd to the various Parts of the human Body, it will appear, that from this ſingle Cauſe an infinite Train of terrible Misfortunes may ariſe.

When the too tender Lungs are not able to bear the Impetus of the Blood propel'd from the Heart; their Veſſels being ruptur'd, an Hæmoptoe is produc'd, and, by its means, an incurable Phthiſis is brought on.

When the weaken'd Veſſels of the Brain are either too much diſtended, or, being ruptur'd, diſcharge their Contents, all the Diſorders of the animal Functions, from the ſlighteſt Vertigo, to the moſt fatal Apoplexy, may be produc'd. This Doctrine holds true in all the other Viſcera: But let theſe Obſervations ſuffice as proper Inſtances.

By rightly underſtanding what has been ſaid, preſent, future, and paſt Diſorders of the Fibres may be known, their Effects prognoſticated, and proper Meaſures taken for their Cure.

The Phyſician, who thoroughly underſtands what has been ſaid concerning the Nature of a too weak ſimple Fibre, concerning thoſe things which preceded this Weakneſs, the Phe-

nomena

nomena which diſcover it, and the Effects it produces, may eaſily determine, whether ſuch a Weakneſs of the Fibres is preſent. This, in Medicine, is call'd the diagnoſtic Sign, or evident Knowledge, of a preſent Diſeaſe, diſtinguiſh'd from all others, and denotes the individual and ſpecific Nature of the Diſeaſe. This diagnoſtic Sign is obtain'd, when we know, that ſuch phyſical Cauſes have preceded as have all along before been found to produce ſuch a Diſeaſe. Thus, for Inſtance, when I conſider the Caſe of a Man naturally weak, who has us'd aqueous Baths, drank tepid Liquors of the ſame Nature, and indulg'd himſelf in Eaſe, I know that ſuch Cauſes as render the Fibres weak have preceded: And this is the firſt Foundation of the Diagnoſtic. The other is, a Knowledge of the Diſeaſe in its Nature, and preſent Effects, which, if they are ſubjected to our Senſes, are to be judg'd of by them. But the Nature of a latent Diſeaſe is diſcover'd, when the Effects produc'd by this Diſeaſe, as the Cauſe, are known. Hence the Phyſician, who knows the Effects produc'd by a Weakneſs of the Fibres, may diſcover whether ſuch a Weakneſs is preſent or not.

To make a Prognoſtic, imports no more than to know any thing before it happens: Hence it implies a Knowledge, in the Mind of a Phyſician, of a Diſeaſe which will certainly happen, tho' it does not yet exiſt. A future Diſeaſe is prognoſticated from a Knowledge of ſuch Cauſes, as, tho' they have not yet produc'd the Diſeaſe, will nevertheleſs do ſo, when they are either render'd more powerful in themſelves, or begin to operate in Conjunction with others. Thus, for Inſtance, when a Phyſician knows, that any particular Man is diſpos'd to an *Hemoptyſis*, he will appriſe him, that ſuch a Diſorder is to be dreaded by him, tho' he never before labour'd under it: He will order him carefully to abſtain from Aromatics, and the liberal Uſe of Wine, as alſo from Bawling and Singing; for the Prognoſtic is not founded on a Knowledge of the entire Cauſe of the Patient's Diſorder, ſince in this Caſe the Diſeaſe would be preſent; but on a Knowledge of ſome phyſical Cauſe prediſpoſing, as a Part of a total Cauſe, to the Diſeaſe, and on the Phyſician's foreſeeing that another Cauſe will concur, which will render the former prediſpoſing Cauſe entire. When a Patient is ſeiz'd with a Pleuriſy, and the Phyſician is deſir'd to form a Prognoſtic, if he finds, that the Pleuriſy is not very violent, but is neither reſolv'd by Nature, nor the material Cauſe of the Diſorder remov'd by any critical Evacuation or Tranſlation, and that proper Medicines have not been us'd, then he will prognoſticate, that this Pleuriſy will come to a Suppuration. This Prognoſtic did not depend upon the preſent Pleuriſy, but upon the Pleuriſy conſider'd in Conjunction with ſuch Cauſes as diſpoſe an Inflammation to a Suppuration.

Thus we evidently comprehend what is meant by the Diagnoſtic, and what by the Prognoſtic.

If we have obſerv'd thoſe Changes, which the Diſeaſe, known by its diagnoſtic Sign, has produc'd in a Body before found, we may, from theſe Changes ſeen in the Patient, conclude, that the Diſeaſe was preſent; and this is what is call'd ἀνάμνησις, or *Recordatio*.

By attentively adverting to what has been ſaid, the moſt proper Methods of Cure may, alſo, be diſcover'd: This is the great and important Intention of Medicine; for to cure is to change the preſent phyſical Condition of the Body whence the Diſeaſe proceeds, that the Soundneſs of the injur'd Functions may be reſtor'd, and Life preſerv'd.

For, after the Diagnoſtic has aſcertain'd the Name of the Diſeaſe, its various Stages, the Part affected, and the peccant Matter in that Part, and after the Prognoſtic has demonſtrated what is to be hop'd or dreaded; from all theſe we are to conclude what Meaſures are to be taken: Theſe are call'd *Indicata*, or things indicated as proper; and the Knowledge thus form'd in the Mind of the Phyſician is call'd *Indication*.

We are always firſt to conſider, whether the Diſeaſe is to be left to Nature, or whether any Aſſiſtance is required from Art. The Patient is as yet alive, and many Effects as yet not exiſting may be produc'd by Life ſtill remaining. If this Change produc'd by remaining Life is ſuch as has been certainly and infallibly obſerv'd capable of ſo changing the Courſe of the Diſeaſe, that Health may return, nothing is to be done by the Phyſician. Thus, for Inſtance, when a pleuritic Patient in the firſt Stage of his Diſorder, in coughing, expectorates a mucous yellow Matter with bloody Strigments, by which all his Symptoms are alleviated, we know from faithful Obſervations made by the Antients, that, if this Expectoration can be continued, the Patient will be cur'd in a few Days. Hence we are neither by Veneſection, nor other Remedies, to diſturb the ſalutary Tendencies of Nature, but only exhibit ſoft Decoctions, in order to continue the Expectoration. But if, on the contrary, in a pleuritic Patient, we obſerve a violent Fever, a burning Heat, a dry Cough, and Dryneſs of the Tongue, without any Signs indicating, that Nature is inclin'd to any ſalutary Tranſlation, we then know, that if the Cauſes acting in this Patient continue to act, either a mortal Gangrene will enſue, or, if the Nature of the Diſeaſe is mild, a Suppuration, which is always good, where the ſuppurated Matter can be evacuated. But in this Caſe there is always great Danger, leſt the Pus form'd ſhould fall into the Cavity of the Thorax, and deſtroy the Patient by a fatal *Empyema*. Hence we in this Caſe conclude, that the Diſorder is not to be left to Nature; but that, by the Aſſiſtance of Art, the Diſeaſe is, if poſſible, to be ſo chang'd, as to prevent a Suppuration, or a Gangrene. Theſe Aſſiſtances, or Means of Relief, are diſcover'd from a Knowledge of the Nature of the Diſeaſe, and the preceding Cauſes.

The Cure of relax'd Fibres is to be obtain'd, firſt, by Aliment which contains Abundance of nutritive Matter, and which is almoſt ſo prepar'd already, as to be nearly in ſuch a State as the nutritive Juices are in a ſound and robuſt Body. Of this Kind, the principal are Milk, Eggs, Fleſh-broths, Decoctions of well-fermented Bread, and auſtere Wines; which are to be taken often, but in ſmall Quantities. Secondly, by increaſing the Motion of the Solids and Fluids by Frictions, Geſtations on Horſeback, in a Chariot, or a Ship, Walking, Running, and other Exerciſes of the Body. Thirdly, by a gentle Compreſſion of the Veſſels, and Repreſſion of the Fluids. Fourthly, by acid and auſtere Medicines, or thoſe of the ſpirituous fermented Kind, prudently and ſparingly us'd. Fifthly, by all thoſe Means which remove a too violent Diſtraction of the Fibres.

Here 'tis ſuppos'd, that there is no Fault in the whole Body, except only a Weakneſs of the Fibres, which is conſider'd abſtractedly as a Diſeaſe, independent of all others. We cannot eaſily cure a preſent weak Fibre, ſo as to reſtore it to ſuch a Degree of Rigidity as is requiſite to Health: But to a Fibre to be afterwards form'd according to the Laws of the animal Oeconomy, we can ſupply ſuch Elements as may, by the Aſſiſtance of the vital Powers, produce a ſufficiently ſtrong Fibre.

The firſt Cauſe of the preternatural Weakneſs of the Fibres mention'd, was an obſtructed Aſſimilation of the crude Aliments to the Nature of that concocted Liquor, which is the moſt ſubtile of all others, and carried through the moſt minute and capillary Veſſels. But, that the Fibres may become ſufficiently ſtrong, there muſt be a proper Matter apply'd and added to them. Now this proper Matter is that, which, having undergone the ſeveral Actions of all the Viſcera and Veſſels, according to the Laws obſerv'd in a ſound Conſtitution, has acquir'd the higheſt Perfection of Elaboration. But ſince the Fibres are ſuppos'd too weak, and ſince the Action of all the Veſſels upon their contain'd Fluids depends upon the due Strength of the Fibres; all the Functions employ'd in changing the crude Aliments into our Nature, will be leſs efficacious. Hence, in ſuch a Body, this Matter ſubſervient to Nutrition can never be prepar'd by its proper Powers. For this Reaſon, Phyſicians are often ſurpris'd to find, that the beſt Fleſhes eaten by ſuch a weak Patient do not nouriſh him; but theſe Fleſhes are only the remote Matter from which the vital Functions prepare the Nouriſhment; and, when theſe Functions are injur'd, the beſt Aliments are in vain exhibited.

Whilſt the tender Embryo is lodg'd in the Uterus of its Mother, the Humours prepar'd by the vital Powers of the latter nouriſh the former, ſince the tender Body of the Fœtus would not be able, from other Subſtances leſs aſſimilated to its Nature, to prepare its Nouriſhment. When 'tis born, the Milk conveys into its Habit the Humours prepar'd in its Mother's Body. Thus Medicine, imitating Nature, conveys, into ſuch weak Bodies, Nouriſhment prepared in the Body of a ſound Animal: Among the moſt conſiderable of which are,

Milk. Every Man is nouriſh'd by his own Milk, and, by the Force of the vital Principle, from it alone prepares all his other Solids and Fluids: For in Men there is always Milk, as well as in Women, tho' they have never born Children, nor been Nurſes. In *Miſcel. curioſ. Dec.* 2. *an.* 5. we are told, that Milk was drawn from a Man of ſixty Years of Age, only by Suction; and in *Miſcel. curioſ. Dec.* 1. *an.* 3. we are inform'd, that Milk was drawn from the Breaſt of a Woman, who was not pregnant: For the Chyle which has undergone the Action of the Heart, Lungs, and Arteries, and is mix'd with all the Humours, is ſeparated from them by the ſurpriſing Structure of the Breaſts.

Now, for theſe Purpoſes, the beſt of all others is human Milk, ſince it is moſt adapted to our Natures; for which Reaſon, 'tis always to be prefer'd to the Milk of other Animals. This Milk ought to be furniſh'd by a ſound Woman, who uſes due Exerciſe, obſerves a laudable Regimen, and is in the Flower of her Age. 'Tis alſo beſt when the Breaſts are drawn four or five Hours after Eating; for then the Chyle is chang'd into concocted Milk, and, having laid aſide the Nature of the Aliments, begins to aſſume that of the human Fluids; for there

is a great Difference in Milk, according to the different Times at which it is drawn after the laſt Meal: That which is collected in the Breaſts, immediately after Eating or Drinking, is crude, and partakes much of the Nature of the Aliments taken: And that which is drawn twelve Hours after a Meal, is thin, yellowiſh, and of a ſomewhat urinous Smell, almoſt like the Serum of Blood: Hence the Milk drawn in the middle Period, between theſe two times, is the beſt.

We muſt here alſo obſerve, that all Animals, which uſe their Mothers Milk, draw it immediately from the Teats, ſo that it is never expos'd to the Air, but is convey'd to the tender Animals, richly impregnated with all its fine and ſubtile Parts; for highly ſubtile Spirits, elaborated by the laſt Concoction in a ſound Body, ſeem to be lodg'd in Milk: This is evinc'd by the large Concurrence of Nerves in thoſe Parts, where the Chyle and Milk are prepar'd, by the ſubtile Steam exhaling from warm Milk, newly drawn from Animals, and by the ſurpriſing Changes produc'd on Infants by Milk: Thus I ſaw an Infant, who by ſucking the Breaſt of a Nurſe who was in a furious Paſſion, immediately became convulſive, tho' before perfectly ſound in every reſpect.

Phyſicians in all Ages have endeavour'd to recruit Bodies ready to fall a Sacrifice to Weakneſs, by having the ſubtile Exhalations ariſing from a ſound young Body, lying in the ſame Bed, convey'd into them. Thus, in the firſt Chapter of the firſt Book of the *Chronicles*, we are inform'd, that the decay'd and ſuperannuated Body of the pious King *David* was cheriſh'd, by laying an healthy young Girl in Bed with him. When, therefore, the Milk is exhibited after it is become quite cold, or again render'd warm by the Fire, it is depriv'd of that highly ſubtile Principle, which was more neceſſary than all the reſt.

Hence *Galen*, in the twelfth Chapter of his fifth Book *de Method. Medend.* uſes theſe Words: "The Antients order'd "a Nurſe to give the Breaſt to thoſe who labour'd under Con- "ſumptions; and I myſelf approve of the Practice: They "alſo order'd, that the Patient ſhould frequently uſe this "Milk, and that in ſuch a manner, as that it might not be "cool'd by the circumambient Air." And, in the ſixth Chapter of his ſeventh Book *de Method. Medend.* after having ſaid ſomething to the ſame Purpoſe, he compares Milk "to "the genital Seed, which cannot long preſerve its Virtues "out of proper Veſſels, but ought either to be retain'd in "the Male, or ſpeedily lodg'd in the Female; and certainly "that Milk is beſt, which is immediately drawn from the "Nipples." And afterwards, when ridiculing the Peeviſhneſs of ſome Perſons, he adds, "As they themſelves will nei- "ther uſe this Milk, nor allow their Children to do ſo, let "them, like Aſſes, uſe Aſſes Milk."

What has been ſaid relative to Milk, is confirm'd by a large Number of Inſtances: Thus *Capivaccius* informs us, that he preſerv'd the only Heir of a noble Family, by ordering him to be laid between two wholſome Nurſes, in the Flower of their Age, and to ſuck their Breaſts. *Foreſtus*, in the fourth Book of his Obſervations, informs us, that at *Bononia* a certain Youth was ſeiz'd with a legitimate *Maraſmus*, but that by ſucking a beautiful young Nurſe, with whom he alſo lay in Bed, his decay'd and exhauſted Body was ſo recruited, that they were afraid, leſt, by an unſeaſonable Venery, he ſhould loſe the Strength he had acquir'd by the Uſe of the Milk.

The Defect of human Milk is beſt ſupplied by that of Aſſes, which is ſucceeded by that of Goats, which may again be ſupplied by that of Cows.

Eggs, which, under a ſlender Shell, contain ſo many Miracles, and which, by the Obſervations of the immortal *Malpighi*, have contributed ſo much to illuſtrate the Generation of Animals, are, alſo, proper for this End.

The White of an Egg, in many reſpects agreeing with the Serum of the human Blood, contains in itſelf a Matter, which, by the Heat of Incubation, being chang'd, within twenty-one Days, makes the latent vital Stamen of the Chick grow to ſuch a Bulk; for the Yolk is not conſum'd, and only the White ſeems ſubſervient to the Nouriſhment of the Chick, whilſt it remains in the Egg.

Hence we may juſtly affirm, that it contains an excellent Nouriſhment. *Hippocrates*, in the ſecond Book *de Ratione Victus*, informs us, "that Eggs contain a Principle of a ſtrong, "nutritive, and inflating Nature: Strong, becauſe it produces "or generates the Animal; nutritive, becauſe it is the Milk "of the Chick; and inflating, becauſe, from a very ſmall "Bulk, the Chick is enlarg'd to a conſiderable Size."

For this Reaſon, the Whites of Eggs are recommended for nouriſhing weak Perſons; but they are to be diluted with Water, in order to deſtroy their tenacious Quality; and moderately ſeaſoned, leſt their Taſte ſhould prove diſagreeable. They muſt be diluted only with tepid Water, or Milk and Water, in equal Proportions; for, when prepar'd with boiling Water; they are coagulated into a ſciſſile Maſs of very difficult Digeſtion.

The Whites of Eggs fall far ſhort of the Uſe of Milk; for, before the White of the Egg can nouriſh the Chick, it muſt undergo the Action of its Veſſels and Viſcera; whereas in Milk there are highly ſubtile Juices, already prepar'd by the animal Fabric.

Though the Yolk of an Egg affords an excellent Nouriſhment, it, nevertheleſs, requires a firm Structure of the Viſcera; for, as *Harvey*, after *Ariſtotle*, has, in his *Exercit. de Generat. Animal.* juſtly obſerv'd, the Chick, ſome Days after its Excluſion, uſes the Yolk, ſhut up in its Abdomen, as Nouriſhment. But the White is conſum'd at the time the Chick is growing from an inviſible Molecule to its due Bulk. For this Reaſon, the White ſeems more eaſily convertible into Nouriſhment than the Yolk.

Galen, therefore, ſeems to have ſpoken of boil'd, and not of raw Eggs, when, for weak Perſons, he principally recommends the Yolks, becauſe the White is with Difficulty concocted [δύσπεπτον γὰρ λευκὸν], as is ſufficiently obvious from the tenth Chapter of the firſt Book of his *Method. Medend.* where he ſays the ſame thing of poach'd Eggs.

Fleſh Broths, eſpecially if the Animals, whoſe Fleſh is us'd in preparing the Broth, have faſted for twenty-fours Hours before they were kill'd; for then all the crude Humours are, by the animal Structure ſo chang'd as to aſſume a due Quality. The Fleſhes of kill'd Animals are highly ſucculent, becauſe, principally, the red Part of the Blood is only carried off, whilſt the other Juices remain in them, which, in boiling, being mix'd with Water, afford to weak Bodies a Matter already elaborated, and prepar'd in the Body of a ſound Animal. But, in Boiling, the moſt ſubtile Parts fly off, which might be retain'd, if they were boil'd in *Papin*'s Machine. Decoctions, however, prepar'd in this manner, have a ſaponaceous nauſeous Taſte; ſince the Fat, always adhering to Fleſh, by the violent Action of the Fire and Water, whilſt the Veſſel is cloſe-ſtopt, is ſo attenuated as to be intimately mix'd with the Water. Beſides, Broths prepar'd in this manner are too rich, and require to be diluted. Hence, every thing of a ſoluble Nature ought, as much as poſſible, to be extracted from Fleſh, till only the muſcular Fibres remain, by long boiling, in a long and well-ſtopt common Veſſel. When Broths of this Kind are thoroughly cold, a concreted Fat generally ſwims upon their Surface, which is carefully to be taken off, leſt, as it ſoon becomes rancid, it ſhould prove offenſive to a weak Stomach.

It is an unaccountable Error, to imagine that Broths, deſtin'd for theſe Purpoſes, are the better, the more rich they are; ſince, in conſequence of their inſurmountable Tenacity, they rather too much load a weak Stomach; for which Reaſon a moderate Dilution of them is neceſſary.

But, that, by boiling Fleſhes in common Veſſels, a great deal of their moſt ſubtile Parts are loſt, is ſufficiently obvious, from the grateful and refreſhing Steam ariſing from the Veſſels in which they are boil'd, when not cloſe-cover'd.

It is highly probable, that all thoſe Animals are the fierceſt, which prey upon other live Animals: For of this we are certain, that Dogs which fed upon raw Fleſh are more bold than others.

For Broths prepar'd with this Intention, the Fleſh of Fowls is generally prefer'd, then Veal, then Mutton, and, laſt of all, Beef. If we except the ſubtile Steam which exhales in common Boiling, the other nutritive Parts are lodg'd in the gelatinous Portion which the inſpiſſated Broth affords. Now it is confirm'd by Experience, that Veal has more of this gelatinous Subſtance than Beef; and Mutton ſtill ſomewhat more than Veal; the Fleſh of Chicken yields leſs of this gelatinous Subſtance, but that of old Fowls almoſt double the Quantity yielded by Veal.

The beſt and moſt ſavoury Broths are prepar'd of a due Mixture of Veal, Mutton, Beef, and Fowls, eſpecially if, after they are prepar'd, a little Lemon or Orange-juice is added, in order to remove their Tendency to Putrefaction.

Decoctions of well-fermented Bread. Theſe are of ſingular Service among thoſe People, who, living in hot Countries, have lean and conſtricted Bodies, in which, in acute Diſeaſes, every thing has a Tendency to the higheſt Putrefaction. It is neceſſary, that, by Fermentation, the too glutinous Nature of the Grain ſhould he deſtroy'd, leſt it ſhould prove injurious. In this Caſe, Decoctions prepar'd from it, of the Thickneſs of Whey, are of ſingular Service; but thoſe made ſo rich as to have the Conſiſtence of Cream, are leſs eaſily digeſted. To Decoctions of this Kind, grateful Aromatics, or a little Wine, may be added; by which means they become more reſtorative.

But we muſt obſerve, that theſe Decoctions, prepar'd from Bread, are only advantageous for this Reaſon, that they nearly reſemble the Chyle, in ſo far as it conſiſts of Aliments, but not as it conſiſts of a Mixture of the other Humours of the human Body: Hence theſe Decoctions always partake of a Vegetable Nature. But, in order to

prepare

prepare the Fluids of an human Body from the Chyle, the Action of the Lungs, the other Viſcera and Veſſels, are requir'd: Hence in phthiſical Patients, and all others who have too weak Lungs, the only Hopes of Recovery are placed in the Uſe of Milk: Decoctions of Bread, therefore, contain a Matter far more remote from the higheſt Perfection of Nouriſhment than Milk does.

Auſtere Wines. In all Wines there is a highly ſurpriſing, but, at the ſame time, a grateful Stimulus, by which they rouſe and warm all the Parts of the Body. If a ſmall Quantity of this Liquor is drank by a Perſon not too much accuſtomed to it, all his Senſes become quick, his Members agile, and his Mind chearful. When the Philoſopher, exhauſted by deep Reſearches, or profound Meditations, takes his Glaſs of Wine, he is forthwith refreſh'd, and a new Vigour and Serenity are reſtor'd to his Mind. Grateful ſparkling Wines, ſuch as Champaign, are poſſeſs'd of this Quality, but their Effects do not laſt for any conſiderable time; whereas auſtere Wines apply their more firmly cohering ſpirituous Principle to the Body, by a more durable Action; and, at the ſame time, by their aſtringent Qualities, ſtrengthen the Fibres more; for which Reaſon, they are, in this Caſe, preferable to the others. The beſt way of exhibiting them is to ſoak a Piece of Biſcuit in them, to be eaten every three Hours. By this means, the Virtues of the Wine will not be ſo ſoon loſt, and the flaccid Primæ Viæ will, as it were, be inſpir'd with new Life; for there is an uncommon Energy and Strength in Bread and Wine. Theſe auſtere Wines are, principally, *Florence*, rough *French* Wines, and black *Greek* Wines.

Theſe remote Materials of Nouriſhment ought to be taken in ſmall Quantities. Faults, with reſpect to this, are often committed; ſince, by endeavouring to reſtore theſe weak and and languid Bodies, People frequently load and deſtroy them, by too large a Quantity of Aliments: What Difficulty of Breathing is produced, when phthiſical Patients, by eating but a little more than enough, oppreſs the Lungs too much by a freſh Quantity of Chyle? It is wiſely order'd by Nature, that Infants ſhould take but ſmall Quantities of Milk at a time, though they have frequent recourſe to the Breaſt. Unleſs, therefore, this Rule be obſerv'd, all other Means, though in themſelves the moſt conducive to the End, will never be of any Service.

Among the other Cauſes of too weak Fibres, we reckon'd too faint and languid an Application of the Parts to each other. This Cauſe is remov'd when the Solids act more powerfully upon their contain'd Fluids: For, upon the Action and Reaction of the Solids and Fluids, all the Functions of the Body depend. Now this Action and Re-action are reſtor'd

By Friction, which is, as it were, an alternate Compreſſion and Relaxation of the Parts of the Body. A gentle Friction only compreſſes the Veins; whereas, by a ſtronger Degree, the Arteries are, alſo, compreſſed. By compreſſing the Veins by Friction, the Motion of the viſcous Blood to the Heart is accelerated. Hence the Motion of the Heart is rous'd; by which means, the Blood is, with greater Velocity, propel'd through all the Veſſels. The vital Force may, therefore, be augmented to any Degree, by means of Frictions, without the Exhibition of any Medicine internally; for, by means of Frictions, a burning Fever may be excited in the moſt cold dropſical Patient. In thoſe Bodies where almoſt all the chylopoietic Organs are ſo languid as not duly to perform their reſpective Functions, Frictions with rough woolen Cloths over the whole Abdomen, when the Patient is faſting, have been found to produce ſurpriſingly happy Effects. Hence the Antients had Frictions in ſo great Veneration, not only for the Preſervation of Health, but alſo the Cure of Diſeaſes.

When a Horſe is left in the Stable without being curried, he, in a few Days, becomes good for nothing; whereas, when he is duly comb'd and bruſh'd, he remains agile and hardy for a conſiderable Number of Years: For, as *Columella*, in the thirtieth Chapter of his ſixth Book *de Re Ruſtica*, obſerves, "The Bodies of Cattle, as well as of Men, are to be daily "rub'd; and it is often of more Advantage to curry them "ſufficiently, than to pamper them with Foods."

Among the Antients there were Frictions of various Kinds, and ſubſervient to different Purpoſes. Hence *Hippocrates*, in his Treatiſe *de Med. Offic.* tells us, "that Friction may re"ſolve, contract, incarn, and diminiſh; ſince ſtrong Friction "contracts, gentle Friction reſolves, much Friction diminiſhes, "and moderate Friction condenſes." Any Part is render'd more lax by being rub'd with ſoft oleous Subſtances.

Nothing is more beneficial in curing a Weakneſs of the Fibres, than Frictions with rough warm woolen Cloths, eſpecially if previouſly impregnated with the Smoke of burning Amber, or Maſtich, that at the ſame time this aromatic and corroborating Steam may enter the relax'd Parts. But we are to proceed gradually in this Work, and not uſe too ſtrong Frictions at firſt; leſt either the ſtagnating Fluids in the preternaturally diſtended Veſſels ſhould be too copiouſly convey'd to the Heart, and by that means overwhelm and ſuffocate it; or the tender Veſſels ſhould be broken by imprudently increaſing the Motion of the Blood.

Geſtation on Horſeback, or Riding. The whole Time this Exerciſe is continued, the entire abdominal and thoracic Viſcera, being pendulous, are ſhak'd, and, as it were, gently rub'd upon each other; the pure Air, in the mean time, acts with a greater Impetus on the Lungs; and all theſe Circumſtances concur to produce incredible Changes. But it is to be obſerv'd, that a weak Perſon ought not to ride with a full Stomach, but before Dinner, or after Digeſtion is almoſt over; for, when the Stomach is diſtended, the Concuſſions occaſion'd by Riding are troubleſome to weak Perſons; whereas, when the Primæ Viæ are almoſt unloaded and empty, the remaining Fæces are, by this Concuſſion, excellently eliminated.

Sydenham laid ſo great a Streſs on Riding, that he thought he could not only cure ſlight Conſumptions, but an almoſt deſperate Tabes, accompanied with nocturnal Sweats, and a violent Diarrhœa, by Riding alone; nor did he believe Mercury more effectual in the Cure of the Venereal Diſeaſe, or the Peruvian Bark in intermittent Fevers, than Riding was in a *Phthiſis*.

But he orders the Time and Degrees of Riding to be gradually enlarged, ſo as not ſuddenly, and all at once, to fatigue the Patient by ſtrong Riding; and gives memorable and beautiful Inſtances of Cures produced by that means. Then he ſubjoins, that tho' Riding on Horſeback is principally beneficial to phthiſical Patients, yet Journeys undertaken in Chariots have often produced ſurpriſingly happy Effects.

Hence thoſe who are ſo weak, that they cannot ſit on a Horſe, may uſe a Chariot, till, becoming ſtronger, they are able to bear Riding. Geſtation, and rocking in Cradles, never fail to prove beneficial to Children, the weakeſt of human Creatures.

Sailing in a Ship is alſo beneficial to weak Perſons. Whilſt the Ship is under a calm and gentle Motion, an uncommon Alacrity, an increas'd Perſpiration, a keener Appetite, and a quicker Digeſtion, are excited. But the Toſſings of a rough and ſtormy Sea, ſometimes in the moſt robuſt Men, not accuſtomed to a Sea-faring Life, produce Vertigo's, Vomitings, intolerable Uneaſineſs, and ſometimes Deliquiums: By theſe means inveterate Diſorders have been known to be accidentally cured; but, in weak Conſtitutions, theſe violent Agitations and Commotions would be injurious.

All theſe are principally beneficial to weak Perſons, becauſe, without much Fatigue, they enjoy the Benefit of Motion; but after, by theſe means, their Strength begins to return, the Body is alſo to be ſtrengthened by muſcular Motion; which End is obtain'd by

Walking, Running, and Exerciſe of the Body: For unleſs Patients of this Kind uſe theſe, they gradually relapſe into the ſame Diſorder. Hence it is ſo often to be lamented in Practice, that young Women, cured of a *Chloroſis*, delighting too much in a ſedentary Life, and neglecting to ſtrengthen their Bodies by Exerciſe, a few Weeks after become equally weak and pale, as they were before. They want to be nouriſh'd by Aliments, and abſtain from Labour; but by this means they never generate a laudable Blood, but the languid and vapid Cacochymy returns; for, according to *Hippocrates*, in his Treatiſe *de Ratione Victus*, "Aliments and Labour have oppoſite Intentions, "tho' both concur to the Preſervation of Health: Labour "conſumes what is preſent in the Body; whereas Meat and "Drink reſtore and recover what is evacuated and exhauſted "from it."

How effectually muſcular Motion contributes to corroborate and ſtrengthen a weak Body, we have already obſerved. Weak Perſons are to begin with gentle and moderate Walking, which is to be gradually raiſed and augmented to Running. Thoſe Exerciſes are principally beneficial, which, at the ſame time they employ the Body, amuſe and divert the Mind; ſuch as playing at Ball, Fencing, and others of a like Nature. Hence the ſagacious Antients propoſed Rewards for thoſe, who, in the Gymnaſtic Exerciſes, ſurpaſſed their Neighbours; that, by this means, the Youth might be encouraged to ſtrengthen and prepare their Bodies for all the Toils of War: And *Hieronymus Mercurialis*, in his Treatiſe *de Arte Gymnaſtica*, informs us, that *Cyrus*, who always had the Intereſt of the *Perſians* much at Heart, enacted a Law, injoining, that his Subjects ſhould not ſet down to a Meal, unleſs they had previouſly uſed ſome proper Exerciſe.

By a gentle Compreſſion of the Veſſels, and Repreſſion of the Fluids. This Direction is of the higheſt Importance, ſince Diſeaſes, by all accounted deſperate, have often been cur'd by no other means than a general Compreſſion of the Veſſels, which ought never to be ſo great as entirely to deſtroy the Cavities of the Veſſels; for, in this Caſe, the Principle of Life would be ſuffocated in the Part; but only to render them leſs than they would have been without this Compreſſion; for, by this means, the weak Veſſels are kept from being preternaturally diſtended by their contain'd Fluids; for the Capacity of a Veſſel does not depend ſimply upon the diſtending Fluid, but on its Exceſs above the Reſiſtance of the Veſſel; but the more a Fibre is diſtracted,

diſtracted, the weaker it becomes: For this Reaſon, every thing which prevents the Diſtraction of a Fibre, removes the weakening Cauſe. Now Bandages, or tight wearing Apparel, of any kind, by proving a kind of Prop or Buttreſs to the Veſſels, perform what the weaken'd Solids could not do; that is, hinder the preternatural Dilatation of the Veſſels.

In the Cure of ſome Diſeaſes, more happy Effects are produced by this Method, than by any other whatever. Thus, for Inſtance, when that Species of Dropſy call'd Anaſarca has render'd the Thighs and Legs tumid, and the whole Water is diſcharg'd, whether by Accident or Deſign, the Parts not only remain pendulous and flaccid, but ſoon after become equally tumid, unleſs ſtrengthen'd and ſupported by proper Bandage.

In that Species of Dropſy call'd Aſcites, when the Waters are evacuated by a Perforation of the Abdomen, unleſs the pendulous and flaccid Belly is forthwith duly ſwath'd, a mortal Syncope is either brought on, or the Waters are again collected in the lax and pendulous Parts, and the Dropſy ſoon render'd as formidable as before.

When Fluids become ſtagnant, or, at leaſt, move very ſlowly in the too much dilated Veſſels of the Legs, the Skin is often corroded, and Ulcers of a bad Kind produc'd, eſpecially if there is a ſcorbutic Taint in the Body, which often prove rebellious to the beſt Medicines: But theſe Misfortunes may infallibly be prevented by Bandage or Socks, ſo tight, as to hinder the Fluids from lodging in the dilated Veſſels.

I remember to have perform'd a Cure on a young Girl of Diſtinction, whoſe nervous Syſtem was the moſt ſuſceptible of irregular Motions, of any I had ever ſeen. Upon hearing a ſhrill Noiſe, or having her Eyes expoſed to a ſparkling Light, ſhe forthwith became convulſive, and felt ſurpriſing Commotions, accompanied with a Senſe of Laceration in her Abdomen. Neither the ferulaceous Juices, nor Caſtor, which is generally ſo effectual in Caſes of this Nature, were of any Service to her. But when her Legs, Thighs, and whole Abdomen, as far up as her Breaſts, were duly ſwath'd, her Diſorder immediately remitted, and, by the Exhibition of proper Remedies, ſhe was perfectly recover'd. But, for ſome Months, ſhe patiently and chearfully liv'd ſwath'd up like an *Egyptian* Mummy, becauſe ſhe found ſo uncommon Relief from that Practice.

The Cure of a too weak, ſolid, ſimple Fibre, ſo far as it depends upon the Non-naturals, and the Aſſiſtance of Surgery or Swathing, has been already deſcrib'd. It now remains, that we conſider and enumerate thoſe Remedies, which, being exhibited internally, and committed to the Force of Nature, induce ſuch a Change as is requiſite for the Reſtitution of Health. The Elements of the Fibres, united by too faint a Degree of Coheſion, produce the Diſeaſe; ſuch Remedies are therefore requiſite, as, when apply'd to the Body, render this Coheſion ſtronger. And the Subſtances of this Kind are,

Acido-auſtere Medicines, commonly call'd Aſtringents. All theſe, when apply'd to the Tongue, exert their Virtues in a ſufficiently ſenſible manner; for they dry the whole Mouth, and conſtrict all the Mouths of the exhaling Veſſels. The Tongue, alſo, becomes, as it were, contracted, and ſhorter than before. Hence *Galen*, in the ſecond Chapter of his eighth Book *de Method. Medend.* informs us, "That 'tis the peculiar "Province of the Taſte to diſtinguiſh aſtringent Subſtances;" for all the Medicines of this Claſs have this peculiar to themſelves, that when apply'd to any Part of the Body, they make the conſtituent Elements of the Fibres approach more nearly, and adhere more ſtrongly, to each other; and ſo powerful are they, that they produce the ſame Effect on the Parts of dead Animals; for when, by a long Maceration, Tanners have freed the Skins of Animals from their adhering Fat, they are ſo ſoften'd as almoſt to fall in Pieces, but a due Strength is reſtor'd to them by an Addition of auſtere Subſtances. This *Pliny*, in the 19th Chapter of his 13th Book, calls *Coria perficere*; where, talking of Pomgranates, he tells us, that their Bark is principally uſeful *ad Coria perficienda*, for tanning Leather. Oak Bark, which is much cheaper, is at preſent uſed for this Purpoſe.

The principal Vegetables, poſſeſs'd of this aſtringent Quality, are thus enumerated in *Boerhaave*'s *Materies Medica*. The Fruit, Juice, Flower, and Bark of Acacia; the Doſe of the inſpiſſated Juice is from four Grains to one Dram. The inſpiſſated Juice of Sloes, call'd Acacia Germanica, from ſix Grains to a Dram and an half. The Juice of (*Aceteſa*) Sorrel, (*Anſerina*) Wild Tanſy. The Fruit and Juice of Barberries. Biſtort-root. The Fruit, Bark, and Root, of Capers. The immature Fruit and Leaves of Cornelian Cherries. The Fruit and Leaves of the Cypreſs-tree. The Flowers, Fruit, and Sponge, of the *Cynosbatos*, common Briar. The Fruit and Marmalade of Quinces. The Roots of Fern. Strawberries. The Bark of the Aſh-tree. The Flowers, Fruit, and Bark, of Pomgranates. St. John's-wort, the whole Plant. The inſpiſſated Juice of Hypocyſtis, from one Dram to five Drams. The Leaves, Flowers, Seed, and Root, of the common Dock. The immature Fruit of the Medlar. All the Sorts of Myrobalans, from five Grains to two Drams. Myrtle-leaves. The Leaves and Flowers of the Great Water-lily. Omphacium. Burnet. Purſlain. Sloes. Unripe Pears. Oak Leaves and Acorns. Cinquefoil. Rhubarb, from half a Dram to two Drams. The Leaves and Grains of Sumach. Roſe-flowers. The greater Houſleek. The Fruit of the Service-tree. Tamarinds, from one to two Ounces; the Pulp of them duly preſs'd and cleans'd, from half an Ounce to two Ounces. The Bark of Tamariſk. *Terra Japonica*. Tormentil-root. From all which, Infuſions, Decoctions, Extracts, Pills, medicated Wines, and Remedies of various Forms, may be eaſily prepar'd. Thus, for Inſtance, an Infuſion may be prepar'd in the following Manner:

Take of Wild Tanſey, one Handful; of Burnet, half an Handful; and of Tormentil-root, half an Ounce: When they are cut ſmall, infuſe them for an Hour in a Pint and an half of boiling Water. The Doſe is one Ounce every three Hours throughout the Day.

For a Decoction:

Take of the Flowers of the ſharp-pointed Dock, one Handful; of the Flowers of red Roſes, four Ounces; of Tamariſk-bark, two Ounces; of Sorrel-root, four Ounces; and of the bruiſed Seeds of the common Dock, two Drams: Boil for a Quarter of an Hour in a ſufficient Quantity of Chalybeate-water, for two Pints of the ſtrain'd Liquor. The Doſe is an Ounce, three or four times a Day.

Or,

Take of Sorrel, two Handfuls; of Biſtort-root, half an Ounce; and of Pomgranate-flowers, two Drams: When they are boil'd for a Quarter of an Hour in a ſufficient Quantity of Water for one Pint of the ſtrain'd Liquor, mix with it one Ounce of the Syrup of Myrtles. The Uſe of this Preparation is the ſame with that of the former.

For an Electuary:

Take of the Marmalade of Quinces, one Ounce; of the Conſerve of red Roſes, half an Ounce; of Pomgranate-flowers, one Dram; and of the Syrup of Myrtles, a ſufficient Quantity for making an Electuary: The Doſe of which is one Dram, three or four times a Day.

For an Extract:

Take of Sorrel, eight Handfuls; of the Garden Dock, four Handfuls; and of the Cinquefoil, ſix Handfuls: Make theſe Ingredients ſufficiently clean, cut them ſmall, boil them in a ſufficient Quantity of Water, ſqueeze them ſtrongly by a Preſs into a large Veſſel, and let them evaporate to the Thickneſs of an Extract; for a Doſe of which, from one to two Drams may be exhibited: Or add to the Extract a Quantity of dry'd Biſtort-root, ſufficient for forming it into a Maſs for Pills, the Doſe of which is from four to fifteen Grains.

For a medicated Wine:

Take of the bruiſed Seeds of the greater Sorrel, ſix Drams; of Pomgranate-flowers, five Drams; of the Root of Capers, two Ounces; of the Bark of the Aſh-tree, ten Drams; of the Leaves of Burnet, two Handfuls: When they are cut and bruiſed, infuſe them in three Pints of auſtere *Freuch* Claret: Of which an Ounce is to be taken three or four times a Day.

Or,

Take of the Barks of Caper and Tamariſk-roots, each one Ounce; of the Flowers and Stalk of St. John's-wort, two Ounces: Of theſe prepare a medicated Wine, with three Pints of auſtere Red-wine.

But, among the Aſtringents of the foſſil Kind, the moſt valuable is Iron diſſolv'd in fermented vegetable Acids; by the Uſe of which, theſe tumid, cold, and weak Bodies, are miraculouſly reſtor'd. By means of this Medicine, no Evacuation of the diſtending Fluid is made, but an additional Strength is procur'd to the Veſſels; by which, being more contracted, they promote the Motion of the almoſt ſtagnant Humours; whereas thoſe who attempt the Cure of theſe Diſorders by Evacuation, weaken the Patient ſtill more and more.

They who uſe Medicines of this Kind, perceive a grateful Warmth ariſing over all their Bodies; the Swelling ſubſides, the pale Colour of the Lips and Cheeks is chang'd into a natural and grateful Red; the Torpor, and Difficulty of Breathing,

upon the ſlighteſt Motions, are remov'd; their former Agility returns; all the Functions are invigorated; and a new Life is, as it were, reſtor'd. The ſame Effect is alſo produc'd by Iron diſſolv'd in medicinal mineral Waters.

By ſpirituous fermented Liquors. The Serum of Blood, or the White of an Egg, are immediately coagulated by an Affuſion of pure Alcohol; and the ſolid Parts of Animals become far more hard, and are contracted every Way, by being depoſited in Alcohol. Hence this Fluid is poſſeſſed of a Power of ſhortening the ſolid Parts of Animals; but, at the ſame time, it coagulates the Fluids; for which Reaſon great Caution is requiſite in the Uſe of fermented Spirits; for, when they are imprudently uſed, they may produce a large Train of Misfortunes, by inſpiſſating the Fluids, and contracting the Solids. Thus, in the *Hiſt. de l'Academ. des Sciences, An.* 1706. we are inform'd, that, upon diſſecting the Body of a Woman ſtrongly addicted to Drinking, the Spleen, Pancreas, Liver, and Lungs, were found dry, ſcirrhous, and, in ſome meaſure, petrified. All the Glands, in the mean time, both internal and external, had aſſum'd a Degree of Hardneſs, almoſt equal to that of a Stone. Many other Obſervations of the like kind occur in practical Writers.

But theſe muſt be uſed prudently and ſparingly; for all theſe Medicines, when taken inwardly, act firſt on the Stomach and Inteſtines, and can never enter the Blood with their entire Virtues, otherwiſe they would prove injurious; for this Reaſon they ought to be exhibited in ſmall Quantities, and at different Times, that, by this means, being diluted by our Humours, they may gradually enter the Maſs of Blood. If only a few Grains of the highly aſtringent Juice of the *Egyptian* Thorn are held in the Mouth, they contract every Part of it, and ſo conſtrict all its exhaling and inhaling Veſſels, that the Mouth remains highly dry for half a Quarter of an Hour. If, therefore, this Juice ſhould be apply'd immediately to the delicate Orifices of the lacteal Veſſels, it would, by conſtricting them, prevent its own Acceſs. But as all theſe Medicines act firſt upon the Primæ Viæ. and cannot, till much diluted, enter the Mouths of the Lacteals, and, as it were, by ſtealth, inſinuate themſelves into the Maſs of Blood; hence their Virtues muſt be much diminiſh'd, before they arrive at this laſt-mention'd Fluid. Thus *Galen*, in the fourth Chapter of his ſecond Book *de Method. Medend.* juſtly cautions us, "That for this "Reaſon we ought carefully to conſider not ſo much the pre-"ſent and immediate Effect of any Medicine, whether exter-"nal or internal, as the Effect it will produce when it reaches "the Part affected."

Aſtringents, eſpecially thoſe of the more powerful Kind, imprudently uſed, may, partly by coagulating the Liquids, and partly by bracing up all the tender Veſſels which conſtitute the internal Surface of the Stomach and Inteſtines, produce moſt terrible Diſorders.

Hence Steel, diſſolv'd in the milder Acids, is preferr'd to almoſt all other Aſtringents; becauſe it not only operates by its auſtere and aſtringent Quality, but by the Stimulus of its metallic Sulphur, which is highly friendly to Nature, ſurpriſingly rouſes the vital Principle. See MARS.

By all the Means which remove a too violent Diſtraction. Diſtraction removes the Elements, of which the moſt minute Fibres are compoſed, from a mutual Contact: For this Reaſon it diſpoſes them to a Rupture, which is no more than a Privation of Coheſion. The State, next to a total Rupture, is the weakeſt Coheſion capable of being ſurmounted by the ſmalleſt additional Force. Every thing, therefore, which diſtracts, by leſſening the Coheſion, produces Weakneſs. When the String of any muſical Inſtrument is ſtretch'd by Weight, by increaſing this Weight gradually, the Diſtraction is augmented, till at laſt the String breaks. Immediately before the Rupture it coher'd, but ſo faintly, as to break by a very inconſiderable additional Weight. The Perſon, therefore, who removes the Weights which diſtract the String, increaſes, by that very means, its Strength.

This holds equally true in the Fibres of the human Body; for, when the diſtracting Cauſes are leſſen'd, the Strength of the Fibres, by which they endeavour to ſhorten themſelves, is almoſt continually and proportionably increas'd. This is confirm'd by what happens in ſeveral Diſeaſes. Thus, a certain Perſon, by a ſcirrhous Tumor gradually increaſing, had his Oeſophagus ſo compreſs'd, that, during the laſt Months of his miſerable Life, he could only, with the greateſt Difficulty, ſwallow a few Drops of Milk diluted with Water, or the like Quantity of very thin Broth. Upon laying open his Body, I ſaw, that the Cavity of his Stomach did not exceed that of one of the ſmall Inteſtines; for, during a conſiderable Number of Months, it had not been at all diſtended; for which Reaſon, its Fibres had gradually contracted it into ſo ſmall a Compaſs: for all the ſolid Parts of our Bodies are poſſeſs'd of this ſurpriſing Property, that when they long remain in any determin'd Poſition, they afterwards ſo firmly retain it, that they cannot by Force be removed from it.

If a Man has the Misfortune to break his Leg, and if the Surgeon, in the Courſe of the Cure, neglects now-and-then gently to bend the Joints, they remain ever after immoveable; for the Ligaments, not being diſtended for ſeveral Weeks, for want of Motion in the Joints, become rigid and hard.

The Laxity of a Fibre conſiſts in ſuch a mutual Coheſion of the Parts, as by a ſmall Force may be ſo chang'd, that the Fibre becomes longer than it was before: Hence 'tis obvious, that the Laxity of a Fibre is a Species of Weakneſs, and that the Flexility, as alſo the impair'd Elaſticity, of a Fibre, depend upon it, as is obvious from what has been already ſaid; for Glaſs, the moſt brittle of all Bodies, may, by the Rules of Art, be drawn out into Threads more ſlender and minute than thoſe of a Spider's Web; which yet cohere, and, by the ſmalleſt Force, are capable of being twiſted in every Direction without a Rupture. The Flexility of a Body increaſes in proportion to its Slenderneſs. See *Hiſt. de l'Acad. Royale*, 1713.

As for the Laxity of a Fibre, Fibres are ſaid to be too weak, when, their Coheſion remaining entire, they cannot ſuſtain that Impetus which muſt neceſſarily be made by the animal Functions for the Preſervation of Health; or when, though able to bear the Efforts of the Functions in the moſt perfect State of Health, they yet break, upon the Motion being a little increas'd, which muſt ſometimes unavoidably happen in the animal Oeconomy. But a preternatural Laxity of the Fibres is known to be preſent, when they indeed bear the Impetus of the vital Motion without having their Coheſion deſtroy'd, but, being too much diſtracted by a ſmall Force, become longer than they ought to be.

A ſilken Thread, not able to bear a Weight fix'd to it without breaking, furniſhes us with a pretty adequate Idea of a too weak Fibre; and a Wire, made of the ſofteſt Lead, which, by having a Weight fix'd to it, is drawn out into a conſiderable Length before it breaks, gives us the Idea of a too lax Fibre. Upon a due Degree of Laxity depends

Flexility. That all thoſe things may happen in the Body, which are daily obſerv'd to be perform'd by the various Motions of the Humours, Veſſels and Muſcles, the Elements of the ſolid Parts muſt partly remain in their natural Coheſion, and partly be changed from it; for which Reaſon they muſt neceſſarily be capable of Elongation. Thus, for Inſtance, in order to the bending of the Joints, their retaining Ligaments muſt neceſſarily be capable of Elongation. For this Reaſon, a certain Degree of Laxity in the Fibres is requiſite to Health; but, if this Degree is enlarg'd, a Diſeaſe is produc'd: Which is,

An impair'd Elaſticity of the Fibres. The Elaſticity of Fibres conſiſts in this, that they are capable of being extended, but again return to their former Length, when the extending Force is remov'd.

But the whole Force of Elaſticity is only that Effort by which the minute Parts, which conſtitute the Fibre, mutually attract each other, whilſt, by the Elongation of their Surfaces, they become more diſtant from each other, their Coheſion in the mean time remaining. If, therefore, a Fibre is render'd weak by any Cauſe whatever, that is, if its Parts attract each other with a faint and languid Effort, its Elaſticity muſt of courſe be neceſſarily impair'd.

The large Veſſels of the human Body are compoſed of ſuch as are ſmaller, and theſe of others ſtill ſmaller; ſo that Anatomiſts have as yet come to no End of their Diviſion. The larger Muſcles, in like manner, conſiſt of others which are ſmaller; and what, to the naked Eye, appears a ſingle muſcular Fibre, by the Aſſiſtance of Microſcopes, appears a Congeries of ſmaller Fibres.

The ſame is alſo obſerv'd in the Nerves, and other Parts of the Body. Hence all the Parts of the Body ſeem to conſiſt of an infinite Number of ſmaller ſimilar Parts; and this wonderful Circumſtance was requiſite for the Flexility of the Parts; and, from the Experiment before alleg'd, we may eaſily conceive, how Glaſs, the moſt brittle of all Bodies, may, by a ſimple Diviſion into the moſt ſlender Filaments, be render'd incredibly ductile; which made the ingenious *Reaumur*, in the *Mem. de l'Acad. Royale des Sciences, An.* 1713. affirm, that he did not deſpair of ſeeing Webs woven of it. I myſelf ſaw a falſe Head of Hair made of Glaſs, drawn out into Wire ſo fine, that without breaking, it was capable of being turn'd up into Curls.

From what has been ſaid, we may account for the following Phenomena; why aqueous and pinguious Aliments render the Fibres weak; why the Fibres of ſuch as are of cold Habits, young, addicted to Eaſe, and growing, are weak; why earthy and auſtere Subſtances render the Fibres ſtrong; why the Fibres of ſuch as are of hot Conſtitutions, and ſuch as uſe Exerciſe, are alſo ſtrong; and, laſtly, why Elaſticity is an inſeparable Concomitant of the Strength of the Fibres.

As for aqueous and pinguious Subſtances, we are taught from Experience, that they weaken the Fibres; for the hardeſt Parts of Animals are render'd ſoft, by being expos'd to the Steam of tepid Water: Long-kept Hartſhorn becomes ſciſſile, by being expos'd to the Steam either of tepid, or boiling Water; as we obſerve in the Philoſophical Preparation of Hartſhorn in the Shops. Young Women, alſo, by the daily Uſe of tepid aqueous Liquors, become highly weak and flaccid. In the ſecond Chapter of the Book *de Uſu Fluidorum*, aſcrib'd to *Hippocrates*, the Diſadvantages attending the liberal Uſe of warm Liquors, are ſaid to be, "Weakneſs of the Muſcles, Impotence of the "Nerves, Stupidity of the Mind, Hæmorrhages, and Deli-"quiums."

The Weakneſs of a Fibre conſiſts in the eaſily-ſeparable Coheſion of its Parts. Now the Elements, or conſtituent Parts, of Water cohere very faintly with each other: Hence, if two or more Particles of Water ſhould be interpos'd between the Elements of a Fibre, the Fibre would in all Probability be render'd weaker by that means; but if only ſingle Particles of Water ſhould be lodg'd between the Elements of the Fibres, they will by that means be render'd much more rigid; for the Elements of Water, conſider'd abſtractedly and by themſelves, ſeem to be highly hard and immutable, and may in a ſurpriſing manner be form'd into Concretions with other Bodies, as we have ſhewn in the Beginning of this Article. Hence, perhaps, the Reaſon may be deduced, why the Parts of Animals become ſofter, by being wet with Water; but, when dry'd again, aſſume a far greater Degree of Rigidity than they had before. But that Water is capable of inſinuating itſelf between the Elements of Bodies, and removing them from their mutual Contact, is ſufficiently certain from the Experiments recorded in the *Mem. de l'Acad. des Sciences*, *An.* 1714. where we are told, that Shreds of Paper wet with Water become longer by a ſixth Part than they were before.

'Tis alſo confirm'd by many Experiments, that for the like Reaſon the ſolid Parts of Animals are ſoften'd by pinguious Subſtances. The moſt rigid Skins of Animals become ſoft, when impregnated with Oil. The Muſcles, in order to make them retain a due Degree of Flexility, are every-where enveloped in oleous Coats; and, leſt the Ligaments ſhould become rigid, an attenuated medullary Oil is pour'd upon them; and they become highly rigid, when, in exceſſive old Age, this Oil begins to be defective. On the contrary, as there is a Redundance of it in too fat Perſons, it renders their weaken'd Bodies highly lax and tumid.

Perſons of cold Conſtitutions have weak Fibres. Cold, indeed, abſolutely conſider'd, ſtrengthens the Fibres, by bringing their Elements into a more immediate Contact with each other; but, in Perſons of cold Conſtitutions, the Circulation is languid, the Blood too little compreſs'd, the crude Aliments not at all chang'd, and the minute Elements of the Fibres apply'd to each other by too ſmall a Force. Hence their Coheſion is proportionably leſs.

Young Perſons have alſo weak Fibres. The human Embryo is originally a Molecule almoſt infinitely ſmall; and when it is gradually increas'd, ſo as to become obſervable by the Senſes, it would diſſolve away into a mucous Subſtance, unleſs it was ſuſtain'd by the equable Preſſure of a circumambient Fluid. A new-born Infant is ſoft, pulpous, and has all its Bones as yet flexible; as it advances in Years, it becomes gradually firmer. Hence, the younger a Perſon is, the ſofter the Parts of his Body are. For this Reaſon his Fibres, tho' ſufficiently firm for his youthful State, may yet be call'd weak, when compar'd with thoſe of Adults. This ſeemingly unfortunate Circumſtance was abſolutely neceſſary, that the human Body which grows from ſo ſmall a Molecule to ſo large a Bulk, might be eaſily extended every Way.

Such as indulge themſelves in Eaſe, have, alſo, weak Fibres. This is obvious from what has been already ſaid; for when Girls are, by means of the ſalutary Uſe of Steel, cur'd of a Chloroſis, but neglect to uſe proper Exerciſe, they ſoon relapſe into their former Languor. *Hippocrates* order'd languiſhing dropſical Patients to uſe Exerciſe; but, in acute Diſeaſes, he recommended a State of perfect Reſt; becauſe, in theſe, the vital Force, too much augmented by the Fever, conſum'd the Fluids, and of courſe render'd the Solids dry. Hence, almoſt the whole Cure of acute Diſorders conſiſts in bringing on a Diſpoſition to a Dropſy, that is, a greater Weakneſs.

Growing Perſons have alſo weak Fibres. For the Humours which fill the conic Veſſels, being carried from their Baſes to their Apices, always endeavour to lengthen the Sides of their Veſſels, according to the Axes of their reſpective Cones. So long as theſe Canals or Veſſels are capable of Elongation by this Impulſe, the Man grows. Hence a ſmall Degree of Coheſion is neceſſary to render them capable of yielding. Now, the younger Perſons are, the faſter they grow, becauſe, at this time, their Solids make little or no Reſiſtance; for in nine Months time the human Fœtus grows from an inviſible Molecule, to an Infant weighing ſixteen, and, ſometimes, twenty Pounds.

In Youths, alſo, not arriv'd at their full Growth, we obſerve, that a Fever lengthens the Veſſels as yet capable of Elongation, ſo as to produce a ſenſible Increaſe of Stature. Such a faint Coheſion of the Fibres, as renders them capable of yielding, is, therefore, requiſite and neceſſary to what we call Growth. When, therefore, by ſtrong Labour the Bodies of young Perſons are render'd firm and hard, a proportionable Stop is, by that means, put to their Growth before the due Time. For this very Reaſon, thoſe who train up Lap-dogs, whoſe Worth is, by the Ladies, eſtimated according to their Smallneſs, daily give them Brandy to render their Bodies firm and hard.

Earthy and auſtere Subſtances, alſo, ſtrengthen the Fibres. With reſpect to auſtere Subſtances, we have already obſerv'd, that they are experimentally found to be poſſeſs'd of a Power of making the Elements of our Fibres approach more near to each other. And as earthy Subſtances are of an abſorbent Nature, they attract all the Moiſture which approaches them, and are form'd into firm Concretions by it. A new unglaz'd Tobacco-pipe, when apply'd to the Lips, adheres ſo firmly to them, that it can ſcarcely be pulled away without hurting them. Since, therefore, aqueous Subſtances, as has been already ſhewn, weaken the Fibres, thoſe Bodies, which abſorb Water, muſt of courſe be reckon'd among the Subſtances which corroborate them.

Perſons of hot Conſtitutions have ſtrong Fibres. Heat, externally apply'd to the Body, weakens all its Parts, makes the Elements of the Fibres recede from each other, and conſequently renders them proportionably weaker: yet, in Perſons of hot Conſtitutions, whoſe denſe and compact Fluids are briſkly carried thro' the Veſſels, the Force by which the Aliments are aſſimilated to the human Fluids, is always ſtrong, and the Elements of the Fibres efficaciouſly apply'd to each other; and upon theſe two Circumſtances depends the Strength of the Fibres.

There is a great Difference betwixt Heat excited by Fire, and that excited by a briſk Motion of the Body. The Man, who in the Winter-time baniſhes Cold by ſitting near a Fire, is by that means render'd languid and weak; whereas the Perſon, who endeavours to remove Cold by a briſk Motion of the Body, remains lively and agile.

Perſons who uſe ſufficient Exerciſe, have, cæteris paribus, *ſtronger Fibres than others.*

This is ſufficiently evident from what has been ſaid; for the Country-man, who earns his Bread by hard Labour, has all the Parts of his Body firm and robuſt; he deſpiſes the Inclemencies of the Seaſons, and eaſily digeſts the ſtrongeſt Aliments; whereas the Man who indulges himſelf in Eaſe and Luxury, is weak and miſerable, is highly ſenſible of the ſmalleſt Change of Air; and by a thouſand delicate Diſhes, the ſhameful Inventions of Luxury, and not of genuine Hunger, can hardly excite his languid Appetite.

Elaſticity is a neceſſary Concomitant of the Strength of the Fibres; for thoſe Bodies are ſaid to be elaſtic, which, when diſtracted, return into as many Points of Contact as they were in before. Hence, a ſtrong Force is neceſſary to make the Parts mutually attract each other; and in this Force conſiſts the Strength of the Fibres, as will be ſufficiently obvious from the following Example: Two Load-ſtones, when apply'd to each other, cohere; and if they are a little remov'd from each other, but ſo as to remain within the Sphere of each other's Attraction, they are again united. Thus the elaſtic Parts of the Body, when remov'd from each other, again mutually attract each other, and are reſtor'd to their former Coheſion, when the diſtracting Cauſe is removed. When any Part of a weak and leucophlegmatic Girl's Body is preſs'd with the Finger, it yields like a Piece of ſoft Paſte, and riſes ſlowly, and with Difficulty; whereas the Parts of a ſound and vigorous Man are ſo elaſtic, as to reſtore themſelves immediately.

Thus we have deſcrib'd the moſt ſimple Fibre, laid down a Method for diſcovering its Nature, enumerated the Cauſes which concur to produce it, ſpecify'd the ſeveral Accidents to which it is ſubject, directed how to form juſt Prognoſtics with reſpect to its Diſorders; how, from the known Hiſtory of the Diſeaſe, deſcrib'd by its Signs, we may form a proper Indication, which teaches in what manner, and by what Medicines the Phyſician ought to attempt the Cure; and from the Whole deduced ſome general Corollaries.

The Weakneſs, however, of the ſimple ſolid Fibres is rarely unattended with other Misfortunes; but it was neceſſary to conſider them in this abſtracted Light, that their Nature might be the more clearly underſtood; for this Reaſon we have gone upon the Suppoſition of a Man perfectly ſound, who next Moment had his Fibres render'd too weak by any Cauſe whatever.

Too great Rigidity of an animal Fibre.

The too great Rigidity of a Fibre is ſuch an Union of its Elements, or moſt minute Parts, as makes them cohere in ſuch a manner as not to yield to that Action of the Fluids, which, in order to the Preſervation of Health, ought to overcome this Reſiſtance.

Life and Health depend on this, that the Fibres of all the Arteries are ſo flexile, that they may, by the Blood impel'd by the muſcular Force of the Heart, be diſtended to ſuch a degree, as to be capable of receiving this impel'd Blood; for, when the Heart is in its Diaſtole, the Arteries and Veins are full; otherwiſe there would not be a continued Propulſion of the Blood. The Moment after, the Heart in its Syſtole expels the Blood into the Arteries, which are already full, and through them into the Veins, which are alſo full: Hence, if theſe numerous Veſſels ſhould forcibly reſiſt their Dilatation, ſince the Blood is not capable of great Compreſſion, the Heart could not be emptied, and Life would be deſtroy'd: Hence the Fibres conſtituting theſe Veſſels muſt be poſſeſs'd of ſuch a Degree of Laxity as to render them capable of yielding to the diſtending Blood expel'd from the Heart into the Veſſels before full: The more rigid, therefore, theſe Fibres become, the ſtronger Reſiſtance they make.

Hence, as we cannot abſolutely define a too weak Fibre, ſo neither can we poſitively aſcertain when a Fibre is too rigid, but muſt conſider it with relation to various Ages. Thus, that the little Heart of the tender Embryo may be ſufficient for dilating the Veſſels, by propelling the Blood, ſo ſmall a degree of Coheſion is neceſſary, that the ſolid Parts, upon being touch'd, diſſolve into a kind of Mucus.

The Rigidity of the Fibres is produc'd by thoſe Cauſes which the Cure of a weak Fibre requires, if they are intenſe, or continue too long.

We have already given the Hiſtory of too weak a Fibre, becauſe the Cure of that gives us ſome Inſight into the Cauſes of too rigid a Fibre: But, inſtead of repeating all that has been ſaid concerning the Cure of too weak a Fibre, we ſhall only illuſtrate the Matter by one Example: Moderate Labour, then, ſtrengthens the Body; exceſſive Labour dries it, and renders all its Parts rigid. As the Country-people are, from their Infancy, oblig'd to uſe hard Labour, they are ſometimes, about the fortieth Year of their Age, ſo rigid, and their Humours ſo much exhauſted, that their ſtooping Bodies become the true Picture of Death, till at laſt they are cut off by a Maraſmus, like that which is the Effect of Age.

When a Rigidity of the Fibres is produc'd, it renders the Veſſels compos'd of theſe Fibres leſs flexible, more narrow, ſhorter, capable of reſiſting the Motion of the Fluids too ſtrongly; and, alſo, is attended with all the Conſequences ariſing from theſe Circumſtances.

The Veſſels of the human Body always reſiſt their Diſtention: Hence their Capacity depends upon the Exceſs of the diſtending Force above their contractile Power. When, therefore, this contractile Power of the Veſſels is increas'd, the diſtending Force remaining the ſame, the Veſſels muſt of courſe be more contracted, or be render'd more narrow. The higheſt Degree of this Diſorder is, when the Veſſels do not at all yield to the diſtending Fluids: Hence the Circulation of the Blood is forthwith ſtopt, and that calm and gentle Death, which ſometimes happens in exceſſive old Age, is produc'd, when all the Veſſels, becoming rigid, reſiſt the impel'd Fluids. When by any Cauſe the Fluids are diminiſh'd, the natural Strength of the Veſſels ſo contracts them, that they remain full, but at the ſame time leſs diſtended than they were before.

In an acute continual Fever a Man may, in a Fortnight's time, loſe half of his Weight, the Veſſels, in the mean time, being gradually contracted, in proportion as his Fluids are diminiſh'd. This is ſufficiently obvious; for all Animals, in which the Strength of the Fibres is increas'd, have Veſſels more contracted than other Animals, whoſe Fibres are weaker.

An Horſe full-fed, and kept in a State of Reſt in the Stable, becomes fat by this means; but when his Exerciſe is gradually increas'd, till at laſt he is daily accuſtom'd to the hardeſt Fatigue, he perhaps loſes a third Part of his Weight, but at the ſame time is render'd more hardy, and fit for Labour; by which the Fibres of his Veſſels are ſo conſolidated, that he will not afterwards become ſo ſoon fat, when he enjoys Eaſe, and is well-fed.

The Rigidity of the Fibres renders them ſhorter. The Impetus of the Fluids impel'd through the conical Canals, endeavours their Elongation: Hence the Fibres are lengthen'd, ſo long as their Coheſion admits of it. This is ſufficiently evinc'd, by the remarkable Growth of young Perſons after any acute Diſeaſe. When a great Toe was cut off by one Stroke of a Chiſel, I remember to have ſeen two Arteries to ſtart forth from the even Surface of the wounded Part to the Length of a geometrical Line [the twelfth Part of an Inch]; ſo much were theſe Veſſels lengthen'd by the Impetus of the Blood, notwithſtanding their Diſtance from the Heart. When the Fibres become too rigid, they are incapable of Elongation, and are at laſt, in conſequence of their Strength, ſhorten'd; as is obvious in old Perſons, who become actually leſs than they were in their Youth.

The Veſſels, in conſequence of the Rigidity of the Fibres, reſiſt the Motion of the Fluids too ſtrongly: For, when the Heart forces the Blood through the Arteries, a Part of the Impetus communicated by the Heart is ſpent in dilating the Arteries, whilſt the other Part propels the Blood through them; if, therefore, the Arteries ſhould become rigid, or leſs capable of Dilatation, the more of the Impetus communicated by the Heart will be ſpent in dilating the Arteries, and the leſs in propelling the Blood through them. Hence the Reaſon is ſufficiently evident, why too great a Rigidity of the Fibres increaſes the Reſiſtance of the Veſſels to the Fluids, which move through them: And, as all the Functions of the animal Oeconomy depend on a due Circulation of the Humours thro' the Veſſels, hence a Cauſe, apparently ſo ſimple, may produce a numerous Train of Diſorders.

From what has been ſaid, a Rigidity of the Fibres may be known, its future Effects prognoſticated, and a proper Method of Cure diſcovered.

The Diagnoſtic, which informs us whether a Rigidity of the Fibres is preſent, may be eaſily diſcover'd; for, if a Perſon is emaciated, has his Mouth and Jaws dry, his Skin parched, and his Joints leſs flexible than they ought to be, and if theſe Sympeoms remain, notwithſtanding the Uſe of ſuch Things as render the Body moiſt and plump, we conclude that the Solids are too firm, that they prevail over the Liquids, and diſſipate them too ſoon. Perſons in this State are highly emaciated, and voracious, digeſt their Aliments too ſoon, and have their Juices diſſipated.

Now, if we know, that either ſuch Aliments or Medicines as are employ'd for the Cure of too great a Weakneſs of the Fibres, have been too plentifully us'd, we prognoſticate a future Rigidity.

Various and ſurpriſing Diſorders are produc'd, according as this Rigidity is either univerſal, or confin'd to ſome particular Part; for anatomical Obſervations have ſufficiently evinc'd, that all the known Veſſels of the human Body are capable of being render'd rigid, and that often by Cauſes of ſuch a latent Nature as not to be diſcover'd by our moſt diligent Reſearches.

Thus ſometimes a Finger, and ſometimes a whole Arm, gradually decreaſes, and becomes parch'd; for if the Reſiſtance of the Veſſels is, by any Cauſe whatever augmented, their Extenſion will be proportionably diminiſh'd: Hence a ſlow Maraſmus enſues. I myſelf ſaw a Woman under forty Years of Age, who, without any perceptible Fault in her Body, without any Signs of an internal Suppuration, and without the Increaſe of any ſenſible Evacuation, in two Years time by a ſlow Maraſmus had her Fluids ſo exhauſted, that her ſqualid loathſome Skin only cover'd her Bones. Perhaps Diſorders of this kind are what the Antients call'd *ἐκ φύσεως γῆρας*, old Age brought on by a Diſeaſe.

The accurate *Sartorini*, in the third Chapter of his anatomical Obſervations, informs us, that whilſt he was diſſecting the Body of a Man, whoſe Right Eye had, long before his Death, been afflicted with a legitimate *Amauroſis*, he found the optic Nerve of the ſame Side preternaturally ſmall and dark-colour'd. In this Caſe a too great Rigidity ſeems to have been produc'd in the Right optic Nerve by a latent Cauſe. A great Variety of Diſorders are produced, when a preternatural Rigidity happens in any of the other Organs of Senſe, or the Viſcera.

Hence the Means of removing a too great Rigidity of the Fibres are diſcover'd.

This Diſorder then is remov'd, firſt, by Aliments and Drink of a mild and aqueous Nature, eſpecially Whey, the ſofteſt Pot-herbs, diluted, farinaceous, and unfermented Liquors. Secondly, by Reſt, in a ſomewhat cool and moiſt Air, together with plentiful Sleep. Thirdly, by unſalted aqueous Remedies, exhibited internally, or apply'd externally tepid, uſing, in like manner, ſmooth and mild oleous Subſtances.

By Aliments and Drink of an aqueous Nature. We call aqueous Drink, either Water itſelf, or any other Liquor in which Water predominates. We call aqueous Aliments, ſuch as have Water for their moſt conſiderable Ingredient, ſuch as Gruels, Broths, and others of a like Nature. All theſe apply a large Quantity of Water to the internal Parts of the Body, carry it through all the Veſſels, and ſoften and lubricate all the Parts; for Water, eſpecially when tepid, is poſſeſs'd of a Power of ſoftening the hardeſt Parts of Animals; Thus Horns, Hoofs, and even Bones, may be render'd ſoft by warm Water.

Hence we obſerve, that the Inhabitants of the hotteſt Climates, who have their Bodies highly conſtricted, are principally fond of Water, and aqueous Subſtances. 'Tis not to be wonder'd at, that Whey is here commended, ſince the Uſe of Milk was before order'd for corroborating too weak Fibres: For, in Whey, the ſubtile, ſpirituous, and caſeous Parts are wanting, and the aqueous Part only remains, which is richly impregnated with the diſſolving Quality of the Graſs. For theſe Purpoſes, the beſt is Whey of Butter-milk, ſtript of all its pinguious Principles, and ſomewhat ſour: Hence this Liquor is highly uſeful in all acute Diſeaſes. To this Claſs belong all the Juices of perfectly ripe Summer-fruits.

The ſofteſt Pot-herbs. All theſe are enumerated in the *Materies Medica* of *Boerhaave*; and there is neither any great Taſte nor Smell in any of them; but they yield an aqueous and highly emollient kind of Mucilage. Broths prepar'd from theſe are highly beneficial to Perſons of this atrabiliarious Habit.

The Pot-herbs mention'd by *Boerhaave* are theſe;

Orache, Potatoes, Beets, Borrage, red Cabbage, Earth-nuts, Chervil; all the Kinds of Succory, Artichokes, Cucumbers, Dandelion, Endive; almoſt all Sorts of Lettuces, Parſnip, Purſlain, Turneps; the Roots of Skirrets, the Roots of Viper's-graſs, Spinage, the Roots of Goats-beard, ſmall Valerian.

Boerhaave, in his *Materies Medica*, ſpecifies the ſubſequent ſoft, aqueous Subſtances, which he recommends as proper in the Caſe before us:

Thin Decoctions of Bread, the Juices of ripe Summer-fruits, either crude, or boil'd with a little Water, and ſweeten'd with Sugar; the Juice of Oranges, the Juice of Elder-berries; all the Kinds of ſweet Cherries, ſweet Citrons full-ripe, Garden-cucumbers, Garden-gourds, Figs, Strawberries, ripe Pomegranates, Jujubs, ſweet Lemons, Apricots, Melons, Mulberries, Peaches, Apples poſſeſs'd of a Sweetneſs together with a kind of Acidity, ſweet Plums, red, white, and black Currants, Raſpberries.

From theſe many Sorts of agreeable Aliments may be prepar'd by boiling, roaſting, and other ways of Management.

A Decoction of Oats alone, drank daily in large Quantities, ſo impairs the ſtrongeſt Man, as to render him entirely weak and languid. Country-people, alſo, have a Practice of rendering Swine lax and fat, only by Meal mixt with Water or Whey.

Many of the common People, who lead a ſedentary Life, uſe no violent Exerciſe, and live conſtantly on theſe farinaceous Subſtances, have always highly lax Bodies.

Farinaceous Vegetables are theſe;

Sweet Almonds, Oats, Buck-wheat, Barley, Mays, Millet, Rice, Panic, Piſtachios, Wheat, Rye, Speltwheat.

From all theſe, Decoctions, Cremors, and Panadas, may be made.

Diluted farinaceous Liquors. When Water is drank by Perſons of conſtricted Bodies, in which the Humours are always compact and denſe, it does not remain long in the Body, but is forthwith diſſipated. 'Tis often to be lamented in acute Diſeaſes, that the Water drank by the Patient is forthwith carried off, either by Urine or Sweats. But the farinaceous Subſtances mention'd in *Boerhaave's Materia Medica* as proper for this Purpoſe, when mixt with the Water, render it ſomewhat more viſcid; by which means it is retain'd, and not ſo ſoon expel'd from the Body. This ſeems to be the Reaſon why *Hippocrates*, in his Treatiſe *de Ratione Victus in Acutis*, condemns the drinking of Water in acute Diſorders, whilſt, in the ſame Book, he ſo warmly recommends the Uſe of Ptiſan. All theſe farinaceous Subſtances procure a kind of Viſcidity to the Water, and, by their latent Oil, which is capable of being mixt with Water, and which may be expreſs'd from them, ſoften all the Parts of the Body.

Unfermented Liquors. The ſame is true with reſpect to the Juices of the Summer-fruits; for ſpirituous fermented Liquors were juſtly claſs'd among the Remedies for a Weakneſs of the Fibres; for, by means of Fermentation, from all theſe are produc'd thoſe ſpirituous Liquors, which, when reduc'd to their higheſt Perfection, like a Fire, as it were, parch all the Solids of the Body, and condenſe the Blood into irreſoluble Maſſes.

By Reſt. Muſcular Motion is a principal Remedy in the Cure of too great a Weakneſs of the Fibres, 'tis not, therefore, to be wondered at, if Reſt ſhould produce the contrary Effect. Thoſe who fatten Animals, keep them, as much as poſſible, from Motion, and feed them plentifully. Hence in acute Diſeaſes, where all the Parts are render'd highly dry, the antient Phyſicians order'd as much Reſt as poſſible, eſpecially in a ſomewhat cool and moiſt Air; for a cold and dry Air corroborates the Fibres.

But nothing more relaxes the Body, than the Warmth of the Bed, eſpecially when the Patient indulges himſelf in Sleep; for in this Caſe the Patient is, as it were, in a Bath, conſiſting of the Exhalations ariſing from his own Body: For this Reaſon, all Animals are ſomewhat larger after Sleep, than they were before. Hence *Hippocrates*, in his ſecond Book *de Ratione Victus*, affirms, "that long Sleeps, by the Heat they "produce, colliquate the Fleſh, relax the Body, and render "it weaker."

And, in his Treatiſe *de Affectionibus*, he uſes theſe Words: "In Diſorders where Dryneſs is beneficial, 'tis highly con-"ducive to ſleep as little as poſſible: But in ſuch as require "Humidity, the Patients ought neither to want Aliments, "nor Drink, nor to labour hard, but to ſleep as much as "they have a mind."

As for aqueous internal and external Remedies; the moſt conſiderable of theſe, and that which is the Baſis of all the others, is Water, which, when warm, and riſing in Steams, is capable of ſoftening the hardeſt Parts of Animals to ſuch a Degree as almoſt to diſſolve them. In acute Diſeaſes, where the Skin is often parch'd and dry, in conſequence of a total Conſtriction of the exhaling Veſſels, the Attempts to provoke Sweats by the hotteſt Medicines are fruitleſs and unſucceſsful: Whereas, when the naked Body is expos'd to the Steams of tepid Water, the Mouths of the Veſſels are relax'd, the Skin becomes moiſt, and ſoon after profuſe Sweats appear. And, becauſe in theſe Diſeaſes the internal Parts are as dry as the Skin, Clyſters of a like Nature are to be injected, and aqueous Decoctions prepar'd with farinaceous Subſtances to be exhibited, in order to ſoften the internal Parts. And when, by the long-continued Uſe of theſe aqueous Subſtances, the Body is weakened, the oppoſite Diſorder, that is, a Dropſy, is often induced.

All theſe aqueous Remedies ought to be us'd tepid; becauſe cold Subſtances condenſe and corroborate the Fibres, and too hot Subſtances coagulate the Blood, and burn the Solids to a gangrenous Cruſt.

All the Medicines of this Kind ought to be without Salt; becauſe Salt indurates all the Parts of the Body, as is obvious from ſalted Fleſh. The Medicines of this Kind afford a very ſingular Relief.

As for mild oleous Remedies; it is certain, that the Skins of Animals become flaccid and pliant, when wet with Water, but are more rigid when dry'd, than they were before; but when they are impregnated with Oil, they remain ſoft for a long time, becauſe Oil is of an adheſive Nature, and not ſoon diſſipated. When the Fibres of the Inteſtines are ſo ſpaſmodically conſtricted, as to excite the moſt violent Pains, by drinking a large Quantity of the ſofteſt Oils, and injecting Clyſters of the ſame, the Stricture is remov'd, and the inteſtinal Fibres are relax'd.

In acute Diſeaſes attended with an exceſſive Dryneſs, and when too great a Strength of the Solids is produced by the Diſeaſe; or when the Patient has often been in ſuch a State before; thoſe oleous Subſtances would be highly beneficial, if the increas'd Heat of the Body did not change theſe Oils, which eaſily become rancid, from a mild to a highly acrid Nature. In this Caſe, Decoctions prepar'd from thoſe farinaceous Subſtances, enumerated from *Boerhaave's Materia Medica*, excellently ſupply the Place of Oils; for from all theſe, eſpecially when dried, a pure and copious Oil may be extracted, by means of a Preſs, which is ſo united with the mucilaginous Part of the Decoctions, that it retains the whole emollient Quality of the Oil, without any Danger of becoming rancid.

When an Anchyloſis ariſes from ſuch an Hardneſs of the Ligaments, that they cannot be extended ſo as to allow the Bending of the Joints, the Rigidity is moſt ſucceſsfully remov'd by duly rubbing all the Part affected with a Lixivium of Soap, ſo as to render it clean, and capable of perſpiring freely. Then it is to be frequently, every Day, expos'd to the Steam of tepid Water; after which, the Part, when dried, is to be anointed with the moſt ſoftening Oil, the rigid Ligaments are to be gently drawn, and the Joint bended; for too great a Diſtraction of the Fibres is one of the Cauſes of their Weakneſs: Hence, after theſe Meaſures are taken, it is highly beneficial to extend and lengthen the too rigid Parts.

When the Antients attempted to reduce extenuated Parts to their natural Situation, they ſtimulated and irritated theſe Parts ſo as to produce a gentle Inflammation and Swelling; for, by this means, the Humours, being convey'd with a greater Impetus, and a briſker Motion, to the Parts, diſtended the too rigid Veſſels proportionably the more. By often repeating this Irritation, the too great Strength of the Veſſels was ſo diminiſhed, as to yield to the Humours, which, in order to their good State of Health, muſt neceſſarily flow into them. Thus *Galen*, in the third Chapter of his fifth Book *de Sanitate tuenda*, informs us, "that, by Frictions with pinguious Subſtances, "he, in a few Days, reſtor'd the Fleſh of many, who had "been, for a long time, emaciated."

Hence Frictions with pinguious Subſtances are highly proper in theſe Caſes, but only to ſuch a Degree as to excite a

ſlight

ſlight and gentle Redneſs of the Part; for when the Friction is violent, that which it attracts to the Part is diſcuſs'd; but, in this Caſe, a large Diſtention of the too ſtrong Veſſels is requir'd. *Galen*, in the ſeventh Chapter of his ſeventh Book, *de Method. Medend.* gives this Caution, in the following Words: "When, ſays he, we intend to produce Fleſh on "any Part, we are by Friction to heat it, ſo as to render it "tumid; but, when we intend to diſcuſs and evacuate, this "Friction and Heat are to be continued, till the tumid Part "ſubſides." And, in the ſixteenth Chapter of his fourteenth Book, *de Method. Medend.* he tells us, "That it was cuſtom-"ary, with ſome, to ſtrike emaciated Parts with ſlender Rods "ſlightly anointed, till the Parts became moderately tumid." He, alſo, informs us, that, by ſuch a Percuſſion repeated daily, or every other Day, together with a moderate Pication, the diminutive and extenuated Buttocks of Children were wonfully enlarg'd.

Hence the Reaſon is obvious, why Friction, ſometimes, produces oppoſite Effects; for a ſtrong Friction with rough dry woolen Cloths, eſpecially when impregnated with the Fumes of kindled Aromatics, cures too weak Fibres; whereas a gentle Friction with pinguious Subſtances, by attracting the Humours, and relaxing the Solids, ſoftens too rigid Fibres.

Boerhaave, in his *Materies Medica*, ſpecifies the ſubſequent aqueous, ſubfarinaceous, ſuboleous, ſoft, and emollient Subſtances, for the Caſe before us:

Water, boil'd with farinaceous or emollient Vegetables; yellow Mallows; the Root, Leaves, Flowers, and Seed, of Vervain Mallows, Ladies Mantle, Chickweed; the Flowers, Leaves, and Root, of Marſhmallows, the Ox-eye Daiſy, Engliſh Mercury, Brank-urſine, Comfrey, Bugle, the common Daiſy, Hounds-tongue; the Leaves of Henbane; the Roots of white Lilies, Toadflax, Flax, Pile Trefoil, and Sweet Trefoil, common Mallows; the Flowers and Leaves of Melilot, French Mercury, Pellitory of the Wall; the Leaves and Buds of the Poplar, Self-heal, Lungwort; the Leaves and Flowers of Elder, Scabious, Solomon's-ſeal, Nightſhade, Orpine, ſtinking Trefoil, Mullein, the Violet, Kidney-vetch, freſh Butter, Cream; the Fat of Birds, as of a Duck, a Gooſe, and a Capon; the Marrow of Beef; ſoftening Oils, prepar'd of mild farinaceous Subſtances, ſuch as the Oils of both bitter and ſweet Almonds, Linſeed-oil, Oleum Mucilaginum deſcrib'd in the *Leyden* Diſpenſatory, Olive-oil, Palm-oil, Oil of white Poppies, Oil of Nightſhade, Oil of white Trefoil, and Oil of Violets; Syrups, ſuch as the Syrup of Marſhmallows of *Fernelius*, Syrup of Borrage, Syrup of Maidenhair, Syrup of Jujubs, Syrup of white and red Poppies, Syrup of Comfrey of *Fernelius*, and the Syrupus violaceus ſimplex, Honey of Mercury; Ointments, ſuch as the compound Ointment of Marſhmallows, the Golden Ointment, Baſilicon, and Ointment of Poplar.

From theſe may be made proper Baths, Fomentations, Vapours, Ointments, Decoctions, Apozems, and Clyſters; but the Hounds-tongue and Henbane are only ſafe for external Uſe.

Hence are underſtood the genuine Nature and moſt proper Cure of too great an Elaſticity of the Fibres, which is generally the Concomitant and Effect of Rigidity.

We have already explain'd Rigidity, which always bears a direct Proportion to Elaſticity; for it is ſcarce poſſible to find a Body ſo perfectly rigid, as to be incapable of being bent by any Force. Hence, as Elaſticity depends on that Force, by which the conſtituent Parts of a Fibre cohere; and as this Force is greater in a rigid than in a lax Fibre; it is ſufficiently obvious, that too great an Elaſticity muſt always accompany too great Rigidity.

Soft Balls of Clay meeting each other in contrary Directions remain in a State of Reſt; but, when bak'd in a Furnace, they become elaſtic, and recoil from each other with a Force which bears a compound Proportion to their Elaſticity, and the impelling Cauſe.

From what has been ſaid, we are, alſo, enabled to comprehend, why Children, Women, and thoſe who are addicted to Eaſe, have lax Fibres; whereas Adults, Men, and ſuch as uſe Exerciſe, have their Fibres, and, conſequently, all their Solids, ſo rigid, that, upon a Solution of Continuity, their Parts are ſtrongly retracted, and drawn from each other.

As for Children; we have already obſerv'd, that in them the Fibres and Veſſels are not become callous; which afterwards happens by the natural Energy of the vital Motions.

As for Women; it is confirm'd, by anatomical Obſervations, that their Bodies are, all other Conditions remaining alike, far ſofter than thoſe of Men. This Circumſtance is the Reſult of our Creator's Pleaſure; who, for wiſe Purpoſes, form'd the Body of Women in this Manner, capable of being diſtended without any conſiderable Inconvenience, that it might be the more capable of lodging and nouriſhing the Fœtus, and have the menſtruous Matter accumulated more commodiouſly. The lax State of Womens Bodies is, alſo, in a great meaſure, owing to their uſing leſs hardy and ſevere Exerciſes than Men.

As for thoſe who indulge themſelves in Eaſe; we have already ſhewn, that their Courſe of Life has a neceſſary Tendency to render their Fibres lax.

As for Adults; the longer a Man lives, the more often and forcibly the conſolidating Force is applied to his Fibres: Hence, the Strength of his Fibres is increas'd, in proportion as he advances in Years. A Boy has all his Members flexible and pliant; whereas, in a decrepit old Man, they are ſtiff and rigid: Nor can any other Reaſon be given why this ſhould happen in Men rather than in Women, all other Conditions being ſuppos'd equal, than that Almighty God, for the Purpoſes already mentioned, and, perhaps, more noble ones as yet unknown to us, intended this ſignal Difference in the original Make of his Creatures.

As for thoſe who uſe Exerciſe; we have already obſerv'd, that Exerciſe contributes greatly to ſtrengthen and corroborate too weak Fibres; for that which we call Tenacity or Coheſion of the ſolid Parts, is the Effect of the Continuation of Life. Now, the leſs of animal Motion a Perſon adds to the vital Motion, the more weak the ſolid Parts of his Body remain: He who does no kind of Work with his Hands, has them ſoft and tender; whereas he who labours ſtrongly with them, has them hard and callous, and, at laſt, rigid and inflexible.

As for a Retraction of the Parts upon a Solution of Continuity; when a Solution of Continuity happens in any ſolid Part of the living Body, the Parts divided are retracted, and recede from each other; becauſe that Force, by which the Elements of the Fibres cohere, neceſſarily retracts the Extremities of the Parts divided: The ſtronger, therefore, this Force is, a proportionably larger Gaping of the divided Parts will neceſſarily be produc'd. Hence Wounds, made in lax Bodies, immediately unite, and are conſolidated; whereas, in rigid Bodies, they gape more, and are conſolidated with greater Difficulty.

Simple Diseases of the large and small Vessels.

As the Diſeaſes of the moſt minute Veſſels proceed from the ſame Cauſes with thoſe of the ſimple Fibres, by an Application, Intexture or Contortion of which, they are form'd, they muſt, of courſe, retain the ſame Nature, produce the ſame Effects, require the ſame Method of Cure, and be, in a great meaſure, underſtood from what has been already ſaid.

Upon conſidering the Diſorders of the Fibres, and, conſequently, of all the ſolid Parts, which are made up of them, it ſufficiently appears, of how ſimple a Nature all the Diſeaſes incident to the Solids are.

As the Elements of the Fibres, mutually apply'd to each other, conſtitute a ſolid Fibre, ſo we may eaſily conceive, how the moſt minute Fibres may have all the Points of their contiguous Sides mutually applied to each other, in ſuch a manner, as only to cohere longitudinally. If two ſuch Fibres are mutually apply'd to each other in a parallel Direction, they conſtitute the ſmalleſt or moſt minute Membrane: If, on the contrary, a thouſand of theſe Fibres are in the ſame manner apply'd to each other, they will form a Membrane, which is broader, but not thicker. Hence the moſt ſimple Membrane is conceiv'd to conſiſt of Fibres longitudinally united to each other.

The Strength of the Fibres depends on the Coheſion of their conſtituent Elements; but all the Elements of a Fibre, which is a conſtituent Part of the moſt ſimple Membrane, cohere with the Elements of the two Fibres, which lie next, on each Side. Hence, the Strength of a Fibre, join'd to other Fibres on each Side, is doubly greater than that of a ſimple Fibre.

Hence the Strength of the Fibres is increas'd by their being join'd and united in the moſt ſimple Membrane; but the Fibres which terminate, or ſet Bounds to, the moſt ſimple Membrane, ſince they have only another contiguous Fibre on one Side, have, therefore, only half a greater Degree of Coheſion in their Elements, than a ſimple Fibre.

Since a Membrane conſiſts of Fibres interwoven and contorted with each other, the greater the Number of Points, in which they touch one another, is, the Strength of the Fibres, which conſtitute ſuch a Membrane, muſt be proportionally the greater.

Hence 'tis obvious, that the Part which conſtitutes the Margin of the moſt ſimple Membrane, is moſt eaſily ſeparated from its Coheſion with the other Parts.

Now, if we conceive ſuch a ſimple Membrane, wrapt up in the Form of a hollow Veſſel, then every Fibre will be plac'd between two other Fibres, and, conſequently, there can be no Margins or Edges; ſo that the Coheſion of all the Fibres, which conſtitute the moſt ſimple Membrane, wrapt up into a hollow Veſſel, is doubly greater than that of a ſimple ſolid Fibre.

Hence we obſerve, that the Inhabitants of the hotteſt Climates, who have their Bodies highly conſtricted, are principally fond of Water, and aqueous Subſtances. 'Tis not to be wonder'd at, that Whey is here commended, ſince the Uſe of Milk was before order'd for corroborating too weak Fibres: For, in Whey, the ſubtile, ſpirituous, and caſeous Parts are wanting, and the aqueous Part only remains, which is richly impregnated with the diſſolving Quality of the Graſs. For theſe Purpoſes, the beſt is Whey of Butter-milk, ſtript of all its pinguious Principles, and ſomewhat ſour: Hence this Liquor is highly uſeful in all acute Diſeaſes. To this Claſs belong all the Juices of perfectly ripe Summer-fruits.

The ſofteſt Pot-herbs. All theſe are enumerated in the *Materies Medica* of *Boerhaave*; and there is neither any great Taſte nor Smell in any of them; but they yield an aqueous and highly emollient kind of Mucilage. Broths prepar'd from theſe are highly beneficial to Perſons of this atrabiliarious Habit.

The Pot-herbs mention'd by *Boerhaave* are theſe;

Orache, Potatoes, Beets, Borrage, red Cabbage, Earth-nuts, Chervil; all the Kinds of Succory, Artichokes, Cucumbers, Dandelion, Endive; almoſt all Sorts of Lettuces, Parſnip, Purſlain, Turneps; the Roots of Skirrets, the Roots of Vipers-graſs, Spinage, the Roots of Goats-beard, ſmall Valerian.

Boerhaave, in his *Materies Medica*, ſpecifies the ſubſequent ſoft, aqueous Subſtances, which he recommends as proper in the Caſe before us:

Thin Decoctions of Bread, the Juices of ripe Summer-fruits, either crude, or boil'd with a little Water, and ſweeten'd with Sugar; the Juice of Oranges, the Juice of Elder-berries; all the Kinds of ſweet Cherries, ſweet Citrons full-ripe, Garden-cucumbers, Garden-gourds, Figs, Strawberries, ripe Pomegranates, Jujubs, ſweet Lemons, Apricots, Melons, Mulberries, Peaches, Apples poſſeſs'd of a Sweetneſs together with a kind of Acidity, ſweet Plums, red, white, and black Currants, Raſpberries.

From theſe many Sorts of agreeable Aliments may be prepar'd by boiling, roaſting, and other ways of Management.

A Decoction of Oats alone, drank daily in large Quantities, ſo impairs the ſtrongeſt Man, as to render him entirely weak and languid. Country-people, alſo, have a Practice of rendering Swine lax and fat, only by Meal mixt with Water or Whey.

Many of the common People, who lead a ſedentary Life, uſe no violent Exerciſe, and live conſtantly on theſe farinaceous Subſtances, have always highly lax Bodies.

Farinaceous Vegetables are theſe;

Sweet Almonds, Oats, Buck-wheat, Barley, Mays, Millet, Rice, Panic, Piſtachios, Wheat, Rye, Speltwheat.

From all theſe, Decoctions, Cremors, and Panadas, may be made.

Diluted farinaceous Liquors. When Water is drank by Perſons of conſtricted Bodies, in which the Humours are always compact and denſe, it does not remain long in the Body, but is forthwith diſſipated. 'Tis often to be lamented in acute Diſeaſes, that the Water drank by the Patient is forthwith carried off, either by Urine or Sweats. But the farinaceous Subſtances mention'd in *Boerhaave's Materia Medica* as proper for this Purpoſe, when mixt with the Water, render it ſomewhat more viſcid; by which means it is retain'd, and not ſo ſoon expel'd from the Body. This ſeems to be the Reaſon why *Hippocrates*, in his Treatiſe *de Ratione Victus in Acutis*, condemns the drinking of Water in acute Diſorders, whilſt, in the ſame Book, he ſo warmly recommends the Uſe of Ptiſan. All theſe farinaceous Subſtances procure a kind of Viſcidity to the Water, and, by their latent Oil, which is capable of being mixt with Water, and which may be expreſs'd from them, ſoften all the Parts of the Body.

Unfermented Liquors. The ſame is true with reſpect to the Juices of the Summer-fruits; for ſpirituous fermented Liquors were juſtly claſs'd among the Remedies for a Weakneſs of the Fibres; for, by means of Fermentation, from all theſe are produc'd thoſe ſpirituous Liquors, which, when reduc'd to their higheſt Perfection, like a Fire, as it were, parch all the Solids of the Body, and condenſe the Blood into irreſoluble Maſſes.

By Reſt. Muſcular Motion is a principal Remedy in the Cure of too great a Weakneſs of the Fibres, 'tis not, therefore, to be wondered at, if Reſt ſhould produce the contrary Effect. Thoſe who fatten Animals, keep them, as much as poſſible, from Motion, and feed them plentifully. Hence in acute Diſeaſes, where all the Parts are render'd highly dry, the antient Phyſicians order'd as much Reſt as poſſible, eſpecially in a ſomewhat cool and moiſt Air; for a cold and dry Air corroborates the Fibres.

But nothing more relaxes the Body, than the Warmth of the Bed, eſpecially when the Patient indulges himſelf in Sleep; for in this Caſe the Patient is, as it were, in a Bath, conſiſting of the Exhalations ariſing from his own Body: For this Reaſon, all Animals are ſomewhat larger after Sleep, than they were before. Hence *Hippocrates*, in his ſecond Book *de Ratione Victus*, affirms, "that long Sleeps, by the Heat they "produce, colliquate the Fleſh, relax the Body, and render "it weaker."

And, in his Treatiſe *de Affectionibus*, he uſes theſe Words: "In Diſorders where Dryneſs is beneficial, 'tis highly con-"ducive to ſleep as little as poſſible: But in ſuch as require "Humidity, the Patients ought neither to want Aliments, "nor Drink, nor to labour hard, but to ſleep as much as "they have a mind."

As for aqueous internal and external Remedies; the moſt conſiderable of theſe, and that which is the Baſis of all the others, is Water, which, when warm, and riſing in Steams, is capable of ſoftening the hardeſt Parts of Animals to ſuch a Degree as almoſt to diſſolve them. In acute Diſeaſes, where the Skin is often parch'd and dry, in conſequence of a total Conſtriction of the exhaling Veſſels, the Attempts to provoke Sweats by the hotteſt Medicines are fruitleſs and unſucceſsful: Whereas, when the naked Body is expos'd to the Steams of tepid Water, the Mouths of the Veſſels are relax'd, the Skin becomes moiſt, and ſoon after profuſe Sweats appear. And, becauſe in theſe Diſeaſes the internal Parts are as dry as the Skin, Clyſters of a like Nature are to be injected, and aqueous Decoctions prepar'd with farinaceous Subſtances to be exhibited, in order to ſoften the internal Parts. And when, by the long-continued Uſe of theſe aqueous Subſtances, the Body is weakened, the oppoſite Diſorder, that is, a Dropſy, is often induced.

All theſe aqueous Remedies ought to be us'd tepid; becauſe cold Subſtances condenſe and corroborate the Fibres, and too hot Subſtances coagulate the Blood, and burn the Solids to a gangrenous Cruſt.

All the Medicines of this Kind ought to be without Salt; becauſe Salt indurates all the Parts of the Body, as is obvious from ſalted Fleſh. The Medicines of this Kind afford a very ſingular Relief.

As for mild oleous Remedies; it is certain, that the Skins of Animals become flaccid and pliant, when wet with Water, but are more rigid when dry'd, than they were before; but when they are impregnated with Oil, they remain ſoft for a long time, becauſe Oil is of an adheſive Nature, and not ſoon diſſipated. When the Fibres of the Inteſtines are ſo ſpaſmodically conſtricted, as to excite the moſt violent Pains, by drinking a large Quantity of the ſofteſt Oils, and injecting Clyſters of the ſame, the Stricture is remov'd, and the inteſtinal Fibres are relax'd.

In acute Diſeaſes attended with an exceſſive Dryneſs, and when too great a Strength of the Solids is produced by the Diſeaſe; or when the Patient has often been in ſuch a State before; thoſe oleous Subſtances would be highly beneficial, if the increas'd Heat of the Body did not change theſe Oils, which eaſily become rancid, from a mild to a highly acrid Nature. In this Caſe, Decoctions prepar'd from thoſe farinaceous Subſtances, enumerated from *Boerhaave's Materia Medica*, excellently ſupply the Place of Oils; for from all theſe, eſpecially when dried, a pure and copious Oil may be extracted, by means of a Preſs, which is ſo united with the mucilaginous Part of the Decoctions, that it retains the whole emollient Quality of the Oil, without any Danger of becoming rancid.

When an Anchyloſis ariſes from ſuch an Hardneſs of the Ligaments, that they cannot be extended ſo as to allow the Bending of the Joints, the Rigidity is moſt ſucceſsfully remov'd by duly rubbing all the Part affected with a Lixivium of Soap, ſo as to render it clean, and capable of perſpiring freely. Then it is to be frequently, every Day, expos'd to the Steam of tepid Water; after which, the Part, when dried, is to be anointed with the moſt ſoftening Oil, the rigid Ligaments are to be gently drawn, and the Joint bended; for too great a Diſtraction of the Fibres is one of the Cauſes of their Weakneſs: Hence, after theſe Meaſures are taken, it is highly beneficial to extend and lengthen the too rigid Parts.

When the Antients attempted to reduce extenuated Parts to their natural Situation, they ſtimulated and irritated theſe Parts ſo as to produce a gentle Inflammation and Swelling; for, by this means, the Humours, being convey'd with a greater Impetus, and a briſker Motion, to the Parts, diſtended the too rigid Veſſels proportionably the more. By often repeating this Irritation, the too great Strength of the Veſſels was ſo diminiſhed, as to yield to the Humours, which, in order to their good State of Health, muſt neceſſarily flow into them. Thus *Galen*, in the third Chapter of his fifth Book *de Sanitate tuenda*, informs us, "that, by Frictions with pinguious Subſtances, "he, in a few Days, reſtor'd the Fleſh of many, who had "been, for a long time, emaciated."

Hence Frictions with pinguious Subſtances are highly proper in theſe Caſes, but only to ſuch a Degree as to excite a

ſlight

ſlight and gentle Redneſs of the Part; for when the Friction is violent, that which it attracts to the Part is diſcuſs'd; but, in this Caſe, a large Diſtention of the too ſtrong Veſſels is requir'd. *Galen*, in the ſeventh Chapter of his ſeventh Book, *de Method. Medend.* gives this Caution, in the following Words: "When, ſays he, we intend to produce Fleſh on "any Part, we are by Friction to heat it, ſo as to render it "tumid; but, when we intend to diſcuſs and evacuate, this "Friction and Heat are to be continued, till the tumid Part "ſubſides." And, in the ſixteenth Chapter of his fourteenth Book, *de Method. Medend.* he tells us, "That it was cuſtom-"ary, with ſome, to ſtrike emaciated Parts with ſlender Rods "ſlightly anointed, till the Parts became moderately tumid." He, alſo, informs us, that, by ſuch a Percuſſion repeated daily, or every other Day, together with a moderate Pication, the diminutive and extenuated Buttocks of Children were wonfully enlarg'd.

Hence the Reaſon is obvious, why Friction, ſometimes, produces oppoſite Effects; for a ſtrong Friction with rough dry woolen Cloths, eſpecially when impregnated with the Fumes of kindled Aromatics, cures too weak Fibres; whereas a gentle Friction with pinguious Subſtances, by attracting the Humours, and relaxing the Solids, ſoftens too rigid Fibres.

Boerhaave, in his *Materies Medica*, ſpecifies the ſubſequent aqueous, ſubfarinaceous, ſuboleous, ſoft, and emollient Subſtances, for the Caſe before us:

Water, boil'd with farinaceous or emollient Vegetables; yellow Mallows; the Root, Leaves, Flowers, and Seed, of Vervain Mallows, Ladies Mantle, Chickweed; the Flowers, Leaves, and Root, of Marſhmallows, the Ox-eye Daiſy, Engliſh Mercury, Brank-urſine, Comfrey, Bugle, the common Daiſy, Hounds-tongue; the Leaves of Henbane; the Roots of white Lilies, Toadflax, Flax, Pile Trefoil, and Sweet Trefoil, common Mallows; the Flowers and Leaves of Melilot, French Mercury, Pellitory of the Wall; the Leaves and Buds of the Poplar, Self-heal, Lungwort; the Leaves and Flowers of Elder, Scabious, Solomon's-ſeal, Nightſhade, Orpine, ſtinking Trefoil, Mullein, the Violet, Kidney-vetch, freſh Butter, Cream; the Fat of Birds, as of a Duck, a Gooſe, and a Capon; the Marrow of Beef; ſoftening Oils, prepar'd of mild farinaceous Subſtances, ſuch as the Oils of both bitter and ſweet Almonds, Linſeed-oil, Oleum Mucilaginum deſcrib'd in the *Leyden* Diſpenſatory, Olive-oil, Palm-oil, Oil of white Poppies, Oil of Nightſhade, Oil of white Trefoil, and Oil of Violets; Syrups, ſuch as the Syrup of Marſhmallows of *Fernelius*, Syrup of Borrage, Syrup of Maidenhair, Syrup of Jujubs, Syrup of white and red Poppies, Syrup of Comfrey of *Fernelius*, and the Syrupus violaceus ſimplex, Honey of Mercury; Ointments, ſuch as the compound Ointment of Marſhmallows, the Golden Ointment, Baſilicon, and Ointment of Poplar.

From theſe may be made proper Baths, Fomentations, Vapours, Ointments, Decoctions, Apozems, and Clyſters; but the Hounds-tongue and Henbane are only ſafe for external Uſe.

Hence are underſtood the genuine Nature and moſt proper Cure of too great an Elaſticity of the Fibres, which is generally the Concomitant and Effect of Rigidity.

We have already explain'd Rigidity, which always bears a direct Proportion to Elaſticity; for it is ſcarce poſſible to find a Body ſo perfectly rigid, as to be incapable of being bent by any Force. Hence, as Elaſticity depends on that Force, by which the conſtituent Parts of a Fibre cohere; and as this Force is greater in a rigid than in a lax Fibre; it is ſufficiently obvious, that too great an Elaſticity muſt always accompany too great Rigidity.

Soft Balls of Clay meeting each other in contrary Directions remain in a State of Reſt; but, when bak'd in a Furnace, they become elaſtic, and recoil from each other with a Force which bears a compound Proportion to their Elaſticity, and the impelling Cauſe.

From what has been ſaid, we are, alſo, enabled to comprehend, why Children, Women, and thoſe who are addicted to Eaſe, have lax Fibres; whereas Adults, Men, and ſuch as uſe Exerciſe, have their Fibres, and, conſequently, all their Solids, ſo rigid, that, upon a Solution of Continuity, their Parts are ſtrongly retracted, and drawn from each other.

As for Children; we have already obſerv'd, that in them the Fibres and Veſſels are not become callous; which afterwards happens by the natural Energy of the vital Motions.

As for Women; it is confirm'd, by anatomical Obſervations, that their Bodies are, all other Conditions remaining alike, far ſofter than thoſe of Men. This Circumſtance is the Reſult of our Creator's Pleaſure; who, for wiſe Purpoſes, form'd the Body of Women in this Manner, capable of being diſtended without any conſiderable Inconvenience, that it might be the more capable of lodging and nouriſhing the Fœtus, and have the menſtruous Matter accumulated more commodiouſly. The lax State of Womens Bodies is, alſo, in a great meaſure, owing to their uſing leſs hardy and ſevere Exerciſes than Men.

As for thoſe who indulge themſelves in Eaſe; we have already ſhewn, that their Courſe of Life has a neceſſary Tendency to render their Fibres lax.

As for Adults; the longer a Man lives, the more often and forcibly the conſolidating Force is applied to his Fibres: Hence, the Strength of his Fibres is increas'd, in proportion as he advances in Years. A Boy has all his Members flexible and pliant; whereas, in a decrepit old Man, they are ſtiff and rigid: Nor can any other Reaſon be given why this ſhould happen in Men rather than in Women, all other Conditions being ſuppos'd equal, than that Almighty God, for the Purpoſes already mentioned, and, perhaps, more noble ones as yet unknown to us, intended this ſignal Difference in the original Make of his Creatures.

As for thoſe who uſe Exerciſe; we have already obſerv'd, that Exerciſe contributes greatly to ſtrengthen and corroborate too weak Fibres; for that which we call Tenacity or Coheſion of the ſolid Parts, is the Effect of the Continuation of Life. Now, the leſs of animal Motion a Perſon adds to the vital Motion, the more weak the ſolid Parts of his Body remain: He who does no kind of Work with his Hands, has them ſoft and tender; whereas he who labours ſtrongly with them, has them hard and callous, and, at laſt, rigid and inflexible.

As for a Retraction of the Parts upon a Solution of Continuity; when a Solution of Continuity happens in any ſolid Part of the living Body, the Parts divided are retracted, and recede from each other; becauſe that Force, by which the Elements of the Fibres cohere, neceſſarily retracts the Extremities of the Parts divided: The ſtronger, therefore, this Force is, a proportionably larger Gaping of the divided Parts will neceſſarily be produc'd. Hence Wounds, made in lax Bodies, immediately unite, and are conſolidated; whereas, in rigid Bodies, they gape more, and are conſolidated with greater Difficulty.

Simple Diseases of the large and small Vessels.

As the Diſeaſes of the moſt minute Veſſels proceed from the ſame Cauſes with thoſe of the ſimple Fibres, by an Application, Intexture or Contortion of which, they are form'd, they muſt, of courſe, retain the ſame Nature, produce the ſame Effects, require the ſame Method of Cure, and be, in a great meaſure, underſtood from what has been already ſaid.

Upon conſidering the Diſorders of the Fibres, and, conſequently, of all the ſolid Parts, which are made up of them, it ſufficiently appears, of how ſimple a Nature all the Diſeaſes incident to the Solids are.

As the Elements of the Fibres, mutually apply'd to each other, conſtitute a ſolid Fibre, ſo we may eaſily conceive, how the moſt minute Fibres may have all the Points of their contiguous Sides mutually applied to each other, in ſuch a manner, as only to cohere longitudinally. If two ſuch Fibres are mutually apply'd to each other in a parallel Direction, they conſtitute the ſmalleſt or moſt minute Membrane: If, on the contrary, a thouſand of theſe Fibres are in the ſame manner apply'd to each other, they will form a Membrane, which is broader, but not thicker. Hence the moſt ſimple Membrane is conceiv'd to conſiſt of Fibres longitudinally united to each other.

The Strength of the Fibres depends on the Coheſion of their conſtituent Elements; but all the Elements of a Fibre, which is a conſtituent Part of the moſt ſimple Membrane, cohere with the Elements of the two Fibres, which lie next, on each Side. Hence, the Strength of a Fibre, join'd to other Fibres on each Side, is doubly greater than that of a ſimple Fibre.

Hence the Strength of the Fibres is increas'd by their being join'd and united in the moſt ſimple Membrane; but the Fibres which terminate, or ſet Bounds to, the moſt ſimple Membrane, ſince they have only another contiguous Fibre on one Side, have, therefore, only half a greater Degree of Coheſion in their Elements, than a ſimple Fibre.

Since a Membrane conſiſts of Fibres interwoven and contorted with each other, the greater the Number of Points, in which they touch one another, is, the Strength of the Fibres, which conſtitute ſuch a Membrane, muſt be proportionally the greater.

Hence 'tis obvious, that the Part which conſtitutes the Margin of the moſt ſimple Membrane, is moſt eaſily ſeparated from its Coheſion with the other Parts.

Now, if we conceive ſuch a ſimple Membrane, wrapt up in the Form of a hollow Veſſel, then every Fibre will be plac'd between two other Fibres, and, conſequently, there can be no Margins or Edges; ſo that the Coheſion of all the Fibres, which conſtitute the moſt ſimple Membrane, wrapt up into a hollow Veſſel, is doubly greater than that of a ſimple ſolid Fibre.

The Veſſel, which conſiſts of ſuch a ſimple Membrane, thus wrapt up, is call'd the ſmalleſt, or moſt minute Veſſel.

All the Diſeaſes of ſuch a minute Veſſel depend either on the too great or too ſmall Force, by which the Elements of each Fibre cohere with each other, and with thoſe of the adjacent Fibres. But of theſe Diſeaſes we have already treated.

The larger Veſſels, compos'd of the ſmalleſt, united to each other by Application, Intertexture, or Contortion, are ſubject to Diſorders of two Kinds; the former of which depends on the Diſeaſes of the ſmalleſt Canals, which conſtitute theſe larger Veſſels; ſo that their Origin, Nature, Effects, and Cure, are to be underſtood from what has been already ſaid; but the other kind of Diſorders, to which the larger Veſſels are ſubject, depends, firſt, on the Degree of Force, by which the Fluid, moving through them, preſſes their Sides in extending them; which Sides, ſince they conſiſt of other ſmaller Canals, are by this Preſſure depriv'd of their Fluids, united as to their Sides, and grow together in the Form of a ſolid, but thick and groſs, Fibre. This ſame Misfortune may be convey'd to the adjacent ſmall Veſſels. Secondly, the Diſeaſes of the latter Kind, incident to the larger Veſſels, depend on the Concretion of the Fluid, with its proper containing Veſſel.

As ſimple Fibres, longitudinally united, conſtitute a Membrane, ſo we may eaſily conceive, that the ſmalleſt Veſſels, form'd of the moſt ſimple Membrane, wrapt up, may be mutually apply'd to each other, and form a Membrane, which, being again wrapt up, will form a Veſſel, not of the ſmalleſt Kind, but larger, and not conſiſting of Fibres, but of the ſmalleſt Veſſels in their ſtead.

As the Section of theſe minute Veſſels, in a Direction perpendicular to their reſpective Axes, conſtitutes a Circle, the Circles of the Veſſels adjacent to each other can only touch one another in a Point. Hence the adjacent Veſſels will only touch each other by a Line, that is, by the moſt ſimple Fibre. In thoſe Places of Contact, therefore, the Strength of ſuch a Membrane, compos'd of the ſmalleſt Veſſels inſtead of Fibres, will be alſo increas'd.

The ſmalleſt Veſſel, then, conſiſts of Fibres united into a Membrane. The Veſſel next to this in Bulk is that whoſe Membrane conſiſts of the ſmalleſt Veſſels inſtead of Fibres. The next Veſſel, or the laſt except two, with reſpect to Simplicity, is not, like the laſt but one, made up of the ſmalleſt Veſſels, but of them, and the next in Bulk, and ſo forward, till we arrive at the largeſt Veſſels, which are made up of all the different Series of Veſſels found in the human Body.

The Aorta, which is the largeſt of the Veſſels, is, by Injections, demonſtrated to conſiſt of Membranes compounded of ſmaller Veſſels, which are, nevertheleſs, pretty large. The Membranes of theſe Veſſels, which conſtitute the Membranes of the Aorta, conſiſt ſtill of other, but ſmaller Veſſels, and ſo forwards, till we arrive at the laſt Series of Veſſels. *Ruyſch* has ingeniouſly ſhewn, that thoſe Membranes, which, in former Ages, were look'd upon as abſolutely ſimple and ſolid, conſiſt of an incredible Number of ſmall Veſſels.

Hence, by the Multiplicity of Concretions in the Sides, the Strength of the larger Veſſels is continually augmented; and thus we begin to comprehend, on what Circumſtances the Strength and Firmneſs of the human Body depend.

If we inquire what Diſorders are incident to the larger Veſſels, not with reſpect to the Fluids they contain, but when conſider'd as ſolid Veſſels, 'tis ſufficiently obvious, that they are ſubject to all the Diſeaſes of the ſmalleſt Veſſels, of which they are compos'd. But of theſe we have already treated.

The latter kind of Diſorders, incident to the larger Veſſels, depends, firſt, on the Degree of Force by which the Fluid, moving through them, preſſes their Sides in lengthening them.

When the Aorta is diſtended by the Blood forc'd from the Left Ventricle of the Heart, the Canals, which conſtitute its Membranes, are, by that means, compreſs'd; but, when the Action of the Heart ceaſes, the Aorta, contracting itſelf, frees theſe Canals from their Compreſſion. But ſince, at every Moment, the minute Veſſels, which conſtitute the Membranes of the larger Veſſels, are thus compreſs'd, they begin gradually to be ſo depriv'd of their Fluids, that Time for a farther Influx is ſcarce allow'd; then their Sides grow together, their Cavities are deſtroy'd, and, by that means, a ſtrong and thick Membrane is form'd; for the Coheſion of a Membrane, wrapt up in the Form of a Veſſel, is doubly greater than the Coheſion of a ſimple Fibre; but, when the Sides of the flatten'd Veſſel grow together, the oppoſite Fibres muſt of courſe do the ſame; and the Coheſion of a Membrane, thus form'd by the Concretion of the Sides of a flatten'd Veſſel, will become ſtill greater than it was before.

The greater, therefore, the Force of the Heart is, and the longer this Force has continu'd to act, the fewer the Veſſels muſt be, but the ſtronger the Solids. Hence, in extreme old Age, the Strength of the Solids becomes incredible; and, at laſt, when the too ſtrong Reſiſtance of the Veſſels ſuffers them to be no longer diſtended by the impel'd Fluids, a Ceſſation of all the Functions enſues; and a calm and gentle Death, for this Reaſon, generally happens in extreme old Age. Hence, alſo, Animals, accuſtom'd to too hard Labour, are ſoon loaded with the Grievances of old Age, becauſe all their Veſſels are render'd callous before the due Time.

Thoſe Quacks are, therefore, juſtly to be ridicul'd, who impudently boaſt, that they can prevent Wrinkles, and the other more formidable Diſadvantages attending Old-age, by a few Drops of ſome wonderful Elixir, daily us'd; ſince all the Veſſels becoming callous by the inevitable Effects of good Health, we muſt, of courſe, gradually approach the fatal dreaded Period which puts an End to Life.

Certainly more juſt and rational were the Meaſures of the celebrated *Medea*, who, by Baths, cheriſh'd old and decay'd Bodies; for which Reaſon ſhe is, by the antient Poets, ſaid to have reſtor'd Youth to old Perſons.

Secondly, the latter kind of Diſorders, incident to the larger Veſſels, depends upon the Concretion of the Fluid, with its proper containing Veſſel.

When the contain'd Fluid is depriv'd of its moſt ſubtile and liquid Parts, it at laſt grows to the Veſſel in which it before mov'd. It has, in all Ages, been obſerv'd, that in thoſe Degrees, in which, to uſe the Language of the Antients, the *Callidum innatum*, or innate Heat, prevail'd over the *Humidum radicale*, or radical Moiſture, or, as the Moderns expreſs themſelves, where the Force of the Veſſels exceeds that of the diſtending Fluids, the Blood aſſumes ſuch a Nature as to form itſelf into a Pellicle, which can ſcarcely be cut by a Razor. Certainly the Fluids of the human Body are poſſeſs'd of a plaſtic Diſpoſition; and it is as certain, that the Aliments we take into the Body are not render'd ſimilar to our Humours, till they have acquir'd ſuch a Nature. *Ruyſch, in Theſaur.* 6. *N.* 7. and *Theſaur.* 7. *No.* 39. informs us, that by only agitating his own Blood with the Twig of an *African* Plant, he reduced it to a thick coherent Membrane.

Hence we may eaſily conceive, that the Blood, already too much inclin'd to Concretion, by its inflammatory State in acute Diſeaſes, may, if its fluid Parts are ſtill farther diſſipated by the Force of the Diſeaſe, grow to its containing Veſſels.

But we have a ſatisfactory Proof, that even the larger Veſſels are capable of growing to the Fluids, which before circulated in them; for the large Canal, which, during the Stay of the Fœtus in the Uterus of the Mother, convey'd the Blood from the Placenta to the Liver, is afterwards concreted, not into a flat Canal, which it muſt have been, if it had been concreted by the collapſing of its Sides only, but into a kind of round and ſolid Chord; which is an irrefragable Argument, that it is concreted with its contain'd Fluid.

The Strength, therefore, of the larger Veſſels is produc'd by three Cauſes; firſt, the Strength of the Fibres; ſecondly, the collapſing of the Veſſels, or their Compreſſion and Concretion into Membranes; and, thirdly, the Concretion of the Veſſels with their contain'd Fluids.

Hence the Weakneſs, Laxity, Strength, Rigidity, and Elaſticity of the Veſſels, concerning which the Ignorant and Unſkilful advance ſo many Abſurdities, may be clearly underſtood.

All theſe Conditions of the Veſſels are already explain'd; and therefore, only here enumerated, in order to exhibit a ſummary View of the important Circumſtances which depend more or leſs upon a due Acquaintance with the Nature and Properties of a ſimple Fibre.

Relaxation of the Viscera.

The Weakneſs of the Veſſels and Viſcera is ſuch a Coheſion of their conſtituent Parts as may be remov'd by ſo ſlight a Motion, that they are uncapable of duly performing the ſeveral Functions requiſite for the Purpoſes of Life and Motion.

The Viſcera are generally defin'd, Organical Parts of the Body, which ſo change the Humours convey'd thro' them, as to render them conducive to Life and Health. Thus the Lungs form an Organ receiving all the Blood, and inducing ſuch a Change in it, as to render it fit for paſſing through all the Veſſels of the Body. Thus, alſo, the Heart receives all the Blood, changes the Direction of its Motion, and promotes its Mixture,

ture. The ſame holds true with reſpect to all the other Viſcera.

Now 'tis certain from anatomical Injections, that all the Viſcera conſiſt of numberleſs Veſſels, which in different Viſcera are diſpos'd in various Orders, and that upon theſe Veſſels the Action of the Viſcera, by which they change the Humours convey'd to them, depends. If therefore theſe Veſſels are weaker than they ought to be for the Purpoſes of Health, they will act proportionably leſs upon their contain'd Fluids, and conſequently change them leſs than is required. Thus too weak Lungs cannot change the Chyle into good Blood: Thus, alſo, if the Veſſels of the Liver are too much relax'd, the Blood will paſs and repaſs through that Organ, without the Secretion of the Bile, and a Dropſy will conſequently be produc'd. When the Action of the Stomach is too faint and languid, the whole Buſineſs of Chylification is ſurpriſingly diſorder'd.

Theſe Functions of the Viſcera, requiſite for Life and Health, vary according to the Age or Sex of the Individual.

As for the Age; all the Viſcera have their Strength gradually increas'd, in proportion to the Time the vital Powers have acted upon them. Hence all the Parts are originally ſo weak, as to be almoſt diſſolv'd; but they gradually become firmer, till in extreme old Age they are render'd almoſt rigid. Now between this greateſt Weakneſs, and the greateſt Firmneſs of the Parts, there is almoſt an infinite Number of intermediate Degrees in the ſeveral Periods of human Life.

As for the Sex; the Author of Nature has ſubjected Man to a Neceſſity of gaining his Bread by the Sweat of his Brow; whereas he has appointed a different Taſk for Woman, that is, to conceive, bring forth, and nouriſh, her Offspring. This Appointment, alſo, prevails among thoſe Nations, who regulate their Conduct rather by the Suggeſtions of Nature, than the Tenor of poſitive Laws. Hence different Degrees of Strength were requiſite for the diſtinct Purpoſes of the different Sexes.

This Weakneſs ariſes, firſt, from the Weakneſs of the Fibres, and the Cauſes producing it. Secondly, from the Weakneſs of the moſt minute Veſſels, and the Cauſes producing it. Thirdly, from the languid State of the Fluids moving thro' the larger Veſſels, which depends upon a Diminution of their Quantity, an Augmentation of their aqueous Parts, and a languid muſcular Motion. And, fourthly, from the large Number of minute Canals remaining too long in proportion to the Age of the Perſon.

As to the Weakneſs of the Fibres, and that of the moſt minute Canals; theſe have been already explain'd: And,

As for the languid State of the Fluids moving through the larger Veſſels; the whole Action of all the ſeveral Viſcera depends on this, that the Fluids, impel'd by the Force of the Heart, dilate the Arteries, which, reacting by their Strength and Elaſticity, ſhould promote, or carry forward, the diſtending Humours: But all thoſe Bodies, which, under the ſame Bulk, contain a large Quantity of Matter, that is, which are more ſolid, retain the Degree of Motion communicated to them, longer.

In the Fluids, therefore, mov'd by the Force of the Heart, a certain Degree of Solidity was requiſite, that they might not too ſoon loſe the Degree of Motion impreſs'd. Where this due Solidity is wanting, the Humours are ſaid to be languid: But this Solidity is procur'd to the conſtituent Parts by the Efficacy of the Veſſels thro' which they move: Now this Efficacy is no more than that Force by which the diſtended Veſſels re-act upon the diſtending Fluids. Whilſt, therefore, the Quantity of the Fluids being too much diminiſh'd, the Veſſels are not ſufficiently diſtended, their Re-action muſt of courſe be the leſs: Hence all the Veſſels are languid and weak. For this Reaſon, alſo, when by Wounds, or any other Cauſe, a great Quantity of the Fluids is diſcharg'd, a ſolid red Blood is not form'd from the Subſtances us'd as Aliments, but all the Fluids become thin like Water.

As for the Increaſe of the aqueous Parts of the Fluids; ſome Phyſicians were of Opinion, that the Body was in the moſt perfect and advantageous State, when all its Fluids were thinneſt; in conſequence of which, they thought they would paſs the more expeditiouſly thro' all the Veſſels. But the human Body is made and contriv'd according to other Laws. Fluids of a proportional Thickneſs correſpond to the different Series of Veſſels; for, if our Blood was as thin as Water, it would ſlip thro' the open Orifices of the exhaling Veſſels, plac'd both in the internal and external Surface of the Body; or all the Cavities of the Body would be fill'd with Humours too thin, but which would there ſtagnate; for the red and moſt thick Part of the Blood, in a State of Health, always remaining in the largeſt, that is, the red Veins and Arteries, receives the Momentum, or Quantity of Motion, neceſſary to Life and Health, from two moving Cauſes, the Heart and Arteries, and communicates this Momentum to the other Parts of the Blood. From the Attrition of this red Part of the Blood, on the Veſſels which contain it, ariſes the Heat of the human Body; for when this red Part begins to be deficient, all the Parts become cold. Leucophlegmatic Patients, and Girls languiſhing under the Greenſickneſs, are ſufficient Proofs of this.

For this Reaſon, the bountiful and indulgent Author of Nature has plac'd large red Veſſels round the medullary Subſtance of the Brain collected into the Medulla oblongata, that theſe highly minute Veſſels, in which all Attrition is wanting, might be cheriſh'd by a gentle Heat; ſo that, among the Cauſes of the Weakneſs of the Viſcera, we may juſtly reckon the aqueous State of the Humours. The Blood ſpringing from the Veins of a robuſt Man is immediately concreted into a coherent ſciſſile Maſs; whilſt the Blood diſcharg'd from a weak and ſickly Girl is but faintly red, thin, difficultly concreted, and abounding with Water.

As for the Weakneſs of muſcular Motion; this has been already conſider'd, in the Beginning of this Article.

As for the large Number of minute Canals; 'tis certain, that in every Diverſity of Age, there is a certain Calloſity and Abolition of ſome Veſſels requiſite. Anatomiſts obſerve, that Injections are moſt ſucceſsfully made upon young Subjects: Thus we ſee, that, in Proceſs of Time, many Veſſels are aboliſh'd.

The Gland called Thymus, ſo conſpicuous in new-born Infants, ſo decreaſes in Adults, as hardly to leave any Traces of itſelf. A Woman, who abounding with Milk, has ſucceſſively ſuckled a conſiderable Number of Children, when ſhe becomes ſuperannuated and ſtiff, has only flaccid Pellicles, which ſcarcely deſerve the Name of Breaſts. The Glands diſpers'd in the Meſentery are totally aboliſh'd in Perſons advanc'd in Years.

Great Strength is added to the Body, when many minute Veſſels are ſo concreted, as to be form'd into ſtrong Membranes. But this Concretion ariſes from the briſk Motion with which the Fluids are convey'd thro' the larger Veſſels: The briſker, therefore, this Motion is, and the longer it has continued to act, the more the Parts of the Body are conſolidated. Hence, in new-born Infants there is a large Number of Canals, but the Compages of the Body is highly lax; whereas in adult Perſons many of the Veſſels are deſtroy'd, and the Texture of the Body by that means render'd firmer.

From this Weakneſs, produc'd by its peculiar Cauſes, ariſe many Diſorders, falſly aſcrib'd to Temperament, or accounted hereditary. The moſt conſiderable of theſe Diſorders are, firſt, a too eaſy Dilatation and Tumors of the Veſſels, their too eaſy Compreſſion and Inanition, and the Stagnation of the Fluid contain'd in them; an increas'd Reſiſtance made to the Heart, Crudities of the Fluids, ſpontaneous Corruption, an Incapacity for performing the vital, animal, and natural Functions. And all the Conſequences of theſe, which, as they are infinite in Number, ſo they are with Difficulty cur'd, and highly productive of other Diſorders, eſpecially a Cachexia, and a Cacochymia. Secondly, an eaſy Diſſolution of the Veſſels by external or internal Cauſes, ariſing either from Acrimony or Motion; the Effuſion, Stagnation, Corruption, or Evacuation of the Fluids neceſſary to Life and Health; An Interception of the Motion of the Fluids thro' the ruptur'd Veſſels; the Corruption of thoſe Parts which were kept in a ſound State by this Motion; and other Diſorders of various Natures, ſuch as a Phthiſis, an Empyema, a Dropſy, and an Atrophy.

'Tis here ſuppos'd, that a Body, before ſound, has Viſcera and Veſſels too weak; in which Caſe the Injuries of the chang'd Functions appear very conſpicuouſly, eſpecially thoſe enumerated in this Paragraph.

As every Individual has a State of Health peculiar to himſelf, and as different Bodies ſeem to vary from each other, both with reſpect to the Solids and Fluids, though each may, at the ſame time, be in a ſound Condition; this Peculiarity of Conſtitutions, by which they differ from other ſound Bodies, is call'd Idioſyncraſy; and the Diſorders ariſing from this Peculiarity are, ſometimes, accounted incurable, becauſe they are thought to be preſent from the very firſt Formation of the Body. But we cannot always aſcribe thoſe Diſeaſes of weak Veſſels and Viſcera to a known Peculiarity of Conſtitution.

A Girl, ſprung from an illuſtrious Family, delicately brought up, and enur'd to Idleneſs, has her Body rendered tender, languid, and weak; whilſt a Country Girl, ſeemingly of the ſame State of Health in the firſt Months of her Life, gradually acquires a robuſt and ſtrong Conſtitution, by being accuſtomed to Labour from her Infancy.

The Weakneſs of the former, and the Diſeaſes ariſing from it, are therefore falſly accounted hereditary.

When the moſt robuſt and vigorous Man loſes moſt of his Blood by a Wound, he becomes dropſical; and in this Caſe a very great Change is induc'd in what is vulgarly call'd the Temperament.

As for the too eaſy Dilatation and Tumors of the Veſſels; the Manner in which the ſeveral Viſcera prepare their reſpective Humours, has been canvas'd from the very Infancy of Medicine to our own Times; but Authors have advanced nothing ſatisfactory on this Subject, till Mr. *Ruyſch* demonſtrated, that, at the Terminations of the Arteries every-where in the Viſcera, there was a peculiar Conformation in various Parts; and it ſeems, that each Bowel has been form'd with a particular Deſign of preſerving this Conformation of the Arteries. Now, if in any Bowel the Arteries ſhould be too much dilated, as the ſame Force of the impel'd Fluid continues to diſtend the leſs reſiſting Sides of the Veſſels, weak Viſcera will not prepare ſuch Humours as are generated in a State of Health, but ſuch as are of a peccant Quality, and diſturb the whole Body. Thus, when the Structure of the Liver is chang'd, Bile is not prepar'd, but a peccant Liquor of quite different Qualities. Thus alſo, when the Veſſels of the Kidneys are relax'd, they tranſmit Blood inſtead of Urine.

The Veſſels, when too much dilated, produce a Tumor either of the whole Body, or ſome particular Part; for Perſons of weak Veſſels and Viſcera have their Faces inflated, their Cheeks tumid, and their whole Bodies œdematous. Hence, when this Diſorder begins gradually to advance, the deluded Patients often rejoice at the Addition made to their Habit.

As for the eaſy Compreſſion and Inanition of the Veſſels; the Veſſels of a ſound and robuſt Man, left to themſelves, are ſo contracted, as to diminiſh the Diameters of their reſpective Cavities; but they do not become flaccid, and collaps'd, but even ſtrongly reſiſt a preternatural Contraction. Any Impreſſion remains on the Legs of dropſical Patients, but in ſound and robuſt Perſons, the Part preſs'd riſes again.

As for the Stagnation of the Fluids; almoſt the whole Force of the Heart is ſpent in dilating the Arteries. Now, if the weaken'd Arteries, diſtended by the Blood, impel'd by the Force of the Heart, do not contract themſelves ſufficiently, the Blood will remain unmov'd in the dilated Veſſels; for two Cauſes concur to produce the Motion of the Fluids thro' the Veſſels: The Force of the Heart diſtending the Veſſels by the impel'd Blood, and the contractile Force of the Veſſels, which, when the Action of the Heart ceaſes, propels the Blood impel'd from the Heart. When, therefore, this contractile Force is wanting, the Fluids become ſtagnant.

As to the increas'd Reſiſtance made to the Heart; this may perhaps appear ſurpriſing, ſince the weaken'd Veſſels yield more eaſily to the Blood impel'd from the Heart. But, as the weaken'd Arteries are not contracted by a ſufficiently ſtrong ſyſtaltic Motion, they remain diſtended and full. Hence, the Moment after, the Heart cannot ſo eaſily diſcharge its Contents into Veſſels already too full and diſtended. We daily obſerve, that People of pale and tumid Habits of Body are pretty eaſy whilſt in a State of Reſt; but, upon the leaſt Motion, they breathe ſhort, their Hearts palpitate, their jugular Veins become tumid, and they themſelves are almoſt ſuffocated; for, whilſt in a State of Reſt, a ſmall Quantity of venous Blood, ſlowly mov'd, is convey'd to the Heart, and eaſily expreſs'd from it; but the Velocity of the venous Blood being augmented by the Motion of the Body, the Heart is not ſo ſoon able to force the Blood receiv'd thro' the full Veſſels.

As for the Crudity of the Fluids; every thing we take by way of Aliment, is crude, becauſe, not being as yet corrected by the vital Force, it is of a Nature quite different from the human Fluids: But when the Viſcera are weaken'd, their peculiar Powers, by which they contribute to change the Aliments into our Natures, are deſtroy'd; for, in order to a due and laudable Chylification, it is requiſite, that all the chylopoietic Organs ſhould furniſh the other Parts with the Humours prepar'd by them. 'Tis therefore requiſite they ſhould elaborate ſuch Humours: If, therefore, they are weaken'd, they will furniſh peccant Humours degenerating from their native and genuine Qualities. Hence the whole Buſineſs of Chylification will be diſturb'd. Thus the weak Body of a Girl, labouring under a Chloroſis, from the beſt Aliments, does not prepare a laudable Blood, but a kind of pale Humour, reſembling a large Quantity of Milk mix'd with a little Blood. Hence ariſe ſurpriſing Depravations of the Fluids, and various Diſeaſes depending on them. All the Viſcera contribute their particular Share in changing the Aliments to our Natures. If, therefore, one or more of theſe ſhould be weaken'd, this Aſſimilation is defective, and a quite different Fluid produc'd. Hence *Galen*, in the ſixth Chapter of the ſeventh Book of his *Method. Medendi*, juſtly gives us this Caution; that in reſtoring weak Patients, we ought to conſider, "that the Aliments are not, without Aſ-"ſiſtance, concocted, diſtributed to the various Parts of the "Body, nor aſſimilated with the Parts of the Perſon to be "nouriſhed."

As for the ſpontaneous Corruption of the Fluids; the Aliments taken into the human Body are chang'd and aſſimilated to our Natures, by the ſeveral Actions of all the Veſſels and Viſcera; and this Change is call'd πέψις, or Concoction. But if the Aliments are of ſo tenacious a Nature, or the Strength ſo impair'd, that the latter cannot ſubdue the former, then theſe Subſtances are indeed chang'd in the Body, but not aſſimilated to our Natures; but, retaining their own Natures, and being, as it were, digeſted in a hot and moiſt Place, degenerate into an acid, or putrid, and rancid Corruption: And this is call'd ſpontaneous Corruption. This will be render'd more obvious, by an Inſtance: The hard and robuſt Viſcera of labouring Men prepare a laudable Blood from Rye-bread. But this Bread, with the Addition of Water, when digeſted in a chymical Veſſel, with a Heat equal to that of the human Body, is converted into the worſt of Acids. Robuſt Viſcera ſubdue this aceſcent Quality. But, if the ſame Bread is us'd by weak Girls, it retains its Nature, and, by its aceſcent Quality, produces Cardialgias and Gripes. This Degeneracy does not happen in the Body preciſely in the ſame manner as out of it; the Aliments, however, unleſs the aſſimilating Power of the Body is ſufficiently ſtrong, always tend to a ſpontaneous Change.

As for an Incapacity for the vital, animal, and natural Actions; all the Actions of the human Body, in a certain Senſe, depend on muſcular Motion; for the Heart and Arteries, the univerſal moving Cauſes of all the Humours, are muſcular. But theſe Actions can only be perform'd when there are good and laudable Spirits; now the Preparation of the Spirits requires the higheſt and moſt perfect Aſſimilation.

Whilſt, therefore, the too weak Viſcera cannot bring the Aliments to the higheſt Degree of Elaboration, the highly ſubtile Spirits, on which almoſt all the Functions of the Body depend, begin to prove defective. Hence, when a tender Girl begins to languiſh under a Chloroſis, ſhe is gradually ſeiz'd with an unuſual Torpor, a ſurpriſing Laſſitude upon the ſmalleſt Motion, a Vertigo, and a Dulneſs of all the Senſes; all which indicate, that the animal Faculty is injur'd. A Palpitation of the Heart upon the ſlighteſt Motion, a ſoft and weak Pulſe, and a difficult Reſpiration, ſhew that the vital Actions are weak and faint. A languid and ſurpriſingly deprav'd Appetite, an uneaſy Senſation, created by Aliments taken, frequent Coſtiveneſs, together with pale and crude Urine, indicate that the natural Functions are deprav'd.

Hence it is obvious, that from this Source an almoſt infinite Number of Diſorders may ariſe; ſince by this means all the Functions of the Body may be injur'd. Hence, alſo, the Difficulty of Cure, in Caſes of this Nature, is ſufficiently obvious; for the defective Strength of all the Parts muſt be reſtor'd: But this cannot be done, unleſs ſo much of the original Nature of the Body remains, that, being freed from Impediments, and its Defects ſupply'd, it may be able, from the Aliments, to prepare and elaborate a laudable Blood. Hence, when the Lungs or Liver are waſted by a Conſumption, a Cure is in vain either promis'd by the Phyſician, or expected by the Patient. But, from this Incapacity for performing the animal, vital, and natural Actions, ariſes principally a Cachexy, which is a bad Habit of Body, accompanied with ſuch a Weakneſs, that the Nutrition is deprav'd and injur'd thro' the whole Parts of the Body at one and the ſame time. This Diſorder is produc'd when all the Fluids and Solids recede from the Conditions requiſite for a due Aſſimilation of the Aliments to our Natures. Now every Cachexy is neceſſarily attended with a Cacochymy, which is a Receding of all the Humours from the Conditions requiſite to Health. But the Humours of the human Body receive their Qualities from the Force and Action of the Veſſels and Viſcera. If therefore the latter are too weak, the former muſt neceſſarily degenerate, and become deprav'd.

As for the eaſy Diſſolution of the Veſſels; ſuch a Coheſion of the ſolid Parts, which conſtitute the Canals of the human Body, is requiſite, that they may, without ſuffering a Solution of Continuity, ſuſtain the Force of the Fluids impel'd from the Heart. When, therefore, this Coheſion is weaken'd, a Rupture of the Veſſels is to be dreaded from an increas'd Impetus of the impel'd Fluid. Hence it ſo often happens, that tender Men, who have arriv'd at their full Growth, and who, either in conſequence of an original Taint, or their Bodies not being ſufficiently ſtrengthened by muſcular Motion, have too weak Veſſels, have an Artery ruptur'd in their Lungs, by Bawling, Singing, or Running; and thus either die under a Vomiting of Blood, or, afterwards, pine away under a ſlow Phthiſis. Thus, alſo, it frequently happens, that Perſons, the Veſſels of whoſe Kidneys are weak, diſcharge Blood inſtead of Urine, by being drawn over rugged and ſtony Places in Coaches.

Beſides, it has been already obſerv'd, that, when the Viſcera are weak, the Humours degenerate into a ſpontaneous Corruption, and, conſequently, always become more acrid; for,

in a State of Health, the Humours are of ſo mild a Quality, that the Blood, when dropt into the Eye, creates no manner of Pain: When, therefore, acrid Humours flow through the weaken'd Veſſels, the latter are eaſily diſſolv'd by the former. This is ſufficiently obvious from a Scurvy, in which the Laxity of the whole Body frequently concurs with the Acrimony of the Humours. Hence, the Veſſels being ruptur'd, the Blood is diſcharg'd under the Skin, and produces ſcorbutic Spots.

When the Veſſels are thus corroded by an acrid Fluid, or ruptur'd by the too violent Impetus of the moving Fluid, their contain'd Humours are diſcharg'd, and become ſtagnant, becauſe the moving Cauſe ceaſes; and, in conſequence of their Stagnation, they become corrupted, tho' this happens later when the Air has no Acceſs to them. When the ruptur'd Veſſels gape, the Fluids are diſcharg'd from them, and the Circulation of the Humours is diſcontinu'd. Thus all the ſeveral Functions, depending on the Circulation of the Fluids thro' ſound Veſſels, are deſtroy'd. Hence, ſince theſe Accidents may happen in various Parts of the Body, they may give Riſe to an infinite Number of Diſorders, which cannot be eaſily enumerated, but may be reduc'd to certain Claſſes. The Principal of theſe Diſorders are,

Phthiſis; tho' this Diſorder takes its Name from a *Greek* Word importing Corruption, yet Phyſicians do not by it underſtand every Species of Corruption, but a Conſumption of the whole Habit, ariſing from the Prevalence of a purulent Cacochymy, in whatever Part of the Body the Fomes is lodg'd. When the too weak Veſſels are either corroded, or ruptur'd, the diſcharg'd Humours are corrupted, and by their Acrimony inflame all the adjacent Parts. Thus Blood diſcharg'd in the Cavity of the Thorax becomes putrid, and inflames the adjacent Lungs. After this Inflammation, a true Suppuration enſuing deſtroys the Patient by a pulmonary Conſumption. Thus we may underſtand, how from the ſame Cauſe an *Empyema* may ariſe; which tho', in an extenſive Senſe, it denotes every Species of Suppuration, yet, for the moſt part, it only imports a Collection of Pus, in the Cavity of the Thorax.

As for a Dropſy; all Patients, on whom this Diſorder gradually ſteals, labour under Weakneſs of the Veſſels and Viſcera; and almoſt every Dropſy, not ariſing from ſome other violent and previous Diſorder, acknowledges this for its Cauſe, for the exhaling Arteries diſcharge their contain'd Humours into all the large and ſmall Cavities of the Body. But it is to be obſerv'd, that the Force by which the numite Orifices of the Veins imbibe the diſcharg'd Humours from the Cavities of the Body, increaſes and decreaſes in proportion to the Briſkneſs of the Circulation. Hence, in acute Diſorders, where the Circulation is too briſk, all the Parts are render'd dry, whereas, in languid chronical Diſeaſes, the Humours, being gradually accumulated, render all the Parts tumid. Beſides, in Diſorders accompanied with the higheſt Languor, the evacuating Power of the Artery ſeems to continue longer than the abſorbent Force of the Vein. Hence in every Diſpoſition of Body, where the vital Vigour is impair'd, aqueous Parts begin to be accumulated.

As for an Atrophy; tho' at firſt this Diſorder may appear of a Nature quite oppoſite to a Dropſy, yet, when the Abdomen is immenſely turgid in that Species of the Diſeaſe, which is call'd Aſcites, we obſerve that all the ſuperior Parts are extenuated. Nor is this to be wonder'd at, ſince all the Viſcera, being too weak, each of them cannot contribute its proper Share, in bringing about the laſt and higheſt Elaboration of the Aliments, by which they are chang'd into our Natures, and what is loſt, reſtor'd; for Life itſelf will, in the very Nature of the Thing, deſtroy the Body, unleſs it is recruited by the Aliments. Nutrition may, therefore, prove defective from this ſingle Cauſe; and this Defect is called an Atrophy.

The Phyſician who accurately adverts to theſe Circumſtances, will know the Origin, Preſence, and Events, not only of this, but, alſo, of an infinite Number of other dark and obſcure Diſorders; and be capable of diſcovering the moſt ſafe and efficacious Means of Relief.

Whoever attentively conſiders what has been already ſaid, muſt neceſſarily conclude, that all the Functions of the Body may be injur'd by the Weakneſs of the Action of the Veſſels on their contain'd Fluids; becauſe the Soundneſs of all the Functions depends on the due Action of the Solids on the Fluids, and of the Fluids on the Solids; ſo that the want of this Action is the genuine Source, from which an infinite Number of Diſorders ariſes. But when the Effects of Diſeaſes ariſing from Weakneſs are obvious to the Senſes, there is no manner of Difficulty in diſcovering the Cauſe; but frequently the moſt latent and obſcure Diſorders draw their Origin from this Cauſe. When a Patient, in conſequence of a Rupture of the too weak Veſſels of the Lungs, throws up a florid ſcarlet-colour'd Blood, a previous Weakneſs is eaſily diſcover'd to be the Cauſe of the Diſorder. But if the like Arteries, being ruptur'd in the Brain, ſhould, by the Effuſion of the Blood, produce a mortal Apoplexy, the latent Cauſe of ſo terrible a Misfortune is preciſely the ſame with that of the former. When the Veſſels of the Liver are ruptur'd, and diſcharge their Humours, theſe Humours, ſtagnating, become corrupted, inflame all the adjacent Parts, and at laſt deſtroy the Patient, after having conſum'd his whole Liver, and expos'd him to the moſt terrible Calamities. The firſt Spring and Origin of this Diſeaſe is the ſame, as in the former Caſes. This holds equally true in all the other Viſcera.

There is not a more juſt or important Maxim in Medicine, than that, in the Cure of Diſeaſes, a due Regard ought always to be had to the firſt Cauſe, from which all the Symptoms proceed; for, from this Foundation alone, infallible and efficacious Medicines may be diſcover'd. They who by Purgatives attempt to evacuate the Waters of a Dropſy, ariſing from Weakneſs, are, a few Days after, ſurpris'd to find all the Parts as much tumid with Water, as before, ſince all the Fluids are convey'd into the flaccid Veſſels, whilſt ſcarcely any Part of the Liquors drank is carried off either by Sweat, or a Diaphoreſis, and very little by Urine; whilſt the Phyſician who has duly inveſtigated the Cauſe of the Diſorder, goes more prudently to Work, and, after removing the diſtending morbid Fluids, orders the relax'd Body to be ſwath'd with proper Bandage; and by drying Aliments, Corroboratives, and due Exerciſe, deſtroys the firſt Cauſe and Spring, from which all the Symptoms of the Diſorder flow'd.

But, in the Application of theſe Remedies, the preſent Weakneſs of the Patient calls for a ſlow Adminiſtration, ſince a ſudden Change is in no Caſe more dangerous than in this.

The judicious *Hippocrates*, in the fifty-firſt Aphoriſm of his ſecond Section, juſtly obſerves, "That it is moſt ſafe to carry "on an Intention by little and little, eſpecially when a "Change, from one Extreme to another, is to be promoted." This Maxim, is, in a particular manner, to be obſerv'd in the Cure of weak Veſſels and Viſcera; for if in this Caſe the Phyſician ſhould by ſtimulating Medicines, or muſcular Motion, imprudently accelerate the Circulation of the Humour, through the Veſſels, the too weak Veſſels and Viſcera, not being able to ſuſtain the increas'd Force, are often ruptur'd, and the Patient ſhamefully kill'd, inſtead of being judiciouſly cur'd.

The Phyſician, who by violent Exerciſe ſhould attempt the ſpeedy Cure of ſpitting of Blood ariſing from a Weakneſs of the Lungs, would act a moſt abſurd and ridiculous Part; becauſe, by accelerating the Impetus of the Blood, the Wound, as yet not conſolidated, would again be broke open. Hence, in Caſes of this Nature, great Caution, and a prudent Slowneſs of Meaſures, are abſolutely neceſſary.

Theſe Remedies are, therefore, to be ſlowly and cautiouſly exhibited from the firſt to the laſt Stage of the Diſorder; and when, by their means, the Veſſels are corroborated, ſtrong muſcular Motion is to be us'd, till from every Circumſtance it is obvious, that the Veſſels and Viſcera are render'd ſufficiently compact, ſolid, and callous.

Without repeating what has been ſaid concerning the Cure of weak Fibres, we ſhall only obſerve, that it is of the higheſt Importance, that all theſe Meaſures ſhould be gradually increas'd and augmented, till Health is perfectly reſtor'd. If the Intention is to cure Diſorders of this kind by muſcular Motion, the Patient muſt begin with the ſlighteſt and moſt gentle Degree of it, which is to be cautiouſly and gradually increas'd. The Phyſician, in the mean time, muſt carefully advert to the Effects produc'd by this Motion in the Body of the Patient. A Perſon dropſical from the Weakneſs of the Veſſels alone, would be ſuffocated by uſing violent Motion all of a ſudden. But when the diſtending Waters are previouſly remov'd, and the relax'd Parts ſecur'd by Swathing, gently heating Medicines are to be exhibited, and afterwards ſuch as are more powerful. Then gentle Motion is to be preſcrib'd and gradually augmented to ſevere Exerciſe. Thus the relax'd Body is infallibly ſtrengthen'd, and the Force of the Diſeaſe overcome.

But 'tis not ſufficient to have remov'd the Diſeaſe; we muſt, alſo, deſtroy and root out thoſe Cauſes, which we foreſee will neceſſarily occaſion a Relapſe; for, when a Phyſician has evacuated the Waters of a dropſical Patient, he has only render'd the Body ſuch as it was before it ſpontaneouſly became dropſical; ſo that in this Caſe he only performs a Part of his Duty, unleſs after this Evacuation he corroborates the relaxed Parts.

That Viſcera, before too weak, are render'd ſufficiently firm and ſtrong, may be known from the following Signs: If there is an equable Heat, like that in a State of perfect Health, diffus'd over all the Body; for, when the Viſcera are weak, there is a Defect of Heat; if, upon drinking, neither the Whole of the Body, nor any Parts of it, are render'd tumid; but eſpecially if the Colour is lively and red, in thoſe Parts where the Veſſels appear conſpicuous without any Covering of the Skin, ſuch as

the Lips, the Tongue, the Fauces, the Gums, and the Corners of the Eyes; for from theſe Signs we may ſafely conclude, that all the Viſcera and Veſſels are ſufficiently ſtrong.

When the Cure is brought thus far, no farther Corroboration is requir'd; otherwiſe the oppoſite Fault, that is, too great a Rigidity, would be induced. But the Body is to be kept in the Degree of Strength already acquir'd; and all thoſe Things are to be carefully avoided, which are enumerated as the Cauſes of too great a Weakneſs; for, unleſs theſe Meaſures are taken, the Diſeaſe will ſoon recur. Hence Relapſes ſo frequently happen to Girls cur'd of a Chloroſis, becauſe they will not abſtain from ſupping warm Liquors, and chuſe rather to loſe reſtor'd Health by Idleneſs, than to preſerve it by due Exerciſe. Thus they create a great deal of Uneaſineſs to the Phyſician, and, at laſt, render their Diſeaſes incurable.

Hence it is evident, that the various Doctrines, relating to the Qualities of Aliments, are of a relative Nature, that is, in ſome Caſes true, and in others falſe; that muſcular Motion corroborates the Fibres; that the Exerciſes of Geſtation reſolve the coagulated Fluids, and ſtrengthen the relax'd Solids, without diſſipating the Strength; that, in the moſt robuſt Perſons, the Blood is highly denſe, viſcid, and mild; whereas in tender Habits it is diſſolv'd, light, and acrid; that an infinite Number of Diſeaſes, apparently widely different, often proceed from the ſame Cauſe, and are remov'd when that is takn away.

As for the Qualities of Aliments; Authors who have wrote profeſſedly on this Subject, have never advanc'd any thing which was abſolutely true in all Caſes; becauſe the Qualities of Aliments depend, not on the Aliments alone, but, in a more particular manner, on the Body into which they are taken, as has been already obſerv'd. Thus, whole Nations live, ſound and healthy, on Vegetables and Water alone; others, on Fiſh and Water only; and others, taught by Luxury, on the various Parts of Animals, and a Mixture of all the Subſtances which the Earth produces, whether ſpontaneouſly, or by Culture; and yet all, or, at leaſt, moſt Part, live ſufficiently healthy: Nor does the vaſt Variety of Aliments produce a very conſiderable Difference; for the human Body is poſſeſs'd of ſuch a Faculty, that, by the Concurrence of the Actions of all the Veſſels and Viſcera, human Blood, the ſame, almoſt, with reſpect to all its Qualities, is produced from Aliments of quite different Natures. But, according to the various Degrees of Strength in the Veſſels and Viſcera, Aliments of the ſame Nature may prove either hurtful or beneficial. Fleſhes, ſalted and dried in Smoak, together with coarſe Bread, agree with the robuſt Viſcera of a hardy Labourer, whoſe Strength would fail, if he was fed on Fleſh-broths; theſe, on the contrary, agree beſt with weak and tender Conſtitutions, which would be highly injur'd by Fleſhes and Aliments of ſuch an hard and difficult Digeſtion. Thus *Hippocrates*, in his Treatiſe *de Affect.* adviſes, "That thoſe who are capable of digeſting a large "Quantity of Aliments, are not to be fed with Sorbitions, "becauſe they paſs off the Stomach too ſoon; but thoſe, "on the contrary, who are not capable of digeſting large "Quantities of Aliments, are to be nouriſh'd with Subſtances "of a ſorbile Nature." No Aliment can, therefore, be pronounc'd univerſally and abſolutely ſalubrious: And the Man who aſks, what particular Aliment is univerſally wholſome, acts juſt as ridiculous a Part, as he who ſhould aſk, whether he had a fair Wind, when he did not know the particular Port to which he was to ſteer.

As for muſcular Motion; this Subject has been already conſider'd; only we ſhall obſerve, that, by an Exceſs of muſcular Motion alone, a Rigidity of the Veſſels, which is directly oppoſite to their Weakneſs, may be produc'd. Thus, there is a ſurpriſing Difference between the Fleſh of a Stall-fed Ox, and that of the ſame Animal, which, by dragging the Plow, and hard Labour, has all its Parts dry and juiceleſs.

As for the Exerciſes of Geſtation; muſcular Motion ſtrengthens, but, at the ſame time, fatigues the Body, and diſſipates the Spirits in the ſame Proportion as it recruits them; for this Reaſon, very weak Patients can never be reſtor'd and cur'd by its means. Hence, for weak Patients, Geſtations, eſpecially of the mild and gentle Kind, are to be ſubſtituted in the room of muſcular Motion: Thus, the Patients, ſitting on a Rope, are to be gently mov'd backwards and forwards. See *Hieronymus Mercurialis*, in his Treatiſe *de Arte Gymnaſtica*. This Step is to be ſucceeded by Geſtations in Coaches; which, again, is to be follow'd by gentle Geſtations in Coaches on ſmooth Ground; then they may be driven in Chariots, on ordinary Roads; and, laſtly, let ſuch Patients get on Horſeback, and ſtrengthen their Bodies by gradually increaſing the Pace of the Horſe. Thus the moſt ſtubborn Diſorders are often happily cur'd, and almoſt all the Advantages of muſcular Motion obtain'd, without a Diſſipation of the Strength. All theſe Meaſures are beneficial for three Reaſons: Firſt, becauſe the pendulous Viſcera, agitated by theſe Concuſſions, are ſtrengthen'd, and the Concretions reſolv'd, partly by the Concuſſions, and partly by the increas'd Strength of the Veſſels and Viſcera. Secondly, becauſe, by theſe means, the Fæces remaining after the laſt Digeſtion are eliminated from the Primæ Viæ, in thoſe who want a due Degree of Strength in theſe Viſcera: Hence theſe Exerciſes are moſt beneficial an Hour or two before Meals. And, thirdly, becauſe, by this means, the Force and Efficacy of the Air on the Lungs is increas'd, and the circumambient Atmoſphere, which is ſoon render'd tepid by the Heat of the Body, is continually renew'd; but this Advantage is, in a particular manner, obtain'd by Riding.

As for the Denſity and Viſcidity of the Blood in robuſt Perſons; we call that Bood denſe, which, in any given Quantity, is of the greateſt ſpecific Gravity; but this Circumſtance depends on the Preſſure of the Veſſels. All the Aliments we take, as, alſo, the Chyle and Milk prepar'd from them, are lighter than the Blood. Blood extravaſated, and ſet at Liberty from the Compreſſion of the Veſſels, becomes lighter than it was when contain'd in them: The compact and ſolid State of the Blood is, therefore, the greater, the more ſtrong and conſolidated the Veſſels acting upon it are. Hence, in acute Diſeaſes, in which the Action of the Veſſels on their Contents is too ſtrong, the Blood becomes more heavy and denſe than it was before. Blood iſſuing from a Vein, or a Wound, in ſtrong Men, is thick and black: Thus *Homer*, when, in the ſeventh Book of his *Iliad*, he repreſents *Ajax* as having wounded *Hector*, ſays, μέλαν δ' ἀνεκήκιεν αἷμα, *blackiſh Blood ſprung* from the Wound of *Hector*; and elſewhere, in the ſame Book, he informs us, that the Blood of Heroes is black, τῶν νῦν αἷμα μελαινόν. But, in this Species of Blood, there is always a certain Lentor, in conſequence of which, it is forthwith concreted into a ſolid Maſs. This is always true, with reſpect to the arterial Blood of robuſt Perſons; and, after violent Exerciſe, or in acute inflammatory Diſeaſes, the venous Blood is, forthwith, concreted almoſt in the ſame manner. This Blood is, at the ſame time, of ſuch a Quality, that, if dropt into the Eye, it produces no manner of Pain; ſo mild is found Blood, which contains ſomething of a gently ſaltiſh Nature, but ſo highly diluted, that it does not, by its Acrimony, offend the Parts of the moſt acute Senſation; for all thoſe Parts, which would, in time, become acrid in the Body, are eliminated by Stool, Urine, and Sweat.

As for the Diſſolution of the Blood in tender Conſtitutions; the Blood of a ſound Man is not, without the greateſt Difficulty, ſubjected to a ſtatical Examination; becauſe it is forthwith concreted, and is rarefied as ſoon as it is free from the Compreſſion of the Veſſels. That Mr. *Boyle*, however, might have ſome, though, as he himſelf confeſſes, in his Hiſtory of human Blood, not an accurate Knowledge of this Affair, he put a certain Quantity of ſound human Blood in an oblong Phial: When it had ſtood at Reſt till the Bubbles diſappear'd, he mark'd its Height on the Glaſs whith a Diamond: Then, waſhing out the Blood, he fill'd the ſame Phial, to the ſame Height, with Water; then, by weighing, he found that the ſound Blood was about a twenty-fifth Part ſpecifically heavier than the Water. But, from what has been already ſaid, it is obvious, that, by the Force of the Veſſels and Viſcera, a Blood is prepar'd from the Aliments, which is more ſolid, and, conſequently, more heavy, than the Aliments themſelves. Hence, ſince in weak Conſtitutions this Force is languid, the Blood is, of courſe, leſs conſolidated; and, conſequently, being more diſſolv'd, and light, it, at laſt, degenerates to a Thinneſs equal to that of Water. This is ſufficiently confirm'd by the Inſtances of Dropſies ariſing from a weak and infirm State alone.

But, generally, a thin State of the Blood is accompanied with a proportionable Degree of Acrimony. On this Account, Perſons of tender Habits are readily ſubject to Corroſions of the weak Veſſels. Hence ariſe Spitting of Blood, acrid and ſaline Catarrhs, together with the other Diſorders to which ſuch Perſons are ſubject.

As for the infinite Number of apparently different Diſeaſes ariſing from the ſame common Cauſe; ſo long as the human Fluids move through Canals, whoſe Diameters are proportion'd to theſe Fluids, and each Series of decreaſing Fluids is carried through its reſpective Veſſels, all the Functions of the Viſcera and Veſſels remain ſound and entire. But when the weak Veſſels, too much diſtended by the impel'd Fluids, admit foreign and improper Fluids, all the Functions are diſturb'd. Hence an infinite Number of Diſorders may draw their Origin from this ſimple and uniform Cauſe; and all the Diſorders ariſing from this Source may be remov'd, by reſtoring the Strength of the Veſſels. One Inſtance will be ſufficient to illuſtrate this Affair. Naturally the Tunica adnata of the Eye contains no red Blood in its Veſſels; but, when it is relax'd by any Cauſe, the red Blood enters theſe Veſſels, remains there, and produces an Ophthalmia; which, at firſt, is often curable by the Application of cold Water, becauſe the Veſſels, conſtricted by the Cold, repel the red Blood, which

which had enter'd; whereas, in ſuch a Caſe, emollient and relaxing Applications often increaſe the Diſorder.

Hence it appears, of how great Importance the due Conſideration of ſuch a ſimple Diſorder is, ſince it opens a Way for the Knowledge and Cure of a great many others, which, though they draw their Origin from the ſame Cauſe, are, yet, highly intricate and perplexing to the Ignorant and Unſkilful.

From the ſame Conſiderations we draw both the Knowledge and the Cure of too great a Laxity of the Veſſels and Viſcera.

Since Laxity is a Species of Weakneſs, what has been advanced on that Head, is applicable to this.

Disorders of the Viscera, arising from too much Stricture, or Rigidity.

The too great Rigidity of the Veſſels and Viſcera is ſuch a Coheſion of their component Parts, as does not yield to that Motion which ought to move and change them, that thoſe Functions, which, in a State of Health and Life, flow'd from this changeable State of the Veſſels and Viſcera, may be duly perform'd.

In every Period of Life, the Veſſels of the human Body undergo a Change, ſince they never remain two Moments of the ſame Bulk, but are ſometimes diſtended by the Force of the Fluid impel'd from the Heart; and, immediately after, have their Diameters diminiſh'd by their natural Force. Such a Coheſion, therefore, of the conſtituent Parts of the Veſſels is requiſite, as that they may be capable of yielding: Ard where this Coheſion is ſo great, as not to yield ſufficiently, the Veſſels and Viſcera are ſaid to be too rigid.

What the Viſcera are, we have already explain'd; and, on the ſame Occaſion, obſerv'd, that all the Viſcera produce their reſpective Effects by the Structure of thoſe Veſſels, of which they conſiſt; but all the Veſſels only act on their contain'd Fluids in ſo far as they are contracted, and endeavour to diminiſh and leſſen their Diameters; and, when they are contracted to their ſmalleſt Diameter, then this Force ceaſes to act till the Veſſels are again diſtended by the impel'd Fluids. Such a Flexibility is, therefore, requir'd in the Veſſels, as they may yield, and be expanded by the impel'd Liquids, and again contract themſelves, when the impelling Force ceaſes to act.

It is, beſides, requiſite, that in all the Viſcera which ſecrete the Liquors, prepar'd in their Structure, through Emunctories, the moſt minute ſecretory Ducts ſhould have a certain determin'd Bulk, leſt they ſhould let thoſe Parts paſs which ought to be retain'd, or retain thoſe which ought to be ſecreted. Upon the juſt Bulk and Proportion, therefore, of theſe ſecretory Ducts, Life and Health entirely depend.

In different Viſcera of the Body various Degrees of Flexibility are requiſite in the Veſſels; for, certainly, a far greater Degree of Flexibility is requiſite in the ſmall Arteries diſpers'd through the cortical Subſtance of the Brain, than in the ſecretory Veſſels of the Kidneys. Hence, in this Caſe, nothing general can be determin'd; but our ſeveral Poſitions muſt be limited by the various Conditions and Purpoſes requiſite to a ſound State of Health.

This Rigidity of the Veſſels and Viſcera ariſes, firſt, from every Cauſe which renders the Fibres too rigid. Secondly, but more eſpecially, from an highly compact State of the Fibres with each other, produced by the ſtrong Force of the propel'd Fluids. Thirdly, from an Union and Conjunction of the minute Canals, depriv'd of their Fluids by ſtrong Preſſure, with which the vital arterial Fluid preſſes the Sides of the larger Canal; and the moſt conſiderable Cauſe, contributing to the Production of this Effect, is ſtrong and violent muſcular Motion. Fourthly, from a Concretion of the Veſſels into one Solid, with its proper contain'd Fluid, becoming ſtagnant, dry, and coagulated.

1. *As for the Cauſes productive of too great a Rigidity of the Fibres*; we have already conſider'd them.

2. *With reſpect to the compact State of the Fibres, mutually and ſtrongly applied to each other, by the Force of the propel'd vital Fluid*; though in the Fluids there are Parts fit for reſtoring the Elements worn away and loſt by the Actions neceſſary for Health, yet, as we before obſerv'd, 'tis requiſite there ſhould, by the Impulſe of the vital Fluid, be a due Application of theſe Parts to proper Places, and, as it were, an Appreſſion of them to other Elements; and the ſtronger this Application or Appreſſion is, the more firm will the Structure of the Fibre, thus produc'd or reſtor'd, be. Now, the ſame Force which mutually unites the Elements of the Fibres, forcibly compreſſes, and produces a ſtrong Coheſion in the Fibres form'd by theſe Elements.

3. *As for the Union and Conjunction of the ſmall Canals*; this may, in ſome meaſure, be underſtood from what has been already ſaid: For the largeſt Canals have their Membranes form'd of the moſt minute Canals, which, by the Force of the Heart, are far leſs diſtended than thoſe which are larger, on which the whole Force and Strength of the Heart act, as it were, with an immediate Impetus. Hence, when the large Canals are diſtended, the minute Veſſels, conſtituting the Membranes of theſe Canals, are render'd flat, and become impervious; in conſequence of which, they grow together, and the Strength is, by that Circumſtance, augmented. Now, ſtrong muſcular Motion, by conveying the venous Blood with greater Velocity to the Heart, increaſes its Action. Hence a greater Impetus, eſpecially on the larger Veſſels, and all the other Circumſtances enumerated, are produc'd.

4. *As for a Concretion of the Veſſels with their contain'd Fluids*; this has been before explain'd.

When there is a Rigidity of the Veſſels; firſt, it produces Effects ſimilar to thoſe ariſing from a Rigidity of the Fibres. Secondly, it produces a ſtrong Effort in the Veſſels, by which the Fibres endeavour to apply themſelves to the Axis of the ſeveral Canals they compoſe; to leſſen their reſpective Cavities; to preſs, compreſs, repel, and expel, their contain'd Fluids; and thus to reſiſt their Motion from the Heart, and, conſequently, the Heart itſelf; to become ſcarcely capable of Dilatation, and thus to interrupt the equable Motion of the Blood, and, conſequently, of all the Secretions; to diminiſh the Quantity of the Blood, which would otherwiſe be expel'd from the Heart, at one Pulſation; to prevent the perfect Evacuation of the Heart, and, by that means, produce polypoſe Concretions of Blood; by compreſſing the Fluids, and diveſting them of their moſt ſubtile Parts, to condenſe them too much, and, by that means, to produce Suffocations and Death. Thirdly, this Rigidity of the Veſſels makes them gape very much when wounded, in conſequence of the great Force with which they are retracted into the Parts which ſuſtain them; and this ſame Rigidity, when the Veſſels are cut entirely through, either leſſens, or entirely ſhuts up, their Extremities.

1. *As to the Effects of too rigid Fibres*; theſe have been already conſider'd.

2. *As to the ſtrong Effort of the Veſſels, by which the Fibres endeavour to apply themſelves to the Axis of their reſpective Canals*; in a conical Canal, a Right Line, drawn from the Apex to the Centre of the Baſe, is call'd its Axis.

When the flexible Canals of the human Body are diſtended by the impel'd Fluids, they are in a State of Violence; and the longitudinal Fibres, diſtended in the Form of an Arch, endeavour to reſtore themſelves to their former Length; whereas the diſtracted orbicular Fibres endeavour to return to ſmaller Diameters. By both theſe Actions, the Sides of the Canal approach more nearly to its Axis; and this Attempt of the diſtended Fibres to reſtore themſelves is the only Action of the Canals of the human Body: The firmer, therefore, the Structure is, and the greater the Elaſticity of theſe Sides, the ſtronger this Effort is, as is ſufficiently obvious.

But, whilſt the Sides of the Canal approach its Axis, its Cavity is neceſſarily diminiſh'd, and, conſequently, the contain'd Fluid preſs'd upon; and ſince this Fluid can neither be ſoon expreſs'd from the converging Extremities of the Arteries, nor forc'd back to the Heart, in conſequence of the Reſiſtance made by the Valves of the Aorta, 'tis, for this Reaſon, compreſs'd, repreſs'd, and condens'd; for every porous and flexible Body is compreſs'd into ſo much the ſmaller Bulk, the ſtronger the compreſſing Force is. This ſeems to be the Reaſon why the Chyle, and Milk, which are always lighter than Blood, being, by the repeated Actions of our Veſſels, compreſs'd, are, at laſt, chang'd to ſolid and compact Blood.

But all the freſh Fluids which enter the human Body, whether by Aliments and Drink, or by the bibulous Veſſels diſpers'd over all the Surface of the Body, always enter by the Veins, which, being eaſily dilated, admit them all. But after theſe Fluids have enter'd the Arteries, if the Strength of theſe latter is increas'd above what is conducive to Health, the former will be forthwith diſſipated from the Body. Hence we underſtand, why lean robuſt Men often eat twice as much as fat and idle Perſons; and yet do not become corpulent, though their Diſcharges by Stool are very ſmall in Quantity: In ſuch Perſons as theſe, the Fluids drank firſt enter the lacteal Veins, then the Vena Cava, and the Right Ventricle of the Heart; but, in the Arteries of the Lungs, and afterwards by means of the whole arterial Syſtem, they are ſo attenuated, that they are capable of being diſſipated, and carry'd off through the ſmall exhaling Veſſels of the Body.

As for the Reſiſtance made to the Motion of the Fluids from the Heart, and, conſequently, to the Heart itſelf; 'tis to be obſerv'd, that, though an additional Strength is communicated to the Arteries, a too great Reſiſtance is not, on that account, forthwith made to the Heart, ſince the Force of the Heart is increas'd in proportion to the additional Strength imparted to the Arteries: For the Influx of the venous Blood into the Cavities of the Heart, the Paſſage of the arterial Blood through the Subſtance of the Heart, and the Influx of the Spirits into its muſcular and villous Fibres, are the Cauſes on which its muſcular Motion depends. But when, the Aorta ſtrongly contracts itſelf, it, with a proportionably greater Celerity, forces the Blood through the coronary Arteries into the Subſtance of the Heart, and, at the ſame time, with greater Force, applies the Blood through the carotid and vertebral Arteries to the Brain and Cerebellum. Hence a larger Secretion of Spirits is produc'd. It alſo accelerates the Motion of the Blood from the Arteries to the Veins; and, by thus increaſing the Motion of the venous Blood, irritates and ſtimulates the Heart to a briſker Action. All the Cauſes, therefore, of the muſcular Motion of the Heart are increas'd by an additional Strength of the Arteries.

So long as this Equilibrium remains, the higheſt and moſt ſpeedy Converſion of the Aliments into a State ſuited to our Nature happens, and the Blood is render'd ſolid, in ſuch a Degree only, as not to be detrimental to Health. But when the Strength of the Arteries is ſo increas'd, as to be ſcarcely capable of Dilatation, then all the Misfortunes above-mention'd are produc'd; for, when the Arteries are not dilated, they cannot afterwards be contracted: But the Contraction of the Arteries is the principal Cauſe which produces the Motion of the Blood through the Veins; for the Action of the Heart does little more than dilate the Arteries, and convey to them, when thus dilated, the Blood contain'd in its Cavities. Immediately after, the Arteries, contracting themſelves, propel the Blood convey'd to them. This evidently appears upon wounding a large Artery; on which Occaſion, the Blood is not diſcharg'd with a continu'd and uniform Impetus, but, as it were, by ſtarts, and far more ſlowly, when the Heart, in conſequence of its Contraction, dilates the Arteries, than when the Arteries are contracted, and the Heart is what we call in its Diaſtole.

When, therefore, by whatever Cauſe, the Veſſels are render'd ſo rigid, that they are not capable of being dilated at all, or, at leaſt, not ſufficiently, then the Force of the Heart is not able to expel the Blood contain'd in its Cavities; and, being irritated by an uncommon kind of Teneſmus, endeavours, by various Pulſations, to do that which it could not do by one Contraction. Hence Palpitations of the Heart, and an interrupted Pulſe, are ſo frequently obſerv'd in extreme old Age; for, in long-liv'd Perſons, the larger Veſſels about the Heart have ſometimes been found cartilaginous, or even of a bony Contexture, as we learn from medicinal Obſervations. Now, when the Motion of the Heart is diſturb'd, all the Functions of the Body are proportionably diſorder'd, ſince it is the Source and Spring of all Motion: Hence none of the Excretions and Secretions remain the ſame they were before. But, when the Blood begins to remain in the Cavities, the Sinuſes and the Auricles of the Heart, polypoſe Concretions are form'd. This Species of Diſorder, which takes its Name from a Fiſh, that fixes itſelf by a great Number of Filaments to adjacent Bodies, is no leſs frequent, than it is latent and obſtinate. *Malpighi*, in his Treatiſe *de Polypo Cordis*, was almoſt the firſt who gave us any diſtinct Account of the Origin of polypoſe Concretions of the Heart, and larger Veſſels; for the Blood of a ſound Man, taken from the Vein, immediately becomes viſcid, and begins to form a concreted Maſs, which ſeparates from itſelf the more thin and yellow Part of the Blood. This Maſs is gradually more and more concreted, and floats in the more liquid Part expreſs'd from it. Then the concreted Part, when waſh'd with pure Water, becomes white, appears fibrous, and, when cut, exhibits ſmall Cellulæ, full of reddiſh Ichor.

The Experiment of *Ruyſch*, before-mentioned, ſhews us, how ſuch a Concretion, when beginning to be produc'd, draws Parts ſimilar to its own, from the remaining Maſs of Blood; and, by an Union of theſe, forms a Species of Membrane.

The Blood, therefore, of a ſound Man, as is obvious from theſe Experiments of *Malpighi* and *Ruyſch*, conſiſts of ſuch Parts as repel each other; but the vital Motion keeps them mix'd with each other: Hence, as ſoon as the Blood of the ſoundeſt Perſon remains at Reſt, for ſome time, in the large Veſſels; or, moving too ſlowly, is too copiouſly accumulated in the diſtended Veſſels; it is diſpos'd to a kind of flaky Concretion, and the Flakes thus produc'd are mutually concreted, aſſimilate, and attract to themſelves ſimilar Parts; and thus produce ſmall polypoſe Maſſes, which, by a Continuation of the ſame Cauſes, are often increas'd to an enormous Bulk, and grow to the Veſſels, the Columnæ of the Heart, and its Auricles, as we find from Diſſections.

In Animals whoſe Throats are cut, and almoſt all the Blood diſcharg'd, there only remains about the Right Ventricle of the Heart a ſmall Quantity of Blood, form'd into oblong polypoſe Concretions. Hence the Reaſon appears, why, after great Loſſes of Blood, polypoſe Concretions are often form'd about the larger Veſſels, which, afterwards, induce very terrible Diſorders. Thus *Boerhaave* informs us, that he ſaw a Woman, who in a Miſcarriage loſt ſo large a Quantity of Blood, that ſhe was laid out for dead: She afterwards, however, came to Life, and remain'd pretty eaſy, ſo long as ſhe continued in a State of perfect Reſt; but, upon her uſing the ſlighteſt Motion, ſhe was forthwith ſeiz'd with an intolerable Uneaſineſs, a ſudden Proſtration of Strength, and an inſupportable Difficulty of Breathing, till, at laſt, a more eaſy State was reſtor'd by Reſt; and, in this Condition, ſhe kept her Bed for ten Years. The ſame Circumſtance ſeems to have happen'd to this Woman, which happens to Animals whoſe Throats are cut, that is, polypoſe Concretions ſuffer'd the Blood to paſs when ſlowly mov'd, but ſtopt it when the Motion was too briſk.

This Circumſtance evidently appears in Syncopes; for, when Life returns to thoſe who have been ſeiz'd with this Misfortune, they ſigh, and breathe with Difficulty. The polypoſe Flakes of concreted Blood are ſtopt in the pulmonary Artery, which, from a large Cavity, is diſtributed into various minute Ramifications. By the Contraction of the Heart and pulmonary Artery, the Effort to Reſpiration being in this Caſe always increas'd, theſe Flakes are carried backwards and forwards, and ſometimes diſſolv'd: But they who are frequently ſubject to Syncopes, in conſequence of a Polypus already form'd, are, thro' the whole remaining Courſe of their Lives, ſubject to Palpitations of the Heart.

This Diſorder would be highly familiar to delicate young Women, who upon any violent Commotion of Mind, forthwith fall into a Syncope, unleſs the State of their Blood had a Fault oppoſite to that which produces polypoſe Concretions; for in thoſe whoſe Strength is vigorous, and whoſe Principle of Life briſk and active, the Blood is poſſeſs'd of a ſtronger Tendency to Concretion: Hence it requires an equable and perpetual Motion to prevent this Misfortune.

But, from theſe polypoſe Concretions, whether in the Cavities of the Heart, or in the Veſſels, ariſe ſo anomalous, and, often, ſo terrible Symptoms, that they have unjuſtly been aſcrib'd to Cauſes apparently of more Importance.

In a confirm'd Polypus, ſmall Hopes of a Cure are left. Many Medicines are highly extol'd for this Purpoſe, but ſcarce any of them prove effectual. Our whole Hopes are plac'd in rendering the Blood as thin as poſſible, and, conſequently, as little prone to Concretion; that is, let a Cacochymy, ariſing from a too much diluted Blood, be artificially brought on, that thus the Polypus may not be enlarg'd by the Addition of freſh Matter, but the Blood kept thin and diluted by a continual Attrition of its Parts.

As for the Gaping of wounded Veſſels; if there was no contractile Force in the ſolid Parts of the human Body, the Aperture of an inflicted Wound would be no larger than the Thickneſs of the wounding Inſtrument. But we obſerve, that Wounds inflicted by the ſharpeſt Razors ſoon after gape; for that Force, by which the ſolid Parts mutually cohere, retracts both their Extremities: The ſtronger, therefore, this Force is, the more the divided Parts will recede from each other. When, therefore, the Veſſels are entirely divided, this ſame Force will retract their Extremities, and conceal them under other Parts. Thus, in this Caſe, Hæmorrhages are more eaſily ſtopt in robuſt ſtrong Perſons, than in ſuch as are weak and tender; becauſe the contractile Force of the orbicular Fibres in the Arteries of robuſt Perſons is proportionably ſtronger than in thoſe who are weak and delicate.

From an accurate Conſideration of what has been ſaid, we may clearly know a paſt, a preſent, and a future Rigidity, Elaſticity, and Force of the Veſſels, together with the Effects they do or afterwards will produce; as, alſo, the moſt proper Methods of Cure.

We have already explain'd the Method of inveſtigating the Diagnoſtic of a preſent Diſeaſe; the Anamneſis, or Judgment, on one that is paſt; and the Prognoſtic, with reſpect to one which is future, and the Effects ſubſequent to it; as, alſo, the moſt proper Intentions of Cure.

The Cure in Caſes of this Nature is obtain'd, firſt, by ſuch Remedies as are proper for the Cure of too rigid Fibres. Secondly, but more eſpecially by ſuch as diminiſh the Quantity, the Denſity, and the Compreſſion of the vital Fluids. Thirdly, by ſuch Things as ſuſpend muſcular Motion. And, fourthly, by ſuch Subſtances as are of a moiſtening,

ing, lenitive, emollient, diluting, reſolvent, and abſtergent Nature.

1. *As for the Remedies proper for the Cure of too rigid Fibres*; theſe are already treated of.

2. *As for ſuch Remedies as leſſen the Quantity of the vital Fluids*; in the Cure of a too rigid State of the Fibres, the Solids are only conſider'd; whereas, in curing too great a Rigidity of the Veſſels and Viſcera, a due Regard is to be had at once to the Solids and the Fluids. Among the Cauſes of too rigid Viſcera, we have already ſpecify'd the violent Force of the propel'd vital Fluids, mutually compacting the Fibres to each other: Now the vital Fluid is that which is expel'd from the Heart, and again returns to it. But, during Life, the more of this vital Fluid is taken away, the leſs the Action and Attrition of the ſolid Parts will be upon their contain'd Fluids; that is, the Briſkneſs of the Circulation is diminiſh'd: For, when the Quantity of the vital Fluid is diminiſh'd, the ſame Quantity cannot be return'd to the Heart, which was before convey'd thither. But the Influx of the Blood convey'd thro' the Veins into the Cavities of the Heart is juſtly reckon'd among the Cauſes exciting its Motion, as we have before obſerv'd: The Strength, therefore, and Velocity of the muſcular Motion of the Heart will be, by this means, diminiſh'd. This is ſufficiently obvious from Veneſection, which, in acute Diſeaſes, ſo checks the exorbitant Force of the vital Circulation, that all the Symptoms begin to remit, and become languid: And, in acute continual Fevers, this Evacuation, continued ſo long as to bring on a Deliquium, provided the Patients have a ſufficient Degree of Strength, frequently removes the Diſorder almoſt inſtantaneouſly; ſo that, when *Galen* cur'd a violent Fever in this manner, he was addreſs'd by one of the By-ſtanders, in the following complimental, but, at the ſame time, nervous and pathetic Strain: *O venerable Man, thou haſt murder'd the Fever.*

Among the antient Phyſicians there were various Diſputes with reſpect to the moſt proper Manner of removing the Redundance of the Blood in ſome Diſorders: The moſt ſimple and ſimilar to Nature, who often cures Diſeaſes by Hæmorrhages, ſeem'd to be Veneſection. But the Favourers of *Eraſiſtratus* condemn'd this Method, and maintain'd, that the ſuperfluous Blood might be remov'd by Abſtinence, which they order'd to be protracted for three Days: The celebrated Διατεσσαρων ἀσιτια was diſcarded by *Hippocrates*, in his Treatiſe *de Ratione Victus in Acutis*. And *Galen* wrote a whole Book *de Venæſectione adverſus Eraſiſtratæos*, in order to confute this abſurd Method, which was afterwards unfortunately reviv'd by ſome of the Chymiſts.

For, whilſt by Abſtinence they attempt to diminiſh the Fluids, their moſt ſubtile Parts are diſſipated; the groſs Humours more condens'd in the large Veſſels, and the whole Maſs of Fluids diſpos'd to a putrid Acrimony. But Veneſection takes away the thickeſt Part of the human Fluids, that is, the red Blood, and, by that means, prepares the way for diluting Subſtances.

As for the Denſity of the Fluids; the Denſity of the Blood in a ſound Perſon always ſurpaſſes that of Water; and, when the Blood begins to degenerate into an aqueous Thinneſs, all the Strength is loſt, as we learn from dropſical Patients. When, therefore, the Veſſels and Viſcera are too ſtrong, after a Depletion of the Veins, and an Evacuation of the moſt denſe Part of the Blood by Veneſection, aqueous Liquors are to be exhibited, ſuch as Whey, Barley-water, and other Liquors in which Water predominates; ſo that the Veſſels, being fill'd with theſe, may be weaken'd, and, as it were, a Diſpoſition to a Dropſy brought on. In acute Diſeaſes, *Hippocrates*, in the Regimen of his Patients, preſcrib'd almoſt aqueous Liquors alone.

As for the Compreſſion of the Fluids; all the Aliments, whether of a ſolid or a fluid kind, are lighter than the Blood. The Force, therefore, of the Veſſels, by its continued Action conſolidates and transforms them into laudable Blood. The ſmaller this Force of the Veſſels is, the leſs compact Blood is form'd from the Aliments. This is ſufficiently obvious from weak and tender Girls, who, inſtead of a ſolid Blood, have only a reddiſh Ichor circulating in their Veins. Now the fuller the Veſſels are, the greater the Compreſſion of the Fluids contain'd in them is; for the Force of the Heart throwing the Blood into the Arteries, already much diſtended, muſt more forcibly compreſs the Blood already lodg'd in theſe Arteries, that by this means it may convey to them the Blood contain'd in its Cavities. Hence, when the Plenitude of the Veſſels is diminiſh'd, the Cauſe of this Compreſſion is, in a proportionable Degree, remov'd: Now the thicker the Fluids of the human Body are, they act with the greater Force on the Veſſels; and, in a ſound and healthy State, the reciprocal Action and Reaction of the Veſſels and Fluids are exactly equal to each other. Whilſt, therefore, the Denſity of the Fluids is diminiſh'd, their Preſſure upon the Veſſels muſt of courſe be proportionably leſſen'd; now the quicker the Circulation of the Blood thro' the Veſſels is, the oftener in any given Time are the condenſing Cauſes apply'd to the human Fluids: Hence the ſagacious Antients enjoin'd the higheſt State of Reſt in all Diſeaſes where the Circulation was too ſtrong and vigorous. By diminiſhing, therefore, the Quantity, the Denſity, and the Motion of the Fluids, their Preſſure is of courſe diminiſh'd, and, conſequently, a preſent Rigidity of the Veſſels and Viſcera remov'd, and a future one prevented.

3. *As for thoſe Things which ſuſpend muſcular Motion*; theſe have been already conſider'd.

4. *As for Subſtances of a moiſtening Nature*; to moiſten the human Body, is to fill it with a larger Quantity of Fluids, than it before contain'd, and at the ſame time to diſpoſe it for the Retention of this larger Quantity. Theſe two Intentions, jointly carried on, conſtitute what we call Humectation; for, when Water is drank without remaining in the Body, the Body may, by this means, be ſaid to be waſh'd, but not moiſten'd. Tepid Water relaxes all the Veſſels, but is far more emollient and moiſtening, when boil'd with farinaceous Subſtances: Thus it renders the Veſſels leſs capable of reſiſting their Repletion. This holds true, with reſpect to the Solids of the human Body; but there is a kind of Difficulty with reſpect to the Fluids; for the human Blood, by the too ſtrong Action of the Veſſels upon it, begins to aſſume an inflammatory Spiſſitude; and in this Caſe it is not eaſily mixt with Water, which is taken into the Body. Thus 'tis often obſerv'd, that, in highly acute Diſorders, large Quantities of Water drank paſs off by Urine and Sweat; and, a few Hours after, the Urine is as red as before, neither are the Symptoms reliev'd. In this Caſe, the Water ſeems to have flow'd through the Veſſels with the Blood, but not to have been intimately mixt with it, ſince it was forthwith ſeparated from it. In this Caſe, therefore, mild ſaponaceous Subſtances mixt with Water; ſuch as the Juices of Summer Fruits, mild Oils, Honey, Manna, and Sugar, ſo divide the Blood, when prone to a Concretion, that the Water may be more eaſily, and more durably, mixt with it.

Moiſtening Remedies are ſuch as always have Water predominant in them; but ſuch Things muſt be, alſo, added to them, as convey ſomething of a glutinous Viſcidity to the Water, which would otherwiſe paſs too ſoon off, ſuch as all farinaceous Subſtances, and emollient Herbs. Saponaceous Ingredients are alſo to be added, in order to divide the tenacious viſcid Blood. In *Greece*, Decoctions of River-crabs were, from the Days of *Hippocrates*, highly celebrated for dry Conſumptions, which ſo much rag'd in that Country. In *Italy*, Decoctions of Vipers Fleſh are highly eſteem'd for this Purpoſe; and, perhaps, in this Part of the World, Decoctions of Eels may be us'd as a proper Succedaneum to the former; for, in all theſe, there is a ſomewhat viſcid, moiſtening, and mild Juice, which in ſuch dry and parched Bodies, is capable of producing almoſt incredibly happy Effects. If to theſe Decoctions, of themſelves inſipid, we add grateful Pot-herbs, we have, by that means, a moſt excellent and perfect Remedy.

Broth of a moiſtening, lenitive, emollient, and reſolvent Quality, may be prepar'd in the following Manner:

Take of lean Veal, well bruis'd, two Pounds; and of well cleans'd Barley, two Ounces. Boil in eight Pints of Water for three Hours, in a well-ſtopt Veſſel, adding, towards the End, half a Pound of recent Garden Lettuce; of the Lactuca Agnina, four Ounces; and of the Roots of Vipers-graſs, ſix Ounces: Then let them boil again for about a Quarter of an Hour, always adding ſuch a Quantity of Water, that there may be at laſt ſix Pints of the Decoction.

Broth of River-crabs is to be prepar'd in the following Manner:

Take of live River-crabs, three Pounds; boil them for an Hour in twelve Pints of Water; then taking them out, bruiſe them with their Shells, and boil them in the ſame Water for four Hours, always adding ſuch a Quantity of Water, that eight Pints of the Decoction may at laſt remain; then expreſs the Broth ſtrongly; and put into it, of Borage-flowers, half an Ounce; of Bugloſs-flowers, one Ounce; of the Roots of Goats-beard, four Ounces; and of Skirrets, two Ounces; then let them boil together for the ſixteenth Part of an Hour: Of both theſe Preparations, let the Patient take two Ounces and an half, every two Hours.

A moiſtening Decoction may be prepar'd in the following Manner:

Take of white Poppy-ſeeds bruis'd, one Ounce; of entire Oats, four Drams; of red Chiches bruis'd, twelve Drams; of the Flowers of Borage and Marſhmallows, each ſeven Drams; of the Roots of Vipers-graſs, two Ounces; of the Roots of Liquorice, two Drams; of the

Flowers of Mallows, and Pellitory of the Wall, each half an Handful: Boil in two Pints of Water, for a Quarter of an Hour; and then add of the Robs of Currans and Elder, each an Ounce: Of this Preparation, let the Patient take two Ounces every Hour, during the Day-time.

As for Subſtances of a lenitive Quality; Medicines are ſaid to be lenitive, either with reſpect to the Solids, or the Fluids. Thoſe which lenify the Solids, are ſuch as remove their preternatural Rigidity, whereas thoſe which are lenitive, with reſpect to the Fluids, are ſuch as ſheath up every Subſtance of an acrid ſtimulating Nature, of which Kind are the Ingredients already enumerated.

As for emollient Subſtances; lenitive Subſtances, alſo, belong to the Claſs of Emollients, only with this Difference, that Emollients have a Relation to the Solids, whereas Lenitives produce their Effects on the Solids and Fluids, at one and the ſame time.

As for diluting Subſtances; Dilution is a Word only applicable to the Fluids; and when theſe are diluted, the Solids are relax'd. Now, Water is the only proper Diluent, with reſpect to the human Blood; and all other Liquors commonly call'd Diluents only operate in conſequence of the Water they contain. Salts attenuate and reſolve, but at the ſame time do not dilute the Fluids; and all ſpirituous Liquors rather coagulate, than dilute the Juices of the human Body. Intenſely cold Water, as well as that which is boiling, in like manner, coagulates the Blood. Hence tepid Liquors are of all others the moſt proper for diluting. Now tepid Water may be us'd in a great many different Methods, ſuch as Baths, Vapours, Clyſters, and Fomentations. Recent Whey may, alſo, be us'd in the ſame Manner, and for the ſame Purpoſes.

As for Reſolvents; too great a Strength of the Veſſels and Viſcera is ſaid to be induc'd, when a large Number of Veſſels, before pervious, are concreted, and grown together. Hence, in order to anſwer the Intention of Cure, reſolvent Subſtances, with reſpect to the Solids, ought to be poſſeſs'd of a Power of rendering the concreted Veſſels again open and pervious. But this Circumſtance is ſcarcely poſſible, or, at leaſt, not obtain'd without the greateſt Difficulty. Now, reſolvent Subſtances, with reſpect to the Fluids, are all ſuch as again diſengage the fluid Parts now concreted, and reduce them to the Molecules, of which they conſiſted before the Concretion. And theſe Subſtances divide the concreted Parts, either by inſinuating themſelves between them, or by increaſing the Force of the Veſſels, in conſequence of their ſtimulating Quality. Hence a greater Attrition, and frequently the Diviſion of the concreted Parts, are produc'd. Sometimes Reſolvents act in both theſe Manners.

The red Blood, when circulating thro' the whole Body, muſt neceſſarily paſs thro' Veſſels, whoſe Diameters do not exceed the tenth Part of the Thickneſs of a ſingle Hair. But this ſame Blood, when out of the Body, is ſo concreted, that it could not poſſibly move thro' the largeſt Canals. Now, a reſolvent Medicine is, properly, ſuch as is capable of dividing the concreted Blood into Particles ſo ſmall, that it may again paſs through theſe minute Veſſels. Now, as Humours of different Kinds may be concreted, ſo Reſolvents of different Kinds become neceſſary; for aqueous Diluents reſolve mucous, glutinous, gummy, and ſaponaceous Humours. But there are various Humours incapable of being reſolv'd in this Manner; for human Blood is not hinder'd from Concretion by being put in tepid Water, whereas moſt ſaline Reſolvents excellently anſwer this Intention: And inflammatory Concretions are moſt effectually reſolv'd by neutral Salts, eſpecially Nitre, and its Preparations, which are not only lighter than Sea Salt, but, alſo, more grateful to the human Conſtitution, and conſequently of ſingular Service in almoſt all acute Diſorders: Alcaline Salts are, on the contrary, more proper for reſolving glutinous and viſcid Concretions. Saponaceous Subſtances, eſpecially thoſe of the milder Kind, ſuch as Sugar, Honey, and ſome others, reſolve various Concretions, without creating any Trouble, whereas the chymical ſaponaceous Subſtances of a ſtrong and acrid Nature never operate without exciting violent Commotions. The Operation of all theſe Reſolvents is much aſſiſted by Frictions, whilſt, by the alternate Compreſſion and Relaxation of the Veſſels, the Reſolvents are mixt with the Blood, and produce a kind of Attrition with the concreted Fluids; for 'tis certain, that after the Uſe of a Vapour-bath, moderate Friction, and the internal Uſe of Reſolvents, have often diſſipated hard Tumors of the Glands, which in all Appearance ſeem'd impoſſible to be reſolv'd.

Reſolvents are, firſt, Diluents; ſecondly, Preparations of Sea Salt, Sal Gemmæ, Borax, Sal Ammoniac, alcaline Salts, whether of a volatile or fix'd Nature; Acids duly fermented, and Subſtances prepar'd from them; ſuch as Sal Polychreſtus, Tartarus tartariſatus, the purgative Tartar of *Sennertus*, the Panacea Duplicata of the Duke of *Holſtein*, antimoniated Nitre, and the *Sal Viperarum ſaturatus* of *Tachenius*.

Saponaceous Reſolvents are volatile, ſpirituous, aromatic, and oleous Salts. Chymical Soaps, conſiſting of diſtil'd Oils, and fix'd Alcalis; as alſo common Soap, conſiſting of expreſs'd Oils, and a fix'd Alcali. Preparations of Honey, and the ripe Juices of Summer Fruit. All theſe Ingredients may be exhibited in various Forms. Thus a Mixture may be prepar'd in the following Manner:

Take of diſtil'd Water of Rue, twelve Ounces; of Venetian Borax, two Drams; of Sal volatile oleoſum, three Drams; and of the pureſt Honey, three Ounces. Mix all together, and let the Patient take one Ounce every Hour, during the Day-time.

Drops may be prepar'd in the following Manner:

Take of Elixir Proprietatis, prepar'd with Salt of Tartar, of Sal volatile oleoſum, and of the purgative Salt of *Sennertus*, each half an Ounce. Let the Patient take twenty-five Drops in Wine, three or four times a Day.

Pills, for the ſame Intention, may be prepar'd thus:

Take of *Venice* Soap, Borax, and the beſt Aloes, each two Drams; make into a Maſs, and let each Pill contain three Grains; and let the Patient take one four times every Day.

A Decoction may be prepar'd thus:

Take of recent Leaves of Soapwort, three Handfuls; of Brook-lime, two Handfuls; of Fumitory, one Handful; of the recent Roots of Graſs and Succory, each two Ounces. Boil in Water, for a Quarter of an Hour, in a cloſe Veſſel; ſtrain the Liquor thro' a Cloth; and when it it depurated by Standing, with every three Pints of it, mix of the Rob of Elder and Simple Oxymel, each two Ounces. Let the Patient drink two Ounces of this Preparation warm, every Hour.

A Powder for the ſame Intention, may be prepar'd thus:

Take of Sperma Ceti, and Borax, each two Drams; make into a Powder, to be divided into eight Doſes, one of which is to be taken, every two Hours, in a little Wine.

As for Abſtergents; when any thing of a viſcid, glutinous, or tenacious Nature ſo adheres to the Surface of a Veſſel, as to ſtop up the natural Paſſage of the Fluids, when this is remov'd, the Part is ſaid to be deterg'd. Hence Abſtergents, eſpecially all thoſe of the ſaponaceous Kind, are ſuch as reſolve the concreted Fluids. But, in thoſe Veſſels where the Motion of the Fluids is moſt ſwift and rapid, ſuch viſcid Concretions are not generally found, but only in the moſt minute Veſſels, or in thoſe Receptacles where the Humours are collected for certain Purpoſes. But it would be a great Error to believe, that all ſuch viſcid Adheſions are of a morbid Nature, ſince the whole internal Mouth, the Œſophagus, and Stomach, are cover'd with ſuch a Mucus; and, when it is defective, the moſt terrible Diſorders are produc'd. To the Claſs of Abſtergents belong all diluent and reſolvent Subſtances, eſpecially of the ſaponaceous Kind. Theſe contribute to the Cure of too great a Rigidity of the Veſſels and Viſcera, becauſe, by removing the Obſtructions, they procure a free Paſſage of the Humours through the Veſſels. Hence the highly equable Circulation neither preſſes the Solids ſo forcibly againſt each other, nor condenſes the Humours ſo much.

The Subſtances which remove glutinous Fluids, or half-corrupted Solids, from the Parts to which they adhere, are, firſt, Diluents; ſecondly, Reſolvents; and, thirdly, but moſt eſpecially, ſaponaceous, lixivial, and fix'd Salts, together with Preparations of Honey and Vinegar.

From what has been ſaid, all the Diſorders incident to the ſolid Parts may be underſtood and explain'd, ſince they all depend on a faulty Coheſion of the Parts: And from this Doctrine ariſe many Things of the greateſt Uſe in Medicine; ſince, by this means, we are able to anſwer the following Queſtions.

What is the Diverſity of Structure in the ſolid Parts, at different Ages? The younger the human Body is, the more ſimple Veſſels, Fibres, and Membranes, it conſiſts of; the more eaſily the Veſſels yield to the Impulſe of the Fluids, and the greater Proportion there is of the Brain, and of the Nerves diſtributed thence to the other Parts of the Body. If we take an accurate Survey of the Body of a new-born Infant, all the Parts appear pulpous, ſoft, and moiſt; the Palms of the Hands, and Soles of the Feet, are wet with the Moiſture diſcharg'd from the ſmall exhaling Veſſels: Nothing appears dry and callous. But gradually, as the Infant advances in Years,

many

many of the minute Veſſels begin to be conſolidated: Thus the Number of the Veſſels is diminiſh'd, and the Strength of the Solids increas'd, till, at laſt, in extreme Old-age, a ſtrong Degree of Callofity is induced on the dry Body; and many of the minute Veſſels are aboliſh'd. Hence all the Functions, which depend on the Motions of the moſt ſubtile Humours through the ſmalleſt Veſſels, begin to be defective in old Peſons; and the Solids, becoming too rigid, make too ſtrong a Reſiſtance to the impel'd Fluids.

Why does a Man grow? *Hippocrates*, in his firſt Book *de Victus Ratione*, informs us, "That all the Parts of the human "Body exiſt, and are increas'd at the ſame time; and one "Part is not ſo, ſooner or later than another; but the larger "Parts are diſcernible ſooner than thoſe which are leſs, tho' "the former did not exiſt before the latter." For, if we conſider the Nature and Phenomena of Generation, pre-exiſtent Parts only ſeem to be enfolded, and take up a larger Space. The ſame holds in the Propagation of Plants; for the whole Plant, to be afterwards rais'd, lies latent, and, as it were, wrapt up, in the Seed. Since, therefore, in a tender Embryo, a great many Veſſels are, as it were, intorted and folded up; a Reſiſtance to the Fluids to be convey'd through theſe Veſſels is produced. But Fluids, when carried through Canals, when they meet with an Effort againſt, or a Reſiſtance to their Motion, endeavour to diſtend theſe Canals, and lengthen their Sides. Hence an Elongation of all the Parts happens: And this is Growth. But, when all the Veſſels are unfolded, a ſmaller Reſiſtance is made to the propel'd Fluids, the Circulation through all the Canals is free and uninterrupted, and then the Lengthening of the Veſſels ceaſes, becauſe the Motion of the Fluids through them is freely carried on, and the Sides of the Veſſels, conſolidated by the vital Motion, no longer ſuffer themſelves to be diſtracted by the ſame Force; and in this Caſe the Body remains without Augmentation or Diminution.

This happens, becauſe the Quantity and Impetus of the Humours are a Balance to the Force of the reſiſting Solids; for the human Body does not ceaſe to grow, becauſe the Solids can be no longer extended, but becauſe, in conſequence of the Unfolding of the Veſſels, the Circulation is render'd ſo free, that the Humours no longer ſtretch the Veſſels; for, even in an adult Perſon, when an Obſtruction happens in any of the Veſſels, the Velocity and Quantity of the Humours remaining the ſame, we ſee the particular Parts are increas'd. This is ſufficiently prov'd by the Uterus of pregnant Women, which is expanded to ſo large a Bulk. And, perhaps, the ſurpriſing Augmentation of particular Parts is owing to ſome ſuch latent Cauſe.

Way does the Body decreaſe? By the neceſſary Effect of good Health ſuch a Strength is ſoon produced in all the Veſſels, that they gradually begin to make too ſtrong a Reſiſtance to the impel'd Fluids. Hence all the Parts are gradually contracted; the whole Body becomes dry and parch'd; and almoſt the whole Fat, which conſtitutes ſo great a Part of the Bulk of the Body, is conſum'd. Hence, in the Hands of old Perſons, we ſee the Tendons almoſt deſtitute of all Fat. The Ligaments, alſo, between the Bodies of the Vertebræ, are often ſo effectually aboliſh'd, that the Vertebræ touch each other. Hence the Talneſs of the Body is diminiſh'd, the Spina Dorſi is incurvated forwards, and old Perſons become gibbous, and, at laſt, die of a Maraſmus, ariſing from Old-age.

Why do Men grow faſter in the Uterus, than at any other Period of their Lives? That this actually happens, is a Circumſtance, the Truth of which we cannot call in queſtion; for in nine Months time, from an inviſible Molecule, the Infant grows ſo large, that its Weight is often equal to ſixteen Pounds, and ſometimes more. The Reaſon of this Phenomenon ſeems to be this: The Veſſels adjacent to their Heart, which is ſtrongly mov'd, are highly tender; and, as many of them are ſhrivel'd up, they make a more forcible Reſiſtance to the impel'd Fluids: Hence they are more lengthen'd and diſtended. Beſides, the whole Embryo is continually cheriſh'd by the tepid Liquor of the Amnios: Hence all the Parts are preſerv'd highly lax; and the Nourſhment prepar'd by the Mother's Body, is not only continually convey'd to that of the Fœtus, but, alſo, equally diſtributed.

How does a Man contract a lax Habit of Body? If a Perſon leads an idle unactive Life, indulges himſelf in Sleep, and at the ſame time uſes ſoft Aliments, his Body will become preternaturally large, but his Strength is not augmented in Proportion; and the Veſſels are not ſufficiently conſolidated. Hence they eaſily yield, and are diſtended by the impel'd Fluids.

How does a Man become ſtrong? When the Force of the Fluids is more than a Balance to the Strength of the Veſſels, the Body becomes tumid and lax. But when the Veſſels, ſtrengthen'd by due Exerciſe, ſuſtain the Impetus of the Fluids without too great a Dilatation, and when this Strength of the Veſſels is a preciſe Balance to the Quantity and Motion of the Fluids, the Man is ſaid to be ſtrong; ſince, in ſuch a Perſon, there is a firm Coheſion of the ſolid Parts, and a due Denſity of the Fluids.

How does a Man acquire a rigid Habit of Body? The ſame Cauſes which render the Body ſtrong, continuing to act, will, of courſe, render it rigid. Age gradually ſtrengthens the render Body of a new-born Infant, and Exerciſe imparts Strength to the weakeſt Conſtitutions; a more advanced Age renders all the Parts callous and rigid; and exceſſive Labour brings on all the Symptoms of Old-age, before the due Time.

Why is a Man of a moiſt Conſtitution? The Veins of the human Body, being eaſily dilatable, are, of courſe, fill'd with the freſh Supplies of Fluids taken into the Body; but the firmer Strength of the Arteries again expels theſe Liquors: For, a ſound and vigorous Man may drink an incredible Quantity of Water, which, being receiv'd into the Veins, is convey'd into the Heart; and then, being diſtributed through the Arteries, is expel'd from the Body, and, next Day, the Man recovers his former Weight. When, therefore, there is ſuch a Weakneſs of the Arteries, that they can neither put the Humours, receiv'd into the Veins, in ſufficient Motion, nor expel the ſuperfluous Juices, then the Fluids are accumulated, prevail over the Solids, and produce what we call a moiſt Conſtitution.

Why is a Man of a full Habit? A Man is ſaid to be full of Juices, when his Veſſels are fill'd with a larger Quantity of laudable Humours than is requiſite for the Purpoſes of Health. In ſuch Perſons there is ſuch a Degree of Laxity in the Veſſels, that they may be fill'd ſo far as not to create a Diſeaſe: But if, in this Caſe, the Humours ſhould be increas'd or rarefied by Heat, or any other Cauſe, Health can no longer remain.

Why is a Man of a dry Habit of Body? This State is produced ſimply by the increas'd Strength of the Veſſels. When the Arteries are contracted with a greater Force than is requiſite for perfect Health, the Fluids are expel'd, and the Body becomes dry. Hence Age, and hard Labour, by corroborating the Solids, render the Body dry.

Why does a Man die a natural Death? A natural Death, is that which, undoubtedly, happens in conſequence of the peculiar Frame and Make of the human Body. This happens, becauſe the Elements of the Fibres are mutually apply'd to each other, Fibres to Fibres, Membranes to Membranes, the Sides of the Veſſels to each other, and the flatten'd Veſſels grow to other ſimilar Veſſels. Thus, at laſt, almoſt all the minute Veſſels being concreted, the Circulation of the Humours is only carried on through the larger Veſſels, which, at laſt, becoming dry, callous, and, ſometimes, cartilaginouss or bony, hinder the free Expulſion of the Blood from the Heart: Thus Life terminates in a calm and gentle Death. *Lewis Cornaro*, that celebrated Model of Temperance and Mortification, died in this grateful and deſirable Manner. Hence the Boaſtings of the Chymiſts are falſe and ill-founded, who fooliſhly promis'd Immortality, or, at leaſt, pretended, that they could protract Life at Pleaſure. This Species of gentle Death happens by the Reſt of the Heart, when full, and not capable of evacuating its Contents into the Arteries, which are full, and ſo rigid, that they cannot be diſtended by the Force of the Heart.

What Diſeaſes are moſt incident to different Ages? In the firſt Years of Life Man is moſt ſubject to the Diſorders of the nervous Syſtem; becauſe, as we know from Experience, the Brain, together with its Appendages, the ſpinal Marrow and Nerves, bear a larger Proportion to the other Parts of the Body, the younger the Body is. Beſides, as at this Age the Brain is leſs firm, ſo the Nerves, ariſing from it, are not only ſoft, but cover'd with thin Membranes, and, conſequently, eaſily affected, and render'd ſubject to Convulſions; for an Infant can hardly be ſeiz'd with the ſlighteſt Fever, without being, at the ſame time, thrown into Convulſions. Gripes, ariſing from an Acid, in the Stomach and inteſtinal Tube, an Infection by the ſmall Pox or Meaſles, and every thing which acts forcibly on the Organs of Senſation, ſuch as a violent Noiſe, or a too ſtrong Light, often excite Convulſions. And *Sydenham*, when, after Dentition, he found Children ſeiz'd with Convulſions, prognoſticated the Small-pox, and thoſe of a good Kind. Hence, ſince at this tender Age Convulſions are produced by ſuch ſlight Cauſes, *Hippocrates* was not very dubious about a Cure, before the ſeventh Year of the Child's Age: But he pronounces them dangerous after that Age, becauſe they are produced by more violent Cauſes.

Another Source of Diſorders, which happen in the firſt Years of Life, is, that the Quantity of the Humours is more than a Balance to the Strength of the Solids; for all Infants are turgid and moiſt. Hence happen ſo eaſy and ſo ſurpriſing Changes of the Humours, which are ſo often diſcharg'd thro' the Skin, in a manner not as yet ſufficiently underſtood. This is obvious from Achors, Herpes, Excoriations behind the Ears, and under the Axillæ. By theſe means an incredible Quantity of Fluids is daily diſcharg'd; and an imprudent Stop put to ſuch Evacuations often lays a Foundation for the moſt terrible Diſorders.

Then,

Then, about the Time of Puberty, ſurpriſing Changes happen to the whole Body in both Sexes; in Men Tumors of the Teſticles, and varicoſe Inflations of the ſeminal Veſſels, which are eaſily curable by gentle Purgatives, and ſlight Frictions over the Steam of kindled Amber. And in young Women ſurpriſing Diſorders often precede, or accompany, the firſt Eruption of the Menſes.

Afterwards when the Parts of the Body begin to make a ſtronger Reſiſtance, and the Veſſels are no longer capable of being ſo eaſily diſtended, an Equilibrium, or juſt Balance, is produc'd between the Quantity and Impetus of the Fluids, and the Reſiſtance of the Veſſels. In the mean time ſound Viſcera continue to generate freſh Humours. Hence a Rupture of the Veſſels eaſily happens, which lays a Foundation for Hæmorrhages of the Noſe, and Spittings of Blood.

In adult Perſons, the Action of the Veſſels on the Fluids is highly ſtrong: Hence their Blood is render'd denſe and compact, which lays a Foundation for acute inflammatory Diſorders.

At laſt, when Old-age comes on, the Solids become more compact; the minute Veſſels are gradually concreted, and become callous; and all the Functions, which depend on the Circulation of the moſt ſubtile Humours thro' the moſt minute Veſſels, are gradually aboliſh'd: Hence all the Actions of the Brain and Nerves begin to be weaken'd; the Humours degenerate to a cold and phlegmatic State; the Circulation is only perform'd thro' the larger Veſſels; and Death, at laſt, neceſſarily follows: Thus *Galen*, in the third Chapter of his ſixth Book, *de Sanitate tuenda*, informs us, "That we become old, and "ſubject to Corruption, becauſe we cannot avoid the Work-"ings of Nature, which becomes gradually more dry."

Hippocrates in *Sect.* 3. *Aph.* 24, 25, 26, 27, 28, 29, 30, 31, has carefully remark'd the Diſeaſes incident to different Periods of Life.

What Regimen is beſt accommodated to the various Periods of Life? So long as the Fœtus remains in the Womb, it receives the Humours prepar'd from its Mother; and, as ſoon as it is brought into the World, it by a happy kind of Inſtinct begins to ſuck its Mother's Breaſts. The Milk, therefore, yielded by theſe, is of all others the moſt proper Nouriſhment for Infants: When their *Dentes Inciſores* appear, Aliments ſomewhat more ſolid, but previouſly reduc'd to a Pap, are to be exhibited; and, according to *Galen*, in the tenth Chapter of his firſt Book *de Sanitate tuenda*, they are to be often rub'd, but not with a full Stomach; then well-fermented Bread reduc'd to a ſoft Pulp by an Affuſion of Milk, or Fleſh-broth, may be properly us'd; and, when the *Dentes Molares* have appear'd, firmer Aliments may be exhibited. But all hot, vinous and irritating Subſtances are highly prejudicial to Infants, becauſe their nervous Syſtems are very delicate and tender.

Children, on account of their voracious Appetite, are to have Aliments often exhibited to them; and *Hippocrates*, in *Aphor.* 13. and 14. of *Sect.* 1. informs us, that Children are, of all others, leaſt capable of bearing Hungar. Thoſe who are in a growing State, have a great Degree of innate Heat, and for that Reaſon require a large Quantity of Aliments, leſt their Bodies ſhould be conſum'd and waſted away.

For adult and ſound Perſons, the Rule laid down by *Hippocrates*, in the ſixth Book of his Epidemics, is generally ſufficient; which is, not *to eat to Satiety*; *and to uſe ſufficient Exerciſe*. And ſince this Age is highly obnoxious to acute Diſtempers, it is obvious, that heating Subſtances are carefully to be avoided, and the Aliments ought to be always proportion'd to the Exerciſe; for a hardy Labourer requires quite different and more copious Aliments, than the Philoſopher, who applies diligently to his Studies.

Since, according to the 13th and 14th Aphoriſms of the firſt Section of *Hippocrates*, "old Perſons bear Hunger eaſily, "have but a ſmall Degree of natural Heat, and therefore "require but little Food, ſince much Nouriſhment extin-"guiſhes this Heat," they are, therefore, to have ſoft Aliments frequently exhibited; and, when they are become toothleſs, they are to be ſuſtain'd almoſt by Milk alone, Broths, and Eggs. The moderate Uſe of Wine is in a particular manner beneficial to them, and is, for this Reaſon, by ſome call'd Old Mens Milk; for, in all fermenting Liquors, there is ſomething of a ſurpriſingly ſpirituous Nature, which in a Moment operates in an efficacious Manner upon the Brain and Nerves; but, when imprudently or too copiouſly us'd, it may produce ſudden Death; or, if it ſhould operate with leſs Violence, it may produce a Diſorder ſtill more terrible than Death itſelf, which is Madneſs, or ſome other Misfortunes ſufficient to render Life a Burden. This ſpirituous Part, in new and fermenting Wines, is a highly efficacious Reſtorative in Old-age.

Cornaro every Year in the Months of *July* and *Auguſt* had an Averſion to all kinds of Wine. In conſequence of this Peculiarity in his Conſtitution, his Appetite gradually languiſh'd, ſo that he became quite weak about the middle of *Auguſt*. But, upon his drinking the new Wine, for the three or four firſt Days of *September*, his Strength and Vigour return'd, notwithſtanding his great Age.

What Method of Life is moſt ſuitable to different Ages? In the firſt Years of Life, the Body is highly agile, Children can ſcarcely remain in a State of Reſt, and have their Health diſorder'd, if they are entirely reſtrain'd from their Diverſions by too ſtrict Parents, or Tutors. But when they are too ſoon inured to hard Labour, their Bodies are render'd ſtrong, but they die of a callous State of the Veſſels, induced before the due Time. Thus we obſerve, that Countrymen, accuſtomed from their Infancy to hard Labour, become rigid and callous like old Men, when, they are about forty Years of Age. It is no leſs a Fault, to accuſtom Children too ſoon to ſevere Studies, ſince, tho' they may at firſt give ſignal Proofs of the Pregnancy of their Genius, yet they either ſoon after die, or remain ſtupid, and good for nothing. Inſtances of this are every-where to be met with.

Adults ought by proper Exerciſe to ſuſtain and confirm their Strength, leſt the Body ſhould become languid, and overburden'd with ſuperfluous Fat. What Advantages accrue to the human Body from Exerciſe, we have already obſerv'd. *Galen*, in the third Chapter of his fifth Book *de Sanitate tuenda*, for old Men, recommends Frictions with Oil in the Morning after Sleep, and orders them to uſe their habitual Labours, tho' without Violence; and, as old Men are ſenſible of the ſmalleſt Errors with reſpect to Regimen, and young Men are ſcarcely affected by the greateſt, he orders the former to uſe ſoft Aliments often repeated.

What Medicines are moſt proper in the different Periods of Life? Such Medicines ſeem almoſt only ſuited to Children, as, in ſome meaſure, diminiſh the Quantity of their Humours. Hence they eaſily bear gentle Purgatives, eſpecially of Rhubarb. Thoſe Subſtances are, alſo, beneficial to them, which have a Tendency to correct an acid Acrimony, ſuch as the abſorbent Powders of Crabs-eyes, and others of a like Nature. Such Medicines are excellently ſuited to Infants, as check the Irritation of the nervous Syſtem, and, at the ſame time, moderately corroborate the Solids: Hence Rhubarb with Crabs-eyes, and a little Cinnamon, is a Medicine excellently ſuited to the Condition of Infants. Then, when they advance in Years, ſuch Medicines are never to be exhibited, as by their Stimulus render the Circulation of the Humours too briſk, leſt the tender Veſſels ſhould, by that means, be ruptur'd. In the Years of Maturity, thoſe Medicines are moſt proper, which remove that Propenſity, which the Humours have, to aſſume an inflammatory Spiſſitude. Old-age, on the contrary, which, according to *Galen*, in the ninth Chapter of his fifth Book *de Sanitate tuenda*, "Is nothing, but a dry and cold "Habit of Body, brought on by Age," requires moiſtening, and gently nutritive Medicines, with the Addition of grateful, ſtimulating, and ſpirituous Subſtances, but always mixed with ſuch as are of a moiſtening Quality.

Of what Certainty and Uſe is the Doctrine of Stricture and Relaxation in the Solids? After Medicine was divided into two Sects, each of which had its Followers, ſome, contending that the Art was built upon Experience alone, maintain'd that a Knowledge of evident Cauſes was neceſſary; but affirm'd that Diſputes about obſcure Cauſes, and natural Actions, were ſuperfluous; and aſſerted that Medicine was not invented after Reaſoning; but that, after Medicine was diſcover'd, the Reaſons of Phenomena were found out. Hence this Sect maintain'd, that Experience, was alone neceſſary, and its Followers were call'd Empirics. Others, who were call'd Rational, did not deny the Neceſſity of Experience, but affirm'd that it could not be obtain'd without ſome previous Reaſoning. Beſides, they affirm'd that a Knowledge of the remote and latent, as well as evident, Cauſes of Diſeaſes was neceſſary, as alſo a Knowledge of the Natural Actions, and conſequently of the internal Parts.

Among the Rational or Dogmatic Sect, *Themiſon*, one of the Followers of *Aſclepiades*, and after him others, reduc'd this difficult Art to a kind of brief Syſtem; and aſſerted that the Knowledge of no Cauſe contributed to the Cure of Diſeaſes; and that it was ſufficient to be acquainted with ſome Circumſtances, which Diſtempers, had in common; and that theſe were of three Kinds, that is, Stricture, Flux, or a Mixture of theſe; becauſe ſometimes the Sick diſcharg'd too little, at other times too much, and at other times too little in one Part, and too much in another.

This was the Origin of the Doctrine of Stricture and Relaxation, concerning which *Proſper Alpinus*, in his *Medicina Methodica*, afterwards treated fully. Many Things, relating to this Doctrine, alſo occur in *Cœlius Aurelianus*, who was of the Methodic Sect.

But Stricture and Relaxation can only properly happen in the Solids, nor could they eaſily explain the Diſeaſes of the Humours from theſe. 'Tis, therefore, of great Importance in Medicine, to conſider the Change of Coheſion in the ſolid Parts; nor yet can all Diſeaſes be deduced from it, as the Methodic Sect maintain'd. See the Articles ACIDA, and ALCALI.

Whence

Whence are we to take our moſt certain Mark of a due Degree of Stricture, or Relaxation? When after copious Eating and Drinking, and the being expos'd to a moiſt Air, the Body either does not become tumid, or does not remain long ſo, we know that the Veſſels and Viſcera have a due Degree of Strength; by which the ſuperfluous Quantity of diſtending Liquors is ſoon expel'd from the Body. When the Body of an adult Perſon does not gradually decreaſe, by the too great Contraction of the Veſſels, and the conſequent Expulſion of the Fluids, we then know, that an Equilibrium between the Solids and Fluids prevails. If, upon a copious Uſe of Aliments, the Body immediately becomes tumid, we know that the Veſſels are too weak, and too eaſily dilated. If all the Parts are lean, dry, and parch'd, we juſtly conclude, that the Veſſels are too ſtrong.

FIBRILLA. A Diminutive of *Fibra*; but commonly us'd in the ſame Senſe.

FIBULA, in Anatomy, is the outer and ſmaller Bone of the Leg. See CRUS. In Surgery it ſignifies a Button. See INFIBULATIO.

FIBULEUS. A Name for the *Muſculus peronæus primus*.

FICARIA. A Name for the SCROPHULARIA, or Fig-wort.

FICATIO, the ſame as FICUS, a Diſeaſe of the Anus, and other Parts. See ANUS and FICUS.

FICATUS, συκωτὸς, is an Epithet apply'd to the Viſcera of thoſe Animals which are fatten'd by feeding on dry'd Figs, and alſo to Meats prepar'd of thoſe Viſcera, particularly the Liver. *Galen, Lib. 3. de Alim. Fac. & Com. 3. in R. V. I. A.*

FICEDULA, Offic. Charlt. Exer. 88. Bellon. des Oyſe. 359. *Ficedula, Atricapilla*, Geſn. de Avibus, 339. *Atricapilla*, Jonſ. de Avib. 90. Schw. A. 227. *Atricapilla, ſeu Ficedula*, Aldrov. Ornith. 2. 757. Raii Ornith. 226. Ejuſdem Synop. A. 79. Will. Ornith. 162. THE BLACK-CAP.

The Bird, uſed as Food, ſharpens the Eyeſight. *Dale.*

FICOIDEA. This Plant is ſo called, from its Reſemblance to the *Ficoides*.

The Characters are;

It has a ſtamineous Flower, whoſe Calyx is divided into five roundiſh Segments: When the Flower is paſt, the Pointal, which is terminated by five Threads, becomes a five-corner'd Fruit; which, when ripe, opens into five Cells, each of which is filled with ſmall Seeds.

The Species are;

1. *Ficoidea procumbens, Portulacæ Folio. Acad. Reg. Scient.* Trailing Ficoidea, with a Purſlain-leaf.

2. *Ficoidea Hiſpanica annua, Folio longiore.* Annual *Spaniſh* Ficoidea, with a longer Leaf. This exotic Plant is cultivated with us in Stoves; but I find no medicinal Virtues aſcribed to it.

FICOIDES.

The Characters are;

The whole Plant is ſucculent, and has the Appearance of Houſleek: The Leaves are conjugated, or grow oppoſite by Pairs: The Calyx ſurrounds the extreme Margin of the Ovary; is of a carnous or fleſhy Subſtance, and pentaphyllous, or pentaphylloidal: The Flower is polypetalous, very minutely divided, and ſpringing from the Top of a Capſule: The Ovary produces five reflected Tubes, and becomes firſt a ſucculent, afterwards a fungous Fruit, divided into five or more Cells, like little Pods, full of numerous minute Seeds.

Boerhaave, in his *Index alter Plantarum, Pars 1. p.* 289. enumerates fifty-three Species of this Plant; which, in the *Hiſtoria Plantarum* attributed to him, are ſaid to be of an emollient Quality, and to have the other Virtues of the *Sedum*, or Houſleek. The Fruit is eatable, and a good Part of the Food of the *Hottentots*.

FICUS.

The Characters are;

From the Extremity of the Pedicle ſhoots forth a ſmall triphyllous Calyx; whence ariſes the Pericarpium, incloſed in a ſomewhat ſpinous Membrane, and contracted at the Top of the Fruit, where it forms an Umbilicus, and paſſes into many ſmall ſquamous ſharp-pointed Leaves, ſucceſſively incumbent one upon another, which by their cloſing almoſt cover the Cavity, which there opens itſelf, while the outer Leaves, being ſupported by the thick Pedicle, preſs one another very cloſely, and the inner ones adhere without a Pedicle.

From within the Cavity of the Pericarpium, all around, proceed, long, tubiform, more petalous, Hermaphrodite Flowers, with Ovaries, which are teſtaceous Capſules, growing in pulpous Huſks, placed within others, which are rough.

Boerhaave mentions eight Species of this Plant; which are,

1. Ficus, communis, *C. B. Pin.* 457. *Boerh. Ind. A.* 2. 258. *Ficus*, Offic. Ger. 1327. Emac. 1510. J. B. 1. 128. Chab. 9. Raii Hiſt. 2. 1431. Aldrov. Dendr. 427. *Ficus vulgaris*, Park. Theat. 1494. *Ficus ſativa*, Jonſ. Dendr. 46. THE FIG TREE.

The Fig-tree ſeldom grows to be a Tree of any great Bigneſs in our Parts, being cloath'd with large Leaves, bigger than Vine-leaves, full of high Veins, and divided, for the moſt part, into five blunt-pointed Segments, yielding a thin milky Juice, when broken. It bears no viſible Flowers, and they are therefore ſuppoſed to be hid in the Fruit, which it produces twice a Year, Spring and Autumn, though thoſe only, which come forth in the Spring, arrive to Maturity. When ripe, they are as big as a Pear, being of a brownish green Colour on the Outſide, and red within, full of ſmall round Seed, and of a ſweetiſh Taſte. The dry Figs come principally from *Spain* and *Portugal*, being firſt cur'd by dipping them in ſcalding hot Lye, made of the Aſhes of the Cuttings of the Tree; and afterwards, carefully drying them in the Sun, they are put into Barrels or Frails; and theſe are what are only uſed in Medicine.

Theſe Figs are cooling and moiſtening, good for Coughs, Shortneſs of Breath, and all Diſeaſes of the Breaſt; as alſo for the Stone and Gravel; and uſeful to drive out the Small-pox, and Meaſles. Outwardly applied, they are diſſolving and ripening, good for Impoſtumations, and Swellings, and peſtilential Buboes.

New Figs, provided they are ripe, are very eaſy and quick of Digeſtion, quicker than any other Summer Fruit: And of this we are certain; becauſe we not only eat of them more freely than of other Fruits, without any Inconvenience; but alſo eat them before Meals, not at all diminiſhing the Quantity of Meat and Drink, we uſually take; and yet are not in the leaſt diſorder'd thereby. *J. B.* In *Italy* it is the Cuſtom to eat plentifully of Figs before Dinner, without any conſequent Inconvenience. *Galen*, in order to preſerve his Health, as he ſays, abſtain'd from all Summer Fruits, except perfectly ripe Figs and Grapes, from his twenty-eighth Year to Old age; and his Friends, whom he adviſ'd, in like manner, to abſtain from theſe ſort of Fruits, maintain'd themſelves in Health, by following his Advice. *J. Bauhine* proves Figs to be of a glutinous and ſalt Quality; becauſe, by their Viſcidneſs, they ſtick to the Hands, and at the ſame time abſterge them after the manner of lixivial Salt, and Nitre: Hence they excite to Stool, but without Gripes, or Perturbations. They increaſe their ſalt Property by an Addition of Salt; and thus are the new Figs, now prepared and eaten in *Italy* and *Provence*. After eating them you are to drink plentifully, that they may not be detained long in the Stomach, but the more eaſily be digeſted, and the more readily deſcend. The Antients, *Dioſcorides, Pliny*, and *Galen*, are very prolix in deſcribing the Virtues of this Fruit. Phyſicians agree that the Caricæ, or dry'd Figs, are good for the Aſthma, Cough, and other Diſorders of the Breaſt and Lungs; the Cuſtom is to macerate two or three Figs for a Night in Wine, and exhibit them in the Morning, to be eaten by the aſthmatic Patient; but the moſt effectual Preparation is a Decoction of the ſame with Hyſſop, which is called by *Meſue* a great Abſterſory. Green Figs allay Thirſt and Heat; the dry ones have a contrary Effect, eſpecially in bilious Conſtitutions, affected with febrile Diſorders, incident to ſuch Natures; for they are eaſily converted into Bile, as are Honey, Sugar, and other ſweet Things. *C. Hoffman* adviſes thoſe who are ſubject to a Looſeneſs to avoid eating Figs, which are very ripe, and of the longeſt ſtanding, and eſpecially at Dinner, becauſe if, by their too long Stay in the Stomach, they ſhould happen to putrefy, they generate putrid Fevers. At preſent Figs, according to *C. Hoffman*, are only uſed in two Caſes, which are, in a Decoction for the Small-pox and Meaſles in Children, and for Gargariſms in Inflammations of the Fauces and Tonſils: It is, however, agreed, by the unanimous Conſent of almoſt all Phyſicians, that they are of excellent Service in the Aſthma, Coughs, and other Affections of the Lungs. It is common with our old Women to adviſe eating of roaſted Figs to Women drawing near their Labour, in order to facilitate Delivery; and it is cuſtomary to kindle Spirit of Wine upon Figs, and to drink Decoctions thereof, in order to mitigate a Cough.

Figs outwardly apply'd ripen, mollify, and draw; bruiſed with Ferment, and Salt mixed therewith, they cauſe peſtilential Buboes, and other Abſceſſes, to break in a few Days. *Tragus* is of Opinion, that King *Hezekiah*, 2 *Kings Cap.* 20. was, by the Advice of the Prophet, cured by the ſame Medicine.

That the frequent Uſe of Figs generates Lice, not only *Galen*, but *Oribaſius, Paulus Ægineta*, and many of the Moderns, are firmly perſuaded; and the ſame Opinion prevails at preſent among the common People: But whether the ſame can be atteſted by Experience, remains, with me, ſays *Ray*, a Doubt.

The Juice of the Fig-tree, whether extracted from a Wound in the Tree, or expreſſed from the Leaves, is hot and biting, ſo as to be reckon'd among Cauſtics; but, with due Preparation, it is of good Service, externally us'd, as an Abſtergent, in malignant Ulcers, Lichen, Lepra, and other cutaneous Diſeaſes; it alſo extirpates the Warts called *Myrmecia*.

The ſame Judgment, ſays *C. Hoffman*, is to be made of the green or unripe Figs, both of the Garden Fig-tree and the *Caprificus*; for theſe, eſpecially thoſe of the latter, have as much of a cauſtic Quality as the Trees themſelves; which appears, becauſe a Solution of them in Vinegar can diſſolve Bulls Blood.

Take of the Shoots, or young Branches, of the Fig-tree, cut ſmall, one Pound: Boil them in a Pint of Wine, and a Pint and half of Water: The Doſe is four Ounces in the Morning for a Dropſy. It is a potent Sudorific.

Letters written on Paper with the Milk, or Juice, of the young Branches, diſappear till held near the Fire, and the Paper is very much heated, when they appear as if they were burnt. The ſame Effect has Vinegar, Juice of Lemons, and other Acids; and hence alſo this Juice, by its acid Quality, will coagulate Milk into Cheeſe, as we are aſſured by *Pliny* and *Dioſcorides*. *Ray Hiſt. Plant.*

2. Ficus; communis; fructu albo. *C. B. P.* 457.

3. Ficus; communis; fructu viridi. *C. B. P.* 457.

4. Ficus; communis; fructu cæruleo. *C. B. P.* 457.

5. Ficus; foliis robuſtioribus, & ramis erectioribus. *H. L.*

6. Ficus; humilis. *C. B. P.* 457. *Chamæficus*. J. B. 1. 120.

7. Ficus; Malabarenſis; folio cuſpidato; fructu rotundo, parvo, gemino. *Pluk.* 178. 2. THE MALABAR FIG, or INDIAN GOD-TREE.

8. Ficus; Bengalenſis; folio ſubrotundo, fructu orbiculato. *H. A* 1. 119. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 258.

Beſides the foregoing Species of FICUS, *Dale* mentions the following:

1. *Ficus ſylveſtris Dioſcoridis*. See CAPRIFICUS.

2. *Ficus Indica*, Offic. J. B. 1. 146. C. Comm. Flor. Mal. 111. Aldrov. Dendr. 434. Jonſ. Dendr. 48. *Ficus Indica Arbor radicum Indiæ*, Chab. 9. *Ficus Indica arcuata*, Park. Theat. 1499. *Ficus Indica foliis Mali Cotonei ſimilibus fructu ficubus ſimili, ex Goa*, C. B. Pin. 457. Tourn. Inſt. 663. *Arbor ex Goa ſive Indica*, Ger. 1331. Emac. 1514. *Katoualou*, Hort. Mal. 3. 73. Tab. 57. Raii Hiſt. 2. 1437. THE INDIAN FIG-TREE.

It grows in many Places in the Country of *Malabar* in the *Eaſt Indies*, and is green, and bears Fruit, throughout the Year, and will live ſome Ages: Its Virtues are much the ſame with thoſe of the common Fig-tree. *Ray. Dale.*

3. *Ficus folio Mori fructum in caudice ferens*. See SYCOMORUS.

4. *Ficus Cypria*, Offic. J. B. 124. *Ficus folio Sycomori, folio non in Caudice gerens*, C. B. Pin. 459. *Ficus ſylveſtris Cretica folio non diviſo, leviter crenato*, Tourn. Coral. 45. *Sycomorus Cypria*, Chab. 8. Jonſ. Dendr. 61. *Sycomorus altera, ſive Ficus Cypria*, Park. Theat. 1492. Raii Hiſt. 2. 1439. THE CYPRIAN SYCOMORE-TREE.

It very much reſembles the *Egyptian* Sycomore (ſee SYCOMORUS) in Trunk, Leaves, and Fruit; only, whereas the latter bears its Fruit moſtly on the larger Branches, and on the Trunk itſelf, this Tree, on the contrary, has its Fruit growing very thick on ſmall ſolitary Shoots, bare of Leaves, and generally about a Span in Length: Theſe kinds of Trees bear Fruit three or four times a Year: The Fruit itſelf is ſmall, inclining to an Aſh-colour, and of a roundiſh oblong Shape, like a Plum; and may be found on the Tree almoſt at any time of the Year. It grows in *Cyprus*, as its Name informs us; and alſo in *Syria*, *Rhodes*, and ſome other Countries.

Its Virtues are the ſame as thoſe of the *Egyptian* Sycomore, or SYCOMORUS, which ſee. *Ray Hiſt. Plant.*

FICUS, alſo, from the Reſemblance, is a Name given to certain Excreſcences, which ſometimes grow about the *Anus*, *Uterus*, and *Pudenda*. See ANUS and VAGINA.

FIDA. Gold or Silver. *Rulandus.*

FIDDA. The Moon. *Rulandus.*

FIDEUM. Saffron. *Johnſon.*

FIDICINALES. The Muſcles call'd LUMBRICALES; which ſee.

FIDO. Quickſilver, ſometimes Gold. *Rulandus.*

FIDUCIA, Confidence, in Medicine, is the firm Truſt or Reliance of the Patient on the Phyſician; which, according to *Hippocrates*, *Prognoſt. in Proœm.* and others ſince him, is of no ſmall Moment towards a Cure.

FIGENTIA are ſuch things as fix Volatiles, and concentrate Acids. *Blancard.*

FIGURA, Figure, the outward Form or Appearance of any thing. *Figurata Medicamenta* are ſolid Medicines reduc'd into particular Forms or Shapes, as Troches, Pills, and the like. *Stercora figurata*, figur'd Stools, are when the Fæces are ſolid enough to aſſume a Figure. *Caſtellus.*

FILACEOUS Roots are ſuch as are furniſh'd with a great Number of Filaments; that is, of ſmall Threads or Strings.

FILAGO.

The Characters are;

The Calyx is ſquamous, and neither ſhining nor ſpecious: The Floſcules are divided or cut in form of a Star: The broken Parts end in ductile Filaments.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Filago; ſeu Impia. *Tourn. Inſt.* 454. *Boerh. Ind. A.* 119. *Gnaphalium*, Offic. *Gnaphalium vulgare majus*, C. B. P. 263. Raii Hiſt. 1. 295. *Gnaphalium Germanicum*, J. B. 3. 158. *Gnaphalium minus ſive Herba Impia*, Park. 686. Raii Synop. 84. *Filago ſive Herba Impia*, Ger. 517. Emac. 642. COMMON CUDWEED. *Dale, p.* 91.

This kind of Cudweed grows to be near a Foot high, uſually with one woolly Stalk, having ſeveral long, narrow, crumpled, ſharp-pointed, whitiſh Leaves, ſet pretty cloſe to the Stalk: On the Top of the Branches grow round Globules or Heads compos'd of a great Number of ſmall naked Flowers ſet together in Cluſters; and, from the Middle of theſe, on both Sides ſpring ſmaller Branches, over-topping them three or four Inches, bearing at their Ends the like, but ſmaller Heads of Flowers, whence 'tis call'd Herb Impious, from the younger Heads over-topping thoſe from whence they had their Original: Theſe Heads paſs away into Down, holding very ſmall Seed: The Root is ſmall, woody, and periſhing yearly: It grows in dry barren Places, and often in fallow Fields.

Cudweed is drying and binding, and accounted good for all ſorts of Hæmorrhages and Fluxes. It is given to Cattle that have loſt the ruminating Faculty, and is therefore called Cudweed. It is rarely uſed. *Miller's Bot. Off.*

Dodonæus mightily commends the diſtilled Water of this Plant for the Cancer in the Breaſts; applying, once a Day, Pledgets and Compreſſes ſoaked in it. *Lobel* ſays, the Infuſion of this Plant in Oil of Olives, makes a very good Balſam for Wounds and Contuſions. *Martyn's Tournefort.*

2. Filago; altera. *Dod. p.* 67.

3. Filago; minor. *Dod. p.* 66.

4. Filago; vulgaris; tenuiſſimo folio; erecta. *T.* 454.

5. Filago; maritima; capite foliofo. *T.* 454.

6. Filago; erecta; latifolia; capitulis tomentoſis.

7. Filago; quod Gnaphalium; longifolium; humile; ramoſum; capitulis nigris. *Raii Synop.* 85. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 119.

This Herb is of an antihyſteric Quality, and highly beneficial in Cancers, and other Diſorders of the Breaſts. Some, alſo, affirm, that it cures the Leproſy; but this they have been induc'd to believe, by the Down with which its Leaves are cover'd; for which Reaſon they have alſo imagin'd, that it removes an Exceſs of unſeemly Down on the Skin: But theſe are groundleſs Conceits. All the Species of this Plant are poſſeſs'd of an incredibly drying Quality, which is ſufficiently conſpicuous upon chewing the Leaves in the Mouth. Hence the ſeveral Species of this Herb are proper for putting a Stop to Fluxes of Humours. *Boerhaave, Hiſt. Plant.*

FILAMENTUM, Filament, in Botany, is a ſmall Thread or Fibre, belonging to the Roots of Plants: It is alſo uſed to ſignify that viſcid concreted Matter, which appears like Hairs or Threads in Urine.

FILELLUM. The Frenum, or Bridle, by which the Prepuce is connected to the Glans of the Penis; it is alſo call'd *Canis. Caſtellus.*

FILETUM. The nervous Ligament under the Tongue, which Midwives uſually divide with their Nail, or a Six-pence, immediately after the Birth: Sometimes it is cut by a Barber-ſurgeon, with a Lancet, or a Pair of Sciſſars, to the endangering the Life or Speech of the Child, tho' this Operation is very rarely found to be neceſſary.

FILICULA. See FILIX.

FILIPENDULA.

The Characters are;

The Root is fibrous and perennial, with glandulous Bulbs faſten'd to it: The Leaves are finely jagged, like thoſe of Millefoil: The Calyx is monophyllous, denticulated, and divided into ſix or ſeven Segments, which are retroflected, or bent backwards: The Flowers are hexapetalous or heptapetalous, looſely diſpos'd in Panicles on long Stalks, which are almoſt naked: The Stamina are numerous, and ſituated on the reflected Margin of the Calyx: The Fruit is generally round, and contains many Seeds compacted together, each of them furniſh'd with its Tube.

Boerhaave mentions two Species of this Plant; which are,

1. Filipendula; vulgaris; an Molon Plinii? *C. B. Pin.* 163. *Tourn. Inſt.* 293. *Elem. Bot.* 243. *Boerh. Ind. A.* 43. *Filipendula*, Offic. J. B. 3. 189. Ger. 900. Emac. 1058. Raii Hiſt. 1. 623. *Synop.* 3. 259. Mer. Pin. 38. *Filipendula vulgaris*, Park. Theat. 434. Hiſt. Oxon. 3. 320. Buxb. 111. *Filipendula Officinarum*, Rupp. Flor. Jen. 129. *Filipendula vulgaris, Oenanthe*, Merc. Bot. 1. 35. Phyt. Brit. 41. *Oenanthe, Filipendula.* Chab. 407. *Saxifraga rubra vulgo.* DROPWORT.

The

The Roots of Dropwort conſiſt of a great Number of oval Glandules, faſtened together by ſlender Strings, from which ſpring ſeveral long, narrow, and, as it were, pinnated Leaves, whoſe Pinnæ are ſerrated, and not much unlike the ſmaller Burnet Saxifrage-leaves: The Stalks grow to be about a Foot high, having but few Leaves there; but, on their Tops, a pretty many Flowers in form of an Umbel, which are white within, and reddiſh on the Outſide, made of ſix Leaves, with a great Number of yellowiſh Stamina in the Middle, which are ſucceeded by ſeveral flattiſh Seeds growing in a Head together: It grows in chalky Grounds, and flowers in *June* and *July*; the Root being principally uſed.

The *Fipendula* is ſtyptic, ſweet-ſmelling, glutinous, of a Taſte a little ſaltiſh, and gives a pretty deep-red Tincture to blue Paper: The Root gives it a pretty ſtrong one: It is ſtyptic, and a little bitter. This Plant contains a Salt, approaching to that of Alum; but it is mixt with a great deal of Sulphur; for by the chymical Analyſis we obtain from it a great deal of acid Earth and Oil. All Authors agree, that it is very diuretic and aperitive. *Tabernæmontanus*, after *Sylvaticus*, *Simon Januenſis*, *Bayrus*, and *Lobel*, recommend it for the Epilepſy; and *Mercator* and *Prevotius* for the Dyſentery. *Martyn's Tournefort.*

The Root is an Attenuant, and ſomewhat aſtringent; a Decoction thereof provokes Urine, expels the Stone, and helps the Dyſury and Strangury. Some commend the Powder of the Root, and its Juice, againſt the Epilepſy: Others write, that *Filipendula* in Qualities approaches very near to Peony; for which Reaſon, as *Lobel* ſays, the Roots are of Service in the Epilepſy, and Vertigo: Uſed with the Seeds of Fennel, they relieve under Shortneſs of Breath, the Aſthma, and Inflations of the Stomach. *S. Pauli*, from his own Experience, commends the Powder of the Roots as an approved Remedy in the *Fluor albus*, when all other Medicines have failed: It is, alſo, of excellent Uſe in an exceſſive Flux of the Lochia: The Doſe is a Dram, in a Decoction of Daucus. *Corbæus* exhibited every Day a Dram of the green Root of Filipendula in black Wine for the Fluor albus. *Prævotius* tells us, that he often cured the Dyſentery, by exhibiting a Dram of the Powder of the Root in Wine, or the Yolk of an Egg, which *Lud. Mercatus*, before him, had recommended as a Secret. The Plant is certainly of a remarkably aſtringent Quality, and to ſuch a Degree, that, as *Tho. Carthuſius* obſerv'd, Hernias have been cur'd by eating it. *Ray*, *H. Plant.*

2. Filipendula; omni parte major; folio anguſtiori. *An Filipendula minor?* C. B. P. 163. Prodr. 85. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 43.

FILIUS ANTE PATREM, the Son before the Father. An Expreſſion, which Botaniſts apply to Plants, whoſe Flower comes out before their Leaves.

FILIUS, the Son, in the Spagiric Language, is a Term apply'd to various Works in the Affair of the Philoſophers Stone: Thus, the Redneſs, which emerges after the Whiteneſs, and is call'd *Rex diadematus*, or *coronatus*, is alſo call'd, *Filius nigri & albi.* Again, *Filius unius Oſtum* is Vitriol, or Orpiment; *Filius unius Diei* is an Egg, and the Philoſophers Stone; and *Filius Veneris* is *Aurichalcum. Rulandus.*

FILIX.

The Characters are;

The Leaf is compos'd of other Leaves, which adhere to a Rib in ſuch a manner, as to have Lobes on both Sides, cut into the Depth of the main Fibre: The Fruit reſembles that of *Polypody.*

Boerhaave mentions nine Species of this Plant; which are,

1. Filix; non ramoſa; dentata. *C. B. P.* 358. *Hiſt. Oxon.* 3. 578. *Tourn. Inſt.* 536. *Elem. Bot.* 428. *Dill. Cat.* 103. *Boerh. Ind. A.* 26. *Filix mas*, Offic. Ger. 969. *Filix*, Chab. 553. *Filix mas vulgaris*, Park. 1036. Raii Hiſt. 1. 143. Synop. 47. Buxb. 112. *Filix mas non ramoſa, pinnulis latis, denſis, minutim dentatis*, Ger. Emac. 1129. *Filix vulgò mas dicta, ſive non ramoſa*, J. B. 3. 737. COMMON MALE FERN.

The Leaves of this Fern are pretty long and large, not divided into Branches, as the Female Fern is; but having ſeveral long Surculi of pinnated indented Leaves, growing on each Side the Stalk, which are not directly oppoſite on the Rib, but grow alternately, one a little above another: The Seed grows in round duſky Globuli, along the Back of the Leaves: The Root pretty much reſembles that of *Oſmund Royal*, and is, indeed, generally ſold for it by the Herb-women: It grows in Hedges, and ſhady Lanes.

The Root is only uſed; being apply'd to the ſame Purpoſes, and ſuppos'd to have the ſame Virtues, with the Roots of *Oſmund Royal:* It is believ'd to be hurtful to the Female Sex, and to cauſe Miſcarriage. See OSMUNDA REGALIS.

It grows on the ſhady Banks of Hedges: The Part uſed in Medicine is the Root, which is thick, blackiſh without, but pale within, fibrous, involv'd and interwoven with Multitudes of Appendages, and of a bitter and ſomewhat aſtringent Taſte.

The Virtues are the ſame as thoſe of the *Female Fern*; but it has a peculiar Efficacy againſt the Rickets, or Reckets: It expels Worms and the Stone; relieves thoſe who labour under an Increaſe of the Spleen. *Dioſcorides* ſays, that the Root drank, or made into an Ointment with Fat, cures Wounds inflicted by Arrows. *Theophraſtus*, *Pliny*, and *Dioſcorides*, agree, that it cauſes Barrenneſs and Abortion. *Tragus* aſſures us, from his own Experience, that when a Horſe falls down, and you are puzzled to find the Nature of his Diſorder, if you put a Rib of the Root of this Plant under his Tongue, he will immediately excrete both Ways, and riſe up. *Dale*, *Ray.* This, however, I will not vouch.

2. Filix; non ramoſa; latifolia; dentata. *T.* 536.

3. Filix; non ramoſa; latifolia; dentata profundius; pinnulis maximis.

4. Filix; non ramoſa; minor; pinnulis in ſummo leviter inciſis. *Flor.* 1. 147.

5. Filicula; fontana; major; ſive Adianthum album, filicis folio. See ADIANTHUM.

6. Filix; baccifera. *Corn.* 5.

7. Filix ſaxatilis Tragi. *J. B.* 3. 755. *Muſcus corniculatus*, Ger. Ic. 1561.

8. Filicula; ſaxatilis; regia; pinnulis ad fumariam accedentibus. *Vaill.*

9. Filicula; ſaxatilis; pinnulis brevioribus acutis. *T.* 542. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 27.

The *Hiſtoria Plantarum*, attributed to *Boerhaave*, informs us, that all theſe Species of Ferns, eſpecially the firſt, ſecond, and third, are excellent in the Rickets, and Diſeaſes proceeding from Laxity; and good in the Scurvy, Pleuriſy, and Dropſy, being a powerful Diuretic.

Botaniſts divide Fern into Male and Female: The Male is that which has no Branches, but only one main Rib: The Female is that which is branch'd.

A great many more Plants, beſides thoſe mention'd under this Article, are call'd by the Name of *Filix*; but theſe are either taken notice of under other Names, agree in Virtues with thoſe here ſpeciſy'd, or have no Virtues aſcrib'd to them.

Beſides the foregoing Species of FILIX, *Dale* mentions the following:

Filix fœmina, Offic. Ger. 969. Emac. 1128. Raii Hiſt. 1. 149. Synop. 49. Buxb. 113. *Filix femina vulgaris*, Park. 1037. *Filix ramoſa major pinnulis obtuſis, non dentatis*, C. B. 357. Tourn. Inſt. 536. Elem. Bot. 428. *Filix major & prior Trago, ſeu ramoſa repens*, J. B. 3. 735. *Filix ramoſa repens vulgatiſſima*, Hiſt. Oxon. 3. 583. *Thilypteris*, Dill. Cat. 174. FEMALE FERN, or COMMON BRAKES.

The common Female Fern, or Brakes, has many large Leaves, divided into ſeveral Branches, beſet with long, narrow, ſtiff Pinnulæ, which are moſtly ſmooth about the Edges, though ſometimes they are a little indented: The Back of theſe, about Midſummer, will be cover'd round the Margins with a great Number of duſty-brown Particles, which are the Seed: The Root is long and thick, ſpreading much in the Earth, ſending out Shoots on every Side, which makes it hard to be eradicated: It grows but too frequently upon Commons and Heaths, being uſed in want of Fuel by the Country-people, for heating their Ovens, and other Uſes.

The Roots only are uſed in Medicine, and thoſe but rarely, being commended as very good for Worms, eſpecially the flat Worms: A kind of Pot-aſh is made of the Stalks and Leaves burnt. *Miller's Bot. Off.*

The Powder of the Root, taken to the Weight of half an Ounce (*S. Pauli* ſays, a Dram) in Hydromel, kills the flat Worms, and, alſo, long ones; being, as *S. Pauli* aſſures us, inſtantaneouſly mortal to theſe Vermin, and, for that Reaſon, accounted, by circumforaneous Quacks and Mountebanks, the beſt of all their Secrets againſt the Worms; and a proportionable Price they ſet upon it. A Decoction of the Root in Wine, drank for ſome Days together, relieves under an Increaſe of the Spleen. The Juice of the Root, either green or dry, with a Mixture of Roſe-water, or Cow-dung Water, or Water of Lime-tree-flowers, or, for want of theſe, common Water, is of excellent Service in all Kinds of Ambuſtions, whether by Fire, boiling Water, or Oil; for, as *Tragus* and *S. Pauli* aſſert, it yields a viſcous and mucilaginous Juice, which is effectual in Caſes where other Medicines are of no Service: It is, alſo, a moſt approv'd Remedy againſt Hernias and Ulcers. *Ray*, *Dale.*

FILLETIN. A Plate of Iron. *Rulandus.*

FILM, in Botany, is that woody Skin which ſeparates the Seeds in the Pods of Plants.

FILONES, in *Fallop. de Metall.* are the Fibres of Stones.

FILTRATIO. Filtration. This is the paſſing any Fluid through a Strainer, or Filtre, in order to ſeparate from it any groſs Particles it contains, and render it limpid. In order to

filtrate

filtrate a Fluid, the Apothecaries fold up a Piece of bibulous or filtrating Paper, in the Shape of a Funnel: This they place in a Funnel, with the ſmall End, in the Veſſel they intend for the Reception of the filtrated Liquor; then they pour the Liquor to be filtrated into the Paper, and ſuffer it to drop gradually through it, taking care not to put in too much at once, for fear of burſting the Paper. But Filtration is, alſo, perform'd by a woollen Bag, call'd *Hippocrates*'s Sleeve, or one of Linen. The Choice of theſe muſt be directed by the Liquor to be filtred.

FILTRUM. See FILTRATIO.

Filtrum is alſo a Name given to a rare and very precious exotic *Mexican* Stone, found at the Bottom of the Waters, at the Depth of about a hundred Yards, in ſome Places of the Bay of *Mexico*, where it grows like a Fungus, and petrifies in the open Air. Large Fragments of this Stone, being reduc'd into the Form of a Pot or Mortar, ſo as to contain Water, are highly valued on account of their ſingular Virtue in purifying the Water, ſo as to make it depoſit a certain Quantity of inſenſible Fæces, by which it becomes purer and lighter without Diminution of its Coolneſs. A fuller Account of this Stone, in *French* and *Latin*, is annex'd to a phyſico-medical Diſſertation of *Mich. Bernh. Valentinus*, printed at *Strasburg*, 1702.

FILUM, a Thread, has various Uſes in chirurgical Operations. *Filum Arſenicale*, in the Spagiric Language, is ſublimate Mercury. *Rulandus.*

FIMBRIA, in Surgery, is the ſame as CATABLEMA; which ſee.

FIMBRIATA, fimbriated, of *Fimbria*, a Fringe, is a Term relating to the Leaves of Plants, when they are jagged on the Edges, having, as it were, a Fringe about them.

FIMUS, κόπρος, Dung of Animals

Neats-dung, apply'd freſh, mitigates Inflammations in Wounds; the Way is, to wrap it up in Leaves, and heat it in hot Aſhes, and then apply it: Uſed in the ſame manner, it eaſes the tormenting Pains of the Sciatica. Rub'd on the Parts, with Vinegar, it diſcuſſes Hardneſſes, Strumæ, and Pani. The Dung of a Bull in particular, uſed in Suffumigations, reſtores a prolapſed Uterus; and, burnt, drives away Gnats.

The Dung of Goats, eſpecially thoſe which live on the Mountains, drank in Wine, cures the Jaundice; and, exhibited with Spices, provokes the Menſes, and expels the dead Fœtus. Being dry'd, triturated, and mix'd with Frankincenſe, and apply'd in Wool, as a Peſſary, it repreſſes the menſtrual Flux; and, uſed with Vinegar, reſtrains other Hæmorrhages; burnt, and rub'd on the Parts with Vinegar or Oxymel, it cures an Alopecia; apply'd in a Cataplaſm, with Fat, it eaſes the Gout; boil'd in Wine or Vinegar, it is apply'd to the Bites of Serpents, Herpes, Eryſipelas, and the Parotides. They have a way of burning it, which is of Service in the Sciatica, and is thus perform'd: In the hollow Part, between the Thumb and fore Finger, where the Thumb joins to the Wriſt, they firſt apply Wool, moiſten'd with Oil, and, upon that, burning Clots of Goats-dung, one at a time, they continue ſo to do, till the Senſation proceeds through the Arm down to the Hip, and mitigates the Pain; this they call the *Arabian* Way of Burning.

The Dung of Sheep, apply'd as a Cataplaſm with Vinegar, cures Epinyctides, Corns, Thymi, and Acrochordones; burnt, and ſpread upon Cerate of Roſes, it ſerves for the ſame Purpoſes. See OVIS.

The Dung of Swine, dry'd, and drank in Wine or Water, ſtops Vomiting of Blood, and eaſes inveterate Pains of the Sides; drank in Vinegar, it is effectual in Ruptures and Spaſms; and, apply'd in Cerate of Roſes, it cures Luxations.

The Dung of Aſſes, as well as Horſes, mix'd with Vinegar, repreſſes Hæmorrhages; the Dung of Cattle, which feed on Herbs, dry'd, then infus'd in Wine, and drank, is an excellent Remedy for the Poiſon of the Scorpion.

The Dung of Pigeons, on account of its exceſſively hot and cauſtic Quality, is properly mix'd with the Flour of Barley; uſed with Vinegar, it diſcuſſes ſtrumous Swellings; and, pounded with Honey, Oil, and Linſeed, it breaks Carbuncles, and heals Ambuſtions; the Dung of Hens is effectual to the ſame Purpoſes, but in a weaker Degree; it is particularly ſerviceable to thoſe who have eaten deadly Muſhrooms, or are affected with the Colic.

The Dung of Storks, drank in Water, is ſuppos'd to be good for the Epilepſy; and the Dung of a Vultur, in a Suffumigation, is ſaid to expel the dead Fœtus.

The Dung of Mice, pounded in Vinegar, and rub'd on the Part, cures an Alopecia; and, drank in Mulſum, with Frankincenſe, expels the Stone; uſed in a Suppoſitory for Children, it ſtimulates the Belly to Excretion.

The Dung of Dogs, evacuated in the canicular Seaſon, dry'd, and drank in Wine or Water, ſtops a Looſeneſs.

Human Dung, apply'd freſh, preſerves Wounds from Inflammation, and, at the ſame time, conglutinates them; dry'd, and rub'd on the Parts, with Honey, it is reported to give Relief under the Quinſey.

The Dung of a Land-crocodile ſerves the Women as a Coſmetic to render the Skin of the Face of a lively Colour, and ſhining. The beſt of this Kind is the whiteſt [for λευκότατη here I read with *Pliny*, and moſt Interpreters, λευκοτάτη] and friable, light, like Amylum, ſoon diſſolv'd in a Liquid, which, when triturated, has an acid Taſte, and ſmells of Ferment. Some adulterate it with the Dung of Starlings fed on Rice, which reſembles what is genuine. Others work up Amylum, or Cimolia Terra, and, colouring it with Anchuſa, paſs it through a fine Leaf; and, after it is dry, reduce it to a vermiculated Form, and vend it inſtead of the true Dung of the Crocodile. *Dioſcorides, Lib.* 2. *Cap.* 98.

FIREX. Oil. *Rulandus, Johnſon.*

FIRFIR. A red Colour. *Ibid.*

FIRMAMENTUM, the Firmament, is either properly ſo call'd, being the whole viſible Extent of the Heavens, and thence ſtyl'd, in the chymical Language, *Macrocoſmicum*; or, by way of Analogy, the *Firmamentum Hominis, ſeu Microcoſmi*, as they expreſs themſelves. Of Man, under this Notion, *Paracelſus* treats in many Places, and eſpecially in his *Paramirum.*

In *Crollius*, *Firmamentum* is the Light of Nature, which inſtructs Man in every thing naturally.

FIRMISIUM *Mineralium* is Antimony. *Paracelſus.*

FISARUM. *Rulandus* explains this, *Confectio Salis Ammoniaci.*

FISSICULATIO. A Word, importing anatomical Diſſection; properly, a Cutting open.

FISSURA. A Fiſſure, or Crack. Theſe are either natural or morbid. Thus, the Mouth, and the Orifice of the Female Pudenda, are frequently call'd natural Fiſſures. Morbid Fiſſures are either thoſe of the *Cranium*, or other Bones, (ſee CAPUT) or Chaps and Cracks of the Skin, which ſometimes happen about the Lips, *Anus*, and other Parts of the Body.

FISTACIA. The ſame as PISTACHIA.

FISTULA.

A Sinus is, by Phyſicians and Surgeons, defin'd, a Cavity in the ſoft Parts of the Body, form'd by Pus collected in an Abſceſs, which removes them from their mutual Contact; and is eliminated by an Aperture, made either ſpontaneouſly, or by the Aſſiſtance of Art. The following Definition is given by *Galen*, in *Comment.* 2. *in Lib. Hippocrat. de officina Medici.* "So long, ſays he, as the Part affected has no Aperture in its "Surface, the Diſorder is call'd an Abſceſs; but, when in any "Part of it an Aperture is made, ſo as to diſcharge the con"tain'd Matter, the Diſorder is no longer an Abſceſs, but "forthwith aſſumes the Name of a Sinus." But, from this Definition, it would follow, that a Sinus muſt neceſſarily be produc'd by every Abſceſs; but, according to Cuſtom, a Sinus is only ſaid to be form'd, when the Sides of the Abſceſs, coming into mutual Contact, in conſequence of the mutual Diſcharge of the Pus, cannot, however, be ſoon conſolidated, but remain, for a long time, ſeparate; ſo that freſh Humours, daily collected in this preternatural Cavity, create an uncommon Difficulty of Cure. For this Reaſon, *Galen*, in the fourth Chapter of his Treatiſe *de Tumor. præter Natur.* gives the following Definition of a Sinus: "When, ſays he, the "Pus excoriates the Parts, and ſeparates thoſe which contain it "from ſuch as lie under it, in ſuch a manner, that the Pus "being eliminated by that means, the ſeparated Parts cannot "recover their former State, the Diſorder is call'd a Sinus." He expreſſes himſelf in the like manner in the tenth Chapter of his ſecond Book *de Method. Medend. ad Glaucon.* for, after, in the ninth Chapter of his ſecond Book *de Method. Medend.* he has told us, that in Suppurations the Skin is with Difficulty united to the ſubjacent Parts, when it is ſo decay'd as to reſemble the Fragments of worn Garments, he immediately ſubjoins, in the Beginning of the next Chapter, "When the "Skin is incapable of being united with the ſubjacent Parts, "the Diſorder is call'd a Sinus." *Paulus Ægineta*, in the 48th Chapter of his fourth Book, gives the ſame Definition of a Sinus, almoſt in the very Words of *Galen.*

A Fiſtula is, in ſome reſpects, different from a Sinus, ſince the former is narrower, generally continues longer, and has its internal Surface, and its Orifice, for the moſt part, callous. Hence *Paulus Ægineta*, in the 49th Chapter of his fourth Book, gives the following Definition of a Fiſtula: "A "Fiſtula, ſays he, which derives its Name from its Reſem"blance to a Reed or Pipe, is a callous Sinus, generally ariſing "from Abſceſſes;" and, in the 77th Chapter of his ſeventh Book, he tells us, that Fiſtulas generally ſucceed ill-cur'd Abſceſſes. The elegant *Celſus*, after having inform'd us, that Fiſtulas ariſe from Abſceſſes and Ulcers of other Kinds, briefly defines them, in the 28th Chapter of his fifth Book, to be deep, narrow, and callous Ulcers.

The Seat of a Fiſtula is always in the *Membrana Adipoſa*; nor have we any well-vouch'd Obſervations of Fiſtulas penetrating

trating into what we properly call the Subſtance of the Muſcles, that I know of. But, if we conſider, that Pus, collected in the *Membrana Celluloſa*, and attenuated by its Continuance, and the Heat of the Body, may be lodg'd upon the Muſcles, 'tis ſufficiently obvious, that this Pus, being preſs'd by the Action of theſe Muſcles, muſt be propel'd through all the adjacent Parts, and produce deep Sinuſes and Fiſtulas of the worſt Kind, eſpecially when it inſinuates itſelf into the Interſtices of the Muſcles. The thicker, therefore, the *Membrana Adipoſa* is, or the more Strata of Muſcles lie above each other in the ſuppurated Part, the more Miſchief the retain'd Pus is capable of doing: For this Reaſon the Sinuſes and Fiſtulas of the Abdomen are found ſo troubleſome on account of the large Quantity of Fat ſituated there, between the Strata of the abdominal Muſcles.

The Preſence of a Sinus, or Fiſtula, may be diſcover'd by the following Means: When there is an external Aperture on the Surface of the Body, then they are eaſily detected by the Eye; for if a large Quantity of Pus is either diſcharg'd from a ſmall Orifice, or may be evacuated by preſſing the adjacent Parts, 'tis ſufficiently obvious, that the Sinus, in which this Pus was contain'd, muſt be proportionably large. But *Celſus*, in the 28th Chapter of his fifth Book, informs us, "That it is, above all Things, highly expedient to "introduce a Probe into the Fiſtula, that we may know "how deep it is, and in what Direction it runs." By this Method, he ſays, we may at the ſame time diſcover, whether the Fiſtula has penetrated to the Bone or not; and whether the Bone is carious or ſound. But, in order to diſcover whether, notwithſtanding one external Orifice, the Fiſtula may not be divided into various Ramifications, he, in the ſame Chapter, gives the following Directions: "The Poſture, "ſays he, of the Body, informs us whether the Fiſtula has "penetrated into more Parts than one, becauſe, upon chang"ing the Situation of the Body, or any particular Member, "the Pus, which before ſtopt, often begins to be diſcharg'd "afreſh; which teſtifies not only, that there is another Sinus, "from which the Pus is diſcharg'd, but alſo, that it runs in "a Direction contrary to the former." But the beſt Method of diſcovering Sinuſes and Fiſtulas, together with their various Directions, is, by means of a Syringe, gently to inject tepid Water into them, which will eaſily inſinuate itſelf into all their Windings: And, if the Fiſtula runs near the external Parts under the Integuments, the Elevation of the Skin will indicate its Courſe: But if the Sinus, or Fiſtula, ſhould be deeper, the Quantity of the Water injected will, at leaſt, diſcover the Largeneſs of ſuch a preternatural Cavity; nor, in ſuch a Caſe, can much more be diſcover'd by the Uſe of the Probe. Beſides, if the Probe is forcibly introduced into the Orifice of the Fiſtula, it often makes a new Paſſage for itſelf, by lacerating the tender *Membrana adipoſa*; nor, by this means, can the Length of the Fiſtula be diſcover'd, if it runs in a winding Direction.

But when Sinuſes are not yet open'd, they are with greater Difficulty diſcover'd, eſpecially when deep ſeated. All the Light we can receive in this Caſe, muſt be drawn from the Symptoms of the preceding Inflammation, and the Nature of the Suppuration ſubſequent to it. If, after this, a Fluctuation, and a Cavity, ſoft to the Touch, are perceiv'd, we may be certain, that ſuch a Sinus is form'd. Beſides, no conſiderable Suppuration can happen in the Body, without being ſoon after accompanied with a ſlight hectic Fever. But, in Caſes of this Nature, the higheſt Caution is abſolutely neceſſary, leſt a latent Aneuryſm, or a varicoſe Tumor, ſhould be taken for a deep Suppuration. But a ſkilful Surgeon will not readily fall into an Error of this Kind, if he attentively conſiders the Origin and Progreſs of the Diſorder. It muſt, however, be confeſs'd, that ſometimes ſo deep Abſceſſes have occur'd, that the moſt ſkilful Artiſts have blunder'd in diſcovering their genuine Natures.

When Fiſtulas, as yet not become callous, are complicated with Ulcers, and diſcover'd either by the Eye, the Aſſiſtance of the Probe, or any other Means, the moſt expeditious Method of Relief is to make an Inciſion to their very Bottom, if it can be done without Danger; after which they are to be deterg'd and conſolidated. But, becauſe Patients are unwilling to ſubject themſelves to this Operation, 'tis expedient previouſly to cleanſe them by an Injection of ſome proper Liquor, or by means of Lint, cover'd with digeſtive Ointment. But tho' many Surgeons thruſt Tents into Fiſtulas, with a View to convey Medicines to their Bottoms, yet, as their Hardneſs, or, perhaps, their too great Length, may poſſibly induce a Callus, or an Inflammation, or excite too violent a Commotion of the Humours, or at leaſt, protract the Cure longer than it ought; it ſeems more expedient, either to abſtain from them entirely, or, at leaſt, to take good Care, that they be neither too hard, nor too long. *Belloſte*, and *Cæſar Magatus*, both ſkilful Surgeons, on account of this Abuſe of Tents, entirely rejected them, not only as ſuperfluous, but hurtful: And I myſelf am ſo far from condemning, that I rather applaud, and approve of, this Practice of theirs. Neither do I think the Uſe of Tents ſafe, except in Caſes where the Conglutination of the Mouths of narrow Fiſtulas is to be prevented; and even in this Caſe they ought to be very ſhort and ſoft.

Another Step to be taken in the Cure of Fiſtulas is, duly to preſs their Bottoms towards their Orifices or Apertures. For this Purpoſe, a narrow Compreſs, or a Slip of Plaiſter, wrapt up in that Form, is, after the Ulcer is cleans'd, and proper Medicines put into the Fiſtula, to be apply'd to its Bottom, and ſecur'd, as in other Ulcers, with Lint, Plaiſters, and Bandage. As for the Method of applying the Bandage, it is moſt expedient to apply it firſt to the Bottom of the Fiſtula, or, at leaſt, to make it tighteſt there, that, by this means, the peccant Matter may be, as it were, propel'd from the Bottom to the Mouth of the Fiſtula; in conſequence of which, the Bottom will be conglutinated before the reſt of the Fiſtula. This generally happens ſooner in Fiſtulas of the Arms or Legs, than in thoſe of other Parts, eſpecially if their Bottoms lie towards the ſuperior, and their Mouths towards the inferior Parts of the Members.

When Fiſtulas lie too deep for having their moſt remote and latent Cavities commodiouſly cleans'd, detergent Medicines are to be injected, in order to waſh out the Sordes; ſuch as Decoctions of Agrimony or Birthwort, mixt with Honey of Roſes, or Eſſence of Myrrh and Aloes; or, which *Belloſte* greatly commends, a Decoction of the Leaves of the Walnut-tree, with an Admixture of Sugar; to which we may juſtly add the following Preparations:

Take of digeſtive Ointment, prepar'd of Turpentine and the Yolks of Eggs, an Ounce and an half; of common Honey, or that of Roſes or Celandine, one Ounce; and common Spirit of Wine, nine Ounces: Mix all together. Or,

Take of the Decoction of Germander, or Southernwood, or Agrimony, eight Ounces; of common Spirit of Wine, three Ounces; of the Elixir Proprietatis, or of the Eſſence of Myrrh and Aloes, one Ounce; and of the Honey of Roſes, two Ounces. Mix all together.

Some of theſe Preparations are, at every Dreſſing, to be injected warm, and retain'd for a ſhort time, gently compreſſing the Bottom and Mouth of the Fiſtula, that the peccant Matter may be the more effectually waſh'd off; and this Method is to be perſiſted in, till the Bottom of the Ulcer begins to be gradually conglutinated; then we are to dreſs with digeſtive Ointment; or if this ſhould ſeem too weak and ineffectual, we may, in its ſtead, uſe the Liniment of *Arcæus*, Peruvian Balſam, Balſam of Meccha, Balſam of Sulphur, Eſſence of Myrrh, and Aloes, Oil of Myrrh per Deliquium, Oil of Eggs; and other vulnerary Balſamics. The Regimen and Method of Cicatrization are the ſame as in Ulcers. See Ulcus.

But, if the Method of Cure already directed ſhould prove inſufficient, both for cleanſing and conglutinating Fiſtulas, greater Relief is generally obtain'd from manual Operation, than from Medicines, eſpecially when the Fiſtulas are directed downwards, or too crooked and winding; or when their Bottoms cannot be ſufficiently compreſs'd: And, in theſe Caſes, an Inciſion is to be made from their Mouths to their very Bottoms.

Some groov'd Probe is, therefore, to be gently paſs'd into the Cavity of the Fiſtula; and, introducing a Knife into the Groove, as much of the Skin and Fleſh is to be cut, as is thought ſafe or ſufficient to anſwer the End; for when the Bottoms of Fiſtulas are laid open, the corrupted Matter is not only more expeditiouſly diſcharg'd, but Medicines are more commodiouſly apply'd. The Inciſion may alſo be made without a groov'd Probe, by means only of an obtuſe-pointed Knife, like thoſe in *Tab.* XXVI. *Fig.* 4. and 5. Sometimes one Branch of a Pair of Sciſſars, like thoſe repreſented in *Tab.* XXII. *D*, are paſs'd to the Bottom of the Fiſtula, and the Inciſion is made by their means. But this Method of making the Inciſion, unleſs the Skin and Fleſh are tender, ſeems to be leſs commodious, and more troubleſome to the Patient, than the other.

If upon making an Inciſion into a Fiſtula, a large Quantity of Blood ſhould be diſcharg'd, which frequently happens, the Wound is, in the firſt Dreſſing, to be fill'd with dry Lint, and duly dreſs'd. Then the digeſtive Ointment, in Conjunction with the *Egyptian* Ointment, or red Precipitate, is to be apply'd, till the Ulcer is ſufficiently deterg'd. The other Meaſures to be taken are the ſame, as in recent Ulcers. The fourth Chapter of the ſixth Book of *Celſus* may be conſulted, not only with reſpect to Fiſtulas in general, but alſo with reſpect to thoſe of the Ribs, the Abdomen, and the Anus. The Fiſtulas happening in particular Parts of the Body are conſider'd under their reſpective Articles. *Heiſter. Chirurg.*

See Anus, and Thorax.

Belloſte abſolutely diſcards all manner of Tents and Injections in the Cure of Fiſtulas.

FISTULA LACHRYMALIS.

A ſpontaneous, or involuntary Efflux of a purulent Fluid, or real Pus, out of the greater Canthus of the Eye, or one ſubſequent to preſſing the lachrymal Sack, is, in general, termed a lachrymal Fiſtula. This Diſorder proceeds from an Ulcer in the lachrymal Paſſages, but principally in the Sack; the more inveterate, therefore, the Ulcer, the more dangerous the Diſeaſe. It is often in the Sack only, and emits the corrupted Matter out of the Puncta lachrymalia; ſometimes it eats into the Skin, which covers it, and the contiguous Bones. If it does not eat into the Skin, it is imperfect; if it does, perfect; and, when it corrodes the Bones too, it is called a compound lachrymal Fiſtula. Here we muſt obſerve, that our modern Writers have been very inaccurate in their Deſcriptions of this Diſtemper, which ſeems to be owing to theſe two Reaſons: 1. The wonderful Variety of Diſorders, to which the greater Angle of the Eye is ſubject, occaſioned a Variety of Names to the ſame Diſorder, and ſometimes the ſame Name to different ones. 2. The Nature of it was unknown to moſt Surgeons. For how few of the Antients have not derived this Fiſtula, either from an Ulcer of the Caruncle itſelf, or one under it, in it, or behind it! When it is plain, to the moſt experienced Moderns, from frequent and accurate Obſervations, that it never flows from the lachrymal Caruncle, or the adjacent Parts, but from the Sack thro' the Puncta lachrymalia. If this Error, therefore, introduced a prepoſterous Practice, Phyſicians have done well in endeavouring to correct it.

But, for our Direction, both with reſpect to Theory and Practice, I think it not amiſs in this Place, briefly to expound their Miſtakes, and lay down Rules for the Amendment of them: 1. Many term'd that a lachrymal Fiſtula, which we denominate an *Epiphora*. 2. Others confounded it with an Anchilops, and an Ægilops. But, before we can reconcile their different Opinions, we muſt diſtinguiſh clearly between theſe two Diſorders. An Anchilops, then, is a Tubercle which riſes between the greater Angle of the Eye and the Noſe, whether it be in or near the lachrymal Sack, and whether it is attended with an Inflammation, or not. Here we may obſerve, that near the Sack, as well as in other Parts, there are, (1.) Encyſted Tumors; (2.) Inflammations and Abſceſſes; and, very often, (3.) a Diſtention and Reſolution of it, which we call a lachrymal Hernia. (See *Tab.* XXXVII. *Fig.* 10. A B, with *Fig.* 16. and 17.) Upon a Preſſure of the Finger, this Tumor ſubſides, ſometimes with Eaſe, ſometimes with Difficulty; and the Matter diſcharges itſelf through the Noſe, or Puncta lachrymalia, or both. The Ægilops is a Tumor nigh the lachrymal Sack, ariſing after an Inflammation or Abſceſs; which, by its ſharp, purulent Matter corrodes the ſuperior Skin, or the lachrymal Ducts, or the Fat near the Sinus of the Eyes, and ſometimes the Oſſa plana; and, laſtly, the Parts and Bones near the Noſe, often producing a deſtructive Caries. Sometimes, both the ſuperior and inferior Ducts are ſo corroded, that Pus flows continually out of the Puncta lachrymalia into the greater Angle (ſee *Fig.* 18. Letters *a* and *b*). And this is properly denominated a lachrymal Fiſtula; for, when the clear lachrymal Fluid diſtils out of the Eye, it is only an Epiphora. What has been ſaid, I think, amounts to ſufficient Directions for the diſtinguiſhing between theſe Diſorders; which, from their Reſemblance to each other, moſt Surgeons and Phyſicians have confounded together.

See ÆGILOPS, ANCHILOPS, and EPIPHORA.

An Anchilops proceeds from various Cauſes; for an encyſted Tumor or Inflammation will produce this, as well as other Diſorders; but it generally ariſes from a Relaxation or Diſtention of the Sack; and a lachrymal Fiſtula is the uſual Concomitant of it, becauſe, as the purulent Matter cannot paſs to the Noſe, it weakens and diſtends the Sacculus. The principal Origin of an Ægilops is a previous Inflammation or Abſceſs; for theſe corrode the Skin, and lachrymal Ducts; whence ſometimes proceeds a Fiſtula: But there are many others; and the principal of theſe is, an Ulcer in the Sack, or adjacent Parts; for, as ſoon as the lachrymal Ducts are corroded, the corrupted Matter diſtils into the Sack (ſee *Fig.* 18.). If the inferior lachrymal Duct (Letters *d d*, *Fig.* 7, 8.) is by any means obſtructed, it often produces a Fiſtula; for it is ſcarce poſſible, but the inherent Pus will inſenſibly contract an Acrimony, which will relax, corrode, or at leaſt, exulcerate the Sack. This Diſorder is frequent in many, either after an Ophthalmy, or Inflammation of the Membrane of the Noſe, or theſe Ducts; or, as I have often ſeen, after the Small-pox. But ſometimes it ariſes ſpontaneouſly, without any ſenſible Cauſe.

There are various Kinds of a lachrymal Fiſtula: For, 1. It is Perfect, or Imperfect. Perfect, when the Skin is corroded, and Pus flows out of the lachrymal Bag, near the greater Angle of the Eye; Imperfect, when, the Skin being entire, it diſcharges itſelf only through the Puncta lachrymalia. The firſt Kind is viſible to the Eye (ſee *Tab.* XXXVII. *Fig.* 19. *a b*). 2. It is Simple or Compound, when attended with a Callus, or Caries. 3. New or Old. 4. Mild or Obſtinate. 5. It is either accompanied with an Obſtruction of the naſal Duct, or not. 6. It is Intermitting and Periodical, or Continual. *Garengeot*, by dividing it into the true and falſe Fiſtula, has made a ſeventh Species. The firſt, according to him, is, when the lachrymal Ducts themſelves are exulcerated; the other, when the Exulceration is in the adjacent Parts; which laſt we term an Ægilops. Some, as *Signorottus*, and *Platnerus*, are of Opinion, that a Callus is requiſite to conſtitute theſe Fiſtulæ, as it is with reſpect to all other Fiſtulas: That this is a Miſtake, not only the received Interpretation of the Word, but the Authority of *Celſus*, *Fallopius*, *Cardan*, and *Wolhouſe*, and Experience itſelf, evince. Beſides what *St. Yves*, a celebrated Oculiſt of *Paris*, aſſerts, that he ſeldom found a Callus, I myſelf have often ſeen inveterate Fiſtulæ without it. Further, ſome think there never was a lachrymal Fiſtula, without an Obſtruction of the naſal Duct, as that appears to them the Origin of this Diſorder. But their Error is manifeſt, not only from the Authors I have already quoted, but from daily Experience; for I have ſeen many Caſes, and know one at preſent, where the Sack, being preſs'd by the Fingers, has daily diſcharg'd Plenty of Pus through the Puncta lachrymalia, when the naſal Duct was entirely open, and it might have been expel'd through that Paſſage. Some ſay, this purulent Matter flows through one Punctum only, but are not agreed which it is; but, in reality, it paſſes through both: In ſome indeed, principally through the ſuperior, in others through the inferior Punctum.

So much for the lachrymal Fiſtula, and Method of diſtinguiſhing it from Diſorders which bear ſome Affinity to it: Let us now conſider the Symptoms. The Patient complains of a frequent dropping of Tears, and a purulent Matter, eſpecially in the Morning, is collected in his Eye, without any Inflammation: And, from a Preſſure of the Finger, the lachrymal Sack emits a Pus thro' the Puncta. And we may conclude there is a Caries, when this Pus is of a bad Smell, or unuſual Colour, as Green or Black; but ſtill more, when the Bone is bare to the Eye, as in open Fiſtulæ, or when it is found ſo by the Introduction of a Probe, for the Colour will deceive you greatly; and I have ſeen many Inſtances, where that has been good, yet, upon Examination with a Probe, I have found the Bone bare: But if the Diſorder is inveterate, and diſcharges daily Plenty of Matter, we may be certain there is a Caries, the Seat of which is different; for ſometimes the lachrymal Bone, ſometimes the Os Plenum, and ſometimes the Bone of the upper Jaw is corroded. We may know the naſal Duct is obſtructed, if none of the Matter, or injected Fluid, paſſes thro' the Noſe, but all flows out of the Puncta lachrymalia. Laſtly, An uncommon Hardneſs of the Parts denotes a Callus; though, as I before obſerv'd, this ſeldom attends a Fiſtula. If there is an encyſted Tumor, the exterior Parts ſwell with an Hardneſs, and will not yield to the Preſſure of the Fingers, but there is no Inflammation; but, if the Tumor yields upon Preſſure, there is a lachrymal Hernia. We know an Ægilops by this, that the Parts contiguous to the greater Angle are exulcerated, and have no Communication with the lachrymal Paſſages.

I met with an extraordinary Inſtance of a lachrymal Fiſtula in a Student, in the Year 1726. Though he had been afflicted with this Diſorder for eight Years, yet no Matter could be expreſſed by the Fingers. A perpetual Flux of Tears dropt down his Cheeks, and, whilſt he ſlept, his Eye was filled with a Pus, which, when any Liquid was injected into either of the Puncta lachrymalia, diſcharg'd itſelf out of the other. There was no Tumor of the lachrymal Sack; yet, upon making an Inciſion into the Skin, I found a Caries in the Os lachrymale.

Theſe Diſorders of the Eyes are generally of very bad Conſequence; for, as they are near the ſoft, ſpongy Bones, they produce violent Diſorders, and often a Caries. An Anchilops, or Ægilops, ſoon degenerate into a Fiſtula, which, from mild, grows obſtinate and dangerous, and even ſometimes cancerous; and, after a Corroſion of the Bones, it is ſeldom or never cured. Their Danger is increas'd by a bad Habit of Body, the Acrimony of the Matter, and an irregular Method of Diet and Living: On the contrary it is leſs, if the Patient is ſound, and the Diſtemper free from bad Accidents, eſpecially a Caries, Callus, and Obſtruction of the naſal Duct; for then it is curable, whatever ſome may ſay to the contrary, within a few Days; particularly, if you follow *Annell*'s Directions. A perfect Fiſtula is often attended with a Caries, and can ſcarcely be remedied, till that is extirpated, either by proper Medicines, Inciſion, or cauterizing the Bone. If a Callus ſupervenes, the Cure cannot be completed, till that is remov'd: Without any of theſe, you may expect a more happy Event. The more inveterate the Fiſtula, the more Difficulties you have to ſtruggle with; for here the Bones are generally corroded with a Caries, and after a Cure, without a thorough Extirpation of that, the Diſorder readily returns: Though, what is ſurpriſing, ſome Surgeons affirm, that Fiſtulæ, with a Caries and Callus, have been cured by Nature alone. Unleſs the obſtructed naſal Duct be open'd, and kept ſo, you cannot hope for a laſting Cure;

Cure; at leaſt, you muſt expect the Continuance of a weeping Eye, tho' you have judiciouſly cauterized the Caries and Callus. Moreover, the compreſſing Inſtruments of the Antients, tho' they were a long time in Uſe, had no other Effect, than to give unneceſſary Pain to the Patient; and, from a ſlight Diſorder, make one more conſiderable. Thoſe Moderns are not without their Merit, who, by the Inſtruction of *Annell*, ſince the Year 1712, have uſed Methods for the Cure of recent Fiſtulæ, or at leaſt, thoſe free from a Caries or Callus, without the Knife, Terebra, or Cautery; whereas formerly they knew no other Way of proceeding.

If any Tumor, or Anchilops, with an Inflammation, ariſes near the greater Angle, Reſolution muſt be immediately attempted, to prevent an Abſceſs or Fiſtula. Firſt, therefore, anoint the Tubercle with a ſoft Pledget, or your Finger, dipt in Spirit of Vitriol; but be careful not to touch the Eye. It is of great Service, to anoint the Parts with Honey of Roſes mixt with Spirit of Vitriol, to ſome degree of Sharpneſs, and upon this lay a Diachylum-plaiſter; nor is it leſs beneficial to apply often a Compreſs, moiſtened with warm camphorated Spirit of Wine, or a Poultice of roaſted or boiled Apples, mixt with Camphire, till a Reſolution enſues. If the Tumor is encyſted, treatit as an encyſted Tumor (ſee TUMOR): For, in that Manner, I extirpated a Tumor, which lay deep in the Orbit of a Girl, with my Inciſion-knife.

But, if the Inflammation tends rather to a Suppuration than Reſolution, promote that; for, by Delay, it may degenerate into a pernicious Fiſtula. This is done by the Application of a Diachylum-plaiſter with the Gums, or an emollient Cataplaſm. As ſoon as the Matter is come to Maturity, to prevent a Corroſion of the Sack, or adjacent Parts, the inferior Part of the Tubercle muſt be cut with a Lancet, or Inciſion-knife; and, when the *Pus* is expreſs'd, cleanſe the Abſceſs thoroughly with Oil of Bricks, a digeſtive Ointment, or Honey of Roſes, mix'd with Myrrh, and a proper Proportion of *Egyptian* Ointment, or red Precipitate; then heal the Ulcer with ſome proper Balſam, as in other Abſceſſes. But, if the Abſceſs breaks ſpontaneouſly, as I have often ſeen it, and the Aperture is ſo narrow, that it cannot be cleans'd, enlarge it by Inciſion, by introducing a Sponge, or a Piece of Gentian-root; and, after this, cleanſe and heal it, as we directed before. If there is a Caries, apply Lint, moiſten'd with ſome Drops of Spirit of Sulphur, or Vitriol; or, inſtead of this, with Powder or Eſſence of Euphorbium; then lay on Compreſſes, moiſten'd with cooling Liquids, or Lime-water; and, when the Caries is remov'd, the Wound will be fit for healing: Sometimes the Caries may be taken off with a Rugine (ſee *Tab.* XXVIII. *Fig.* 3, 4, 5. or *Tab.* XXXIX. *Fig.* 9.). Some prefer the Uſe of the Cautery, guarded in a proper Canula, as that (*Tab.* XXXVII. *Fig.* 21, 22.), or one of the like Kind; and afterwards they apply balſamic Medicines, to heal the Wound.

The Manner of curing the true Fiſtula lachrymalis (when the Ulcer is in the lachrymal Paſſages) varies according to the Nature, Degrees, and other bad Accidents, of the Diſorder. For, when it is recent, when there is a good Habit of Body, the external Skin not yet corroded, and the naſal Duct ſtill open, laſtly, when the Matter is of a good Colour, and due Conſiſtence, forbear Inciſion, and the Application of the Cautery, as this may be cur'd without any chirurgical Operation, by frequently preſſing the Matter out of the lachrymal Sack, with your Fingers, which will prevent it from contracting any Acrimony, and corroding the adjacent Parts. You muſt, at the ſame time, uſe the reſolvent and cleanſing Medicines preſcrib'd for the weeping Eye, under the Article *Epiphora*; not neglecting, according to the Patient's Habit of Body, Purging, Bleeding, Scarification, Veſicatory, and other Medicines, as the Caſe ſhall require, and a regular Method of living and Diet.

DIONIS, in his Book of Surgery, mentions ſeveral Cures of recent Fiſtulæ lachrymales, particularly in Infants, which he himſelf had perform'd by a proper Compreſſion. His Method was this: 1. He laid a little Plaiſter of burnt Ceruſe upon the Tubercle of the Fiſtula. 2. A ſmall triangular Compreſs, an Inch thick, (or, inſtead of that, ſeveral thin ones) to fill the Angle exactly near the Eye. 3. Another ſuch Compreſs, but ſomething larger; having firſt moiſten'd them with Lime-water, or Spirit of Wine, or ſome other drying Liquor. Laſtly, he faſten'd them on with a circular Bandage, ſo firmly, that he prevented any Collection of the vitiated Humour from being form'd within, and reſtor'd the relax'd Sack to its former Shape and Strength. DIONIS orders this to be continued for many Months, if you would complete the Cure. But, inſtead of his Bandage, others have us'd proper compreſſing Inſtruments; ſome of which are recommended by *Aquapendente*, *Scultetus*, *Palfyn*, and *Heiſter* (ſee *Tab.* XXXVII. *Fig.* 20.) and others by other Surgeons: Though all theſe Ways of Compreſſing are in vain, if the lachrymal Duct is ſtopp'd; for it can never be of any Service, but when the Abſceſs is near the lachrymal Sack, (as in *Tab.* XXXVII. *Fig.* 18.) or, at leaſt, when the lachrymal Duct is yet pervious.

But, ſince this laſt Method will not cure an inveterate Fiſtula in a Patient who has been long afflicted with it, or is of a bad Habit of Body, the Surgeons, before *Annell*, were of Opinion, and ſtill are, that the Tubercle ſhould be open'd, between the greater Canthus and the Noſe, either with ſome corroſive Medicine, or, rather, a Lancet, or Inciſion-knife; in which Operation they adviſe the utmoſt Care, leſt the Ducts proceeding from the Puncta lachrymalia to the Sack, or the Ligaments, reſtraining the Eyelids, ſhould be cut, and the Eye greatly deform'd. Some direct an oblique Inciſion, as *Fig.* 9. *Tab.* XXXVII. from *d* to *e* or *c*, or *Fig.* 10. from B to A, with a ſtraight Inciſion-knife; others, with a crooked one; which, to me, ſeems indifferent, as I have uſed both ſucceſsfully. This Inciſion muſt reach the Cavity of the lachrymal Sack, which muſt be dilated, in the Direction above-mention'd, upwards and downwards, with the Knife, from the Top of the lachrymal Sack to the bony Canals. The Cavity muſt then be fill'd with Lint, laying Compreſſes over it, and faſtening all with a Bandage. Others would have the Inciſion ſemicircular, with the concave Part tending to the Eye, and the convex to the Noſe, beginning at the lower Part of the Apophyſis of the Os Frontis, call'd the naſal Apophyſis, where it touches the maxillary and lachrymal Bone, (a Part well known in the Head of a Skeleton) proceeding in the Form of an Arch, according to the Direction of the naſal Apophyſis of the maxillary Bone to that Part, where it almoſt touches the interior Apophyſis of the Os jugale (ſee *Tab.* XXXVII. *Fig.* 19. the prick'd Line *c b*). When this Inciſion is ſufficiently enlarg'd, they fill it with Lint, and bind it up, leaving it till next Day, that it may be well dilated; then examine, not only whether there is a Caries, but how, and where, they may beſt perforate it. If there is too large an Hæmorrhage, they apply Lint, dipt in ſtrong Spirit of Wine, and then a Compreſs, and faſten them on tight with a Bandage. Then they deterge it with Eſſence of Amber, Oil of Bricks, or other Medicines of the ſame Kind, as directed above, in caſe of an Ægilops. When it is thus cleans'd, they apply vulnerary Balſams, and drying Plaiſters, with thick triangular Compreſſes, and Bandage, as mention'd above, and heal the Wound gradually. Some uſe the compreſſing Inſtruments before-mention'd, with a Plaiſter, and ſmall Compreſs; and then heal the Wound, though very ſeldom with Succeſs, as the naſal Duct is generally obſtructed.

The antient Method of curing a callous Fiſtula was, after having open'd the Ulcer, firſt, to extirpate the Callus, with Trochiſci de Minio, red Precipitate, *Egyptian* Ointment, or the Lapis Infernalis; then to treat it as before directed. If it was carious, they apply'd Powder of Euphorbium, with Lint dipt in Spirit of Sulphur, or of Vitriol. As this was ſeldom effectual, they remov'd the Caries with the Kniſe, as we obſerv'd above, or with a Cautery, which they repeated, as often as was requiſite. The Shape of the Inſtruments was varied, as the Surgeon pleas'd. Some were without a Tube (as in *Tab.* XXIV. *Fig.* 14. and 16.). Others, to prevent burning the Skin, had a ſmall Tube, which was introduced into the Ulcer as far as the Bone, and then through that they paſs'd the Cautery; ſuch a one I have copied from PLATNERUS (*Tab.* XXXVII. *Fig.* 21. and 22.). Then they reſolv'd the Eſchar, rais'd by the Cautery, by the Application of a digeſtive Ointment; and proceeded to heal the Ulcer by the Application of vulnerary Balſams, in the Method already laid down. It is not only proper in this Operation to bind up the ſound Eye, that the Sight of the Cautery may not terrify the Patient, but likewiſe to cover the affected Eye with an Inſtrument of a ſpiral Form, (ſee *Tab.* XXXVII. *Fig.* 23.) that it may not be touch'd. Obſerve always to dry the injur'd Bone thoroughly with Lint, before you apply the Cautery; otherwiſe it will be extinguiſh'd too ſoon. But none of theſe are effectual, when the naſal Duct is obſtructed; for, unleſs the Bone is perforated accidentally, or deſignedly, to the Noſtrils, and a new Paſſage open'd for the Pus, it is ſo far from dropping into the Noſe, that the Diſorder returns, or, at leaſt, a weeping Eye remains. If this is the Caſe, which the antient Writers do not deny, it is manifeſt, in my Opinion, that the above-mention'd Methods of Cure are principally ſerviceable, when there is only a Suppuration on the Outſide of the Saccus Lachrymalis, or when the naſal Duct is pervious. Diſtinguiſh therefore, carefully, between theſe Fiſtulæ, and thoſe wherein the naſal Duct is obſtructed.

To ſupply this Defect in Surgery, ſome took another Method: They open'd the Saccus lachrymalis, and, next Day, perforated the Os Unguis, with a ſharp Inſtrument, (ſee *Tab.* XXXVII. *Fig.* 24. or *Tab.* XXVIII. *Fig.* 7. A; or *Tab.* XLV. *Fig.* 2. B) obliquely, between the ſuperior and inferior Os Spongioſum, even to the Noſe; then they put a Tent into the Aperture, form'd a new lachrymal Duct by Tents, and a frequent Introduction of Probes into the Noſe. When this was form'd, they heal'd the external Wound. Others forbore the Uſe of Cauteries, but perforated the Bone with the Inſtruments already mention'd, or a ſulcated Probe: Thus they remov'd the Caries, and open'd a new lachrymal Paſſage into the

the Noſe by the ſame Operation. Again, others, having laid a Tube (*Tab.* XXXVII. *Fig.* 22.) on the Os lachrymale, apply the Cautery (*Fig.* 21.) in ſuch a manner, as to perforate the Bone to the Noſe; then proceed as we have already directed. Though all theſe Methods are very troubleſome, and ſubject the Patient to a weeping Eye, yet, for want of better, the moſt experienc'd Moderns have been oblig'd to follow them. *St. Yves* himſelf, the celebrated Oculiſt at *Paris*, as appears from his Treatiſe on the Diſorders of the Eye, as well as ſeveral others, purſu'd this Method.

Since Perſons of Diſtinction are not eaſily induc'd to undergo this Operation, on account of the Pain of Inciſion, Terebration, and Cauterizing; and are likewiſe deter'd by the Danger of an unſeemly Cicatrix, and unſucceſsful Cure, eſpecially under the Hands of an ignorant Surgeon; the moſt ingenious *Annell* thought it worth while to invent a new, ſafer, and more tender Method, for curing the moſt Serene Duke of *Savoy*, in the Year 1712. which he perform'd with ſo much Succeſs, that not only a new, but ſometimes an inveterate Fiſtula lachrymalis, where there was neither Callus nor Caries, has been often cur'd without the Knife, Cautery, or the troubleſome Bandage, before us'd. I ſhall, therefore, now give a very exact Account of his Proceſs.

He made a peculiar thin crooked Probe, of Silver Wire (ſee *Tab.* XXXVII. *Fig.* 11, 12, 13.): Then plac'd the Patient on a Seat oppoſite to the Light, in the moſt commodious manner; and, elevating the upper Eyelid ſufficiently with one Hand, he introduc'd the Probe with the other, in the tendereſt manner, through the upper Punctum lachrymale, (which ought to be well known to a Surgeon) into the Saccus. For the more ready and eaſy Performance of this, the Operator ſhould be well acquainted with the Figure and Situation of the Parts. Then, with the ſame Care, he directs the Probe to the Noſe; after this, he elevates the Handle a little; and, by a gentle Motion, dexterouſly forces the other End, inherent in the Saccus Lachrymalis, down into the Noſe, and opens the naſal Duct. But it is far more eaſily open'd, when it is obſtructed only by Matter, than when it is grown together, as is very common in inveterate Fiſtulæ. For, in the laſt Caſe, the Violence muſt be ſo great, that the Patient feels an acute, though not an intolerable Pain, and the Noſe bleeds. To prevent a ſecond Obſtruction in the lachrymal Duct, he injected a Liquid, with a Syringe, not only Morning and Evening, but more frequently, if Occaſion requir'd; and repeated it, till no more Pus return'd through the Puncta lachrymalia; whence he concluded the Ulcer to be healed, and the naſal Duct reſtor'd to its former Integrity.

Garengeot was unacquainted with the real Uſe of theſe Probes; for he thought they did not open the naſal Duct, but only ſerv'd for ſearching the Saccus lachrymalis.

The Injection ſhould be made with the little Syringe of *Annell*, (ſee *Tab.* XXXVII. *Fig.* 14.) or one like it; for the anterior Part, or ſmall Tube, of it A, about the Thickneſs of an Hog's Briſtle, is paſs'd into the Punctum lachrymale of the lower Eyelid, as leſs moveable; and the contain'd cleanſing and healing Collyrium (ſee EPIPHORA) is to be injected into the Saccus Lacrhymalis. By frequent Repetitions of this, the Pus is diſcharg'd, and the new lachrymal Duct kept open. For the more commodious Performance of this, let the Patient be plac'd in a Seat oppoſite to the Light, with his Head erect, or a little reclin'd; and, if the Right Eye be diſorder'd, let the Surgeon ſtand on the Right Side; and, when he has fill'd his Syringe with a proper Liquor, thoſe, for Example, mention'd under the Article EPIPHORA, lay the Ring-finger of his Left Hand on the inferior Eyelid, immediately under the lower Punctum lachrymale, near the Saccus. By this Method, he brings down the Eyelid; which will not only render the Punctum more conſpicuous, but make the Introduction of the Syringe more convenient. This Finger, likewiſe, will keep his Hand ſteady. After this, he takes the Syringe, at the poſterior Part C, in the middle and fore Finger of his Right Hand; then he puts the inferior Part D between the ſame Fingers of his Left Hand, which are already under the Patient's Eye, *and holds them faſt*. Then the extreme Part A is carefully introduc'd into the inferior Punctum lachrymale, the Head of the Piſtil B being preſs'd by the Right Thumb; and thus the Liquor is forc'd through the Punctum into the Sack, naſal Duct, and Noſe. But it muſt be confeſs'd, all this may be made more intelligible by ſeeing the Operation, than by any Deſcription. We muſt obſerve, that whatever Liquor is injected into the inferior Punctum lachrymale, immediately returns, either by the ſuperior, or flows through the naſal Duct into the Noſe, and the very Fauces. If the Left Eye is to undergo the Operation, let the Surgeon ſtand on the Left Side, and proceed according to the former Directions. I have, ſometimes, by way of Variety, injected into the ſuperior Punctum: In order to this, I plac'd the Ring-finger of my Left Hand above it, and pull'd the ſuperior Eyelid upwards, till I plainly ſaw it; then introduc'd my Syringe, and injected the Liquor with the ſame Facility as the other Way. Here Dexterity, and Quickneſs of Sight, is very requiſite. However, the firſt Method is the moſt convenient.

This muſt be repeated daily, till (1.) The Injection penetrates into the Noſe voluntarily, without the Help of the Probe. (2.) Till no purulent Matter proceeds from the greater Canthus, either voluntarily, or after Compreſſion with the Fingers. Then you may conclude your Operation has been ſucceſsful. And this happens ſooner in ſome than others; for, ſometimes, the Cure is perfected in four, eight, fourteen, or twenty Days; ſometimes it requires a longer Time; though no Fiſtula is ſo obſtinate, but that this Method will extirpate it, provided there is no Caries or Callus. I have myſelf, indeed, often cur'd theſe Fiſtulæ in three or four Days, by this Proceſs; and, from a ſingular Experiment, found, that a ſlight Caries may be remov'd by it. I remember, in the Year 1727. I freed a Girl of eleven Years old, by continuing this Injection daily about ſix Months, of an inveterate Fiſtula, and ſlight Caries, who is now married, and perfectly well.

I muſt confeſs, that this Method, invented by Mr. *Annell*, as here deſcrib'd by *Heiſter*, appears perfectly rational, and well calculated to anſwer the End propos'd: And *Heiſter*, no inconſiderable Practitioner, affirms, that, with him, it has ſucceeded beyond all others. Mr. *Sharp*, however, a competent Judge of chirurgical Operations, ſeems to diſapprove it, for Reaſons not drawn from his own Experience, as it appears; which renders them the leſs valid. This Author informs us, that, "Some "Years ſince, Monſieur *Annell*, a *French* Surgeon, recom- "mended, in the recent Fiſtula, to paſs a ſmall Probe through "one of the Puncta lachrymalia, into the Saccus and Noſe, in "order to break the Concretions which are ſuppos'd to make "the Obſtruction; and, with the ſmall Pipe and Syringe, to "throw an Injection through the other, in order to waſh them "away. This Method was, at firſt, receiv'd with great Ap- "plauſe; and ſtill continues to be practis'd by ſome very emi- "nent Surgeons: Yet, by what I have been able to learn from "the Experiments of others, and the Reaſon of the Thing, I "am, by no means, inclin'd to think favourably of the In- "vention; for, as the very Characteriſtic of this State of the "Fiſtula is the Reflux of the Tears from the Saccus, the "Chanels leading to it from the Puncta lachrymalia muſt be "ſuppos'd clear; and, as to the Obſtruction in the naſal Duct, "an Injection, thrown with ſo little Force, can hardly be "imagin'd ſufficient to remove it; and ſtill leſs, if it be true, "that the Obſtruction is not owing to any looſe Subſtance "clogging up the Paſſage, but to an Inflammation of the "Membranes.

"If, then the Injection cannot aſſiſt, by the Force of its "Stream, the Advantage muſt ariſe from its balſamic Quali- "ties. But no Surgeon, at this time, dilates an Abſceſs of "any Kind by Injections, when the Pus is good-condition'd, "and he can, by Compreſs, diminiſh the Cavity of it, as "may be done in this very Caſe, and which ſhould be pra- "ctis'd before any other Method is undertaken. Indeed *An-* "*nell*, and his Followers, after the Injection, applied a Com- "preſs and Bandage, to the good Effects of which, rather "than any of the other Proceſſes, I am inclin'd to think their "Succeſs was owing."

After comparing the Reaſons here given, with the Sentiments of *Heiſter*, given above, and what is farther ſaid below, relative to this Method, the Reader will readily diſtinguiſh when it is likely to ſucceed, and when not; and may judge for himſelf, which of the two Authors above-quoted is in the right.

When a Fiſtula lachrymalis is perfect, that is, when the external Skin is corroded, the obſtructed lachrymal Duct may be more eaſily open'd; and, in this Caſe, it is better to paſs the *Annellian* Probe through the external Fiſtula, directed downwards, through the naſal Duct, than through the Punctum lachrymale; and this with the thick End *b* (*Fig.* 12.). Sometimes I have even open'd the naſal Duct effectually with the Probe K (*Tab.* 22.). For cleanſing the Ulcer, proceed according to the former Directions; except, that a Leaden or Wax Tent is more commodious than a Linen one; and the naſal Duct muſt be carefully touch'd every other Day with the Lapis Infernalis, in the Shape of an inverted Cone, till its Sides are ſufficiently harden'd, and render'd fit for healing; but, when the external Aperture of the Ulcer is united, you muſt continue the Injection for keeping the naſal Duct open ſome time. *Garengeot*, in his Book *de Operat. Chirurg.* tells us, that *Petit* us'd a thick wax'd Thread inſtead of a Tent, and that it prov'd effectual. When the Os Unguis, in theſe Caſes, is corrupted, the Aperture of the Ulcer muſt be dilated, the Caries taken off, or the Bone perforated.

In a Fiſtula not attended with an Obſtruction of the naſal Duct, frequent Expurgation of the Matter by a proper Injection is more ſerviceable than the Introduction of the Silver Probe. When, likewiſe, the Saccus lachrymalis is too lax, apply ſtrengthening Medicines, or compreſſing Inſtruments (ſee *Tab.* XXXVII. *Fig.* 20.), or others, delineated by *Fabricius*

ab Aquapendente, *Scultetus*, *Palfyn*, and others, which, by degrees, reſtore it to its former Vigour.

It is a great Miſtake to imagine the *Annellian* Method infallible in every Fiſtula; for when it is accompanied with a very hard Callus, or inveterate and large Caries, all his Injections are of no Service; nor have we yet diſcover'd Medicines that will anſwer this Purpoſe. It, likewiſe, frequently happens, that the naſal Duct can neither be kept open, nor a continued Increaſe of the Pus be prevented, or that the *Annellian* Injection cannot be tranſmitted to the Noſe, though it is pervious to the Probe. I have ſeen ſeveral Inſtances of this, though I could never conceive the true Reaſon. If, therefore, any thing of this Kind happens, and the Patient has, notwithſtanding, an Inclination to be cur'd, our only remaining Hope is in the Uſe of the moſt effectual Methods propos'd above, for making a new Paſſage to the Noſe, and extirpating the Callus and Caries; or in the new one we ſhall preſently deſcribe. Some are of Opinion, that the Caries ſometimes penetrates ſo deep into the Oſſa ſpongioſa of the Noſe, that it can neither be remov'd by Medicine nor Cautery: But this I never found. And, indeed, it may be ſo far mitigated, that, by forming a new naſal Duct, in the manner already mention'd, the Matter may be brought to the Noſe, which before diſcharg'd itſelf at the Eye, with inexpreſſible Agony to the Patient; eſpecially if proper Injections are continued for ſome time after.

The celebrated *Brunner*, Phyſician to the Elector Palatine, aſſur'd me once, by Letter, that he had cur'd a very bad Fiſtula lachrymalis by a Mercurial Injection.

We have already ſaid, that in an imperfect Fiſtula, that is, when it is conceal'd under the Skin, the external Skin ſhould be cut through, before we perforate the Os Unguis. To render this Operation more expeditious, and leſs troubleſome, a Surgeon of *Hamburgh* invented a peculiar Inſtrument, (ſee *Tab.* XXXVII. *Fig.* 24.) which, at the ſame time, would perforate the external Skin, the Saccus, and Os Unguis; after which he took care to form the new naſal Duct by the Introduction of a Tent, as before directed, and heal'd the external Wound. Since that time, as this new Duct has been often found to coaleſce, ſome, after the Method of *Wolhouſe*, inſtead of the Tent, have paſs'd a Leaden, Gold, or Silver Tube (ſee *Tab.* XXXVII. *Fig.* 25.) thoough the Os Unguis, into the Noſe, and, after uniting the external Wound, left it there, to prevent a ſecond Obſtruction: This I have done often, with the deſir'd Succeſs, though I us'd a Tube ſomewhat larger, (*Fig.* 26.) that the Paſſage might be wider, and then heal'd the Ulcer.

The Royal Academy of Sciences at *Paris*, in the Year 1729. publiſh'd another Method. The Inventor *Lamorier*, according to the old Practice, made an Inciſion into the Saccus lachrymalis with a Knife; then introduc'd a peculiar Forceps, with a ſharp crooked Beak (ſee *Tab.* XXXVII. *Fig.* 29. A); and with this perforated the Os lachrymale to the Cavity of the Noſe. Next, that this Paſſage might be large enough, (which is abſolutely neceſſary, to prevent a Coalition) he dilated his Forceps a little (ſee *Fig.* 30.) and with that lacerated the Os lachrymale, and internal Membrane of the Noſe. Having remov'd the Forceps, he dreſſes up the Wound with Lint, and a digeſtive Ointment; on the third or fourth Day, inſtead of the Tent, he introduc'd into this Duct a ſmall crooked wax Candle, of the Thickneſs of a Straw at leaſt, and with a little Head, (ſee *Fig.* 31. A B) which he order'd to be kept there for thirty-five or forty Days, till the Duct is completely form'd; then he extracts it, and heals the Wound.

Jo. Caſp. Schobinger, of *Saintgall* in *Switzerland*, in his Diſſertation *de Fiſtula lachrymali*, *Baſil. An.* 1730. deſcribes *St. Yves*'s Method. It is this: After the Patient is ſeated, the Skin about the greater Angle of the Eye is gently extended, as in opening a Vein; and that, with the Saccus lachrymalis, is cut into obliquely with a Lancet, from the Eyelids towards the Tendon of the orbicular Muſcle *, and, by introducing a Piece of *prepar'd* Sponge, which is to continue all Night, the Wound is dilated; and is then cover'd with a proper Plaiſter. Next Day, upon the Removal of the Dreſſing, the State of the Wound and ſubjacent Os Unguis is examin'd into, by an Injection, or Probe, and an Inquiry made, whether the Bone is carious. After this, the Surgeon ſupports the Patient's Head with one Hand, and with the other carefully and obliquely perforates the Os Unguis, towards the Noſe, with a ſtrong Probe, or Trocar (a Needle, or Spike rather, with a triangular Point). He muſt know exactly the Situation of the Os Unguis, leſt he ſhould perforate the Os Planum inſtead of it, or enter into the naſal Apophyſis of the maxillary Bone, or the Sinus thereof: Further, let him be careful, that his Inſtrument is directed ſo obliquely, that, having perforated the Os Unguis, it may paſs into the Middle of the Noſe, between each Lamina of the Oſſa ſpongioſa. Then he orders the Patient to inſpire (or rather expire) through his Noſtrils, that he may know, from the Breath and Blood coming through the Wound, whether the Perforation has been properly conducted. When he finds his Proceſs ſo far right, he endeavours to keep it thus, and dilates it a little by the Introduction of a ſmall wooden Wedge into the Wound; then lays upon that a Plaiſter; he continues the Dilatation for ſome Days, with Tents of wax'd Linen; theſe he changes every third Day, and, by degrees, applies thicker (though the thickeſt does not exceed the Size of a Quill); then he gradually returns to his originally thin ones. By the Help of theſe, he affirms, that the corrupted Bone, without the Uſe of a Cautery, ſpontaneouſly ſeparates, and a new Paſſage is procur'd from the Saccus lachrymalis to the Noſe. If there appear any Splinters and Aſperities during the Cure, they muſt be taken away. If there is a Sinus, it is to be open'd with the Sciſſars; and Ulcers of the Membrana Schneideriana, and Saccus lachrymalis, are remedied towards the End of the Cure, by a repeated Application of the Lapis Infernalis. At every Dreſſing, whilſt the Noſtrils are ſtopt, let the Patient reſpire thro' this new Paſſage, that he may expel the Pus, which, perhaps, may be collected and ſtagnate there; and the Surgeon is to introduce a freſh Tent, firſt dipt in Oil †, and on that lay a Plaiſter. When the Sides of the Duct are ſufficiently confirm'd and conſolidated, the Tent is omitted, and the Wound heal'd by a Plaiſter only, which, as he ſays, is generally completed within ſix or eight Weeks. "Repeated proper Injections, towards the Concluſion, or after the Cure," (I ſuppoſe he means thro' the Punctum lachrymale) "if they penetrate "the Noſe, will ſhew whether the Operation has had its "deſir'd Effect."

I muſt here obſerve, that *Schobinger* ſays, *Annell*'s Method of curing a Fiſtula by Injections is grown obſolete, and almoſt forgotten, becauſe it requires the utmoſt Induſtry and Dexterity. I agree with him, that it is buried in Oblivion among thoſe, who are incapable of performing it; but, for my own Part, I have often uſed it, and found no Difficulty in the Operation; but, from the Deſcription *Schobinger* gives, it is probable he had ſome Difficulties to ſtruggle with, from his Ignorance of the proper Manner of proceeding.

Garengeot, likewiſe, in his *Operat. Chirurg.* paſſes it by in Silence, as of no Conſequence; and, in his Treatiſe of *Chirurgical Inſtruments*, ſpeaks of it with ſo much Indifference, that it is manifeſt he never try'd it: And the Probe he there repreſents for this Uſe, is made ſo ſlender, weak, and, in conſequence thereof, ſo ill towards the ſuperior Extremity, that it can never perforate the obſtructed naſal Duct; and he has repreſented the Extremity of the Tube of the Syringe ſo ſmall and ſlender, that it would rather prick like a Needle, if applied to the Eyelids. Laſtly, he recommends a *Speculum Oculi*, in uſing theſe Injections, contrary to *Annell*'s and my Deſcription; and has exhibited two for this Purpoſe, which rather impede than aſſiſt the Operator, the Whole being better performed by the ſole Application of the Fingers, as I have already ſaid, than by the *Specula*; and this I am convinced of by numberleſs Experiments. *Garengeot*, alſo, affirms, that the Probe cannot paſs into the naſal Duct, becauſe the Paſſage is too much winding; but it is a ſufficient Anſwer to this, that the Probe has actually, in a great many Inſtances, paſs'd the naſal Duct, and ſtill is found by Experience to do ſo; tho', perhaps, a Perſon not furniſh'd with a ſufficient Degree of Practice, or Knowledge of the Part, or who is unattentive to the true Method of performing this Operation, might meet with ſome Difficulty. As a further Proof, that this Method is not only poſſible, but very eaſy, I have practiſed it upwards of twenty Years with Succeſs, upon many of my Patients, only from having read it, without once ſeeing it put in Execution; and ſeveral Surgeons have come from remote Places, as *Hamburg*, for Example, to me at *Helmſtadt*, to ſee and learn this Operation, which they before, having frequently attempted in vain, thought impoſſible; and then, after I had ſhewn them the Method of performing it often, they could readily imitate it. I once attended a Student of Divinity, who, when I had for ſome time every Day, and oftener, introduced this Probe through the *Punctum lachrymale*, and obſtructed naſal Duct, into his Noſe, with very little Pain, himſelf attempted it before a Looking-glaſs, and ſucceeded; and he ſoon did it, by a dextrous Motion of the Probe, in the Sight of many Students, more readily than I could; ſo that, when you would think the Probe ſcarce touched the *Punctum lachrymale*, it had enter'd the *Saccus*, and naſal Duct; and he would leave it for Hours, without any Inconvenience, in the lachrymal Paſſages and Noſe, to keep it open. I have been the more prolix in this Account,

* Here *Heiſter* remarks, that the Deſcription ſeems obſcure; for, when he ſays, From the Eyelids, we are certainly told in which Eyelid the Inciſion ſhould be begun; but, in my Opinion, he means the inferior.

† All other Surgeons declare againſt the Uſe of Oils in any Diſorder of the Bones, as prejudicial: I am ſurpriſed, therefore, that he ſhould recommend them for an Injury of the ſofteſt; nor does he tell us what Oil we may ſecurely apply. I think it, therefore ſafer to dip the Tent into Spirit of Wine, or rather ſome vulnerary Eſſence.

both to refute the Impoſſibility, and evince, that *Garengeot* was not only unacquainted with this Operation, but an entire Stranger to the true Uſe of this Probe, when he ſays, it is of Service only to diſcover the *Saccus lachrymalis*; whereas the principal Deſign of it was, to open the obſtructed naſal Duct, both in a weeping Eye, and a *Fiſtula lachrymalis*; and, in theſe Diſorders, it ſeldom fails. Laſtly, he makes no mention of the Inventor *Annell*; for what Reaſons, let others determine.

The different Methods us'd by different Surgeons for the Cure of this Diſorder are remarkable; nor do they vary ſo much in their Treatment of any other Caſe whatever.

It now remains, that I ſhould briefly explain my own Method: I begin, then, with the gentle one of *Annell*, eſpecially in recent Fiſtulas; and purſue it for ſeveral Days or Weeks, according to the Nature of the Diſorder, particularly when I find it diminiſh. When this is not effectual, I have recourſe to the Knife, and, carefully covering both Eyes, make an oblique Inciſion thro' the external Skin into the Saccus lachrymalis, in ſuch a manner, that I may next Day, without any Impediment from the Blood, perforate the Os Unguis to the Noſe ſufficiently with the Inſtrument (*Tab.* XXXVII. *Fig.* 24. or *Tab.* XLV. *Fig.* 2.) and this, for Reaſons already aſſigned, with the utmoſt Caution; then, after waſhing the Wound with warm Wine, I inſert firſt a Tent dipt in balſamic Medicines; and, after the ſecond or third Day, a Wax-candle, or leaden Tent ſomewhat larger, to fill up the new Paſſage, about the Thickneſs of the Inſtrument (*Fig.* 21. A. *Tab.* XXXVII.). This I continue, till the Canal is confirm'd; for the more ſpeedy Promotion of which, I touch the Lips every other Day, after extracting the Tent with the Lapis Infernalis: This I do for three Weeks or a Month, and longer, if it is requiſite; then I heal the Wound, if the Duct is large enough, without the Inſertion of a Tube; and, if I do leave one in, it is either of Lead or of Gold, and ſhort, (ſee *Tab.* XXXVII. *Fig.* 25.) ſuch as *Platnerus* has delineated; but, as I have found theſe too ſmall to admit the viſcid Humour, I generally uſe a larger, as in *Fig.* 26. in ſuch a manner, that after applying a balſamic Medicine, and Plaiſter, the Saccus lachrymalis, and external Skin, may be properly healed. That this Cure may ſucceed the better, the Day after the Wound is cloſed, I inject a Decoction of Veronica, with *Annell*'s Syringe, through the Punctum lachrymale; and this I repeat for ſome time every Day, to point out a Paſſage for the Tears through that Tube. Tho' theſe Tubes are generally large enough to admit the Matter into the Noſe, yet it muſt be confeſs'd, that in conſiderable Fiſtulas, eſpecially when they are narrow, they do not fully anſwer the End, but ſometimes leave ſome Inconvenience behind, and, principally, a weeping Eye: However, I never uſed the Cautery to theſe, and think it rarely neceſſary; though it is ſo * often recommended by ſo many Writers: But I prefer the making a new Canal, with the Inſtruments already mentioned, large enough to prevent a ſecond Obſtruction; for this will extirpate a Caries of the Os Unguis, without a Cautery. Hence it is manifeſt, that, when the Tube is too narrow, the Cure can never be complete.

Laſtly, it may not be improper to add here ſome Cautions: And, firſt, in the Beginning, where an Inciſion is neceſſary, I think Purging proper, and Bleeding, if the Patient is too full of Blood; which ſhould be repeated, after the Cure when there is an Inflammation, which, however, ſeldom happens. 2. If there is an ill Habit of Body, I preſcribe purifying Medicines, as a Decoction of the Woods, with a proper Purge. 3. If there is any other Diſtemper, it ſhould be cured by proper Methods. 4. I perform this Operation, whilſt the Patient is ſtanding; *Platnerus* ſitting, as for a Cataract. 5. He orders, that in this Inciſion the Perioſteum be ſeparated from the Bone; and the Saccus lachrymalis, by a tranſverſe Inciſion, from the Os Unguis: But, as I cannot ſee any Reaſon for this, I never did it, and yet have ſucceeded: For what can be done by one Operation, does not require more. 6. For a Hernia of the Saccus lachrymalis, when the naſal Duct is open, *Platnerus* adviſes to make an Inciſion into it with a Knife; and afterwards to heal it with Balſam of Meccha, which will ſtrengthen it by a Cicatrix. I have done the ſame thing in the like Caſe; but, for ſome time after the Inciſion, I touch'd the Lips of the Wound every Day with Lapis Infernalis, and then heal'd it, ſtrengthening the Saccus lachrymalis afterwards by injecting a Decoction of Veronica, with a little Spirit of Wine. 7. When the Os Unguis is carious, I only perforate that with a Cautery, as the Antients directed; *Platnerus* ſays, it ought to be cauterized often to the very Noſe; but, as he gives no Reaſon for this cruel Method, and the Cure may be completed without it, I prefer the milder Way. 8. *Garengeot*, in an Inciſion of theſe Fiſtulas, will have the leſs oblique Muſcle of the Eye cut out, if it appears to be depriv'd of its Fat; but, as he too does not back his Opinion with any Reaſons, I muſt diſſent from him, as it may prove prejudicial to the Eye. 9. *Garengeot* alſo denies, that, by perforating the Bone, you can preſerve a new Paſſage to the Noſe; and, conſequently, that after the Operation, the Tears cannot paſs thither: And, he further aſſerts, that the Puncta lachrymalia become uſeleſs; but this contradicts the Experience of the beſt Surgeons, and is a manifeſt Indication, that he is not converſant in the Diſorders of the Eye. For which Reaſon, he has taken no notice of the Methods propos'd by *St. Ives*, *Wolhouſe*, and *Lamorier*.

FISTULARIS. Fiſtular, in Botany, is an Epithet for Flowers, which are compounded of many long, hollow, ſmall Florets, like Pipes.

FISTULARIA. A Name for the *Pedicularis*; *pratenſis*; *purpurea*.

FIXA. Fix'd Subſtances; that is, ſuch as do not aſcend, and fly off, when expos'd to a conſiderable Heat.

FIXATIO, Fixation, is the rendering any volatile Subſtance fix'd, ſo as not to fly off, upon being expos'd to an intenſe Degree of Heat.

FLABELLUM *Marinum*. A Name for the *Keratophyton*; *maximum*; *cinereum*; *elegantiſſime reticulatum*. It is thus call'd on account of its Reſemblance to a Fan, *Flabellum*.

FLAGELLATIO. Flagellation. For the Effect of this on the muſcular Parts, ſee FIBRA.

FLAMMULA *Jovis*. A Name for the *Clematitis*; *ſive Flammula*; *ſurrecta*; *alba*.

FLAMMULA is, alſo, a Name for ſeveral Species of the RANUNCULUS.

FLATUARII. Chymiſts.

FLATUS. Flatulencies; that is, Air contain'd in any Cavity of the Body, and rarefy'd by the Heat of the Part: Hence Diſtentions, uneaſy Senſations, and, frequently, Pain.

FLAVII *Clementis Medicamentum*. The Name of a Medicine for the Gout, deſcrib'd by *Actuarius*, *Meth. Med. L.* 6. *C.* 8.

FLEMEN. A Tumor about the Ancles. But it ſometimes imports callous Sulci, or Furrows, in the Hands or Feet.

FLERESIN. A Name for the Gout.

FLEXOR. A Name apply'd to many Muſcles, which are ſo call'd from their Office, which is to bend the Part to which they belong.

FLEXOR CAPITIS. See RECTUS INTERNUS MAJOR.

FLEXOR CARPI RADIALIS.

This ariſeth tendinous from the internal Extuberance of the Os Humeri; and, becoming fleſhy, adheres ſtrictly to the *Pronator Radii Teres*; and in half its oblique Progreſs to the Carpus, it becomes a flat Tendon, which paſſes under the annular Ligament, and is inſerted into the upper Part of the *Os Metacarpi*, which ſuſtains the fore Finger.

FLEXOR CARPI ULNARIS.

This ariſeth partly fleſhy, but principally tendinous, from the ſame Tubercle of the Shoulder-bone with the former, as alſo from the ſuperior and external Part of the Ulna, where the *Muſculus Perforans* ariſes; and, continuing fleſhy, according to the Length of the Ulna, is partly inſerted by a ſhort ſtrong Tendon into the fourth Bone of the Carpus, and partly into the Os Metacarpi, which ſuſtains the little Finger.

FLEXORES PRIMI INTERNODII DIGITORUM. See LUMBRICALES MANUS.

FLEXOR POLLICIS LONGUS.

This is an Antagoniſt to the *Extenſor Longus*, ariſing oppoſite to it from the back Part of the Fibula, with a double Order of fleſhy Fibres, running to a middle Tendon, like the *Flexor Tertii Internodii Pollicis Manus*. It ceaſeth to be fleſhy, as it paſſes over the Juncture, and runs through a Chanel on the internal Part of the Os Calcis, under the Tendon of the *Muſculus Flexor Digitorum Longus Perforans*, to which Tendon it ſends off a fleſhy Slip over the following Muſcle, and is inſerted into the upper End of the ſecond Bone of the great Toe.

FLEXOR POLLICIS BREVIS

Is ſhort, thick, and fleſhy, ſeemingly divided into two Muſcles, by the Tendon of the former paſſing over it. It ariſeth from the ſuperior of the *Os Cuneiforme Medium*, and, running over the Termination of the *Muſculus Peronæus Primus*, is implanted into the Oſſa Seſamoidea of the great Toe, which are likewiſe tied to the ſuperior Part of the ſecond Bone of that Toe.

FLEXOR PRIMI INTERNODII DIGITORUM PEDIS. See LUMBRICALES PEDIS.

* *Galen* tells us, *de Comp. Pharmac. ſec. locos, Lib.* 5. *Cap.* 2. that the Antients proceeded ſo cruelly in the Cure of this Fiſtula, that they pour'd melted Lead through a Funnel upon it.

FLEXOR SECUNDI INTERNODII DIGITORUM MANUS. See PERFORATUS MANUS.

FLEXOR PRIMI ET SECUNDI OSSIS POLLICIS.

This is a large, disgregated, fleshy Muscle, arising from the *Ligamentum Transversale Carpi*, the Bones of the Carpus at the Basis of the *Mons Lunæ*, and the *Os Metacarpi* of the middle Finger, whence it passes to its Insertion into the first and second Bones of the Thumb. That Part of this Muscle, which arises from the *Os Metacarpi* of the middle Finger, is divided from its other Part by the Tendon of the *Flexor Pollicis Longus* passing between them. Besides which, there is a second Division of this Muscle in that Part, which arises from the *Os Metacarpi*, insomuch that it has the Appearance of three distinct Muscles, as *Vesalius* observes. In its Tendon, near the Insertion into the first Bone of the Thumb, are plac'd two Sesamoide Bones.

Its Actions are various, according to the Diversity of its Series of Fibres, bending the Thumb, either directly or obliquely, whether towards the Carpus, or the Palm of the Hand, which Motions are frequently made use of by Jugglers.

FLEXOR SECUNDI INTERNODII DIGITORUM PEDIS. See PERFORATUS PEDIS.

FLEXOR TERTII INTERNODII SEU LONGISSIMUS POLLICIS.

This we have frequently observ'd to have a twofold Beginning; the first and superior of which arises tendinous from the internal Extuberance of the *Os Humeri*, between the *Perforatus* and *Perforans*, becoming a fleshy Belly, and then tendinous again, before it joins with the middle Tendon of its other larger Head. The first Head is sometimes wanting, and sometimes it is found springing from the superior and fore Part of the *Ulna*. The second or inferior Origin of this Muscle is that Part of it, which is commonly describ'd, arising with a double Order of fleshy Fibres, for some Space on the *Radius*, from immediately below its superior Part, which unite in a middle Line or Tendon (not unlike the Fibrillæ of a Feather joining to their Stamina); and, passing over the Articulation of the *Carpus*, it becomes entirely tendinous, as it runs over the *Flexor Primi & Secundi Internodii* to its Implantation at the superior Part of the third Bone of the Thumb. For the better Dissection of the rest of the Muscles of the Thumb, raise first the *Abductor Pollicis*. *Cowper*, 84.

FLEXOR TERTII INTERNODII DIGITORUM MANUS. See PERFORANS MANUS.

FLEXOR TERTII INTERNODII DIGITORUM PEDIS. See PERFORANS PEDIS. *Cowper's Myotomia Reformata.*

FLOCCUS. A Flock of Wool, or the Knap of Cloth. The picking of Flocks out of the Bed-clothes is esteem'd a Sign of an approaching Delirium, and is of bad Presage. See DELIRIUM.

FLOS ADONIS. See ADONIS FLOS.

FLOS ÆRIS. See ÆS.

FLOS AFRICANUS. See AFRICANUS FLOS.

FLOS AMBERVALIS. A Name for the *Polygala*; *vulgaris.*

FLOS AMORIS. A Name for the AMARANTHUS.

FLOS ARMERIUS. A Name for several Sorts of CARYOPHYLLUS.

FLOS AURICULÆ. See XOCHINACAZTLIS.

FLOS CARYOPHYLLÆUS. See STATICE.

FLOS CONSTANTINOPOLITANUS. A Name for several Sorts of *Lychnis.*

FLOS CUCULI. See ARMERIA.

FLOS MIRABILIS. A Name for the *Jalapa*; *flore flavo.*

FLOS PASSIONIS. A Name for several Sorts of *Granadilla.*

FLOS REGIUS. A Name for several Sorts of DELPHINIUM.

FLOS SOLIS. See CORONA SOLIS.

FLOS TINCTORIUS. A Name for the *Genista*; *tinctoria*; *Germanica.*

FLOS TRINITATIS. A Name for the *Viola*; *tricolor*; *hortensis*; *repens.*

FLOS TROLLIUS. A Name for the *Helleboro-ranunculus*; *flore luteo globoso.*

FLOS SALIS. The Flower of Salt flows down with the River *Nile*; it is also found on the Surface of some Lakes. Chuse such as is of the Colour of Saffron, has somewhat of a rank Smell like Garum, and sometimes ranker, with a biting Taste, and a fattish Substance. What is colour'd with Minium, or is grumous, is to be rejected. Besides, what is pure and genuine is not to be dissolv'd but in Oil, whereas the adulterated is partly dissoluble in Water.

It is effectual against malignant and phagedenic Ulcers, Nomæ in the Pudenda, and Purulencies in the Ears; it also cures Dimness of Sight, and removes Specks and Albugos from the Eyes. It is mix'd with Plaisters and Ointments, as also with Oil of Roses, for the sake of the Colour it communicates to them. Taken inwardly, in Wine or Water, it provokes Sweat, disturbs the Belly, and incommodes the Stomach. It is, also, an Ingredient in Acopa and Smegmata, for extenuating the Hair: In general, it is of an acrimonious and pyrotic Quality, as are all Salts themselves. *Dioscorides, Lib.* 5. *Cap.* 129.

FLORES. Flowers, in Chymistry, are the most subtile Parts of Bodies, separated from the more gross Parts by Sublimation, in a dry Form. Thus there are Flowers of Antimony, of many Sorts; of Benzoin; of Bismuth; of Tin; of Sal Ammoniac; and of Sulphur; which see under their respective Articles. Mace is, also, sometimes call'd the Flowers of Nutmeg.

FLUCTUATIO. Fluctuation. A Term in Surgery generally us'd with respect to Abscesses, in which Matter is form'd; for then it is perceiv'd by the Fingers to fluctuate in the Tumor, or move in the manner of a Wave.

FLUOR ALBUS. The Fluor Albus is a cachectic Disorder, consisting in an irregular Discharge of an impure, mucid, and generally whitish Humour, from the Female Pudenda, and accompanied with very considerable Inconveniencies, and Diminution of the natural Functions.

Tho' Women, in the Flower of their Age, are, generally, most subject to this Misfortune; yet such as are pretty far advanc'd in Years are not exempted from its Tyranny, as *Hippocrates*, in his second Book *de Morbis Mulierum*, long ago observ'd. There are, also, various Instances of Girls, of six or seven Years of Age, who have labour'd under it, as may be seen in *Fernelius, Lib.* 6. *Pathol. Cap.* 16. in *Rodericus a Castro, Lib.* 1. *Morb. Mulier. Cap.* 14. and in the *Act. Hafniens. Vol.* 1. *Obs.* 83. This Discharge generally appears in Women of thirteen or fourteen Years of Age, at which time an Eruption of the Menses usually happens. Nor are married Women, whether pregnant or not, at all times free from the Attacks of this Disorder; for I have known pregnant Women afflicted with it during the whole Time of their Gestation. We also find, from Experience, that those Women are more subject to it, than others, whose Nerves and Fibres are highly lax, and less solid than they ought to be, or whose Constitutions abound with Serum.

It is call'd an irregular Discharge, because it is not stated and periodical; for in some it is daily and continually made, whereas in others it appears at certain Intervals; twice, for Instance, or thrice a Month; tho' there are not wanting Instances of its returning periodically, and at stated Times. It sometimes precedes, sometimes accompanies, and sometimes follows, the menstrual Discharge; whilst, on other Occasions, it appears in the intermediate Time between the Discharges of the Menses. Besides, when it is very violent, it appears instead of the Menses, and afflicts Women whose Age has render'd them free from Evacuations of this Kind.

The Matter of this Discharge differs as to Colour and Consistence, as *Platerus, in Prax. Tom.* 3. has judiciously observ'd in the following Words: "In this Disorder, says he, the "Humour is sometimes serous, and generally copious; at other "times limpid, without exciting a pungent Sensation; some"times acrid, or saline; at other times yellowish, greenish, "somewhat blackish, or even sanious; sometimes inodorous, "and at other times fetid. With the Serum is, also, some"times mix'd a pituitous Humour, somewhat glutinous, and "odorous, and cold; sometimes in a smaller, sometimes in an "equal, and sometimes in a larger Quantity than the Serum."

This Disorder, when moderate, is attended with so mild a Train of Symptoms, that Women, both married and unmarried, may, for several Months, and even Years, labour under it, without any signal Inconvenience. But when it becomes immoderate, it is accompanied with a Cachexy, or bad Habit of Body: Hence arises not only a considerable Languor and Weakness of the Functions, but also an Itching, a Heat, and Sense of Pungency, in and about the Pudenda. In some Women this is a great Hindrance to Conception, and in others none at all. And, if the Matter discharg'd is fetid, it is not only troublesome to the Woman, but generally so loathsome to the Husband, that he abhors the Embraces of his Wife.

That this Disorder bears a near Affinity to a Cachexy, is beautifully shewn by *Hippocrates*, in his second Book *de Morb. Mulierum*, in the following Words: "The Matter, says he, "discharg'd, resembles the white Urine of an Ass. White "Swellings appear on the Patient's Face; the Parts below her "Eyes swell, her Eyes are disorder'd, and appear as if she "was dropsical, the Colour of her Skin is whitish, and the "lower Part of her Abdomen tumid; on her Legs appear "Tumors, so soft and lax, as to retain the Impressions of the "Finger; she perceives a biting Pain of the Stomach, and "seems to feel an acid Water lodg'd in it, when she is either "fasting, or happens to vomit; when she goes up a steep "Place, she is seiz'd with a Shortness of Breathing, her Legs are "cold, her Knees feeble, and her Uterus preternaturally open'd,

"and

" and fallen down, with a Senſe of Weight, to its Mouth. " But it is difficult to cure thoſe who labour under this Degree " of the Diſorder." Theſe Aſſertions of *Hippocrates* are by no means to be underſtood of a moderate and beginning Fluor Albus, but rather of one of the chronical and obſtinate Kind, whoſe firſt Cauſe and Source is a deprav'd State of the Solids and Fluids, but more eſpecially a preternatural Weakneſs of the Stomach; for, as that chylous, lymphatic, mild, and ſubtile Fluid, which imparts Strength and Tone to the ſolid Parts, is too copiouſly carried off by the Veſſels of the Uterus, it muſt neceſſarily happen, that the elaſtic and ſyſtaltic Force of the Heart and Arteries, together with the periſtaltic Motion of the Stomach and Inteſtines, muſt be impair'd. Hence a Languor and Loſs of Strength enſue; and the Digeſtion of the Stomach being deſtroy'd, crude and viſcid Juices, accumulated and convey'd to the Maſs of Blood, not only ſpoil Nutrition, and deform the Countenance, but alſo impair the Vigour of the Mind, and induce Melancholy and Depreſſion of the Spirits.

As the Seat of this Diſorder is the Uterus, we ſhall take an accurate anatomical View of its Structure, eſpecially that of its Veſſels. No Part of the Body, then, is furniſh'd with ſo large a Number of Veſſels as the Uterus. The moſt conſiderable of theſe are the ſpermatic Arteries and Veins, which reach the Ovaries, and are, by copious Ramifications, convey'd to the Bottom of the Uterus. The Ramifications alſo of the hypogaſtric Vein and Artery are diſtributed, not only to the middle and inferior Parts of the Uterus, but alſo to the Vagina. Theſe Blood-veſſels, copiouſly diſpers'd through the Subſtance of the Uterus, are diſtributed in highly winding and ſerpentine Directions. But the exquiſite Union or Connection of the Veſſels of the Uterus by Anaſtomoſes, has this peculiar to itſelf, that Canals, of different Bulks, terminate in a large Number of ſmall Cells, which communicate with each other, and are of an oval Figure, a Circumſtance which renders the Subſtance of the Uterus fungous and ſpongy. It is, alſo, to be obſerv'd, that the hypogaſtric Veins, which carry back the Blood, are not only as large again as the hypogaſtric Arteries, but, alſo, that the ſpermatic Veins are not ſtraight, but run in a highly winding and crooked Direction, ſo that, if they were to be unravel'd, their Length would amount to ſeveral Ells, and be far greater than that of the ſpermatic Arteries.

From this peculiar Structure of the Veſſels of the Uterus it is ſufficiently obvious, that the Blood muſt circulate ſlowly through theſe Veins, eſpecially ſuch of them as are deſtitute of Valves; and from this anatomical Theory we may commodiouſly account, not only for the Diſcharge of the Menſes, but alſo for all the Misfortunes to which the Uterus is ſubjected. Hence the Reaſon is ſufficiently obvious, why Women, both married and unmarried, are ſometimes afflicted with ſo long and ſo troubleſome a Diſcharge of Serum of different Colours and Conſiſtencies from the Uterus and Vagina; for as the Tone and Motion of the Uterus, which depend on a due Conſtriction and Dilatation of its Fibres, are eaſily injur'd and weaken'd; as the Motion of the Blood and Humours is highly ſlow through the winding and ſerpentine Veſſels of the Uterus; and as the Return of the Blood is very ſlow through the Veins which are deſtitute of Valves, hence not only Infarctions and Stagnations of Blood and Serum are eaſily produc'd in the Uterus, but, alſo, the ſerous and lymphatic Humour, becoming viſcid, by the Slowneſs of its Motion, finds a Paſſage for itſelf, and is diſcharg'd through the ſmall Orifices which every-where occur in the Uterus and Vagina. It is the common Opinion of moſt Authors, that this Humour is ſecreted from the Lacunæ of *De Graaf*, or the ſmall Pits conſpicuous about the Urethra, and the Glands lodg'd in that Part. But in theſe Lacunæ there is ſcarce any Perforation found which admits the Point of a Briſtle; whereas on both Sides of the Orifice, and thro' all the Subſtance of the Vagina, there are a great many Lacunæ, which eaſily admit half a Finger's Breadth of a Briſtle; and, when their Ducts are preſs'd, they diſcharge an Humour not unlike the ſeminal Matter.

But tho' theſe Glands, when relax'd, may diſcharge a large Quantity of Humour, yet they are not the only Seat of the *Fluor albus*, ſince there are a great many more Paſſages from which the Matter of this Diſorder, as alſo the impure ſerous Liquor diſcharg'd both with and after the Lochia, are ſupply'd. And tho' *Ruyſch* denies, that the Glands of the Uterus could be ever ſeen or exhibited to the View; yet 'tis not to be doubted, but in a *Fluor albus* the Serum may be diſcharg'd from the ſmall Orifices, which, in the Menſes, give Vent to the Blood. For *Fantoni*, in his Anatomy, obſerves, that, when one blows into the Veins of the Uterus, the Air is convey'd into its Cavity, and the Vagina; and, *vice verſa*, by blowing into the latter, the Air may be convey'd into the former. Beſides, according to *De Graaf* and *Van Horne*, there are ſmall Perforations obſervable in the Neck of the Uterus. *Verheyen*, alſo, obſerves, that when the Uterus is macerated in Water, and kept in a gentle Heat for ſome time, many globous Corpuſcles are not only obſervable in the internal Surface of the Vagina, ſome in Cluſters, and others diſpers'd up and down; but alſo affirms, that he ſaw the like Corpuſcles, in the inferior Part of the Cavity of the Uterus, and that they are juſtly to be look'd upon as Glands, ſubſervient to the Secretion of a ſerous and pituitous Humour.

'Tis not, therefore, to be doubted, but in a *Fluor albus* the Matter is diſcharg'd from the ſame Veſſels and Ducts with the menſtruous Blood; and the Truth of this Aſſertion is evinc'd by this, that in ſome Women a Suppreſſion of the Menſes brings on a *Fluor albus*. That a white Fluid is diſcharg'd inſtead of the menſtruous Blood, is alſo obvious from an Obſervation of *Severinus Pinæus*, in his Treatiſe *de Notis Virginitat. Lib.* 1. *Prob.* 3. where this Author informs us, that, in diſſecting the Bodies of married and unmarried Women, who, during their Lives, had labour'd under a *Fluor albus*, tho' they were not cut off by that Diſorder, he found in the Uterus a highly limpid Humour, which dropt from its Cavity to the Vagina, where it became white, like a Calx diſſolv'd in Water, perhaps, by means of the cold Air interpoſing itſelf betwixt the ſerous Particles, not to mention a certain Acrimony, perhaps, deriv'd from the Glands of the Uterus.

Since, therefore, the immediate Cauſe of a *Fluor albus* is a Debility of the Fibres and Veſſels of the Uterus, and a retarded Circulation of the Blood thro' its Veſſels, by which means the Serum is ſeparated from the Blood, we muſt next inquire what remote and ſecondary Cauſes concur to produce and conſtitute this direct and immediate Cauſe. Now, nothing has a more immediate Tendency to relax the Tone of the Fibres, than a cold and moiſt Air. Hence the Reaſon is ſufficiently obvious, why in the Autumn, and in Places which are cold and moiſt, marſhy, low, vapid, and ſuch as are not ſufficiently purg'd by briſk and wholſome Winds, this Diſorder is moſt epidemical; and why, according to *Sylvius*, in *Prax. Lib.* 3. *Cap.* 4. the *Fluor albus* is more frequent in *Holland*, than in other Countries, eſpecially if any Error, with reſpect to Regimen, concurs; for all thoſe Aliments which, on account of their too great Viſcidity, cannot be eaſily digeſted, ſuch as leguminous Subſtances, Preparations of Milk, farinaceous Aliments, and ſuch as are too ſweet; as alſo Periwinkles, Oyſters, Fiſh inhabiting Ponds and Lakes, Summer Fruits copiouſly eaten, all Acids and Sallads, which, as they generate a glutinous and crude Chyle, unfit for Aſſimilation and Nutrition, greatly cheriſh and increaſe the *Fluor albus*; and this happens in a ſtill more remarkable Manner, when young Women, or even Infants, have a voracious Appetite. 'Tis alſo confirm'd by daily Experience, that ſuch Women, as are addicted to Eaſe, and a ſedentary Life, or indulge themſelves too much in Sleep, are much more ſubject to this Diſorder, than thoſe, who, by ſufficient Exerciſe and Motion, procure a due Degree of Strength to their Bodies. For this Reaſon, Country Girls are leſs ſubject to this Misfortune, than thoſe who live in Towns and Cities; and the former, by reaſon of their Labour and Exerciſe, enjoy a more conſtant and uninterrupted State of Health, than the latter.

We muſt alſo obſerve, that thoſe Women, who are ſubject to frequent mucous Defluxions from the Noſtrils, are, upon a Suppreſſion of theſe, generally ſeiz'd with the *Fluor albus*, ſince the Humour is tranſlated to the Uterus. But this happens moſt readily, when the menſtrual Diſcharge is not duly and regularly carry'd on: And, as ſoon as this happens, the State of Health begins forthwith to be impair'd, the Veſſels are fill'd with impure Humours, and the Foundations of a Cachexy are laid.

Having already conſider'd thoſe Cauſes which generate a Redundance of thoſe Humours which conſtitute the Matter of the *Fluor albus*, we now come to conſider thoſe Cauſes which diſpoſe the Uterus, the genuine Seat of this Diſorder, to it. The Cauſes, then, which concur to the Production of this Effect, are principally ſuch as, by relaxing the Veſſels and Fibres of the Uterus, deſtroy their due Tone and Strength; by which means the Maſs of Blood and Humours muſt neceſſarily be too ſlowly carry'd through ſo large a Number of winding Veſſels. Hence a Secretion of viſcid Serum will eaſily be made through the Pores of the Uterus. Hence, alſo, we obſerve, that, in marry'd Women, difficult Labours, which weaken the Uterus, frequent Abortions, and imprudent and violent Extractions of the Secundines, often lay a Foundation for this Diſorder. 'Tis, alſo, confirm'd by Experience, that thoſe Women who are ſubject to immoderate Diſcharges of the Menſes, as alſo thoſe who are deliver'd of Moles before the due Time, are generally afflicted with the *Fluor albus*; for all theſe Circumſtances indicate too great a Diſtention and Relaxation of the Veſſels, which muſt ſpeedily be remov'd by proper Corroboratives; otherwiſe, in Proceſs of Time, the Tone of the Veſſels cannot be reſtor'd without great Difficulty.

In order, not only to prognoſticate the Event of a *Fluor albus*, but alſo to take proper Meaſures for its Cure, it is highly neceſſary, accurately to diſtinguiſh it from other Diſcharges from the Uterus, which bear a kind of Reſemblance to it. Firſt, then, it ought not to be confounded with the ill-colour'd Menſes, to which ſome Women, eſpecially thoſe of the younger Kind, are ſubject; for, tho' theſe are peccant, yet they exactly keep their ſtated Period; whereas the Matter of a *Fluor albus*

not only varies in Colour and Conſiſtence, but is promiſcuouſly and irregularly diſcharg'd, either when the Menſes are irregular, or flow too copiouſly. 'Tis, alſo, of great Importance to diſtinguiſh a *Fluor albus* from a virulent Gonorrhœa, contracted by impure Embraces; for the Venereal Taint not only affects the glandulous Proſtatæ with Pain, but alſo the Vagina; which it ſo exulcerates, as to infect the Men who have the Misfortune to enjoy a Woman in ſuch a State. Beſides, the Diſcharge of the Venereal Matter is far leſs than that of the *Fluor albus*; but it is more acrid, creates a Heat, accompany'd with Pain, and continues when the Menſes flow, and when the Urine is diſcharg'd; whereas the *Fluor albus* either precedes, or comes after, the Menſes. Hence the celebrated *Baglivi*, in *Prax. Med. Lib.* 2. *Cap.* 8. *Sect.* 3. gives us an infallible Rule for diſtinguiſhing thoſe Diſeaſes from each other, in the following Words: "Aſk, ſays he, of the Patient, whether ſhe diſ-" charges this white Matter during the Time of her Menſes: " If ſhe ſays ſhe does, you may aſſure her, that ſhe labours " under a Gonorrhœa: But, if during the Time of her men-" ſtrual Diſcharge the white Matter diſappears, and again re-" turns when it is over, you may be ſure, that the Woman " only labours under a *Fluor albus*."

Nor is every Diſcharge of ſanious Matter to be accounted a virulent Gonorrhœa; for ſometimes, tho' rarely, Abſceſſes and Ulcers, free from every Degree of a contagious Quality, are form'd in barren Women. With reſpect to this Subject, the Reader may conſult *Claſius, in Obſ. Med. rarioribus, Obſ.* 4. & 5. *de Ulcere Muſculorum Uteri, Vaginæ, Vicinorum, & Uteri purulento.* Nor is every Eroſion and Exulceration a ſure Sign of a virulent Gonorrhœa; for in a *Fluor albus*, and ſtill more in ſcorbutic Patients, the Serum may acquire ſuch a Degree of Acrimony, as to corrode and exulcerate the adjacent Parts; but this Exulceration is accompanied with an uncommon Itching, and is more ſuperficial, and eaſily cur'd, than that in a Gonorrhœa. But, in order to prevent our forming a wrong Judgment in Caſes of this Nature, I think it expedient to inquire into the Caſe of the Patient, and accurately to examine every Circumſtance.

A *Fluor albus*, when moderate, recent, and produc'd by an external Cauſe, is not a dangerous Diſorder, and may be ſupported without any violent Symptoms for ſeveral Months, either by marry'd or unmarry'd Women. 'Tis, however, highly diſagreeable and troubleſome to the more delicate and cleanly Part of the Sex; becauſe, in Proceſs of Time, it deſtroys the Beauty of their Complexions. But that Species of *Fluor albus* is attended with worſe Conſequences, which, ariſing from a great Weakneſs of the Stomach, and a bad Habit of Body, has arriv'd at a conſiderable Height, or ſucceeds other Diſeaſes; for this Species of the Diſorder, by injuring all the Functions of the Parts, induces a remarkable Change on the whole Body; for frequently great Extenuation, accompanied by a ſlow Fever, is produced by it; and ſometimes it proves the Cauſe of Sterility, as *Hippocrates*, in the 42d *Aph.* of *Sect.* 5. has long ago obſerv'd, in the following Words: "Thoſe Women, who " have their Uterus too moiſt, cannot conceive, becauſe the " ſeminal Matter is extinguiſhed in them." And, in his Book *de Sterilitate*, he tells us, "that a Woman, whoſe Uterus is " ſlippery, cannot conceive; becauſe the Uterus ſuffers the " ſeminal Matter to fall out of it." Beſides, thoſe Women, who have long labour'd under the *Fluor albus*, are frequently and eaſily ſubject to Abortion; becauſe, in conſequence of the relaxed Tone of the Uterus, the Conception is not ſufficiently retain'd, but corrupted by a continual Defluxion of Matter, and, at laſt, expel'd. A Falling down of the Uterus is, alſo, frequently the Effect of this Diſorder.

Since, when this Diſeaſe is obſtinate, and of long ſtanding, it is ſo difficultly cur'd, as to be juſtly claſs'd among the Reproaches of Phyſicians, we ſhall inquire into the Cauſes which concur to render the Cure ſo difficult. The firſt, then, of theſe Cauſes ſeems to be, that Phyſicians place the immediate Cauſe of this Diſorder, only in a Redundance of an impure and contaminated Serum; whereas, they ought rather to direct their Views to the Fault of the Uterus, the Seat of the Diſorder, and the deſtroy'd Tone of its Veſſels; not neglecting, at the ſame time, ſuch Medicines as eliminate and diſcharge the Sordes. But, without doubt, the beſt Corroboratives, and great Pains, are requiſite to reſtore the natural Strength of the Uterus, in conſequence of the large Number of Veſſels interwoven with each other, and the ſlow Circulation of the Blood thro' them, by which the Veſſels and Glands, being too much relax'd, are depriv'd of their due and proper Tone. Another Cauſe why this Diſorder is cur'd with greater Difficulty than it otherwiſe would be, is, that generally Phyſicians either entirely overlook, or do not ſufficiently regard, the firſt Origin of the Diſorder, which is the Weakneſs of the Stomach; for, when the Digeſtion of the Aliments is not duly carry'd on, peccant Juices are convey'd to the Maſs of Blood; and even ſuch Subſtances as are eaſily digeſted, are converted to a bilious or pituitous Sordes, which create in the Stomach a nauſeous Senſe either of a rancid Fat, or of a Sweetneſs reſembling that of Honey, or of ſome

ſour or nidorous Subſtance: Unleſs, therefore, the Fault is firſt corrected in the Primæ Viæ, all the Remedies exhibited for purifying the Blood, and eliminating the peccant Humours, will prove ineffectual. Nor is it to be forgot, as a Cauſe why this Diſorder is with Difficulty cur'd, that Women are naturally ſo obſtinate, as generally to neglect the Injunctions of their Phyſicians, ſince they indulge themſelves in all thoſe things, which contribute to induce the *Fluor albus*, ſuch as an idle Life, the Abuſe of ſweet Fruits, Acids, farinaceous Aliments, Tea and Coffee, drinking little, and ſleeping much, refrigerating their Abdomen and lower Parts, admitting the hot Steam of live Coals to their Pudenda, in the Winter-time, and drinking cold Liquors when the Body is over-heated; all which are highly prejudicial to Health, but ſtill more ſo when the Uterus has contracted any Diſorder by difficult Labour, Abortion, or any other Cauſe.

As for the general Intentions of Cure, the Primæ Viæ, and whole Body, are to be empty'd of the Redundance of peccant Serum, by proper Evacuants thro' the Emunctories allotted by Nature for that Purpoſe. Then the due Tone and Strength of the Uterus are to be reſtor'd, by the beſt choſen Remedies, both of the internal and external Kind, that the Circulation of the Blood and Humours may be the more eaſily and expeditiouſly carry'd on; and that, by this means, the Stagnation of the peccant Humours may be prevented, the Relaxation of the Glands remov'd, and the like Misfortunes guarded againſt for the future. After this, the Phyſician is to direct his Views to the State of the Stomach, that good Juices may be convey'd to the Maſs of Blood, in order to correct the peccant Humours, and reſtore the good and laudable ones, which are loſt. If the Diſorder is violent, and the Patient cachectic, the Phyſician is to endeavour to bring the Maſs of Blood and Humours to a better State, to promote the natural Excretions, and to reſtore the former Strength and Functions of the Viſcera.

The firſt Step, therefore, to be taken, is, to eliminate the recrementitious Sordes from the Primæ Viæ; which, however, is not to be done by violent Medicines, and draſtic Purgatives, but rather by thoſe of a mild and gentle Kind, which operate as Alteratives. My Opinion, with reſpect to this, ſays *Hoffman*, is confirm'd by the Authority of the ableſt Practitioners; among whom, I ſhall only mention the learned *Riverius*, who, in the eighty-ſecond Obſervation of his third Century, affirms, that, after he had try'd all other Medicines to no Purpoſe, he found ſingular Relief afforded by a laxative Ptiſan us'd for a Month; by means of which alone, a Woman, who had for a long time labour'd under a *Fluor albus*, was reſtor'd to perfect Health. This ſame Medicine is again highly extol'd in the fourth Chapter of the fifteenth Book of his *Praxis*. But, among the whole Claſs of laxative Medicines, none are more beneficial, in this Diſorder, than Preparations of Rhubarb; becauſe, beſides their laxative, they are alſo poſſeſs'd of a balſamic and bitteriſh Quality, by which they not only correct the peccant Acid, but alſo corroborate the weaken'd Parts: But, for this Intention, the beſt and moſt ſolid Rhubarb ought to be choſen, and not ſuch as is light and rotten. This Medicine may commodiouſly be mixt with others, anſwering the ſame End, and exhibited either in the Form of a Powder, an Infuſion, a Decoction, an Extract, or an Eſſence. The Powder may be thus prepar'd:

Take of the beſt Rhubarb, half a Dram; and of the *Terra foliata Tartari*, (otherwiſe call'd *Tartarus Regeneratus*) twelve Grains: Mix together for a Doſe.

A moſt uſeful Infuſion may be prepar'd in the following Manner:

Take of the beſt Rhubarb, ſix Drams; of the Roots of Zedoary, round Birthwort, and Burnet, and of Orange-peel, each three Drams; of the Seeds of Carrot, and ſtellate Aniſe, and Salt of Tartar, each one Dram and an half: Mix all together, to be put into one Pint of Wine.

The Extract is moſt commodiouſly mixt with Pills of a laxative and corroborative Nature, and may be prepar'd in the following Manner:

Take of the Extract of Rhubarb, of roſated Aloes, of Gum Galbanum, of the beſt Myrrh, Gum Hedera, Gum Sandarach, Extract of round Birthwort, and Amber, each one Dram: Mix together, and out of each Dram make twenty Pills, with Eſſence of Peruvian Balſam.

When the *Fluor albus* is very violent, the Stomach highly weak, and the Viſcera much relax'd, I have always, ſays *Hoffman*, found the following Medicines of ſingular Efficacy:

Take of the fineſt Crocus Martis, or chalybeated cachectic Antimony, the Fæcula of Arum, the Salt of Wormwood,

and a Solution of Crabs-eyes, each one Dram; of the Bark of Caſcarilla, of Amber, and Cinnabar, each half a Dram; and of the Oil of Saſſafras-wood, ſix Drops: Mix up into a Powder; one Dram of which may be exhibited for a Doſe each Morning in Wine diluted with Water.

But the Operation of this Medicine will be ſtill more effectual and conſpicuous, if an Infuſion prepar'd of the Herbs Baum, Mint, Dead-nettle, Sage, and the Seeds of the Carrot, and ſtellated Aniſe, is drank after it. After this, in order to reſtore the Strength of the Stomach, and reſolve and eliminate the Sordes, the following Medicine is of ſingular Efficacy:

Take of the Eſſence of Amber, of Aloes-wood, of the acrid Tincture of Antimony, of the anodyne mineral Liquor, and of the Spirit of Hartſhorn, each half an Ounce: Of this Mixture fifty Drops, according to the State of the Patient, may be exhibited in ſome proper Infuſion, or Wine diluted.

Tho' the beſt and moſt proper internal Medicines for this Diſorder are already enumerated, yet 'tis ſometimes neceſſary their Virtues ſhould be aſſiſted by external Applications; the moſt celebrated of which are, from long Experience, known to be Baths prepar'd with corroborating nervous Species, and ſuch as are impregnated with a volatile oleous Salt; of which kind are the Herbs Marjoram, Savory, Thyme, Baum, Calamint, Feverfew, Southernwood, Origanum, Roſemary, and Hyſſop, together with the Flowers of *Roman* Chamomile, Bay, and Juniper-berries; all which ought to be included in a Bag, and boil'd gently in the Water for half an Hour. This Bag, whilſt the Patient ſits in the Bath, is to be applied to the Region of the Uterus. 'Tis alſo expedient, when the Patient is out of the Bath, to apply, in the Night-time, ſmaller Bags of the ſame kind gently boil'd in red Wine, to the Region of the Groin. Beſides, Suffumigations prepar'd of Tacamahac, Maſtich, Amber, Benzoin, and Frankincenſe, are of ſingular Service, when admitted into the Uterus.

As for the Regimen, 'tis neceſſary that, during the Cure of this Diſorder, the Diet ſhould be ſpare, ſlender, and of eaſy Digeſtion: The Patient muſt carefully abſtain from all Fleſhes, eſpecially ſuch as are of hard Digeſtion, pinguious, or ſmok'd; as alſo from Sea-fiſh, Preparations of Milk; and ſuch Subſtances as are leguminous, farinaceous, acid, or ſweet; and, if the Patient will eat Fleſh, that which is roaſted is preferable to that which is boil'd. For ordinary Drink we recommend a Decoction of China-root, Saſſafras-wood, red and yellow Sanders, the Wood of the Maſtich-tree, and Cinnamon. Good *Hungarian* Wine moderately drank at Meals, is, alſo, excellent for removing the Weakneſs of Digeſtion.

In a *Fluor albus*, whether of the ſimple or virulent kind, as alſo in Caſes where the Menſes have an unnatural Colour, nothing is more prejudicial than Aſtringents, whether internally exhibited, or externally applied; for, by their means, the ſerous Matter retain'd in the Uterus, and its Veſſels, is often concreted into a highly tenacious Maſs: Hence its Excretion is not only prevented, but alſo a large Tumor, hard to the Touch, is form'd in the Region of the Pubes, which, unleſs ſpeedily cur'd, ſcarce ever fails to bring on a Train of highly formidable Symptoms; for I have ſeen this Misfortune give Riſe to ſlow Fevers, attended with an Atrophy, a Phthiſis, purple Eruptions, ſuch Tumors as happen in a Tympanites, Defluxions which prey upon the Uvula and Tonſils; as, alſo, Scirrhuſes, Apoſtems, and almoſt incurable Exulcerations of the Uterus.

As uterine Peſſaries and Injections were highly eſteem'd, and frequently us'd, by the Antients, and eſpecially by *Hippocrates*, in ſome Diſorders peculiar to the Sex, ſo 'tis ſurpriſing their Uſe ſhould be baniſh'd from the modern Practice, ſince in certain Caſes, eſpecially where the Subſtance of the Uterus is injur'd, we are by Experience convinc'd of their ſingular Efficacy: For I myſelf have ſeen happy Effects produc'd by them in an inveterate *Fluor albus*, which would not yield to other Means, as alſo in Abſceſſes and Exulcerations of the Uterus; for as, in Men, inveterate Gonorrhœas, whether of the benign or malignant Kind, are not to be cur'd without Injections, ſo, alſo, in a *Fluor albus*, 'tis neceſſary that ſome powerful Remedy ſhould be immediately applied to the Part affected. But 'tis to be obſerv'd in general, that ſuch Injections are not to be us'd in large Quantities at one time, but frequently injected in ſmall Quantities, an Ounce or two, for Inſtance, at a time; but, for this Purpoſe, we muſt carefully abſtain from all ſuch Subſtances as are of a ſaline, acrid, too pinguious, or lubricating Nature.

Tho' in cachectic Caſes the *Caroline* Baths are highly efficacious, yet they are cautiouſly to be us'd, both internally and externally, when the Subſtance of the Uterus is injur'd, and too copious a Diſcharge of Serum made; and they muſt be us'd with ſtill greater Caution, when the Diſcharge is of the Venereal kind, the Parts exulcerated, and the Urine diſcharg'd with Pain, and containing a large Quantity of glutinous Matter, which ſubſides; for theſe Waters, by reaſon of the ſubtile calcarious Earth, with which they abound, are of an highly conſtricting Nature, when externally apply'd; and, when us'd internally, they injure the Parts relaxed and corroded by a corrupted Matter.

Chalybeate Waters are far more proper in Caſes of this Nature; ſuch as the Springs of *Laughſtad* and *Freyenwald*, which, when made into Decoctions with nervine Herbs, are highly efficacious in eliminating the ſuperfluous Serum by Perſpiration, and diverting the Courſe of the Humours from the Uterus.

I have often obſerv'd a large Diſcharge of Blood after a Suppreſſion of the Menſes for two or three Months, not by Pregnancy, but ſome other Cauſes, ſucceeded by a Fluor albus. For preventing both theſe Misfortunes, Veneſection, after duly weighing all Circumſtances, is to be adminiſtred; for the Veſſels of the Uterus, diſtended by too large a Quantity of Blood, loſe their Tone and Strength; ſo that Stagnations not eaſily to be remov'd happen in them.

In this Diſorder, Baths, whether of the dry or moiſt kind, are almoſt always rather pernicious than beneficial before the proper Uſe of Correctors, Corroboratives, and Evacuants; for as they put the peccant and impure Humours into too violent a Commotion, they often, not without the greateſt Danger, force them from a leſs to a more noble Part. Dry or *Laconic* Baths are of ſingular Service to phlegmatic Women, if the Body is previouſly freed from the ſuperfluous and recrementitious Humours, ſince, by promoting Sweat by means of the external Warmth, they reſtore the natural Strength to the Parts before too much relax'd, by the Excretion of the redundant Humidity.

If the Stomach is full of Crudities, as in this Diſorder it frequently is, mild Emetics are, with great Succeſs, frequently repeated: Among theſe, the beſt and moſt efficacious is Ipecacuanha, which is generally corroborating, and aſſiſts Perſpiration: The Elixir Viſcerale, mix'd with the Eſſence of *Caſcarilla*, and taken together with the Aliments, alſo produces very happy Effects.

After the Cure of an inveterate *Fluor albus*, if any Matter ſhould ſtill continue to drivel from the Pudenda, beſides the external and internal Medicines already mention'd, Suffumigations of Olibanum, Tacamahac, Maſtich, and Amber, are of ſingular Service, if commodiouſly apply'd to the Vagina; for they, in ſome meaſure, ſtrengthen and corroborate the relax'd Glands.

When ſcorbutic Women, ſuch as are infected with the Venereal Diſeaſe, or thoſe who are frequently ſubject to the purple Fever of the red kind, are ſeiz'd with the *Fluor albus*, they muſt carefully abſtain from hot Purgatives and Baths; and are, at firſt, to be mildly treated with fix'd Diaphoretics, and ſuch Medicines as powerfully reſiſt the Corruption of the Lymph. In a Caſe, therefore, of this kind, I with ſingular Succeſs order'd bezoardic Powders, in Conjunction with a Grain or two of Sulphur of Antimony, preſcribing, at the ſame time, a Decoction generally us'd in the Lues Venerea, and prepar'd of ſuch Roots and Woods as purify the Blood, with an Addition of crude Antimony. If by this means the Body is prepar'd for a Month or more, both internal and external Medicines will prove more effectual in promoting the Cure. *Frederic Hoffman.*

In the preceding Diſſertation there are many excellent Hints relative to the Cure of a *Fluor albus*; and the Caution he gives, eſpecially relative to the Uſe of Aſtringents, are never to be forgot by the prudent Phyſician; for, from the Uſe of theſe, very formidable Diſorders are frequently brought on. I muſt remark, that a Cancer of the Uterus, not unfrequently cauſes a *Fluor albus*, which is generally ſucceeded by Floodings and Death. A ſtrumous Habit of Body, alſo, frequently induces a *Fluor albus*.

FLUTA. The ſame as MURÆNA; which ſee.

FLUVIALIS. An aquatic Plant, of which *Tournefort* reckons three Species:

1. *Fluvialis Piſana Foliis denticulatis.* J. B.

2. *Fluvialis Foliis anguſtis dentatis. Fluvialis Species, anguſto brevique Folio undequaque Spinis infeſta.* Raii H. 3. 132.

The third Species is the *Algoides vulgaris*; for which ſee ALGOIDES.

FLUVIORUM, *vel* FLUVIALIS AQUÆ *Qualitates.* The Qualities of Rivers, or River-water.

The Waters of all Rivers and Pools are bad, except the Water of the River *Nile*, which is endu'd with all good Qualities; for it is pleaſant in drinking, ſtays but a moderate time in the Body, and quenches Thirſt; and, if it be drank cold,

it creates no Moleſtation, but is ſerviceable to Concoction and Digeſtion; whence it renders the Body graceful, robuſt, and florid. But the Waters of other Rivers are hard of Concoction, dry, and create a Thirſt, eſpecially if they paſs through a bad Soil. The beſt of this Sort are Streams which flow from never-failing Springs, and mix with no other River-waters. *Aetius, Tetrab.* 1. *Serm.* 3. *Cap.* 165.

FLUXIO. The ſame as CATARRHUS; which ſee.

FLUXUS, ῥόος, ῥύσις, ῥύσις, a Flux, is ſometimes taken for all kinds of Defluxions, and in this Senſe is the ſame as *Catarrhyſis*, or *Catarrhus*; ſometimes it bears a reſtrained Senſe, as *Fluxus Ventris*, a Flux of the Belly, which is a continual Evacuation of humid Fæces, without a Teneſmus or Lientery, as *Galen* defines it, *Com.* 2. *in* 1 *Epid.* Again, there is a *Fluxus hepaticus*, an hepatic Flux, when from an Imbecillity of the Liver proceeding from a cold Diſtemperature of that Part, the Excrements are render'd very like Water in which Fleſh newly killed has been waſhed. *Galen, Lib.* 5. *de Loc. affec. Cap.* 7. *Sylvius Prax. Med.* ſays, he never knew this Affection, but he thinks the Cauſe of it to conſiſt in a Redundance of Serum in the Blood, attended with a Relaxation of the Veſſels. *P. Barbette* ſuppoſes it to be a Species of the *Fluxus Hæmorrhoidalis*. Sometimes *Fluxus*, ῥόος, is taken in the ſtricteſt Senſe for the *Fluxus muliebris*, as in ſeveral Places of *Hippocrates de Nat. Mulieb.* Of this there are various Kinds with reſpect to the Colour of the Excretions, ſuch as the *Fluor albus*, which ſee before; the *Fluor ruber ſive cruentus*, which is the ſame as the MENSES; or, if the Flux be different from the two preceding, it proceeds from the ſame Cauſe as other Hæmorrhages, that is, a Solution of Continuity of the Veins of the Uterus from a Redundance or Acrimony of the Blood. *Fluxus*, ῥύσις, is alſo ſpoken of a Flux, or Falling off of the Hair, as in *Trallian, Lib.* 1. *Cap.* 2. *Caſtellus.*

FOCALE, a Kerchief, or Muffler, worn by the Antients about the Neck, to guard the Fauces from the Injuries of the Air. It is ſtill much in Uſe among the *Germans.*

FOCHA. It is not certain what it means: *Coſtæus* and *Magius*, the Tranſlators of *Avicenna*, expound it of a ſort of Drink made of Barley, or elſe of Raiſins. *Avicenna*, in one of his Treatiſes, gives the Name *Focha* to an aromatic Drink prepared for exciting Venery. *Caſtellus.*

FOCILE MAJUS ET MINUS, the greater and leſſer Focil, are Names for the two Bones of the fore Arm, the *Ulna* and *Radius*; for which ſee BRACHIUM. The ſame Terms are apply'd to the Bones of the Leg, the *Tibia* and *Fibula.*

FOCKII. A Species of SOLANUM, which grows in *Java. Bontius.*

FOCOT GUEBIT. A Species of Poplar. *Ray Index.*

FOCUS, *ἑσία*, in Metallurgy, according to *Rulandus* and *Johnſon*, is a Smelting-houſe for Metals. *Focus Morbi*, the *Focus* of a Diſeaſe, is the Part where it is ſuppoſed to keep its principal Reſidence, and whence it communicates its noxious Influence; for Inſtance, the *Focus* of a Fever, according to *Galen, Lib. de Maraſmo, Cap.* 7. is that Part of the Body which firſt contracts an immoderate Heat in its ſolid Subſtance; or, as he expreſſes himſelf in another Place, *M. M. Lib.* 11. *Cap.* 20. the *Focus* of a Fever is that Part where the Obſtruction, Putrefaction, or Inflammation, lies. Among ſome antient Anatomiſts the firſt Lobe of the Liver was called the *Focus*, from a Perſuaſion that it contributed to Concoction; the ſecond was called *Menſa*, the Table, becauſe the Aliments were imagin'd to be plac'd thereon; the third *Culter*, the Knife; and the fourth *Auriga*, the Carrier, as ſuppos'd to be inſtrumental in the Diſtribution of the Aliment.

FODINA. A Name given by ſome Anatomiſts to that turning and winding Cavity of the Ear called *Labyrinthus*, the Labyrinth.

FŒDULA. A Species of *Fungus. Rulandus.*

FŒNICULUM.

The Characters are;

The Root is fibrous; the Leaves capillaceous; the Petals of the Flowers entire; the Seeds oblong, ſomewhat thick, gibbous, and ſtriated.

Boerhaave mentions eight Species of this Plant; which are,

1. Fœniculum; vulgare; Germanicum. *Boerh. Ind. A.* 48. *Rupp. Flor. Jen.* 224. *Mor. Umb.* 3. *Hiſt. Oxon.* 3. 270. *C. B. Pin.* 147. *Fœniculum*, Offic. *Fœniculum vulgare*, Ger. 877. Emac. 1032. Park. Theat. 884. Raii Hiſt. 1. 457. Synop. 3. 217. *Fœniculum vulgare minus, acriore & nigriore ſemine.* J. B. 3. 2. Tourn. Inſt. 311. Elem. Bot. 260. *Marathrum ſeu Fœniculum.* Chab. 381. FENNEL, or FINCKLE.

Our ordinary Fennel has pretty large, thick, white Roots, which run deep into the Earth, without much dividing, beſet with ſmall Fibres. It has large winged Leaves, branch'd into ſeveral Segments of long, ſlender, very fine, capillaceous Parts, of a dark-green Colour, and ſometimes a little reddiſh; the Stalk grows to be four or five Foot high, much divided, and full of whitiſh Pith: The Flowers grow on the Tops of the Branches, in flat Umbels, of ſmall yellow five-leav'd Flowers, each of which is ſucceeded by a Couple of roundiſh, ſomewhat flat, ſtriated Seed. The whole Plant has a pretty ſtrong, but not unpleaſant Smell. It is generally planted in Gardens to be near at hand, but it grows wild in ſeveral Places toward the Sea-coaſt; and at *Woolwich* and *Graveſend* it is frequently met with: It flowers in *June.* The Leaves, Root, and Seed, are in Uſe; the Root being one of the five opening Roots, and the Seeds one of the great carminative Seeds.

FOENICULUM, *μάραθρον*, ſeems to be a Diminutive from *Fœnum*, Hay; becauſe, when wither'd and dry'd like Hay, it is in like manner repoſited againſt Winter. *C. B.* Others think it ſo called, becauſe when ſown it returns the Seed *magno cum Fœnore*, with vaſt Intereſt. *Marathron*, *μάραθρον*, *ἀπὸ τῦ μαραίνεσθαι*, from withering, becauſe, when dry and wither'd, it is much us'd in ſeaſoning a great Variety of Things.

In putrid Fevers, attended with a Malignity, we ſhall hardly find a Plant more aperitive and diſcuſſive, by means of Sweat, than Fennel; whence nothing can be more proper in the Small-pox and Meaſles, than a Decoction of the Herb, or its Seeds or Roots. *Sim. Pauli.*

The Seeds, taken in Powder every Morning, faſting, with Sugar, wonderfully ſharpen the Sight. The dry'd Seeds, infus'd in Vinegar, with an equal Quantity of Cinnamon, and an Addition of Sugar, is an excellent Preſervative of the Sight, and reſtores it when weak, or decay'd through Age; ſo that Perſons eighty Years old, and quite dim, have, by means hereof, recovered the Uſe of their Eyes, to a Degree almoſt incredible. *Arnaldus de Villa nova.* Inſtead of Sugar, it would perhaps be more convenient to make uſe of Honey. Nothing is more effectual for Dimneſs of Sight than Fennel-ſeed, ſays *Tragus.* Of the ſame Efficacy is the Juice of the Flowers or Root, or the diſtil'd Water, dropped into the Eyes.

Beſides, the Seed corroborates the Stomach, and cures a Nauſea, or Loathing. *C. Hoffman* aſſerts, the Seed or green Herb of other Plants, are ſo far from promoting Concoction, that they rather hinder it. What has been ſaid is ſpoken of the dry Seed, which is alſo a noble Carminative, according to the well-known Verſe,

Semen Fœniculi reſerat Spiracula Culi:

The Seed of Fennel forces Vent for Winds below:

And, mix'd with other Pectorals, gives Relief under an Aſthma, and is alſo an Alexipharmac. The Leaves, boiled in Barley-water, increaſe Milk in Nurſes; and a Decoction of the Leaves or Seed eaſes the Pains of the Kidneys, provokes Urine, and expels the Stone. The Roots provoke the Menſes, and are ſuppos'd to open Obſtructions of the Liver and Spleen, and to cure the Jaundice. The whole Herb, boiled in Broth and Soops, is accounted good to extenuate an exceſſive Fatneſs and Obeſity of Body. The *Italians* and Inhabitants of *Languedoc* and *Provence* make the tender Shoots with a Bit of the upper Part, whence they ſpring, ſeaſon'd with Oil and Pepper, ſerve at a ſecond Courſe at Table, inſtead of ſweet Smallage. It is uſual with us to put the Leaves, cut ſmall, into Vinegar, as Pickle for boil'd Fiſh, as Salmon, Pike, Sturgeon, and others.

For a Quartan and other Fevers, take of the Juice of the Root of Fennel, four Ounces; ſweeten it with Sugar; and let the Patient drink it, for ten Days together, in the Morning, faſting. *Zacutus*, who ſays it mightily provokes Sweat, to thoſe who are well cover'd in Bed, to others, Spitting of viſcous Phlegm, and, to others, fetid Eructations, or Diſcharges of Wind downwards, calls it an eaſy, but uſeful Remedy.

Joannes Crato, Phyſician to the Emperor of *Germany*, ſaw a Monk, who was cur'd by his Tutor, in nine Days, of a Cataract, by only applying the Roots of Fennel, boiled in Wine, with the Decoction, to the Eyes.

A Woman, feeling her Child deſcend to the Pecten before the due Time, with other Signs of Abortion, applied a Cataplaſm prepar'd of toaſted Bread, with Vinegar, and the Powder of Fennel-ſeeds, to the fore Part of the Belly, under the Navel, and behind alſo as far as the *Os ſacrum*; by which means all the Symptoms were immediately remov'd; for Fennel is excellent for preventing Abortions. *Ray, Hiſt. Plant.* 457.

Officinal Preparations are a ſimple Water from the Leaves, and a diſtil'd Oil from the Seeds. *Miller's Bot. Offic.*

The Steam of the Decoction of Fennel excellently cleanſes the Eyes, and ſtrengthens the Sight. 'Tis, alſo, highly beneficial in Diſeaſes, as we are inform'd by *Gabelchoverus Centur.* 1. *Curat.* 60. *in Aunotat.* A Decoction of this Plant is alſo ſerviceable, in increaſing the Quantity of Milk in Nurſes, as we are told by the ſame Author, *Centur.* 6. *Curat.* 86.

Hoffman de Præſtantia Remediorum Domeſticorum.

2. Fœni-

Oxon.* 3. 270. *Raii Hiſt.* 1. 458. *Fœniculum dulce Majori & albo Semine.* J. B. 3. 4. Tourn. Inſt. 311. Elem. Bot. 260. Rupp. Flor. Jen. 224. Chab. 381. SWEET FENNEL.

The ſweet Fennel grows not ſo tall as the common, otherwiſe they are much alike ; the main Difference being in the Seed, which is longer and narrower, not ſo flat, but for the moſt part ſomewhat crooked, of a yellower Colour, and of a much ſweeter Taſte. The Seed is brought to us from *Germany*, and is much of the Nature of the common Sort ; but is accounted better, and is therefore more us'd in the Shops ; though *Parkinſon*, upon his own Experience, prefer'd the Seed of the common Fennel before this. *Millers Bot. Offic.*

It agrees in Virtues with common Fenel.

5. Fœniculum ; ſylveſtre. C. B. P. 147.

6. Fœniculum ; ſylveſtre ; glauco folio. T. 311.

Oxon. 3. 273. FRENCH HARTWORT.

It is cultivated in the Gardens of Botaniſts, and flowers in *Auguſt*. The Part us'd is the Seeds, which are white and ſtriated, of an aromatic Taſte, attended with ſomewhat of Acrimony. They are hot and dry, provoke Urine and the Menſes, and enter the Compoſition of the *Theriaca Andromachi*.

FOENICULUM *Sylveſtre*. A Name for the *Seſeli* ; *perenne* ; *folio glauco breviori* ; and for the *Seſeli* ; *perenne* ; *folio glauco longiori*.

FOENICULUM *Alpinum*. A Name for the MEUM.

FOENICULUM *Porcinum*. A Name for the *Peucedanum, Germanicum*.

FOENIX *vel* PHÆNIX, the Son of one Day, the Philoſophers Stone. *Rulandus*.

FOENUM BURGUNDIACUM. A Name for the *Medica* ; *major* ; *erectior* ; *floribus purpuraſcentibus*.

FOENUM GRÆCUM.

The Characters are ;

It has a flat Pod, ſhap'd like a Horn, and generally full of Rhomboidal or Kidney-ſhap'd Seeds, mark'd with a hollow Line reaching from Corner to Corner.

Boerhaave mentions ſeven Species of this Plant ; which are,

1. Fœnum Græcum ; ſativum. *C. B. Pin.* 348. *Park. Theat.* 1096. *Hiſt. Oxon.* 2. 166. *Rupp. Flor. Jen.* 213. *Tourn. Inſt.* 409. *Elem. Bot.* 326. *Boerh. Ind. A.* 2. 32. *Fœnum Græcum.* Offic. Ger. 1026. Emac. 1196. Raii Hiſt. 954. Chab. 167. *Fœnugræcum.* J. B. 2. 365. FENUGREEK. *Dale, p* 227.

Fenugreek is one of the trifoliated leguminous Plants, growing a Foot or two high, having the Stalks ſet alternately with Leaves like Trefoil, round-pointed, and a little indented about the Edges : The Flowers grow ſingly with the Leaves, and are white and papilionaceous, much leſs than the Bloſſom of a Pea ; theſe are ſucceeded by very long ſlender Pods, ſomewhat flat and full of yellow hard ſquare Seed, of a very ſtrong unpleaſant Smell. The Root is ſmall, and periſhes every Year ; it is ſown in ſeveral Parts beyond Sea, for the ſake of the Seed, which comes from *Germany*, and is the only Part us'd.

It is rarely given inwardly, but is us'd in Fomentations, Baths, Cataplaſms, and emollient Glyſters ; being ripening, diſſolving, anodyne, and good for all kind of Tumors and Swellings, to which Purpoſes the Farina, or Powder, in very effectual.

Fenugreek is ſown in many Places, but I know not any where it grows ſpontaneouſly. The farinaceous Subſtance of the Seed, which is the only Part in Uſe, is emollient, digeſtive, maturating and diſcutient, and alſo paregoric ; it is of ſo great Service in Medicine, that Surgeons very rarely prepare a Cataplaſm, for any of the aforeſaid Intentions, without a Mixture of Fenugreek, or its Mucilage. It is a common Ingredient in emollient Clyſters ; for by its mucilaginous Subſtance it blunts the Acrimony of the Humours, and covers over the Eroſions of the Inteſtines with its ſlimy Parts. Its Mucilage is alſo of Service in diſcuſſing the Marks of Sugillations about the Eyes, being thereto apply'd. The Antients held the Decoction to be effectual in very many Diſorders incident to Women.

For the SCIATICA,

Take of Fenugreek boiled in Hydromel to a Diſſolution, a ſufficient Quantity ; bruiſe it, and boil it again with Honey ; then ſpread it upon a Cloth, and apply it to the Part : It gives immediate Relief under this Diſtemper as well as the Gout, and all Pains of the Joints, as we are told by *Bayrius*. This Preſcription was communicated to Mr. *Ray* by Dr. *Hulſe*.

Fenugreek, we are well aſſured, is an excellent Ophthalmic ; and I have obſerv'd a Sugillation in the Adnata Tunica of the Eye, which a Boy had contracted in a violent Fit of the Epilepſy, quite remov'd, after taking a Purge of Sena-leaves, with a very ſmall Quantity of the Root of Mechoacan, in three Days, by Help of the following Preſcription : Take of the Pulp of ſweet Apples, of the Conſiſtence of a Poultis, boiled in a ſufficient Quantity of Water of Fennel, and Vervain, half a Pound ; ſhake it well, in a new Hair-ſieve ; then add, of Mucilage of Fenugreek, extracted by Roſewater, one Ounce ; Lapis Hæmatites, finely levigated, one Dram ; Camphire, and Tutty prepared, one Scruple ; Bole Armoniac, a ſmall Quantity, and Roſe-water, as much as is ſufficient : Make them into an Epithem for the Eyes. The Flour of Fenugreek, mixed with the Juice of Apium, is proper to be apply'd to cold Tumors of the Breaſts. *Ray's Hiſt. Plant.*

Fenugreek, and its Flour, are of an emollient and diſcuſſive Quality ; triturated, and made into a Cataplaſm with Hydromel boiled, they are effectual againſt internal, as well as external Inflammations. Made into a Cataplaſm, with Nitre and Vinegar, they extenuate the Spleen. The Decoction of Fenugreek, us'd by way of Inſeſſion, is effectual in Female Diſorders proceeding from an Inflammation or Obſtruction of the Uterus. The Cremor of the ſame, boiled in Water, cleanſes the Hair, and abſterges Scurf, and Achors ; made into a Peſſary with the Fat of a Gooſe, it mollifies and dilates the Parts about the Region of the Uterus. The green Herb, us'd with Vinegar, is accommodated to ſuch Parts, as are relaxed and exulcerated. The Decoction is good for the Teneſmus, and the Dyſentery accompany'd with fetid Diſcharges ; and the Oil of Fenugreek, with Myrrh, cleanſes the Hair, and obliterates the Marks of Cicatrices in the Pudenda. *Dioſcorides, Lib.* 2. *Cap.* 124.

2. Fœnum Græcum ; ſylveſtre. *C. B. P.* 348. WILD FENUGREEK.

6. Fœnum Græcum ; ſylveſtre ; πολυκερατιον ; minus ; Monſpelienſe. *Breyn. Cent.* 1. 79. *Ic.* 80.

7. Fœnum Græcum, corniculis reflexis, minus ; & repens. See ALCHIMELECH. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 32.

FOETABULUM. A Term coined by *M. Aurelius Severinus, Lib. de Abſceſſ. in Animal.* to ſignify an Abſceſs with a Bag, or Cyſtis : He thought this Word *Fœtabulum* more proper to expreſs the firſt Generation of ſuch Abſceſſes, than *Germen*, becauſe they are produced only in Animals, whereas *Germen* rather belongs to Vegetables. *Caſtellus*.

FOETUS. The Young of all viviparous Animals, whilſt contain'd in the Womb, and of oviparous Animals, before they are hatch'd, are call'd by this Name. The Name has alſo been transfer'd by Botaniſts to the Embryos of Vegetables.

In the *Edinburgh* Medical Eſſays, *Vol.* 2. *p.* 172. there is a Diſſertation on the Nutrition of the Fœtus in the Womb.

FOLIACEUM ORNAMENTUM. A foliaceous or fringed Subſtance at the Extremity of the *Tubæ Fallopianæ* ; which receives the Egg as it deſcends from the Ovary, and tranſmits it to the Uterus.

FOLIATA TERRA. Sulphur perfectly prepared by Mundification, Purification, and Dealbation. *Theat. Chym. Vol.* 4. *p.* 720. At preſent the eſſential Salt of Tartar, and the *Arcanum Terræ foliatæ Tartari* of the Chymiſts, paſs under this Name, and are highly extol'd, tho' nothing elſe but Tartar regenerated. See TARTARUS.

FOLIATIO, Foliation, is one of the Parts of the Flower of a Plant, being a Collection of thoſe fine-colour'd Leaves, which conſtitute the Compaſs of the Flower. *Miller*.

FOLIATUM, φωλιατον, was a precious Ointment for the Stomach and Head, only in Uſe among the Rich at *Rome* : It was alſo called *Spicatum*, σπικατον. *Galen, de C. M. S. L.* and *de C. M. P. G.*

FOLIUM,

FOLIUM, φύλλον, a Leaf. See the Article BOTANY.

FOLIUM INDUM. See MALABATHRUM.

In the Spagiric Language *Folia* ſignifies pure, and ſeparated from Droſs: Hence, when a Spagiriſt ſays, *Vertite Aurum in Folia*, "Turn ye Gold into Leaves," he means as much as to ſay, Diſſolve it into Liquor, that the Soul may be ſparingly extracted, which Soul is tingent Sulphur. *Folium* is alſo a Name for the Philoſophers Stone, in *Theat. Chym. Vol. 4. p.* 772. Again, *Folium*, with ſome Anatomiſts, is that triangular membranaceous Sinus, where there is a Concourſe of the ſagittal and coronal Sutures in Infants; and laſtly, *Arnaldus de Villa nova* gives the Name of *Folium* to a relaxed Uvula. *Caſtellus.*

FOLLICULUS, in Botany is the thin Involucrum, or membranaceous Cover incloſing the Grains or Seed of a Plant: *Folliculus*, in Surgery is the Bag, or Cyſtis, reſembling a Membrane, which contains the Matter of anomalous Abſceſſes; ſuch as the *Steatoma*, *Atheroma*, and *Meliceris*, of which in their proper Places.

Folliculus Fellis is the Gall-bladder.

FOLLIS, in Anatomy, means the ſame as the preceding Word.

FOM. Sound, or Voice. *Rulandus.*

FOMENTATIO. The ſame as FOTUS.

FOMENTUM is us'd in the ſame Senſe as FOTUS.

FOMES, ἴναυσμα, ζέπυγον, Fewel, in a medicinal Acceptation, is the internal or antecedent Cauſe, which foments and continues the Diſeaſe. *Galen.*

FONS, πηγή, Fountain, has various Significations in Medicine. *Hippocrates*, *Lib.* 4. *de Morb.* calls Blood, Bile, Phlegm, and Water, the four Fountains of the Body: So the *Fontes Signorum*, "the Fountains of the Signs," are thoſe Things, or Circumſtances, from which the Signs of Health or Diſeaſes may be collected: The three Heads from whence Remedies may be derived, have alſo the Name of *Fontes*, or Fountains, given them; as *Fons Diæteticus*, *Pharmaceuticus*, & *Chirurgicus*, "the diætetic, pharmaceutic, and "chirurgic Fountains." In Anatomy, that membranous Part which is found in new-born Infants at the coronal and ſagittal Commiſſures, and which, in Length of Time, hardens into a Bone, tho' of a thin Subſtance, is call'd by ſome *Fons pulſans*, or *pulſatilis*, by others *Fontana* and *Fontanella*. Among the Chymiſts Mercury is honour'd with the Title of *Fons Chymiæ*, "the Fountain of Chymiſtry." And the *Balneum Maris* or *Mariæ*, according to *Rulandus*, is the *Fons Philoſophorum*, "the Philoſophers Fountain."

FONTALE *acetoſum*, in *Paracelſus*, *Lib. de Tartar. Morb. Cap.* 16. means the ſame as ACIDULÆ.

FONTALIS *Raii*. A Name for the *Potamogeiton rotundifolium.*

FONTANELLA. An Iſſue. See CAUSTICA.

Fontanels are thoſe ſmall Ulcers made by Surgeons in various Parts of the Body, either for the Preſervation of preſent, or the Recovery of loſt Health. They are, by ſome, call'd *Cauteries*, though leſs properly, becauſe by that Word we generally underſtand either a red-hot Iron, or a corroding and cauſtic Medicine. Surgeons in this Operation ſeem to imitate Nature, who often ſpontaneouſly excites Ulcers of this kind, by which means the latent Corruption of the Body is eliminated, and Mankind freed from various Diſorders. The Parts of the Body in which Fontanels are moſt commodiouſly and moſt generally made, are, firſt, the ſuperior Part of the Head; ſecondly, the Neck; thirdly, the Arms, in which the Fontanel is to be made near the loweſt or extreme Part of the Deltoide Muſcle, and the Muſculus Biceps; for in theſe Parts Fontanels are at preſent generally made; fourthly, the lower Extremities, eſpecially that Part above the Knee, on the Inſide of the Thigh, where there is a Sinus, which may be perceiv'd by the Fingers; fifthly, and laſtly, the Part below the Knee, on the Inſide of the Leg, where a kind of Sinus is found, is generally a very proper Place for a Fontanel.

Though there are various Methods of making a Fontanel, yet there is generally none more expeditious, than, after the Part is mark'd with Ink, and the Skin rais'd by the Fingers both of the Surgeon and an Aſſiſtant, with a Knife to make an Inciſion capable of commodiouſly admitting a Pea. When the Pea is introduc'd, a Plaiſter is to be apply'd over it, and ſecur'd with a Bandage; and nothing more is requiſite, in order to making the Fontanel, which, when united, and cleans'd every Morning and Evening, is to have a freſh Pea put into it, and the Plaiſter and Bandage is then again applied; by which means it will, in a few Days, become a ſmall Ulcer, from which a purulent Humour is daily diſcharg'd; and this Humour ought to be carefully wip'd away with a clean Linen Cloth at every Dreſſing.

Another Method of making Fontanels is to open the Skin by means of a red-hot Iron. But, leſt this Iron ſhould ſtrike a Terror into Patients, eſpecially Women and Children, it is expedient to conceal it in a Caſe (ſee *Tab.* XXXIII. *Fig.* 8. A). The Caſe B B is ſo to be applied to the Part in which the Fontanel is to be made; that, by depreſſing the Plate C, the red-hot Iron, contain'd in the Caſe, may be forcibly applied to the Body. After this, the cauteriz'd Part is anointed with Baſilicon, or freſh Butter, and cover'd with a Plaiſter, till, after repeating this Dreſſing every Day, the Cruſt falls off; and then the Ulcer left is to have a Pea put into it, and treated in the Manner already directed. Though this antient Method of making Fontanels may ſeem uneaſy and cruel to the Patient, yet it is highly efficacious, ſince the intenſe Pain, created by it, muſt neceſſarily produce a great Revulſion; but delicate Patients will rarely ſubmit to this Method.

The third Method of making Fontanels is by means of corroſive or cauſtic Medicines. In order to this, a Plaiſter, perforated in the Middle, as in *Tab.* XXIII. *Fig.* 11. is ſo laid on the Part intended, which is to be mark'd with Ink, that the Perforation in the Middle, which ought to be as large as a Pea, may correſpond to the Part mark'd. Then the Part of the Skin, appearing through the Perforation, is to be cover'd with ſome proper ſolid Cauſtic, which, leſt it ſhould fall off, is to be cover'd with Lint, or a ſmall Compreſs, over which is to be laid a pretty large Plaiſter; and, above all, a Compreſs and Bandage are to be applied. Then the Patient is order'd to be kept in a State of Reſt, and this Dreſſing is left on for ſix or eight Hours, according as the corroſive Medicine requires more or leſs Time to operate on the Part. Then, removing the Dreſſing, a certain Cruſt is found on the Skin, which is to be treated in the Manner before directed.

But, in whatever Manner the Fontanel is made, the Dreſſing is to be renew'd once a Day, and if, in the Summer-time, much Pus is diſcharg'd, twice; for a freſh Pea, after the former is taken out, ought always to be put in, and a freſh Plaiſter apply'd, almoſt as large as the Palm of one's Hand; or, inſtead of a Plaiſter, a Piece of Paper, or Silk, cover'd with Wax, or a Leaf of Ivy, which muſt be ſecur'd with a Compreſs and Bandage. But Linen Bandages are, for this Purpoſe, far leſs commodious than thoſe made of Leather or Braſs Laminæ, ſo contriv'd with Claſps, or Strings, that the Patient may himſelf apply them, without any Trouble. The beſt Machine for this Purpoſe ſeems to be that delineated in *Tab.* XXXIII. *Fig.* 9. The Letters A A repreſent a Thong of Leather, B a ſmall Hook of Metal, C a Plate made of Braſs or Copper, with various Perforations for receiving the Hook. We muſt alſo obſerve, that ſome, inſtead of Peas, put ſmall Silver or Wooden Balls into their Fontanels; but there ſeems to be little or no Difference betwixt the one and the other. The Fontanel is to be kept open, till the Diſorder, for the Removal of which it was deſtin'd, is cur'd: And, in Patients who have labour'd under any inveterate Diſorders, it is to be kept open till the very Day they die, leſt their former Misfortune ſhould return: Or, if a Diſorder, formerly cur'd, returns, which ſometimes happens, the Fontanel is to be made again.

The principal Uſe of Fontanels ſeems to be either to mitigate, or remove, various Diſorders of the Head, Eyes, Ears, Teeth, Breaſt, and other Members, together with ſciatic Pains. And as theſe Uſes of Fontanels are of the greateſt Importance, ſo various Authors have treated profeſſedly of them: Nor are we to regard the Opinion of *Helmont*, who, with ſome others, affirms, that Fontanels are of no other Uſe but to torment the Patient. I cannot, indeed, deny, that in ſome Men Fontanels are made to no manner of Purpoſe; but, as ſoon as this is perceiv'd, it is expedient to conglutinate the Ulcer. Nor is it to be forgot, that, in violent and obſtinate Diſorders, there ought to be two Fontanels, one in each Leg or Arm; or one in one Arm, and one Leg; or in one Arm or Leg, and in the Neck; that, by this means, the peccant and corrupted Humours may be the more eaſily and expeditiouſly eliminated.

When, by means of Fontanels, the Patient is recover'd, or when other Circumſtances indicate their Conglutination as proper, the Pea, or ſmall Ball, is to be taken out, and the Fontanel will ſoon ſpontaneouſly be heal'd. It ſometimes happens on this Occaſion, that proud and fungous Fleſh ariſes in a Fontanel; but it may be ſoon remov'd by ſprinkling a little of the Powder of burnt Alum, or black Hellebore, upon it. It is, alſo, to be obſerv'd, that, when, in old Perſons, Fontanels ſtop, and the Lips of the Ulcer become dry, livid, or black, it is often a Sign, that ſome violent Diſorder, or, perhaps, Death, is approaching. Hence, proper Remedies are quickly to be exhibited, in order to ward off the impending Misfortune. *Heiſter. Chirurg.*

The METHOD *of making* ISSUES *in the* CORONAL SUTURE.

Fontanels are, ſometimes, cut on the Top of the Head, where the coronal and ſagittal Sutures join. This Operation is not ſo frequently perform'd in *Germany*, as in *Italy* and *Holland*: And, though many Surgeons are of Opinion, it is of no Service, ſince nothing can be extracted from the Inſide of the Head; yet there are ſome, and thoſe Men of Experience and Probity, who eſteem it a noble and efficacious Remedy. And

it muſt be confeſs'd, that it is frequently very beneficial in the Head-ach, Vertigo, Epilepſy, Dimneſs of Sight, Defect of Memory, and many other Diſeaſes of the Eyes and Head.

For diſcovering the proper Place for theſe Fontanels, the Antients ſhav'd the Head; then laid a double String upon the Middle of it, and extended one from the Noſe to the Neck, and the other from the Middle of one Ear to the Middle of the other; for where theſe two Threads croſs in the Vertex, there is the Juncture of the coronal and ſagittal Sutures, and the propereſt Place for this Operation. But this Method is ſo far from being exact, that it ſometimes deceives; for the Juncture is different in different Men. Nor is it very material, whether the Iſſue be cut in or near the Juncture, or in the ſagittal Suture; ſince the Diſcharge does not proceed ſo much from the inclos'd Brain, as the Antients ſurmis'd, as from the external Integuments of the Cranium. They were, likewiſe, miſtaken, in thinking that Part of the Cranium, where the Sutures join'd, thinner and more perſpirable; for though there is often an Aperture of that Part in Infants, (call'd *Fontanella*) yet the Bones, gradually concreting, often render it, in Adults, of the ſame, and, ſometimes, a greater Thickneſs than any other; yet this Opinion, however erroneous, of the Antients, ſeems to have been the Reaſon of their making Iſſues in this Part. The Sutures, and their Junctures, are not eaſily diſcover'd without an intimate Acquaintance with the Heads of Skeletons, and an Application of the Fingers to the Patient's Head who is to undergo the Operation; for moſt Men have a Depreſſure, or a Prominence, in that Part where the Sutures meet; and this is the moſt commodious Place for your Purpoſe.

To render this Remedy more effectual, the Iſſue is generally made with a Cautery. Firſt, the Head is ſhav'd; and, after having diſcover'd the Commiſſure of the Sutures, that Place is cauteriz'd to the very Cranium. The Inſtrument for this Operation is either ſimple, as that deſcrib'd by *Meekren* and *Decker* (ſee *Tab.* XXIV. *Fig.* 9.); or furniſh'd with little Tubes, as that repreſented *Tab.* XXXVI. *Fig.* 1. and 2. from *Aquapendente*. To prevent the Cautery from being extinguiſh'd; before it has reach'd the Cranium, ſome make an Inciſion into the Skin, either rectilinear, as *Celſus* did, or tranſverſe; and, opening the Lips of the Wound, firſt lay the little Pipe (*Fig.* 2.) upon the Cranium; then through that preſs the Cautery, till the Bone is ſufficiently burn'd. When the Aperture is perfected, they put in a Pea with a digeſtive Ointment, and upon that a Plaiſter, ſquare Compreſs, and the four-headed Bandage; for the reſt, proceed as directed above, with reſpect to Iſſues in other Parts.

In order to account for the Efficacy of theſe Fontanels in the Cure of many violent Diſorders of the Head, we muſt obſerve, that the Burning, though it does not, perhaps, extract the malignant Humours, through the Cranium, out of the Brain, yet the Pain, occaſion'd by it, diſpels or removes them in an Inſtant, by cauſing a ſtrong Revulſion. For further Proof of their Efficacy, ſee *Marc. Donatus, Lib.* 2. *Hiſt. Miral. Cap.* 4. *M. A. Severinus Pyrot. chirurg. Lib.* 2. *Pars* 1. *Cap.* 6. *Riverius, Cent.* 11. *Ob.* 93. *Aquapend. Operat. Chirurg. Cap.* 1. *Claudini Reſponſ. de Cauterio in Sutura Coronali.*

See alſo *Frederic Hoffman's Diſſertatio de Veſicantium & Fonticulorum circumſpecto in Medicina Uſu*, in the ſixth Volume of the folio Edition of his Works, *Genev.* 1640. *p.* 67.

FONTANELLA, alſo, imports the quadrangular Aperture found betwixt the Os Frontis and Oſſa Sincipitis in Children juſt born, which is alſo call'd *Fons Pulſatilis.*

FONTICULUS, in Surgery, is the ſame as FONTANELLA.

FONTINALIS. A Species of Moſs, deſcrib'd under the Article BOTANY.

FORAMEN. A Perforation, is an open Place, ſo call'd *a forando*, from boring or piercing, the Way by which it is uſually effected. *Foraminulentum Os* is the Os cribriforme, or ethmoides. *Caſtellus.*

FORBICIN, an Inſect, the ſame as FORFICULA; which ſee.

FORCEPS. The Name of a well-known chirurgical Inſtrument, of which there are many Sorts, adapted to various Operations. Their Uſes are to lay hold of any thing, and extract it from the Body. In Mechanics they are call'd *Pincers*, or *Tongs.*

FORFEX, in Surgery, is a Pair of Sciſſars.

FORFICULA, *Auricularia, Mordella, Vellicula*, an Earwig. This Inſect inſinuates itſelf into the Ear, and bites or pierces the Place where it fixes, cauſing much Pain, ſo that the Brain ſometimes is offended thereby; it lodges itſelf alſo in other ſinuous Parts of the Body, where it acts in the ſame manner, but with leſs dangerous Effects than in the Ear. It contains a good Quantity of volatile Salt and Oil.

They make an Infuſion of theſe Inſects in Oil, which is afterwards boil'd, in the ſame manner as when they prepare Oil of Worms. Oil of Earwigs is good to ſtrengthen the Nerves under convulſive Motions, by rubbing it on the Temples, Wriſts, and Noſtrils. Theſe Inſects, being dry'd, pulveriz'd, and mix'd with the Urine of a Hare, are eſteem'd to be good for Deafneſs, being introduc'd into the Ear. *Lemery des Dregues.*

When this Inſect gets into the Ears, a ready way to extract it is, to lay the Patient on the oppoſite Side, and to pour warm Water into the affected Ear; after which, you will ſoon ſee the Earwig floating on the Water.

FORMA, the Form, in the Senſe of the Chymiſts, as they would explain themſelves, is either the Spirit of the World, by which natural Bodies are produc'd, or the generative Virtue which is in Things, by which they are enabled to produce their Like: Thus the *Form* of Man lies in Man, and no other Being; the *Form* of a Tree in a Tree; the *Form* of Metal in Metal; and ſo of other Things. The *Forms* of Things, as *Rulandus* ſays, are the celeſtial Influences communicated from ſuperior to inferior Things; the occult Power, Force, and Virtue, of every thing. The Term *Forma* is alſo often us'd by the Chymiſts inſtead of *Quinta Eſſentia*, as well as for the outward Form or Figure of any thing. *Caſtellus.*

FORMATUS, form'd, is an Epithet apply'd by *Bohnius, Circul. Anat. Phyſ.* to the Muſcles properly ſo call'd, by way of Diſtinction from the *Nonformati*, or *Informes*: By the firſt, he means all the carneo-tendinous Parts, which always paſs'd among Anatomiſts under the Name of Muſcles; by the latter, we are to underſtand carneo-fibrous Contextures; for Inſtance, the Membranes, eſpecially thoſe of the middle Parts of the Body, as of the Stomach, Inteſtines, and the like. *Caſtellus.*

FORMICA, Offic. Ind. Mod. 52. Jonſ. de Inſect. 85. Mer. Pin. 202. Mouff. 238. Aldrov. de Inſect. 517. Charlt. Exer. 51. Jonſ. de Inſect. 85. Raii Inſect. 69. *Formica minor*, Schrod. 5. 341. THE ANT.

It is a ſmall, oblong, red, or blackiſh Inſect, arm'd with a Sting, and living in Swarms; the Male is wing'd, the Female deſtitute of Wings; the Animal, and its Eggs, are in Uſe.

Ants heat and dry, and incite to Venery; their acid Smell mightily refreſhes the vital Spirits. They are ſaid to cure the Pſora, Lepra, and Lentigo. The Eggs are effectual againſt Deafneſs, and correct the Hairineſs of the Cheeks in Children, being rub'd thereon. *Dale* from *Schroder.*

FORMICA MAJOR, Offic. Aldrov. de Inſect. 517. *Formica major Herculeana, ἱππομύρμηκες*, Charlt. Exer. 57. *Formica alata, ἱππομύρμηκες, Ariſtoteli*, Ejuſd. *major Ariſtoteli ἱππομύρμηκες*, Jonſ. de Inſect. 85. *Hippomyrmaces*, Raii Inſect. 70. THE HORSE ANT.

The Inſect provokes to Venery, and the Oil thereof, by Infuſion, is good for the Gout and Palſy. *Dale.*

In the Philoſophical Tranſactions, I meet with the following Account of Ants:

There are three Sorts of Ants, as the black, dark-brown, and philemort; each Kind inhabit by themſelves in their ſeveral Banks, two Sorts ſeldom or never being found together.

Mr. *Ray* ſays, that Dr. *Huiſe*, in *Auguſt* 1670. ſent him theſe Obſervations: "Make bare an Ant-hill with a Stick, and "then caſt Succory-flowers upon it, and you ſhall ſee the "Ants creep very thick over them; now, as they creep, they "let fall a Drop of Liquor from them; and, where that "chanceth to light, there you ſhall have, in a Moment, a "large red Stain. Sometimes they will be a pretty while "before they diſcolour them; and, at other times, they will "do it ſuddenly. At the firſt, I gueſs'd, that, being vex'd "by ſtirring their Hill, they might thruſt their Stings into the "Flowers, and thorough them convey that ſharp Liquor; "but, by bruiſing them, and rubbing the expreſs'd Juice againſt "the Flowers, I find they will be equally ſtain'd. 'Tis a "Thing well known, that Ants, if they get into Peoples "Clothes, and ſo to their Skin, will cauſe a Smart, or Tingling, as if they were ſtung with Nettles; which I conceive "is done by letting fall the fore-mention'd corroſive Liquor, "rather than by ſtinging.

"To what Sort of Liquor to refer this Juice, I know not. "I dropt Spirit of Salt, and Oil of Sulphur, upon the Flowers; "but they did not cauſe them to change Colour. I alſo put "Salt of Tartar upon them, and dropt thereon a little Spirit of "Salt; which cauſed a ſufficient Fermentation, but prevailed "not to change the Colour of the Flowers in the leaſt.

"This Obſervation holds true, not only in Succory-flowers, "but alſo Larkſpur, Borage, and all others of a blue "Colour."

Some Years ſince, Mr. *Sam. Fiſher*, of *Sheffield*, made me acquainted with theſe Experiments. "If with a Staff, or "other Inſtrument, you ſtir an Heap of Ants, (eſpecially "Horſe Ants) ſo as to anger them, they will let fall thereon "a Liquor, which, if you preſently ſmell to, will twinge the "Noſe like newly-diſtil'd Spirit of Vitriol.

"A weak Spirit of Piſmires will turn Borage-flowers red in "an Inſtant; Vinegar, a little heated, will do the like. "Piſmires, diſtil'd by themſelves, or with Water, yield a

"Spirit,

" Spirit, like Spirit of Vinegar, or rather like the Spirit of " Verdegriſe: Lead, put into this Spirit, or fair Water, with " the Animals themſelves being alive, maketh a good Sugar " of Lead: Iron, put into the Spirit, affords an aſtringent " Tincture; and, by a Repetition, a Crocus Martis. Take " Sugar of Lead thus made, and diſtil it, and it will afford " the ſame acid Spirit again; which the Sugar of Lead, made " with Vinegar, will not do, but returns an inflammable Oil " with Water, and nothing that is acid. Sugar of Lead, made " with Verdegriſe, doth the ſame (in this reſpect) with that " made with Spirit of Piſmires. When you put the Animals " into Water, you muſt ſtir them to make them angry, and " then they will ſpirt out their acid Juice. No Animal that " we ever diſtil'd, (he ſpeaks of his Brother and himſelf) " except this, yields an acid Spirit, but conſtantly an urinous " one; and yet we have diſtil'd many, both Fleſh, Fiſh, and " Inſects."

In Dr. *Hulſe*'s Account, where he ſaith, that Spirit of Salt, and Oil of Sulphur, dropt upon Succory-flowers, did not cauſe them to change Colour, it is to be underſtood of the Flowers, entire and unbruis'd; for any blue Flowers, being a little bruis'd, and then a Drop of Spirit of Salt, or any other acid Spirit, let fall thereon, will turn inſtantly red. The Reaſon is obvious; for that the Leaves of the Flowers (as all the other Parts of the Plant) being inveſted with a Skin or Membrane, the Liquor dropt thereon cannot eaſily penetrate it, and ſo mix itſelf with the interior Juice or Pulp. Hence it is, that if theſe Flowers be put into cold Vinegar, eſpecially if the Weather be cool, they will not change Colour for a conſiderable time; but, if you heat the Vinegar, they will change immediately. *Phil. Tranſ. Abr. Vol.* 2.

FORMICA, alſo, ſignifies a kind of black Wart, with a broad Baſe, and cleft Superficies, call'd likewiſe *Myrmeciæ*. Beſides theſe Significations of *Formica*, certain ſmall varicoſe Tumors on the *Anus*, and *Glans Penis*, and the *Herpes Miliaris*, are call'd by this Name.

FORMICANS, *μυρμηκίζων*, formicating, an Epithet beſtow'd by *Galen* on an unequal Kind of Pulſe, the loweſt and weakeſt of all Pulſes, and reſembling the creeping Motion of Ants, being no other than a lower Degree of the vermiculating Pulſe, and proceeding from an extreme Languiſhment of the vital Flame, and Imbecillity of the Syſtole of the Heart. *Galen, de Pulſ. ad Tyron. Cap.* 8. *& de Diff. Pulſ. Lib.* 1. *Cap.* 26, 27.

FORMICATIO, Formication, is a Senſation in any Part, reſembling the creeping of Ants thereon.

FORMIX. The ſame as *Noli me tangere*, *Herpes Eſthiomenos*, or *Lupus*. See HERPES and ULCUS.

FORMULA. A technical Term, ſpoken of the Conſtitution of Medicines, whether ſimple or compound, both with reſpect to their Conſiſtence and Deſcription. *Paracelſus* calls red and clear Urine *Formula Urinæ*. *Morellus* wrote a Treatiſe expreſly on the Forms, or Formules, of Medicines; and *Gaubius* has lately done the ſame.

FORNACEÆ TESTÆ, *ὄστρακα τὰ ἐξ ἰπνῶν*. Bricks or Tiles us'd in the Structure of Furnaces, Stoves, or Chimnies, being heated to a great Degree are good Eſcharotics, and, rub'd with Vinegar, cure Itchings, and exanthematous Eruptions. They give Relief alſo under the Gout; and, made into a Cerate, diſcuſs ſcrophulous Tumors. *Dioſcorides, Lib.* 5. *Cap.* 178.

FORNACUM *Terra*, *ἡ τῶν καμίνων γῆ*, the Earth of Stoves, Furnaces, or Chimnies, being heated to a Redneſs, work the ſame Effects as the Bricks or Tiles in thoſe Structures. *Dioſcorides, ib. Cap.* 178.

FORNAX, *κάμινος*, a Furnace, for chymical Purpoſes, is divided by *F. Hoffman*, and others, from *Geber*, into ſeven Kinds; which are, the *calcinatory*, *ſublimatory*, *diſtillatory*, *deſcenſory*, *fuſory*, *ſolutory*, and *fixatory*; according to the ſeveral Operations perform'd in them, of which an Account may be found under their proper Articles.

FORNIX. A Part in the Brain. See CAPUT.

FORPEX, for FORFEX. *Caſtellus.*

FOSSA, in Anatomy, is the interior Cavity and *Rima magna* of the *Pudendum Muliebre*, which appear on a Separation of the Labia; by *Bartholine*, it is call'd *Foſſa navicularis.*

FOSSIO, Digging, is reckon'd by *Galen de San. tuend.* among the more violent Kinds of Gymnaſtics; and is eſteem'd the more wholſome Exerciſe, becauſe the Perſon employ'd therein, at the ſame time, ſucceſſively receives the kindly and beneficial Effluvia of the freſh and newly-open'd Earth.

FOSSULA. The ſame as BOTHRION, which ſee.

FOTUS. A Fomentation. A liquid *Epithem*, if apply'd hot, is the ſame as a Fomentation. It is generally apply'd to the Body by means of Stuphs, or doubled Flannels, wrung out of the Fomentation; but it is a neceſſary Caution, to expreſs out all the Liquor, provided it is extremely hot; otherwiſe it will ſcald the Part, raiſe Bliſters, and may be attended with ill Conſequences. It is alſo obſervable, that a certain Degree of Heat will diſſolve and diſſipate a Tumor; and a higher Degree of it will harden, and make it ſcirrhous. See EPITHEMA.

FOVEA, in Anatomy, is the Sinus of the Pudendum Muliebre; it is alſo the ſame as BOTHRION. *Fovea*, in *J. C. Claudinus*, *Appendic. de Ingreſſ. ad Infirmos*, is a particular little Vaporary, or Sudatory, for receiving only one, or both Legs, in order to ſweat; on which account it differs from the *Stupha*, which is ſpacious enough to receive one or more entire Bodies. *Caſtellus.*

FRACES are the preſſed Pulp, or the Subſtance, of the Olive.

FRACTURA, *κάταγμα*, a Fracture. See CATAGMA.

The different Species of Fractures, as diſtinguiſh'd by the Antients, are; (1.) The *Catagma raphanedon*, *κάταγμα ῥαφανηδὸν*, (from *ῥάφανος*, a Radiſh) a tranſverſe Fracture of a Bone through its whole Thickneſs, as we break a Radiſh; it is alſo called *Sicyedon*, *σικυηδὸν*, and *Cauledon*, *καυληδὸν*, from *σίκυος*, a Cucumber, and *καυλὸς*, a Stalk, becauſe they are broken in that manner. See CAULEDON. (2.) *Catagma Schedacedon*, *κάταγμα σχιδακηδὸν*, an oblong Fracture of a Bone. (3.) *Catagma ad Onycha*, *τὸ εἰς ὄνυχα*, or *καλαμηδὸν*; for which ſee CALAMEDON. (4.) *Alphitedon*, *ἀλφιτηδὸν*, or *Caryedon*, *καρυηδὸν*. See ALPHITEDON. (5.) *Catagma ſecundum Apothrauſin*, *& Apocopen*, *τὸ κατ' ἀποθραυσιν, ἢ κατ' ἀποκοπὴν*, " when by the " Fracture a Splinter or Fragment of a Bone is ſo broken off, " as to lie looſe on the Surface." See APOTHRAUSIS.

Fractures of the Cranium, obſerv'd by *Hippocrates*, *Lib. de Cap. Vuln.* are, (1.) *Regme*, *ῥαγμὴ*, the Fiſſure, which, when it appears very ſmall, and like a Hair, is called, by *Paulus*, *Trichiſmus*, *τριχισμὸς*, from *θρὶξ*, a Hair. (2.) *Phlaſis*, *φλάσις*, by *Galen* call'd *Thlaſis*, *θλάσις*, in which, ſays *Hippocrates*, there is a Colliſion or a Contuſion of the Bone, without either a Fiſſure or Depreſſion. (3.) *ἔδρα*, when the Inſtrument leaves a Mark or Impreſſion on the Bone; and this Species, if the Cranium be deeply penetrated, is call'd *διαχοπὴ* (ſee DIACOPE); if Part be cut off without a Diviſion, *ἐκκοπὴ* (ſee ECCOPE); if the Wound be inflicted as with an Ax, *ἀποσκεπαρνισμὸς* (ſee *Apoſceparniſmus*). (4.) *Apechema*, *ἀπήχημα*, or *Apochepema*, *ἀπεχόπημα*, call'd alſo *Xumphore*, *ξυμφορή*. See APECHEMA and CONTRAFISSURA. (5.) *Eſphlaſis*, *ἔσφλασις*, or *Engiſoma*, *ἐγγίσωμα*, which is divided into *Ecpieſma* and *Camaroſis*. See theſe four laſt Words under their proper Articles.

When a Solution of Continuity happens in a Bone, the Diſorder is by the *Latin* Writers call'd *Fractura*, and by the *Greeks*, as we learn from *Galen's Method. Medend. Lib.* 6. *Cap.* 5. *Κάταγμα*. In Cartilages, however, a Solution of Continuity has obtain'd no peculiar Denomination, but is comprehended under the general Name, Fracture; at leaſt, *Hippocrates*, in his Book, *de Articulis Text.* 48. when treating of a Fracture of the external Ear, which is totally cartilaginous, uſes the general Name Fracture, ſince his Words are, *ἢν δ' ὦς καταγῇ.*

It was not, however, cuſtomary among the Antients, to call every Solution of Continuity in a Bone, a Fracture, but only ſuch a Solution as was produc'd by external Violence, as *Paulus Ægineta*, in the 89th Chapter of his ſixth Book, tells us, in the following Words: " A Fracture, in general, is ſuch a Separa- " tion or Rupture of a Bone, as is made by external Force." For, by this Circumſtance, a Fracture is diſtinguiſh'd from a Caries of the Bone. Beſides, a Fracture is only ſaid to happen when the Parts of one Bone have their Coheſion deſtroy'd, in order to diſtinguiſh a Fracture from a Luxation, in which Bones naturally contiguous, are ſeparated. A Fracture is diſtinguiſh'd from a Contuſion, which ſuppoſes an Attrition of the Solids, by this Circumſtance, that the Bones are, in the former, divided into large Portions. Among the Antients, however, the Comminution of the Bones into the ſmalleſt Portions, was refer'd to Fracture, provided it was produc'd by external Force; and this Species of Fracture was call'd *ἀλφιτηδὸν*, as we learn from *Paulus Ægineta*, in the Part above-quoted.

Surgeons generally divide Fractures into three Species, or thoſe of the ſimple, compound, and complicated Kind. A ſimple Fracture is produc'd, when only one Bone is broken in one Part, without any conſiderable Injury done to the ſuperincumbent or adjacent Parts. But when ſuch a Fracture happens in thoſe Parts of the Body where two large Bones are contiguous to each other, in the *Cubit*, for Inſtance, when the *Radius* is broken whilſt the *Ulna* remains entire, this Species of Fracture is, by Surgeons, call'd incomplete, becauſe the Situation of the Parts is not much chang'd, and the Length of the Member remains the ſame. But when the *Ulna* and *Radius*, or the *Tibia* and *Fibula* in the Leg, are both broken, this is call'd a complete or a compound Fracture, tho' we may, alſo, properly enough call it a compound Fracture, where only one Bone is broken in ſeveral Parts. But, where, beſides the Fracture of one or more Bones, there is a Train of Symptoms which requires a particular Method of Cure, ſuch as a Wound or Ulcer; then it is call'd a complicated Fracture, becauſe, in the Cure of ſuch a Diſorder, particular Regard is to be had to

the concomitant Symptoms. But 'tis ſufficiently obvious, that a Fracture cannot properly be ſaid to be complicated, unleſs the above-mention'd Symptoms are preſent in a very conſiderable Degree; for a Fracture cannot be produc'd without ſome Degree of Contuſion, and a ſlight Inflammation is almoſt always ſubſequent to Fractures. Hence a Fracture is only ſaid to be complicated, when the concomitant Symptoms are of ſuch Importance as to require an Apparatus and Method of Cure different from thoſe requiſite in a ſimple or compound Fracture. Thus, for Inſtance, when a conſiderable Wound accompanies a Fracture, ſuch a Dreſſing cannot be us'd as in a ſimple Fracture, where it is often left unchang'd for ſeveral Weeks; but ſuch an Apparatus is requir'd, as may, without endangering the Separation of the fractur'd and reduc'd Bone, be frequently remov'd, in order to dreſs the Wounds.

Fractures are call'd tranſverſe, oblique, or longitudinal, according to their different Directions. They, alſo, receive various Names, and require different Methods of Treatment, according as the Portions of the Bone either reſt on each other, or are mutually apply'd to each other ſideways, or riſe into the Fleſh like Prickles.

Fractures are differently denominated according to their different Directions. A tranſverſe Fracture is produc'd, when a Bone is divided by a Section perpendicular to its Length. An oblique Fracture, on the contrary, is ſaid to be produc'd, when the Diviſion of the Bone is not perpendicular to its Longitude, but declines more or leſs from a perpendicular Direction. Hence the Surface of the Fracture is the greater, and the Retention of the fractur'd Portions, when reduc'd, the more difficult. A longitudinal Fracture is, when the Bone is ſplit in a longitudinal Direction; for which Reaſon, it is rather a Fiſſure than a Fracture, properly ſo call'd, becauſe the Parts of the Bone are not entirely ſeparated, but, as it were, fiſſur'd in a longitudinal Direction; which Species of Fracture was therefore call'd, as we learn from *Galen, de Method. Medend. Lib.* 6. *Cap.* 5. χιδαικὸν, or a longitudinal Diviſion of the Bone.

As for the different Situation of the fractur'd Portions; the Extremities of the fractur'd Bone may remain in their natural Situation, eſpecially in a tranſverſe Fracture. They may alſo be a little remov'd from each other, but in ſuch a manner, as mutually to reſt on each other, in ſome meaſure. The fractur'd Portions may, alſo, be entirely remov'd from their uſual and natural Contact, and ſlip to the Sides of each other; which almoſt always happens in an oblique, and ſometimes in a tranſverſe Fracture. And, laſtly, if the fractur'd Portions are acute, they may riſe like ſo many Prickles through the Integuments; and this Species of Fracture is certainly the worſt of all others.

Theſe Circumſtances ought to be duly adverted to, not only in order to diſtinguiſh the various Fractures by their reſpective Names, but alſo becauſe, according to the Diverſity of Fractures, different Methods of Cure are requir'd; and becauſe, by adverting to their Differences, we are the more able to prognoſticate their Events.

The Effects of a Fracture are various, according to the different Natures of the Bones fractur'd; the different Directions of the Fracture; the State of the fractur'd Portions with reſpect to Situation, Figure, Number, and Bulk; and according to the Nature of the Place in which, and the Parts near to which, the Fracture is made.

The moſt conſiderable Conſequences of Fractures are, a Deſtruction of the Office of ſupporting the Body; as alſo of ſuſtaining and directing the Muſcles; a Contraction of the Muſcles; a ſhortening of the Member; a Removal of the Muſcles from their natural Situation; an Intorſion and Deformation of the Member; a Laceration, Contuſion, or Corruption of the internal Perioſteum of the medullary Membrane, and of the Marrow itſelf; a Luxuriancy of the Veſſels of the Bone: Whence ariſe an Inequality of the Callus; a Tumor and Deformity of the Member, together with a Diſtraction, Laceration, Irritation, Compreſſion, and Convulſion, of the Membranes, Tendons, and Nerves; a Change, Deſtruction, Obſtruction, and Inflammation of the adjacent Veſſels; together with Pain, Ecchymoſis, Extenuation, Suppuration, Gangrene; the Mortification of a Part, and often of the Whole, of the Member, and almoſt always Contuſion.

As for a Deſtruction of the Power of ſupporting the Body; when we ſtand or walk, the whole Weight of the Body is ſupported by the Bones of the Legs and Thighs. Hence, in rickety Children, theſe Bones, being too pliant and flexible, are bended by the Weight of their Bodies. When, therefore, theſe Bones are fractur'd, the Power of ſupporting the Body is forthwith deſtroy'd, unleſs, in a tranſverſe Fracture, the Extremities of the Bone ſhould correſpond exactly to each other, and not change their Situation. But ſoon after, if the Patient continues to move the fractur'd Part, the Portions of the Bone will quickly be remov'd from each other, and the Power of ſupporting the Body conſequently ceaſe.

As for ſuſtaining and directing the Muſcles; moſt of the Muſcles of the human Body not only riſe from, but are alſo inſerted into Bones: If we except the Sphincter Muſcles, and the muſcular Fibres of the Viſcera and Veſſels, there are ſcarce any Muſcles in the Body which have not one of their Ends fix'd to a Bone: When, therefore, the Bones are fractur'd, the Direction of the muſcular Motion is deſtroy'd, and the Action of the Muſcles affix'd to theſe Bones ſurpriſingly diſorder'd. When the Patella, which adheres to the Tendon, riſing from the crural Muſcles, and raiſes this Tendon, like a Lever moving on its Fulcrum, is broken, the Direction and Action of theſe Muſcles is forthwith diſturb'd. The ſame holds true in the other Bones when fractur'd.

As for the Contraction of the Muſcles, and Shortening of the Member; *Galen*, in the eighth Chapter of his firſt Book *de Motu Muſcul.* obſerves, that the Bellies of the Muſcles have a Power of contracting themſelves ſpontaneouſly: And, that this Effect was not produc'd by the animal Faculty moving the Muſcle, he prov'd by the Retraction of both Parts of a Muſcle, upon dividing it after the Death of any Perſon. *Veſalius*, in the 19th Chapter of his ſeventh Book, beautifully confirms this by Experiments made on live Animals; for, when he cut the Belly of a Muſcle, he perceiv'd one Part of it retracted towards its Origin, and the other towards its Inſertion. When he cut the Tendon of another Muſcle, he obſerv'd the Muſcle retracted to its Origin. When he cut the Head of another Muſcle, it was drawn towards its Inſertion: And, when he cut both the Head and Inſertion of a Muſcle, then both Parts of it were contracted towards its Belly, or moſt fleſhy Part. But the Bones, to which the Muſcles are fix'd, retain them in the Diſtention which produces their Retraction when cut: Hence, when the Bones are fractur'd, the Muſcles, in conſequence of their ſpontaneous Contraction, become ſhorter, and retract the Part of the Bone to which they adhere: Hence the Member becomes ſhorter; and this Shortneſs is the greater, the more and the ſtronger the Muſcles are which are fix'd to the inferior Portion of the fractur'd Bone. Thus, if the *Os Humeri* is fractur'd above that Part to which the Deltoide Muſcle is affix'd, the fractur'd Bone will be ſtrongly drawn upwards, and the Member ſhorten'd; for, as *Celſus* tells us, in the tenth Chapter of his eighth Book, "the Muſcles and "Nerves, which were before tenſe, are now contracted." The ſame alſo holds true in the *Os Femoris*. For this Reaſon, all Surgeons are agreed, that Fractures of the *Os Femoris*, if they happen in the upper Part near the Hip, are rarely cur'd without Lameneſs; but, if this Bone is fractur'd about the Middle, or towards the Knee, the Cure generally ſucceeds more happily. This ſeems, among other Reaſons, to happen principally, becauſe, the higher this Bone is fractur'd, the more Muſcles draw the inferior Portion of the Bone upwards; and, ſince theſe Muſcles are very ſtrong, a violent Extenſion is neceſſary to the Reduction of the Bones, which are, for the ſame Reaſon, with great Difficulty, retain'd in their natural Situation.

As for the Removal of the Muſcles from their natural Situation; moſt of the Muſcles not only draw their Origins from the Bones, but are alſo inſerted into them, and ſome of them even adhere for a conſiderable Length to the Bones. If, therefore, the fractur'd Bones are remov'd from their natural State, the Situation and Direction of the adjacent Muſcles, which either derive their Origins from theſe Bones, or are inſerted into them, are much diſorder'd. Beſides, the Portions of the fractur'd Bone may remove other Muſcles from their natural Situation, tho' they neither derive their Origins from them, nor are inſerted into them, ſince they repel, and take up the Room of, the adjacent Parts.

As for the Intorſion and Deformation of the Member; the external Surface of the human Body has certain Eminences, and, conſequently, ſome Parts which are more depreſs'd. This is principally produc'd by the various Poſitions of the Muſcles, and their various Actions, during which they are ſometimes turnid, and ſometimes ſunk. This is, in a particular manner, obvious in ſuch Men as are brawny and not over-fat, but much leſs in Women, whoſe Bodies always appear more ſmooth and equable. This Circumſtance is highly regarded by Painters and Statuaries, who, in their reſpective Performances, make the Limbs of *Hercules* and *Laomedon* ſtrong and brawny, whereas they make the Body of *Venus* ſoft and ſmooth. When, therefore, the Muſcles, in conſequence of a Fracture of the Bones, are put out of their natural Situation, the Figure of the Parts is chang'd, and the natural Form of the Member is deſtroy'd. Hence ſkilful Surgeons, in order to diſcover whether Bones are well ſet, compare the affected Arm or Leg with that which is found, carefully obſerving whether the Eminences

nances and Cavities of both are exactly ſimilar. Thus, for Inſtance, the fractur'd Parts of the Arm may be mutually apply'd to each other, tho' not exactly in their former and natural Situation; but in this Caſe the Deformity of the Member will always diſcover the Error: And this Deformity appears moſt conſpicuous, when the Bones of the Cubit are fractur'd; for then the Muſcles ſubſervient to the Supination and Pronation of the Hands generally induce a ſurpriſing Change on the natural Figure of the Part.

The Misfortunes incident to the Bones themſelves, after Fractures, are theſe following:

The Laceration, Contuſion, or Corruption of the external Perioſteum, of the Veſſels lodg'd in the ſmall Cellulæ of the Bones, of the internal Perioſteum, and of the medullary Membrane.

All the Bones are cover'd with a Membrane, which not only conveys the Veſſels to them, but alſo receives ſuch as are ſent out from them. This Membrane is call'd the Perioſteum, and, for the moſt part, adheres cloſely to the Bones. It covers the external Surface of the Bones in every Part, except where the Ligaments, which ſurround and ſecure the ſeveral Articulations, ariſe from them; for in theſe Parts the Perioſteum is ſeparated from the Bone, and runs upon the Ligament, till it is inſerted into another Bone, and adheres to it. By this means the Perioſteum, without any Interruption of its Continuity, is convey'd from one Bone to another. The whole Surface, therefore, of the Bones is cover'd with the Perioſteum, except that Part of them which is contain'd in the Capſula of the Joints, form'd by the Ligaments ſurrounding the Articulations: But the Part of the Bone which is contain'd in the Capſula, is rarely or never fractur'd. When, therefore, a Bone is fractur'd, the external Perioſteum is almoſt always injur'd: Beſides, the Structure of many Bones is ſurpriſingly cellular; for the ſmaller Bones, which have not a large medullary Cavity, ſuch as the Phalanxes of the Fingers, together with the Bones of the Carpus and Metacarpus, have their whole Subſtance full of ſmall bony Cells: But in the larger Bones, which have a large Cavity in their Middles for containing the Marrow, the Laminæ of the Bone, which in the Middle are cloſely united, recede from each other towards the Extremities of the Bone, and form ſurpriſing Cavities, in which Blood-veſſels and medullary Globules are lodg'd. If, therefore, ſuch Bones are fractur'd towards their Extremities, this cellular Sructure will be deſtroy'd, the Blood-veſſels ruptur'd, and their Contents diſcharg'd; which, by ſtagnating, may produce a large Train of Misfortunes. 'Tis, at the ſame time, equally obvious, that by a Fracture of a Bone the internal Perioſteum, the tender Membrane of the Marrow, and the Marrow itſelf, may be deſtroy'd, ſince the laſt of theſe is ſo tender, that in an old Ox it may, by handling it rudely with the Fingers, be reduc'd to the Conſiſtence of a Pulp. How terrible Symptoms may be produc'd by a Corruption of the medullary Oil, is ſufficiently obvious from daily Experience. But all theſe are infallibly dilacerated, if the Extremities of the fractur'd Bone recede from each other, and are laterally apply'd; for then 'tis certain, that every thing contain'd in the Cavity of the Bone is broken: 'Tis true, that the worſt Misfortunes to be dreaded from this Circumſtance do not always follow ſuch Fractures, but that they may ſometimes happen, is ſufficiently obvious: Hence 'tis expedient to advertiſe the Patient, or his Friends, of theſe poſſible Conſequences, leſt, if they ſhould afterwards happen, they ſhould be aſcrib'd to the Ignorance of the Surgeon.

As to the Luxuriance of the Veſſels of the Bone, from which proceeds an Inequality of the Callus, together with a Tumor and Deformity of the Member; *Hippocrates*, in his *Coacæ Prænotiones*, informs us, "That Bones, or Cartilages, when "broken, do not increaſe;" And in the nineteenth Aphoriſm of his ſixth Section, he tells us, that "they do not coa-"leſce, or grow to each other." *Galen*, alſo, in the ſeventh Chapter of his fifth Book *de Method. Medend.* affirms, that a Bone can never be united to a Bone, nor a Cartilage to a Cartilage, ſince in fractur'd Bones the Union is produc'd by the Interpoſition of a Callus anſwering the End of Glue, but not by a Concretion of the ſeparated Parts. But, in his firſt Commentary on *Hippocrates de Fracturis*, he gives his Sentiments on this Subject more fully, in the following Words: "Since "the Bones cannot, in conſequence of their natural Dryneſs, "grow together like Fleſh, a Callus growing about the Lips "of the Fracture becomes the means of their Union. But "the Origin of the Callus is the ſuperfluous Nouriſhment of "the fractur'd Bone; and when the Patient does not uſe a "proper Regimen, or is plethoric, this ſuperfluous Nouriſh-"ment is too copious, and, diſcharging itſelf, renders all the "Bandages wet, juſt as when the Blood is diſcharg'd." Hence he ſeems to inſinuate, that the Callus is not form'd of what is properly call'd the Subſtance of the Bone, but that it is only a Species of Glue, which, interpoſing itſelf between the Extremities of the fractur'd Bone makes them cohere; for a little after he ſubjoins, "For as Glue is to united Pieces of "Wood, ſuch is a Callus to fractur'd Bones." But ſince it cannot be deny'd, that a Callus at laſt acquires the Hardneſs of the Bone, and, ſince *Galen* did not believe, that the Callus aſſum'd the Nature of the Bone, he us'd a pretty uncommon Way of expreſſing himſelf, when he ſays, "Whatever "is diſcharg'd from the Bone, and is concreted about the "Lips of the Fracture, is ſo chang'd by the contiguous Bone, "as to become highly like it, and is denominated Callus." Hence he is of Opinion, that this Matter diſcharg'd retain'd the Name Callus, after it had acquir'd the Hardneſs of the Bone. After *Galen*, many ſeem to have embrac'd the ſame Opinion: But 'tis ſhewn under the Article VULNUS, that in Wounds the loſt Subſtance is reſtor'd, and the ſeparated Parts united, not by means of a certain Glue, but by a genuine Reſtitution produc'd from a laudable Blood by the Aſſiſtance of Nature, as *Galen* himſelf truly affirm'd in the Paſſage laſt-quoted; and under the Article CAPUT 'tis ſhewn, that a Part of the Cranium remov'd by the Trepan, or any other wounding Inſtrument, grows again. The ſame ſeems to hold true in fractur'd Bones, which are again united, not by the Interpoſition of a certain Glue, but by a true Union of the Subſtance of the Extremities; and, in thoſe Caſes where a Part of the Bone is remov'd, a viſcid Humour, which gradually becomes hard, is not interpos'd between the ſeparated Fragments, but the organical bony Structure is renew'd, and the loſt Part, by that means, reſtor'd. This is ſufficiently confirm'd by practical Obſervations. This wonderful Phenomenon is to be aſcrib'd to that ſurpriſing Property of the human Body, by which it is able, from the Aliments duly chang'd by the Action of the Viſcera and Veſſels, to reſtore what is loſt, and augment in every Dimenſion, what is already form'd. Certainly the vital Rudiment lodg'd in the Colliquamentum of an impregnated Egg, after the Structure of the Chicken's Body is form'd, produces, in twenty-one Days, from the White of the Egg, which is highly ſoft, ſolid Bones, by which the Chicken not only ſtands, but runs nimbly as ſoon as it is excluded from the Shell. The ſame, therefore, ſeems to obtain in Bones, with reſpect to Loſs of Subſtance, and the Union of their divided Parts, which happens in Wounds of the ſoft Parts, that is, a Regeneration, or true Concretion of the organical Subſtance, and not an Agglutination by means of a certain glutinous Matter.

As the growing Veſſels in Wounds of the ſoft Parts are highly tender and pulpous, in conſequence of their not being cover'd with the Skin, they may eaſily be too much diſtended, and degenerate into fungous Fleſh. The ſame holds true in the Callus of the Bones, which may become luxuriant, when the Veſſels, which conſtitute the Subſtance of the growing Bone, are diſtended, either by a Redundance, or too ſtrong an Impetus, of the Fluids. But this Misfortune is moſt to be dreaded in young Patients, in whom the Strength of the ſolid Parts is leſs, the Quantity of Fluids larger, and their Circulation generally briſker, than in Perſons advanc'd in Years. For theſe Reaſons Surgeons ſo often obſerve the Calluſes form'd in young Perſons to be luxuriant, eſpecially if they feed high. Hence there neceſſarily follows an Inequality, and a Change of Figure, in the Part. But a Deformity of the Member happens far more frequently, when, before the Callus has acquir'd a due Firmneſs, the Extremities of the Bone are preſs'd to each other; for in this Caſe the Callus, like flexible Wax, is every-where forc'd out, and forms a prominent kind of Ring in the fractur'd Part. This principally happens, when the Patients, after Fractures of the Thighs or Legs, attempt to walk too ſoon; for, as the whole Weight of the Body is ſupported by theſe Bones, the Callus is by this means ſqueez'd, if it has not acquir'd the Hardneſs of a Bone.

As for the Diſtraction, Laceration, Irritation, Compreſſion, and Convulſion of the Membranes, Tendons, and Nerves; theſe moſt generally happen, when the Fracture is ſuch, that the Fragments lie over each other; but eſpecially if they are ſharp and pointed, which often happens; for in this Caſe all the adjacent Parts are injur'd and lacerated. The Misfortunes to be dreaded from Injuries or Irritations of the Membranes, Tendons, and Nerves, are enumerated under the Article VULNUS. From Accidents of this Kind, Misfortunes of ſo terrible a Nature often ariſe, that *Hippocrates*, in his Treatiſe *de Fracturis*, adviſes Surgeons to avoid ſuch Caſes, if they can with Honour do it, ſince there is little Hope, and a great deal of Danger: "For, ſays he, if the Bones are not reduc'd to their natural "Situation, the Surgeon is thought ignorant; and, if they are, "the Reduction tends more to the Deſtruction than to the "Recovery of the Patient."

As for the Change, Deſtruction, and other Misfortunes, of the adjacent Veſſels; the worſt Misfortunes ſubſequent to Fractures are rarely produc'd by the Injury done to the Bone itſelf, but far more frequently by the Fragments of the Bones compreſſing or wounding the adjacent Parts. Many Veſ-

ſels are either affix'd to the Bones themſelves, or are adjacent to them; and may, therefore, be injur'd or compreſs'd by the Fragments of theſe Bones mov'd from their natural Situation. Hence *Hippocrates*, in the Paſſage laſt quoted, tells us, that it is a Circumſtance of great Moment, whether the Bones of the Humerus and Thigh give way externally or internally, becauſe a great Number of large Veins run along their internal Parts. Now Obſtructions are produc'd by all thoſe things, which, by an external Compreſſion or Diſtraction, render the flexible Veſſels narrower than they were before: It is, therefore, obvious, that Obſtructions muſt be frequently ſubſequent to Fractures of the Bones. And though the Motions of the Humours through the Veſſels, thus render'd narrower, is not totally obſtructed, yet moſt of the Functions of the Body are ſurpriſingly diſorder'd by this means, ſince the Soundneſs of theſe Functions, in a great meaſure, depends on the due Proportion of the Trunks of the Veſſels to their Ramifications, and of the Ramifications to their reſpective Trunks. If, therefore, an Obſtruction of the Veſſels is accompanied with a briſk Circulation of the Humours, by the Fever excited, an Inflammation may be produc'd, together with all its different Terminations, ſuch as a Suppuration, a Gangrene, and a Sphacelus. By a Diſtraction of the Membranes, Tendons, or Nerves, highly intenſe Pains are produc'd in Fractures, not ſo much by the Injury done to the Bone itſelf, as is obvious from the total Ceſſation, or, at leaſt, the conſiderable Diminution, of the Pain, when the Bones are reduc'd to their natural Situation: But when the Veſſels are ruptur'd, or only divided by a ſmall Wound, under the ſound Skin, the Blood is diſcharg'd, collected in the Membrana adipoſa, and forms an Ecchymoſis, as is ſhewn under the Article CONTUSIO. But when an Artery, or a large Trunk of a Nerve, diſtributed to the inferior Parts, are ſo compreſs'd, or deſtroy'd, that they can no longer tranſmit their reſpective Fluids, the Parts below this Compreſſion, or Deſtruction, are totally depriv'd of the vital Influx of the Humours; in which Caſe they are either corrupted by a putrid Gangrene, or dried up by a ſlow Maraſmus.

Death is, ſometimes, ſubſequent to Fractures of the Bones, in conſequence of the acute Pains, which produce acute Fevers, Deliriums, and Convulſions; or, if ſuch a Gangrene ſhould ſeize the Part affected, and, degenerating into a Sphacelus, ſpreads itſelf to the ſuperior Parts, the Patient, after Watchings, Deliriums, Syncopes, and Hiccups, at laſt dies, as it were, in a gentle Slumber.

Fractures are, almoſt always, accompanied with Contuſion: For an external Force cannot deſtroy the Coheſion of the Parts of a Bone, without, at the ſame time, acting on the ſuperincumbent ſoft Parts. Since, therefore, theſe are preſs'd between the wounding Cauſe, and the ſubjacent hard Bone, they muſt neceſſarily be contus'd. Hence, in Fractures, there is always ſome Degree of Contuſion, except in Caſes where, by a Lues Venerea, a Scurvy, or other Diſeaſes of a like Nature, the Bones are become ſo brittle, that they may be broken by the ſmalleſt Force. This Circumſtance is carefully to be adverted to, becauſe, when Bones are happily reduc'd, many Misfortunes often ariſe from the Contuſion of the Parts. Hence *Hippocrates*, towards the End of his Treatiſe *de Fracturis*, in which he recounts the many bad Conſequences of Fractures and Luxations, lays it down as an Axiom, that more is to be dreaded from the Contuſion, than from the Fracture itſelf; for, ſays he, "Thoſe Diſorders are ſlighter in which the Bones are fractur'd, "than thoſe in which they are not fractur'd, if, at the ſame "time, conſiderable Veins and Nerves are contus'd; for theſe "latter Diſorders endanger the Patient's Life more than the "former, if they are accompanied with a continual Fever." Hence thoſe Remedies which are proper for the Cure of Contuſions, are often to be applied to Fractures; for though the Reduction of the fractur'd Bones, and their Retention in their Situation, are Circumſtances, which, to the Generality of Surgeons, ſeem ſufficient to anſwer the general Intention, yet it is ſufficiently obvious, from what has been ſaid, that different Methods of Cure are requiſite, according to the different Symptoms accompanying the Fracture.

The METHOD *of* DISCOVERING FRACTURES, *according to* HEISTER.

Fractures may be examin'd, 1. By the Eye; as when the injur'd Part appears ſhorter than that which is ſound, or the Patient cannot lean upon it. 2. By the Touch, when you perceive any preternatural Inequality or Flexibility of the Bone; where, by the way, I would recommend it to the Surgeon, if poſſible, to lay the Patient in the Bed, where he is to continue, before he either examines or reduces the Fracture. 3. By the Ear; when you hear a Craſhing of the Bones, upon moving or touching the Part. 4. We may, without much Danger, conclude this to be the Conſequence of any extraordinary external Violence: Though, 5. it may not be amiſs to obſerve, that we are more liable to Fractures in the Winter, than at any other time. 6. In Fractures, eſpecially tranſverſe, the Parts are frequently reſtor'd ſpontaneouſly to their proper Place, without any Aſſiſtance, and, conſequently, leave very little or no Grounds to ſuſpect them. In this Caſe, therefore, if the Patient, after any external Violence receiv'd, cannot uſe the Part without great Difficulty, or if it cannot be touch'd or mov'd without great Pain, it is more than probable there is a Fracture. But the propereſt Method of finding the Truth is to put the Part affected into the Hands of an Aſſiſtant, who muſt move it gently, while you are employ'd in examining, whether any Noiſe, Hiatus, or Inequality, can be diſcover'd.

The METHOD *of* DISCOVERING FISSURES.

As for Fiſſures, we cannot ſo eaſily come at the Knowledge of them, as we have no Aſſiſtance from the Sight, Touch, or Hearing; and, therefore, according to *Gouey*, many Surgeons have been deceiv'd. However, if we will give Credit to thoſe who affirm the Exiſtence of them, we ſhall not want Symptoms to diſcover them. They ſay, that, after a Fiſſure, the Place affected can neither bear the Touch, nor ſupport the ſuperior Parts; that it is accompanied with very great Tumors, and, ſometimes, violent Inflammations, Suppurations, and Caries; and that Perſons advanc'd in Years, from the Fragility and Rigidity of the Bones, are more liable to them, than young Perſons. And, indeed, theſe Obſervations ſeem very well grounded; for it is next to impoſſible, that the Blood and Sanies, adhering to the Fiſſures, ſhould not putrefy, and, by corroding the Marrow, the neighbouring Parts, and the Bone itſelf, produce theſe Inconveniences.

Of the PROGNOSTICS.

In prognoſticating the Event of Fractures, a Surgeon ſhould be very circumſpect, and not promiſe too ſpeedy, eaſy, or certain a Cure, leſt he be diſappointed from ſome unforeſeen Accident, and that be imputed to his Ignorance; for Perſons unacquainted with the Profeſſion are ſubject to imagine Fractures the moſt curable Injury attending the human Body; whereas it is often impoſſible to reſtore the Limb to its former Strength and Beauty, even by a ſkilful Hand. Since, then, ſome Fractures are inconſiderable, and others very bad, a prudent Surgeon ſhould not only have regard, in his Prognoſtics, to the Diſpoſition of the fractur'd Part, but alſo the neighbouring Parts, the Place of the Bone, accidental Diſorders, the Conſtitution, Age, and Habit, of the Patient. But, above all things, let him avoid promiſing a ſpeedy Cure; for the Patient's Neglect will be often attributed to his Unſkilfulneſs.

Here I would recommend ſome particular Obſervations; as, 1. Simple and recent Fractures are much more eaſily cur'd, than thoſe accompanied with external Wounds, a Luxation, violent Contuſion, Hæmorrhage, or Caries. 2. Some are cur'd with more Speed and Readineſs, others more ſlowly and difficultly, according to the Difference of the fractur'd Bone; for the ſmall Bones, as the Clavicles and Ribs, will agglutinate within twenty Days; the Radius, within thirty; the Tibia and Humerus require forty or fifty; the Thigh-bone is ſcarce to be cur'd under fifty, or, perhaps, ſeventy Days. Though, 3. We muſt obſerve, that Fractures unite ſooner, and more eaſily, in healthy young Men, than in the old, and thoſe of an ill Habit of Body.

When the fractur'd Bone is remov'd but a little from its proper Place, it is much more eaſily reduc'd, than after a great Separation. Tranſverſe Fractures, likewiſe, are ſooner cur'd, than oblique. And thoſe near the Articulations are more dangerous than thoſe in the Middle; for, in the former, not only the Joints are often affected in ſuch a manner, that they become rigid; but the Ligaments, and Tendons too, are generally bruis'd; which often produces violent Pains, Inflammations, Convulſions, and even Death.

If two Bones are broken in the ſame Limb, the Cure is render'd abundantly more difficult. If, alſo, one is broken into ſeveral Pieces, it is next to impoſſible to prevent a Gangrene and Sphacelus; at leaſt, you muſt expect your Cure to proceed very ſlowly, and the Limb to be unequal: A judicious Surgeon, therefore, would diſcover this to the Patient, or ſome of his Family, in due Time.

When a Fracture is immediately reduced, the Reunion will be more ſpeedy and commodious: When, therefore, you are called in ſome time after the Accident, do not promiſe too ſpeedy a Cure.

When a Fracture happens near the more noble Parts, it is always dangerous, and often fatal; as of the Cranium, from the Vicinity of the Brain; the Vertebræ, from the ſpinal Marrow; the Ribs, Sternum, Os Ileum, and Pubes, from the ſubjacent Viſcera in the Breaſt and Abdomen: Nor is it leſs hazardous, if any of the greater Veins or Arteries are near, more particularly when the Points wound them; for hence, as moſt uſually the Caſe is in the Humerus and Femur, mortal Hæmorrhages are produc'd.

If the Fragments are ſo far ſeparated, that they burſt thro' the Fleſh and Skin, the interjacent Muſcles, Nerves, Veins, and Arteries,

Arteries, will prevent the replacing them; and many unexpected Inconveniences will impede the Cure, and deform or weaken the Member, eſpecially the Humerus, Leg, and Thigh, or, perhaps, corrupt it to ſuch a Degree as to render Amputation neceſſary.

The moſt convenient Seaſon for the Cure of Fractures, as well as other Diſeaſes, is the moſt ſerene and temperate; that is, neither too hot, nor too cold. Your Cure is completed ſooner, too, in young Men than old; but in pregnant Women the Cure generally ſucceeds very ill, till they are deliver'd.

Inflammations, Suppurations, or Fiſtulæ, are generally the Conſequence of a Bone being broken into ſeveral Fragments, which will not admit of a Cure, till the Pieces are extracted: But Fractures proceeding from an internal Cauſe, which are often attended with a Caries, are more dangerous than thoſe from an external, and often incurable, unleſs the Cauſe, whether ſcorbutic, venereal, or hydropic, be firſt removed, and the Patient's Habit of Body entirely mended.

When any large Fragment of the Bone is carry'd away by a large Iron or Leaden Bullet, it is better to cut off the lower Part of the ſhatter'd Limb, as the divided Bones can never unite, than by a tedious and fruitleſs Proceſs to weaken the Patient, and hazard his Life: But if a ſmall Piece only be ſeparated, the Fragments may, indeed, unite, but the Limb will be ſhorter; and, if this happens in the Leg, the Patient muſt be lame.

If any Blood gets from the Fiſſures into the interior Sinus of the Bone, very great Danger of a Caries, or a Spina Ventoſa, incurable Fiſtulæ, Conſumption, and Sphacelus, enſue; ſo that the Limb muſt be amputated, or the Patient die: And, indeed, in all other Fractures, whenever the Blood corrupts the Marrow, the Conſequence is the ſame.

Fractures in the Legs are worſe, and more inconvenient, than in the Arms, as they are leſs capable of being conceal'd, eſpecially in Men; and they are not only accompanied with Lameneſs, but even a Deformity, and therefore require the utmoſt Care in the Management of them.

The Cure of Fractures.

In curing of Fractures, the principal Concern ſhould be the Agglutination of the Bone: Take care, therefore, 1. That it is reduced to its proper Situation; and this is done by Extenſion and Repoſition. 2. After Reduction, apply a proper Bandage, and preſcribe Reſt to your Patient. 3. Prevent, or remedy, the Inconveniences that may enſue; and the Surgeon will be qualify'd for this, if he knows, firſt, how the Bones are ſituated, whether there are one or more in the Limb; whether they are large or ſmall, robuſt or ſpongy, even or uneven; and, whether one, or more, be fractur'd. 2. What Muſcles are near, with their Poſition and Office. 3. Whether any of the larger Nerves, Veins, or Arteries, are near. For a thorough Knowledge of theſe Things conduces very much to a ſucceſsful Cure.

When the fractur'd Bones continue in their natural Poſition, a proper Bandage will promote the Agglutination of the Fragments, without Repoſition or Extenſion; though, as often as they recede from each other, ſome Degree of Extenſion is abſolutely neceſſary, which muſt always be proportion'd to the Diſtortion of the Fragments; for the wider the Separation, and the ſhorter the Limb, from a Contraction of the Muſcles, the greater Extenſion is required. But this Operation muſt be performed tenderly, leſt too great Violence ſhould injure the Patient.

In extending a fractured Limb, care is to be taken, 1. That the Patient is kept ſteady, to prevent his giving Way to the Extenſion. The Poſture muſt be accommodated to the Circumſtances; for ſometimes ſitting in a Chair, or on the Floor, ſometimes lying on a Bed or Table, is more commodious. 2. The broken Limb, both above and below the Fracture, muſt be held by an Aſſiſtant. 3. The Aſſiſtant, who holds the lower Part, muſt extend it with Strength ſufficient to replace the Fragments. But, if the Hands alone are not ſufficient, uſe a Rope or Napkin; and, if one Man is not enough, employ two or three. Obſerve always to proceed with Tenderneſs, that you may not rack the Patient with unneceſſary Tortures.

The Antients, as often as the Hands, Ropes, and Napkins, failed them, which was not very often, invented ſeveral Machines for the Reduction of Fractures; as the Pullies with Ropes, the *Scamnum Hippocratis*, and others repreſented by *Oribaſius*, *Paré*, *Andreas a Cruce*, *Scultetus*, and other Authors. But the Moderns have rejected them, as their Action is unequal, and Application inconvenient; nor can they be always at hand in a Battle, and other proper Places, where wanted. Beſides, it is certain, that the Hands, Ropes, and Napkins, will anſwer every End propoſed.

There remains one very important Obſervation relative to the Extenſion of fractur'd Bones; which is, that if the Surgeon is called in, after Tumors, or violent Inflammations, come on, he ought to defer the Extenſion, till they are remov'd: For, under theſe Circumſtances, the Parts affected cannot be handled, compreſſed, or extended, without moſt acute Pains, Convulſions, and the Danger of a Sphacelus: But if the Tumor or Inflammation are ſlight, we may ſafely proceed to Extenſion directly, in order to prevent their Increaſe.

If the Inflammation is ſo violent, as to render Extenſion impracticable, the firſt Care muſt be to mitigate this Symptom; and the Rules laid down under the Article Contusa will anſwer this End, as Bleeding, Purging, drinking aqueous Fluids, internal Medicines which reſiſt Inflammation, and the frequent Application of warm reſolvent Fomentations: By the Help of theſe, the Inflammation will gradually abate; ſo that in twenty-four Hours the Extenſion of the Limb may be made; though, inſtead of the above-mention'd Fomentations, the following may be us'd with very good Effect:

> Take of the Leaves of Scordium, two or three Handfuls; Water, one Pint; Spirit of Wine, ſix Ounces: Let them boil together for a Quarter of an Hour; and then add, of common Salt, an Ounce; of Nitre, half an Ounce. Let Linen Cloths, impregnated with this Decoction, be bound upon the fractur'd Part, and frequently renew'd.

When the Inflammation is ſo violent, that you cannot the next Day reduce the Bone, continue theſe Medicines, till the Diſorder is entirely remov'd.

Sometimes the Splinters, which irritate the neighbouring Parts, prevent the Repoſition of the Bone: If, therefore, theſe are looſe, they are to be taken out; if they adhere to the Periоſteum, cut them off; for they never will unite, and, conſequently, will prevent the Cure: But if they adhere firmly to the other Parts, and do not obſtruct the Reſtitution, firſt, reduce the Bone; and, after the Application of proper Bandages, leave them, either till they are reſolv'd by Suppuration, and come away without great Pain to the Patient; or, till they unite with the Bone; after which, you muſt never attempt to extract them, but rather reſtore them, as near as poſſible, to their former Poſition, by which means they often agglutinate; but, if this does not happen, they muſt be extracted in the beſt Manner you can.

When the Fragments or Splinters are ſo prominent as to hinder the Repoſition of the Bones, you muſt conſider whether they can be reunited or not: And this will appear to be practicable, if they are not too widely ſeparated from the great Bone, and much Fleſh is not interpos'd between: But, when they can neither be reſtor'd nor agglutinated, they muſt be remov'd by a ſharp ſtrong Forceps (ſee *Tab.* XXIX. *Fig.* 1.); or, when they are firm and thick, by a fine Saw, (ſee *Tab.* XXVIII. *Fig.* 9.) ſo far as is requiſite. When this is done, proceed to the Extenſion and Reſtitution of the Bone; for, till then, the Bones can ſeldom be replac'd or united.

If the Splinters lie concealed under the Skin, ſo that they cannot be reached with the Hands, firſt try to reduce them: If that cannot be done, make an Inciſion in the Skin, and extract them.

The beſt Method of Extenſion has been already ſpecify'd. The Surgeon is to take hold of the Part, which is extended by two Aſſiſtants, and to preſs it ſometimes outwards, ſometimes inwards, ſometimes upwards, ſometimes downwards; and to put it into different Poſitions, according as the Circumſtances of the Caſe require, till every Splinter appears to be reſtored to its natural Poſition.

You may judge whether the Fragments are reduc'd, from an Abſence or Remiſſion of Pain, and from the Limb recovering its former Shape and Length: If theſe Appearances fail, you may ſafely conjecture the Reduction not to be complete; and then you muſt continue the Extenſion, till the Bone is entirely reſtored.

After a Reduction of the Fragments, keeping them in their proper Situation alone will promote the Reunion.

The Methods for procuring a Reunion are principally theſe: 1. To apply a proper Bandage: 2. To place the Limb in a convenient Poſition. To the firſt belong Rollers, Compreſſes, and Splints of Paſteboard or Wood; and, ſometimes, of Copper, Braſs, Tin, Iron, or Lead (ſee *Tab.* XXIX. *Fig.* 7.); but I ſhould recommend principally thoſe of Wood or Paſteboard. The Method of Dreſſing is, firſt, to apply a Bandage round the fractur'd Limb; upon this lay Compreſſes and Splints; then faſten them firmly with Fillets, or by Tying. In ſome Caſes, Boxes of Paſteboard, Wood, or Metal, (ſee *Tab.* XXX. *Fig.* 9.) and other Inſtruments, are requiſite (ſee Art. Fascia.). And ſome of theſe are proper for ſimple Fractures, others for compound; but they all tend to this, that the reduced Bone may be ſecured in its Situation, and unite the better: It, therefore, is no Wonder, that the Want of Reſt, or of a proper Bandage, ſhall render the Cure unſucceſsful.

Some

Some of the Moderns apply a Plaiſter before the Bandage; but others, with good Reaſon, reject this Practice, not only as unneceſſary, but often hurtful: For, beſides that Plaiſters are ineffectual without Bandages, and that Bandages will retain the Fracture without them, there is this additional Inconvenience, that they obſtruct the Pores of the Skin, and occaſion Tumors, Inflammations, and violent Itchings: But, to ſpeak my own Opinion freely, I am convinced from Experience, that moſt Fractures may be cured without Plaiſters: However, if any one will apply them, let them take care, that they be not too long, nor the whole Limb ſurrounded with them, but a Part about a Finger or Thumb's-breadth left bare, leſt, if a Tumor ariſes, they ſhould prevent the Circulation of the Blood, and produce a Gangrene or Sphacelus.

Since we have already treated of Bandages at large, we ſhall here only give a brief Explanation of the Apparatus; and, ſince the principal Hopes of completing a Cure ſeem to depend on them, we muſt be very careful, that they be not only of a proper Length and Breadth, but likewiſe adapted to the Shape of the fractured Limb. In ſimple Fractures, we apply two ſingle-headed Rollers, in ſuch a manner, that each begins upon the Part affected, the one after two or three Rounds aſcending, the other deſcending in a contrary Direction, and then aſcending again.

We muſt here obſerve, that Bandages, the more tightly they are bound, retain the Fragments the more firmly; but ſince, when too ſtraitly obſtructing the Circulation of the Blood, they occaſion Tumors, Inflammations, and a Gangrene, and, on the contrary, if too lax, they will come off, and quit the diſunited Parts, a juſt Medium is carefully to be obſerv'd. The State of the Bandage may be thus diſcover'd: When the Extremity of the Member, ſome time after the Application of the Bandage, ſwells a little, it is right; for, if it ſwells too much, it is plain your Bandage is too tight; if not at all, it is too lax. In one Caſe, therefore, it muſt be render'd ſtraiter, in the other it muſt be relax'd.

The Compreſſes and Splints ought to be ſuitable to the Size of the fractured Limb; and if that is unequal, as in the Legs, the Compreſſes ſhould be folded, (ſee *Tab.* XXX. *Fig.* 13.) ſo as to fill up the leſſer Part; for then the Splints may be more commodiouſly and firmly apply'd. The Splints muſt always be ty'd with three Strings, beginning with that in the Middle.

If the Arm is fractur'd, after a proper Deligation, ſuſpend it in a Sling about the Neck; if the Leg, place it either in a Straw-bed, (*Tab.* XXX. *Fig.* 5.) or a Box, (*Tab.* XXX. *Fig.* 9.) with a Pillow and a ſmooth Board under it, extending from the Bottom of the Foot to the Thigh, for the more commodious Situation, as appears more plainly from what we have already ſaid under the Article FASCIA. And theſe Machines muſt be faſten'd with three or four Strings about the Leg, to keep it fix'd. Some uſe a Pillow for this Purpoſe, which they bind firmly under the Limb after the Bandage. Others uſe wooden Boxes, which *Solingen* and *Scultetus* have both deſcribed. But the moſt judicious of our modern Surgeons, prefer the Straw-bed, as it is not only convenient for retaining the fractur'd Bone, but alſo more eaſily made. To this they often add a ſort of a Sole made of Wood or Paſteboard, (*Tab.* XXX. *Fig.* 6.) which retains both the Foot and Leg; and, to prevent its being troubleſome to the Foot, they cover it well with a ſoft Compreſs, (*Fig.* 7.) and faſten it to the Straw-caſe with the Strings (*a a a*, *Fig.* 6.) Then they ſew a Piece of Linen, in the Shape of a Ring, furniſh'd with Strings, (*b b*, *Fig.* 8.) to the lower Part of the Compreſs, to ſuſpend the Heel, leſt, by lying on it too long, as it frequently happens, Inflammations, Pains, and, perhaps, more dangerous Symptoms, ſhould be excited. Over the Leg form an Arch, either with a Hoop of a Tub, a Drum, or a Buſhel (ſee *Tab.* XXX. *Fig.* 10.): For this not only prevents the Bed-clothes from being offenſive, but makes it more eaſy to cover the Part with warm Napkins, or any other Linen Cloths.

The Patient ſhould lie on his Back, with his Head and broken Leg ſomewhat elevated, to prevent ſliding down; and a Rope ſhould be fix'd either to the Teſter of the Bed, or a Beam, that he may raiſe himſelf at Pleaſure. If he is of a plethoric Habit of Body, open a Vein, leſt ill Conſequences ſhould enſue. It is the Duty of a Surgeon, at firſt, to be frequent in his Viſits, and examine the Bandage accurately, whether it be tight, and in its proper Place; for, if it is removed, he muſt immediately replace it; if too ſtrict, relax it; and, if too looſe, ſtraiten it. As for Diet, the Rules laid down, under the Article VULNUS, are applicable to Fractures.

The firſt Dreſſings may be taken off either ſooner or later, as the Nature of the Caſe requires; for, without a Neceſſity, it ſhould not be renewed under five or eight Days: But when Inflammations, Pains, or Itchings, ariſe, or the Bandage is found too tight, or too looſe, as it often happens, it muſt be immediately renewed: In the ſecond and third Dreſſing, proceed as you did in the firſt. Though it may not be amiſs, if there is no Tumor, to make the Bandage ſomewhat more firm at the third Dreſſing, which will prevent the Growth of a deformed Callus, and promote the Conſolidation of the Fracture.

If any of the Symptoms mentioned above denote a Fiſſure, *Wurtzen* directs the Application of his Plaiſter, with Compreſſes proper for Fractures, and keeping the Patient quiet for ſeveral Days, by which means the Tumor will abate. When the Swelling is large and ſoft, he directs Inciſion; after which the corrupted Fluid muſt be ſqueezed out, and a Tent, dipt in his yellow Ointment, put into the Wound, applying afterwards a Bandage proper for Fractures complicated with a Wound. On the contrary, Unguents, Cataplaſms, Fomentations and Baths, according to him, are ſo far from removing this Diſorder, that they increaſe it. For the collected putrid Matter, by gradually corroding the ſubjected Parts, and principally the Bones, cauſes a Caries, and other bad Symptoms. And tho' theſe are generally attributed to the Gout, and Defluxions of Humours, he informs us, that they frequently proceed from ſuch Fiſſures. *Gouey* is of Opinion, that recent Fiſſures may be cur'd by Bandages only.

Wurtzen's Plaiſter is thus prepar'd:

> Take of pure white Reſin, two Pounds; of common Turpentine, half a Pound: Whilſt theſe are melting over the Fire, throw in four Ounces of the powder'd Root of *Ulmaria* (Meadow-ſweet); and ſtir them together, till all cools. When this is to be ſpread, upon Linen Cloth, or Leather, it muſt firſt be put into hot Water. *Wurtzen* attributes great Virtues to this Plaiſter.

If a Fracture is complicated with a Wound, after Reduction, it muſt be treated almoſt in the ſame manner as other Wounds. Firſt, cleanſe it with warm Wine, Spirit of Wine, or Salt-water; then fill it with dry Lint, to ſtop the Hæmorrhage: Thirdly, anoint it with ſome digeſtive Ointment. And laſtly, with a vulnerary Balſam, till it is entirely healed. But ſince the Bandage muſt be looſen'd daily for the ſake of cleanſing the Wound, and the Limb muſt by no means be moved, it certainly ought to be very ſhort, particularly if the Fracture is in the Thigh or Leg; for as you cannot carry the Roller round the Part affected without lifting up the Leg, it almoſt neceſſarily follows, that the Bone, after a Reunion, will be diſturbed, and conſequently not agglutinate neatly. Therefore the beſt Surgeons have rejected the longer Bandages, and ſubſtituted in their room that of eighteen Heads (ſee *Tab.* XXX. *Fig.* 4.); as it is ſufficient to keep the Limb quiet, and ſuſtain it properly. But when the Wound is healed, and the Fracture not agglutinated, it is convenient to leave off the eighteen-headed Bandage, and apply the narrow, long, ſimple Roller, till the Cure is completed. But this will appear more plainly by the Article FASCIA.

If an Ulcer accompanies a Fracture, eſpecially in the Leg or Thigh, as this muſt be opened every Day, like a Wound, after Reduction, apply the eighteen-headed Bandage, till the Ulcer is healed; then, laying that aſide, uſe the narrow, long, ſimple Roller, till the Bone is conſolidated, as we directed for a Fracture with a Wound.

Sometimes a Fracture happens in a Part of the Bone, where there have been an Ulcer and Caries for ſome time. The Cure then is difficult, if not impoſſible, and very few Writers have propos'd any proper Method in this Caſe. *Petit*, indeed, mentions an Inſtance, where a fractur'd Leg was attended with a Caries; but this, ſince he ſpeaks of no other, is very far from being a ſufficient Guide. However, it may be of ſome Service, till we can find a better. There was a young Man, ſays he, about the Age of Twenty, who having been a long time troubled with an Ulcer and Caries about the Tibia, broke the Bone in that very Part, and the Fibula remain'd entire. Here he found Extenſion unneceſſary, but, firſt removing all the vitiated Fleſh near the Fracture, he reduc'd it with his Fingers, and filled the Ulcer with dry Lint, applying Compreſſes, and the eighteen-headed Bandage, as to a Fracture with a Wound; then placed the Limb in a Straw-caſe. Some Days after, when the Fever abated, he cauterized the Extremity of the Bone, where the Caries was; and then took off the carious Parts with an exfoliating Trepan: He then apply'd Lint moiſtened with Tincture of Aloes, to the bare Bone, having firſt uſed a digeſtive Ointment to the Fleſh, and afterwards the Unguentum Fuſcum, to check the luxuriant Fleſh, which is very prejudicial. This he continued for fifty Days, till the corrupted Parts of the Bone exfoliated. Laſtly, he produc'd a new Fleſh by the vulnerary Balſam; and then agglutinated the Ulcer, and Bone, after the uſual Method.

But the Caſe of a fractur'd Thigh with an Ulcer and Caries, which *Petit* has made no mention of, is much more difficult. I knew a Student, about the Age of Twenty, who, for ſeveral Years, had an Ulcer with a Caries, in the middle and internal Part of his Thigh, where the crural Artery deſcends. The Caries, from the Thickneſs of the Fleſh in this Part, was inviſible; neither could the Ulcer be enlarg'd with a Knife,

Knife, or the Bone cauteriz'd, on account of the Vicinity of the great Artery; ſo that all the Medicines, which were applied, prov'd ineffectual. At length, in Walking, without any external Violence, his Thigh was broken in this very Part. Here, again, we could neither enlarge the Wound, nor cauterize the Bone, for the Reaſons above-mention'd. And though the Bone was reduc'd, and a proper Bandage applied, yet it would never heal, and the Patient led a miſerable Life. It is, therefore, the Duty of every one to conſider, how ſuch a Fracture in the Thigh, Arm, and other Parts, where the Bone does not appear, nor can be ſafely laid open, ſhould be treated, which would be ſomewhat difficult to diſcover.

A Surgeon, after having reduc'd the Fracture, and given proper Directions for keeping it at Reſt, has done his Duty; for Nature herſelf, by inducing a Callus, performs the Agglutination. From the little Arteries, and bony Fibres, of the fractur'd Parts there ſweats out a certain Gelly, or liquid viſcous Matter, which adheres to the Chinks like Glue. This, being firſt converted to a Cartilage, then to a harder cartilagineous, and, at laſt, to a bony Subſtance, unites the Fragments ſo firmly, that any other Part may be broken ſooner than this; as is obſervable in Planks join'd with Glue.

But as in Wounds the new Fleſh, ſo in Fractures the Callus, is ſometimes too luxuriant, rendering the Limb uneven and deform'd. When this happens, and cannot be prevented, the Surgeon ſhould acquaint his Patient with it, leſt the Diſproportion be imputed to him. Nor can this Excreſcence of the Callus be always prevented, or, when it is come to a Pitch, be cut off, like luxuriant Fleſh, for many and good Reaſons: It is therefore incurable.

But too great a Luxuriance of the Callus may, in ſome meaſure, be prevented, by binding the Part pretty tight, and bathing it with rectified Spirit of Wine; for this will not only ſuppreſs, but harden, the viſcid Matter. I would recommend this particularly in the Arms of Women, and the Legs of Men, as they are the moſt conſpicuous Parts of the Body. But, if the Callus is already indurated, ſcarce any Remedy can be found, either to remove or ſuppreſs it; though ſome ſay it may be ſucceſsfully check'd by the Application of the *Emplaſtrum de Ranis cum Mercurio*, binding a Leaden Plate over it. This Callus grows ſooner or later, according to the different Size of the fractur'd Bone, the Habit of the Body, Temperament of the Air, and the Age of the Patient. When it is obſerv'd to be too ſlow in its Progreſs, ſome promote it by giving frequently half a Dram of Oſteocolla to the Patient.

The beſt Method to prevent an Itching is the Removal of all fat and oily Applications, and even Plaiſters; for they are of ſuch a Nature as to obſtruct the Pores of the Body entirely. If this does not anſwer the End, it will be proper to bathe the Part with warm Wine, Spirit of Wine, or Oxycrate, and to make the Bandage with clean ſoft Linen. If there are any Bliſters, they may be cut with the Sciſſars.

Inflammations may be treated in the Manner directed under the Articles INFLAMMATIO, CONTUSIO, and VULNUS. But, for Pains and Convulſions, obſerve what is ſaid under the Article VULNUS; but particular Care muſt be taken, that the Fragments be replac'd; and, if any are looſe, let them be extracted, and the Limb put in the moſt commodious Poſture: Though the beſt Method is to open a Vein, and apply reſolvent Cataplaſms, and Fomentations; not neglecting, in the mean time, internal Medicines, and a proper Diet; for, without theſe, violent Inflammations, a Sphacelus, and Death, will often enſue.

But if the Inflammation is ſo violent, that you apprehend a Mortification; firſt, let Blood; then apply an eighteen-headed inſtead of the long ſimple Bandage, with digeſting Fomentations, either of Lime-water with camphorated Spirit of Wine, and Eſſence of Aloes and Myrrh; or of Spirit of Wine comphorated, and Sal Ammoniac; or the Medicines already preſcrib'd above for the Mitigation of Inflammations. But, if the Mortification already appears, you muſt make frequent Scarifications and Inciſions, to let out the ſtagnating Humours, not forgetting the Fomentations juſt recommended; and, when the Gangrene has gain'd ſuch a Head, that Fomentations will avail nothing, and the Sphacelus approaches, the Limb muſt be amputated, to prevent the Corruption from ſpreading.

If an Hæmorrhage attends a Fracture, you muſt ſearch diligently for the ruptur'd Vein or Artery, and check the Profuſion of Blood, either by Preſſure, or a proper Application of Lint, Compreſſes, and Bandages; or by a proper Ligature of the affected Veſſel; or, laſtly, by the Cautery. After this, reduce the Bone, remove all the extraneous Bodies which can readily be come at, and then apply the Bandage.

If a Fracture is accompanied with a Palſy, or Waſting of the Limb, there is but little room for Hope. Though it is proper, in this Caſe, (1.) To rub the Part affected with warm Cloths, often and diligently. (2.) To anoint it with ſtrong Spirits, as the Spirit of Ants, Earth-worms, Hartſhorn, Sal Ammoniac, or the Spiritus Matricalis of the *Leyden* Diſpenſatory, Eſſence of Euphorbium, and Caſtor. (3.) To foment it with warm Fomentations, and Baths made of Wine impregnated with ſtrengthening, aromatic, and nervous Vegetables, or natural warm Baths. (4.) But the moſt proper Method is to put the paralytic, rigid, or tabid Limb into the Bellies of Animals freſh-kill'd, as Oxen, Calves, Swine, or Dogs, as this will promote an Afflux of the Blood and Animal Spirits to the injur'd Part, and recover it; particularly if it is aſſiſted by internal, nervous, and corroborating Medicines.

As often as a Joint grows rigid, and the corrupted Matter therein is ſuppos'd to be harden'd; this the *Greeks* call *Anchyloſis*: If it proceeds from an Infuſion and Concretion of the Juice of the fractur'd Bones into the Joint, the Cure will be difficult; but if it ariſes from too long Reſt, or the Inſpiſſation of the Humour which ſhould lubricate the Joints, it is proper to uſe frequently warm Fomentations, and rub the rigid Parts with Oils, and Fat of Animals, and emollient Unguents; and to move it in different Directions, with the Hands, till the natural Power of moving be reſtor'd.

When a Luxation accompanies a Fracture; firſt, reduce that, then the Fracture; and apply to both a proper Bandage. In ſome Caſes, for Example, where the Fracture is near the Head of the Bone, ſo that the diſlocated Part can neither be taken hold of, nor ſufficiently extended, it is better to reduce the Fragments, bind them up properly, and agglutinate them, before you meddle with the Diſlocation; though you muſt not omit to preſerve the luxated Bone from Tumors, and Inflammation, by applying Spirit of Wine, or Spirit of Wine comphorated, or warm Vinegar. But I cannot forbear confeſſing, that this Method is not always effectual; for, ſometimes, the luxated Parts cannot be reduc'd by any means whatever, afterwards. Mean time, as we have no better Way, this muſt not be rejected, eſpecially ſince there are many Inſtances in Authors, where the Luxation has been reduc'd ſome Months, and even a whole Year after.

If a fractur'd Limb, either through the Negligence of the Surgeon, or the Imprudence or Inquietude of the Patient, after Conſolidation, is deform'd, there is no other Method of reſtoring it to its priſtine Beauty, but employing ſtrong Men to extend, divide, and break it again; though a repeated Cure of ſuch a Fracture requires the utmoſt Circumſpection. When, therefore, the Deformity and Pain are inconſiderable, and the Callus harden'd, or the Patient old and infirm, it is not only troubleſome, but ſometimes dangerous; and, conſequently, ought not to be attempted. On the contrary, when the Callus is tender, and the Patient young and robuſt, you may ſafely uſe theſe means for reſtoring the Member to its former Shape. Mean time it is neceſſary to obſerve, that, before this is undertaken, reſolvent and emollient Baths, Fomentations, Ointments, and Plaiſters, for ſeveral Days, are to be applied to the Callus.

Zwinger affirms, that a Callus may be reſolv'd by the Application of the *Emplaſtrum de Ranis cum Mercurio*, and that in fourteen Days, provided it has not been form'd above ſix Months. But *Heiſter* doubts of this, and leaves it to Experience to be determin'd.

Having treated above of Fractures in general, and of Fractures of the Head in particular, under the Article CAPUT, we now proceed to Fractures of particular Parts, not ſpecified under other Atricles.

FRACTURES OF THE NOSE.

Both the Bone and Cartilages of the Noſe are liable to a Fracture, from a Fall or Blow. This happens in the Middle, or on the Side, and is diſcoverable by the Sight or Touch; for, when either of the Bones in the Front are broken, the Noſe will become flat, and the Patient breathes with Difficulty. If a Bone on either Side is fractur'd, the Part is hollow. When this Accident happens to the Cartilage, the Noſe inclines to one Side. This is ſometimes a ſimple Fracture, but more frequently attended with an external Wound; and, when the Injury is very conſiderable, the Cure can never be complete, but there will remain ſome Deformity in the Noſtrils; and, from the Vicinity of the Brain, which is often affected at the ſame time, it is very dangerous: Beſides, Ozæna, Caries, or Polypus, frequently ſucceed, which greatly impede the Smell, Speech, and Reſpiration.

When the Bone of the Noſe is to be reduc'd, place the Patient oppoſite to the Light, either reclining on a Bed, or an Aſſiſtant holding his Head back, whilſt you elevate the depreſs'd Parts with a Probe, Spatula, or Quill; and externally apply the Thumb and fore Finger of the other Hand. If the Fracture is on both Sides, proceed in the ſame Method with the other; and, to prevent their collapſing, fill each Noſtril with a Doſſil of Lint, laying on a Plaiſter, and ſuch Dreſſings as are directed for recent Wounds. The Splinters muſt be forced into their natural Situation by the Fingers; but, if a Splinter is ſo far remov'd from the Bone, that it will not reunite, extract it with the Forceps.

If this Fracture is attended with an external Wound after Reduction, firſt dreſs it with dry Lint, covering it with a vulnerary Plaiſter; afterwards apply balſamic Medicines, as digeſtive Unguents, Eſſence of Aloes, Myrrh, Amber, Maſtich. Fat oily Medicines muſt be avoided in this, and all other Fractures, as very improper; but, if there is no external Wound, the Plaiſter only will be ſufficient to ſecure the Bone; and, unleſs an Abſceſs or Caries follow, the Agglutination is completed in fourteen Days. However, as a ſingle or double Support of ſtrong Paſteboard, cover'd with Splints, and adapted to the Noſe, (ſee *Tab.* XXIX. *Fig.* 8.) ſometimes ſeems neceſſary, it may be applied to the Side, and faſten'd, but not too tightly, with the four-headed Bandage (ſee FASCIA). Before the Application of the Plaiſter or Bandage, ſome introduce a little Silver or Leaden Tube, or a Quill, into the affected Noſtril, in order to preſerve Reſpiration (ſee *Tab.* XXIII. Letters P and Q); and, to ſecure theſe, as well as the Bone, they uſe the four-headed Bandage, or a peculiar String faſten'd to the Bandage: Though many Moderns reject this whole Apparatus, except the Splints, Bandage, and Plaiſter, as unneceſſary, and even prejudicial, rather than ſerviceable, eſpecially ſince the Patient can ſeldom bear theſe Tubes, or even the Tents themſelves, as they irritate the Part, and hinder Reſpiration: Beſides, theſe Bones, once reduc'd, do not eaſily ſeparate again, as is generally imagin'd.

FRACTURES OF THE JAW.

The lower Jaw is leſs ſubject to Fractures than any other Bone; but, when it does happen, either on one or both Sides, the Fragments are not far ſeparated from each other; for the Muſcles are ſo ſituated, that they cannot ſeparate the Bone far: But, however, the more violently it is injur'd by a Blow or Fall, the more are the Fragments bruis'd, and remov'd from their proper Situation.

As for the Diſcovery of a Fracture in the Jaw-bone, it is made by the Sight, but, principally, by the Touch; for the laſt will demonſtrate, evidently, what is divided in the Jaw, and whether the Teeth are remov'd from their natural Poſition. Beſides, the violent Pains and Convulſions are infallible Signs of a fractur'd Jaw; though, if the Pieces are not entirely ſeparated, it is not ſo eaſily diſcover'd.

The Method of reducing the fractur'd Bones of the lower Jaw, is to place the Patient in a convenient Seat oppoſite to the Light, and let his Head be held back firmly by an Aſſiſtant: Then the Surgeon muſt introduce his Finger or Thumb of one Hand into his Mouth, and apply the other Hand on the Outſide; and with theſe bring the Fragments together, till they appear to be properly replac'd, which he may know from the accurate Situation of the Teeth. But, when any of the Teeth are looſen'd, or fore'd out, it will be proper, if the Caſe will permit, to faſten them with Gold or Silver Wire, or Thread, to the next Teeth. If the Jaw is broken on both Sides, you muſt proceed in the ſame manner, with one after the other; and you will be the more ſucceſsful in this, the more you are acquainted with the Anatomy of this Part. When the Fragments are not ſeparated, Repoſition is unneceſſary.

When you have reduc'd the Bone, firſt apply a Plaiſter, then a Compreſs dipt in Spirit of Wine; and, upon that, if only one Part is broken, lay another Compreſs, ſew'd to a Piece of Paſteboard, in the Form of a half Jaw, provided only one Side is fractur'd (ſee *Tab.* XXIX. *Fig.* 9.). Faſten them both, either with a Bandage of four Heads, perforated in the Middle, to receive the Chin, or with the Habena, deſcrib'd under the Article FASCIA. When the Jaw-bone is fractur'd on both Sides, then apply, in the ſame manner, one Compreſs, moiſten'd with Spirit of Wine; and another with Paſteboard, perforated in the Middle, (*Tab.* XXIX. *Fig.* 10.) and fitted to the Chin, ſo that the Perforation *a* may be applied to the Chin, and the Extremity *b b* to the Ears. Theſe Fractures, however, may be eaſily cur'd without Plaiſters or Compreſſes, by a proper Bandage, as they will not, without Violence, relapſe after Reduction. For your further Direction, in regard to the Bandage, conſult the Article FASCIA.

Laſtly, to promote the Agglutination of a fractur'd Jaw-bone, it is proper to open a Vein, and recommend Reſt to the Patient, and forbid him all manner of Diſcourſe and Manducation, eſpecially at firſt. Preſcribe, therefore, before the Agglutination, Spoon-meats, as Broth, Soop, and Eggs; order him to lie on his Back, and not upon his Face or Cheek; for thus your Cure will be completed in twenty or thirty Days; eſpecially if the internal Part, where the Fracture is, be anointed ſeveral times every Day with Honey of Roſes.

If the Fracture is attended with a Wound, it muſt be open'd every Day, and Care taken of the Wound, till it is heal'd. *Le Dran* gives an Example of a Fracture of each Maxilla, in *Obſ. Chirurg.* 3. *Tom.* 1. and one of the lower Jaw, *Obſ.* 8.

For the Method of treating Fractures of the Clavicle, ſee CLAVICULA.

FRACTURES OF THE SCAPULA.

The Scapula is fractur'd, either near the Acromion, that is, the Part where it is join'd to the Clavicle, or elſewhere. If the Acromion is broken, it may be eaſily reduc'd with the Fingers, either elevating the Arm, to relax the Deltoide Muſcle, or preſſing the Os humeri directly upwards, laying hold of it near the Elbow; but it will ſlip out again from a very ſlight Cauſe, ſo that it does not agglutinate without great Difficulty; and this even by the Weight and Motion of the Arm, and the Contraction of the Deltoide Muſcle: The Conſequence of which is, that few Perſons, who have met with this Accident, can afterwards lift their Arm up freely. After the Reduction, apply a Compreſs moiſten'd in Spirit of Wine, faſten it with the Bandage commonly call'd Spica, put a Ball under the Ala, and ſuſpend the Arm in a Sling about the Neck. But, if the Neck of the Scapula, which is below the Acromion, or the Acetabulum, be broken, which, from its deep Situation, cannot be well diſcover'd, and, indeed, but ſeldom happens, a Stiffneſs of the Joint, or Inability of Motion, an Inflammation, a violent Abſceſs, or ſome other bad Symptoms, and even Death, generally enſue: An Inſtance of which I ſaw in a Profeſſor at *Helmſtadt*; and it cannot be otherwiſe, by reaſon of the neighbouring Joint, the Tendons, Muſcles, Ligaments, Nerves, Veins, and great adjacent Arteries, as ſome of theſe muſt be affected by the Fracture. All other Fractures of the Scapula are leſs hazardous.

In order to reduce the Scapula, an Aſſiſtant ſhould extend the Arm forwards, whilſt the Surgeon, in the beſt manner he can, is employ'd in reſtoring it with his Hands, laying thereon Compreſſes, and Splints of thick Paſteboard, adapted to the Part, and dipt in Spirit of Wine, or Oxycrate, binding it afterwards with the Faſcia Stellata, or Quadriga. See FASCIA.

FRACTURES OF THE STERNUM.

The Breaſt-bone, or Sternum, as well as others, may be depreſs'd, or fractur'd, by external Injuries, as a Fall, or Blow. After this Accident, the Part is not only in Pain, and unequal, but the latent Veins and Arteries are very much injur'd, or entirely broken; from whence proceed Pains of the Breaſt, Difficulty of Breathing, violent Coughs, Spitting of Blood, or Extravaſations of Blood on the Precordia, or within the Mediaſtinum, with many other dangerous Symptoms.

Nor are theſe only, which we have already mention'd, Symptoms of a fractur'd Sternum, but it is plainly indicated, when the Sternum is remarkably or unnaturally diſproportion'd, or when it is moveable by the bare Touch of the Fingers, but particularly if a Noiſe is heard: Though the proper Indication of a depreſs'd Sternum is, that, beſides theſe Symptoms, there is a manifeſt Sinus, or Inequality, in the Part.

The propereſt Method of reducing the Sternum is, to lay the Patient upon his Back, on a Bed or Table, putting under him ſome hard Pillows, a great Loaf, a Drum, ſome cylindrical Body, a Tub, or ſome other large Subſtance, ſo as to depreſs or recline the Shoulders, and elevate or extend the Breaſt-bone. Then the Surgeon muſt preſs, and with ſome Violence ſhake, each Side of the Breaſt; for that both extends the Ribs forwards, and forces the depreſs'd Parts of the Sternum into their natural Situation. But, as this Method may ſometimes fail, it is then proper to make a crucial Inciſion in the Skin, and elevate the depreſs'd Part of the Sternum, with an Elevator (*Terebra*) gently ſcrew'd into the Part; and, though this is the moſt painful Method, yet *Gouey* and *Petit* both recommend it, as the readieſt and beſt. We have already, under the Article FASCIA, explain'd the propereſt way of retaining this Bone. But, if any Blood is collected within the Mediaſtinum, (as it often happens, particularly when violent Pains under the Sternum continue after Reſtitution) and cauſes a Suppuration internally, it will not be amiſs to trepan the inferior Part of the Sternum, as we do the Cranium; and, after purging the Breaſt of the corrupted Matter, to apply a vulnerary Balſam. Laſtly, when any Effuſion of Blood is diſcover'd within the Breaſt, the only remaining Hope is plac'd in a Perforation of the Breaſt, after the manner recommended under the Article EMPYEMA. As for the Dreſſings, you muſt uſe Compreſſes dipt in warm Wine, or Spirit of Wine, with the Napkin and Scapulary.

FRACTURES OF THE RIBS.

Sometimes the Ribs are broken or fiſſured in ſuch a manner, that only the exterior or interior Part is affected, nor do they remove from their proper Place; and then there are very few bad Symptoms, inſomuch that it is often not perceivable, ſo that they reunite ſpontaneouſly: But, when the whole Rib is fractur'd, and the Fragments recede from their natural Situation,

Situation, the Caſe is more dangerous; for theſe ſeparated Fragments fret the Muſcles, and the internal Membrane of the Breaſt, call'd the Pleura: When theſe Bones are fractured, they project either internally or externally, and almoſt in the ſame Manner as a broken Bow: In the latter Caſe the Symptoms are not dangerous; whereas, in the former, eſpecially if the Veins or Arteries are injur'd, they are very hazardous, and generally attended with violent Prickings, an Inflammation, a Difficulty of Reſpiration, Cough, Fever, Spitting of Blood, Suppuration, Hæmorrhage into the Cavity of the Thorax, or cellular Interſtice of the Mediaſtinum, with many other dangerous Symptoms, particularly if the Viſcera, which are near, have received any Injury; and, if theſe are not timely relieved, violent Fevers, Inflammations and Ulcers of the Breaſt and Lungs, Empyemas, incurable Fiſtulas, and Caries of the Bones, and even Death itſelf, will frequently enſue. Sometimes, indeed, it is only a ſimple Fracture; but, for the moſt part, it is accompanied with an external Wound; or ſome acute Fragment irritates the tender Parts, and then there follows a great Profuſion of Blood, which is hardly to be ſtopped; and, if this Blood infuſes itſelf into the Breaſt, it never can be extracted but by an Aperture, or at leaſt a Dilatation of the Wound, if the Injury be in the baſtard Ribs. If the Cartilage is divided from the Bone, we denominate it a Fracture, and treat it as other Fractures.

When the Parts of the fractur'd Rib continue in their proper Situation, or when the Rib is not fractur'd quite through, and the natural Equality of the Part remains unalter'd, or when the Pain is not violent, it is difficult to diſcover ſuch a Fracture; yet a ſlight Touch of the injur'd Part will give Pain; on this Account, however, it agglutinates more eaſily: But, when the fractur'd Parts are ſeparated from each other, you may not only perceive an Inequality by the Touch; but the Noiſe of the Bones, if they are mov'd, will diſcover it to the Ear. When any acute Part touches the Viſcera, or any Fragment points inward, the Symptoms mention'd above will enſue; from the dangerous Appearance of which, we collect the Danger of the Fracture. A windy Tumor (which the *Greeks* term *Emphyſema*) very often proceeds from a Fracture of the Ribs; for the Wind inſinuates itſelf through a ſmall Wound between the Fleſh and Skin into the Subſtance of the cellular or adipoſe Membrane; and firſt inflates the Breaſt, then the Neck, Head, Belly, and other Parts, as Calves or Sheep are blown up by the Butchers. Of this Mr. *Littre* gives a remarkable Inſtance in the *Memoirs of the Academy of Sciences for* 1713. and Mr. *Mery* gives another in the *Memoirs* for the ſame Year. That of Mr. *Mery* is as follows:

A poor Man, about ſixty Years of Age, on *Monday* about Three of the Clock in the Afternoon, had the Misfortune to be thrown down by a Coach, the Wheels of which paſs'd over his Breaſt, and broke the fourth and fifth Ribs of his Left Side in the Middle. His calamitous Situation oblig'd him immediately to apply for Relief to the *Hotel-dieu*, where he was forthwith receiv'd as a Patient.

Upon examining his Body, the Fracture of his Ribs was eaſily and palpably diſcover'd: Soon after there appear'd in the ſame Place a conſiderable Tumor, occaſion'd by a Quantity of Air pent up, and confin'd in the veſicular Texture of the Membrane lying under the Skin. The Surgeon, to whoſe Care this Patient was committed, did not think it adviſeable to apply Medicines to the *Emphyſema*, becauſe externally he could perceive neither Wound nor Contuſion: Nor durſt he venture to apply the Bandage commonly us'd for Fractures of the Ribs, for Fear of injuring his Reſpiration, which was already conſiderably diſorder'd. He contented himſelf with only Bleeding the Patient; and the Veneſection, by Order of the Phyſician of the Ward, was repeated on the ſubſequent Days: But, notwithſtanding theſe Meaſures, the Difficulty of Reſpiration, and the Emphyſema, gradually increas'd till the Evening of the *Thurſday*, which was the fourth Day of his Indiſpoſition, and the laſt of his Life.

Next Morning, upon examining his Body, I found that the Emphyſema had diffus'd itſelf thro' all its external Parts, except the Soles of his Feet, and Palms of his Hands, ſo that his Face, his Neck, his Breaſt, his Abdomen, his Arms, and his Legs, were fill'd and diſtended with Air, which yielded under my Fingers, when I but gently preſs'd the Skin, under which it was lodg'd.

Making an Inciſion in the Skin, and other Integuments, which cover'd the Fracture of the Ribs, I obſerv'd a very ſmall, and almoſt imperceptible, Opening in the intercoſtal Muſcles, but without any Ecchymoſis. Then laying open the Breaſt, I perceiv'd a ſmall Portion of the Membrane, which ſurrounds the Lungs, torn, and one Part of it adhering to the Lungs, and another to a Portion of the fractur'd Ribs: Notwithſtanding this, a ſingle Drop of Blood was not diſcharg'd from the Lungs into the Cavity of the Breaſt; a Circumſtance which to me appear'd pretty ſingular and uncommon.

After the Diſcovery of theſe Phenomena, it was no difficult Taſk to find out the particular Road the Air had taken in forming this monſtrous Emphyſema; for 'tis obvious, that a Part of the Air, which enter'd thro' the Arteria Trachea into the Lungs, during the Dilatation of the Breaſt, muſt, during its Contraction, be carried back thro' the ſame Paſſage, whilſt another Part of the Air, making its Eſcape from the Cellulæ of the Lungs, thro' the Opening of their torn Membrane, muſt paſs from the Cavity of the Breaſt, thro' the ſmall Wound of the intercoſtal Muſcles, and inſinuate itſelf into the Texture of the cellular Membrane; becauſe the Reſiſtance made by it was not equal to the Effort of the Air, which penetrated it; for 'tis by no means probable, that the Air ſhould have inſinuated itſelf into this Membrane during the Dilatation of the Breaſt, ſince, in dilating itſelf, it can only convey into the Lungs a Quantity of Air equal to that, whoſe Place it takes up by its Dilatation; for, on this Occaſion, its Cavity within is enlarg'd in a direct Proportion to the Space it takes up externally; for which Reaſon, the Air could not inſinuate itſelf into the cellular Membrane, during the Dilatation of the Breaſt: It muſt, therefore, have penetrated this Membrane, during the Contraction of the Breaſt; and, as the Air enter'd into it without creating any Pain to the Patient, who, alſo, perceiv'd no uneaſy Senſation in any Part of his Body, upon preſſing the Skin under which the Air was pent up, we have juſt Reaſon to conclude, that all the Cellulæ of the cellular Membrane have a mutual Continuation with each other; otherwiſe this poor Patient had been ſubjected to the moſt intenſe and racking Pains, if the Texture of the cellular Membrane had been broken and lacerated by a forcible Inſinuation of the Air.

In reducing the Ribs, you ſhould always obſerve very particularly, whether the Splinters project internally or externally: In the laſt Caſe, the Patient ſhould be placed on a high Chair or Table, and the ſeparated Bones gently reſtored by the Fingers; after which, apply Compreſſes dipt in Spirit of Wine, with a Splint of thick Paſteboard, which you muſt faſten with a circular Bandage, or the Napkin and Scapulary. In the former Caſe, while the Patient draws his Breath, the Surgeon ſhould preſs and move gently with his Hands, both the anterior and poſterior Extremity of the Ribs, till the depreſs'd Part recover its Situation. As to the Bandage, proceed as before, omitting only the Paſteboard, and binding the Napkin ſomewhat looſer; but the Bandage muſt not be unloos'd, unleſs it is too lax, or ſome Symptom makes it requiſite; and, in theſe Caſes, the Patient muſt be in an erect Poſture whilſt it is done: Thus will your Cure be completed within three Weeks or a Month. During the whole Time, according to *Celſus*'s Advice, the Patient muſt avoid Clamour, Talking, Paſſion, any violent Motion of the Body, Smoak, Duſt, and every Provocative to Coughing or Sternutation. If theſe Rules fail, it will not be amiſs to elevate the Ribs by means of a ſticking Plaiſter, as in a Depreſſion of the Cranium. See CAPUT.

If any acute Fragments, breaking through the Pleura, cauſe great Pains, difficult Reſpiration, Coughing, Spitting of Blood, Inflammation, Fever, and other dangerous Symptoms, an Inciſion muſt be immediately made in the Skin, and the Fragments which ſtick in the Fleſh, muſt be extracted with the Fingers, Forceps, Hooks, or ſome other Inſtrument, the Omiſſion of which will endanger the Patient's Life: Open, therefore, a Vein in the Arm, give Glyſters, temperating and anodyne Medicines, and preſcribe a thin Diet. This Inciſion is particularly neceſſary, when neither a Plaiſter, nor the Concuſſion of the Breaſt, before recommended, are ſufficient to reduce the Ribs.

When the Signs, mentioned under the Article THORAX, indicate that the Veins or Arteries under the Ribs are injur'd, and an internal Hæmorrhage excited, you muſt open the Breaſt, about the affected Part, and paſs in your Finger, arm'd with Lint or Linen, impregnated with ſome proper Styptic, till the Bleeding ceaſes. If the Finger will not perform the Office, you muſt ſearch for the broken Veſſel, and cloſe it, either with a Ligature, or by the actual Cautery. But, to omit nothing which may conduce to cleanſing the Wound, the Surgeon ought to keep it open with Lint, if it is in the lower Part of the Breaſt, as long as is neceſſary; if in the upper Part, or at the true Ribs, after Agglutination, a Perforation of the Breaſt, in the inferior Part, will be very proper.

For the Cure of an *Emphyſema*, it is proper to enlarge the external Wound of the Skin, if it is ſmall, by Inciſion, and rub the Tumor gently at every Dreſſing, or preſs it towards the Wound, that the included Air may be gradually expel'd. For the Treatment of Contuſions, if they are accompanied with a violent Cough or Suppuration, Phlebotomy and other Remedies muſt be uſed.

In *Le Dran, Obſervat.* 29. *Vol.* 1. there is an Example of an Emphyſema cur'd by this Method.

FRACTURES

Fractures of the Vertebræ.

When any of the Vertebræ are fractur'd by a Fall, a Blow, or any other external Cauſe, without affecting the ſpinal Marrow, then very ſeldom any thing but the poſterior Apophyſes, or acute Tubercles, are injur'd, which is not at all dangerous. But, when the Body of the Vertebræ, and, conſequently, the ſpinal Marrow, is injur'd by any external Violence, the Parts of the Arms, Legs, or Viſcera, which are below them, become immediately rigid and motionleſs. It is, therefore, no Wonder, that Death enſues ſooner or later, according to the Degree of the Injury. If the tranſverſe Apophyſes, which tend towards the Cavity of the Thorax, are broken, then muſt the Heads of the Ribs, which are inſerted in them, be likewiſe broken, which is a dangerous Caſe.

We diſcover a Fracture of the Vertebræ, not only (1.) from an outward Violence, as a Fall, Blow, or Contuſion; but, principally, (2.) from the Pains of the affected Part; and (3.) the Touch, Sight, or Hearing.

When the Apophyſes are only fractur'd, you may reduce them with your Fingers, applying on each Side of the Spina Dorſi narrow Compreſſes, moiſten'd with Spirit of Wine, and a Splint of thick Paſteboard, with the Napkin and Scapulary. This will eaſily and ſpeedily reunite the Bones of the Vertebræ, as they are ſoft and ſpongy.

If the ſpinal Marrow is wounded, Death follows inevitably; though, as it may ſeem cruel not to attempt the Relief of one under theſe unhappy Circumſtances, the Surgeon ſhould lay the injur'd Part bare by the Knife, and elevate the Fragments, which preſs upon the Medulla, in a proper manner, or, when they are quite looſe, extract them; then let him cleanſe the Wound thoroughly, and apply balſamic Medicines, uſing the Napkin and Scapulary. He muſt continue this, till the Wound heal'd, or the Patient dies.

Fractures of the Os Sacrum.

It ſometimes happens, that the Os Sacrum is fractur'd by a Fall, or ſome violent Blow; and this appears from the Pain the Patient undergoes, but, principally, from the Touch, as in other Fractures.

When this happens, the Fragments ſhould be immediately reduc'd with the Fingers. But, if they are depreſs'd internally, the beſt Method is, after cutting your Nail cloſe, to introduce one Finger, moiſten'd with Oil or Butter, into the Anus, and raiſe the Part depreſs'd into its natural Situation, and, with the other Hand, to reduce it externally. Having done this, apply a Plaiſter ſuitable to the Fracture, and Compreſſes dipt in warm Spirit of Wine, with the T Bandage, or only Compreſſes impregnated with Spirit of Wine, with any Bandage. Laſtly, to promote Conſolidation, let the Patient lie quiet in his Bed, upon either Side, for about a Fortnight; or, if he chuſes ſometimes to ſit, put him in a Chair, without a Bottom, that the Bones may not ſeparate again.

The Os Innominatum is ſeldom fractur'd; but, when it is, the Danger is great; becauſe the adjacent Parts are generally affected, and bad Symptoms enſue, eſpecially if the Patient diſcharges by Vomit a brown or bloody Matter. In reducing it, the Patient muſt lie on the ſound Side; the fractur'd Parts muſt be reſtor'd with the Hands; and Compreſſes, dipt in Spirit of Wine, muſt be apply'd, which are to be faſten'd with the Spica. After this, open a Vein, give temperating and reſolving Medicines, and preſcribe a thin Diet.

Fractures of the Humerus.

The Os Humeri is liable to be fractur'd, either in the Middle, where the Danger is ſmall, or near the ſuperior or interior Head, where the Fracture is worſe, attended with greater Pains, and cur'd with greater Difficulty. It may be eaſily diſcover'd, as it is apparent to the Senſes; but the Bandage, and Method of Cure, is different, according to the Difference of the Parts affected; ſometimes the fractur'd Bones remain in their proper Situation, but much more frequently ſeparate; and one, ſlipping over the other, makes that Limb ſhorter than that on the oppoſite Side; and it ſometimes, though rarely, happens, that the Weight of the Arm cauſes the Fragments to recede from each other. However, in the firſt Caſe, they are reduc'd with great Eaſe; in the latter, more Strength is requiſite to reſtore them, eſpecially if the Patient's Nerves and Muſcles are ſtrong, as they uſually are in robuſt Men.

When the Os Humeri is fractur'd, the following is the propereſt Method of extending it: The Patient is plac'd upon a high Seat; then one Aſſiſtant, the Patient's Elbow being gently bent, takes firm hold of his Arm above the Fracture, and another below it, which laſt extends the Arm in a direct Line, while both pull in oppoſite Directions. The Surgeon himſelf takes the fractur'd Part in his Hands, and, when the Bone is ſufficiently extended, reduces it; then he applies a Bandage, in the manner directed under the Article Fascia. If one Aſſiſtant cannot complete the Extenſion, you muſt employ two; and ſurround the Heads of the Joints with Napkins, or Linen Bandages; and pull different Ways, till the Limb becomes longer then it ought to be naturally; and then the Surgeon, with his Hands, muſt replace the Bones in their proper Situation.

Fractures of the Cubit.

The Cubit has two Bones, the Radius, and the Ulna: In a Fracture, therefore, of the Cubit, either one or both are broken; and that ſometimes in the Middle, ſometimes at the Extremities: If both are broken, each is the more eaſily remov'd out of its proper Situation, but, for that Reaſon, reduc'd and agglutinated with the more Difficulty; if one only, it is not ſo readily remov'd out of its Place; and, therefore, the Reduction and Retention are more eaſy; for one entire Bone is more ſerviceable than any Bandages or Splints whatever. When the Fracture happens near the inferior Head, the broken Bone, by reaſon of the Muſculus Quadratus, and that ſtrong Ligament which lies between the two Bones, is attracted towards the entire Bone, which makes the Reduction difficult; and this ought to be principally conſider'd both in that and the Prognoſtic.

A Fracture in theſe Bones is diſcoverable by the common Indications of Fractures. The Touch, or Sight, by moving the Hand of the affected Cubit inwards and outwards, will certainly indicate whether one or both are broken, and in what Part; though a Fracture of the Ulna, from its Inability to ſupport the Joint, will ſhew itſelf ſooner than that of the Radius: The Ear likewiſe will aſſiſt in this Diſcovery; for, if you take firm hold of the ſuperior Part of the Elbow, and move the Hand inwards and outwards, you will perceive a grating of the Bones.

If the Radius is to be reduc'd, and the Fragments have receded towards the Ulna, an Aſſiſtant ſhould ſtretch the Arm, and the Surgeon preſs down the Patient's Hand towards the Ulna, till the depreſs'd Part is elevated. After this, the Arm muſt be compreſs'd on each Side, with the Palms of both Hands, ſo as to reſtore the compreſs'd Muſcles, between the Ulna and Radius, and Fragments of the Radius, to their natural Poſition; then bind up the Arm, as we have directed under the Article Fascia, placing it in a Caſe of Paſteboard, or thin Wood (ſee *Tab.* XXIX. *Fig.* 14.); and ſuſpend it in a Sling about the Neck.

In reducing, binding up, and ſuſpending the Ulna, follow the Method preſcrib'd for the Radius; only here remember to turn the Hand towards the Radius, or Thumb, till the depreſs'd Part of the Ulna has recover'd its former Poſition.

When both Bones of the Arm are fractur'd, proceed in the ſame manner as you would with either of them ſingly; but here you muſt employ more Strength and Circumſpection, both in reducing and retaining them; nor can you be too careful in the Bandage; but, above all, uſe your utmoſt Endeavours to prevent the Mucilage of the Joints from growing hard, the Ligaments from becoming rigid, and the Arm or Elbow motionleſs, by keeping it quiet too long. It will not, therefore, be amiſs, to turn and extend it cautiouſly, every two or three Days, and foment it ſometimes with Oil, or warm Water, for this will preſerve its natural Mobility.

Fractures of the Carpus.

The Bones of the Carpus, as they are very ſmall, are ſeldom broken; though this ſometimes happens by a violent Blow with a Beam, Stone, or ſome other heavy hard Body; and then there ſcarce remain the leaſt Hopes of a perfect Cure; for theſe minute Bones can never be properly replac'd, much leſs will they conſolidate; and the Ligaments and Tendons are, for the moſt part, very much bruis'd; and, conſequently, the Joint of the Hand becomes rigid and immoveable; and Abſceſſes, Suppurations, Fiſtulas, and a Caries, generally enſue; which, by reaſon of the Tenderneſs of the Bones, and Difficulty of extracting the Pus, is ſeldom reliev'd but by an Amputation of the Hands. Thus *Ruyſch*, and others, ſaw a Fracture of this Kind, which was not cur'd in three Years.

However, as the Surgeon ought to attempt any thing, rather than leave the Patient deſtitute of Hope, let one of his Aſſiſtants lay hold of the Part of the Arm near the Carpus, the other of the Hand itſelf, and pull in oppoſite Directions, as much as is neceſſary; after this, he ſhould reduce the fractur'd Carpus, as well as he can, with his Hands, and bind it up properly.

Fractures of the Metacarpus.

As the Metacarpus is much more frequently broken, ſo is it in general more eaſily reduc'd, becauſe the Bones are large; for the Performance of which Operation, an Aſſiſtant muſt extend the fractur'd Hand upon a ſmooth Table, and the Surgeon reſtore the ſeparated Bones, as exactly as he can, with his Fingers; after which, he muſt apply a proper Bandage.

See an Example of a fractur'd Metacarpus, complicated with a Wound, in *Le Dran, Obſ.* 56. *Tom.* 1.

Fractures of the Fingers.

When one or more Fingers are fractur'd, your principal Care ſhould be, accurately to reduce the fractur'd Parts, remov'd out of their Places, to their proper Situation, and then to make a proper Bandage, with a narrow Fillet, faſtening it to the next Finger, as is directed under the Article Fascia; where the Method is alſo laid down of proceeding, when more Fingers than one are injur'd; though, when the Colliſion of the Hand or Fingers appears to be very great, ſo that there are no Hopes of a Reunion, it is better to amputate them, than torment the Patient with tedious Pains, and, perhaps, endanger his Life.

Fractures of the Thigh.

The Thigh-bone, which is the thickeſt of the whole Body, may be fractur'd in the Middle, or near the Joints, but moſt frequently at that Part which Anatomiſts call the Neck of the Femur, near the Juncture with the Os Coxæ: When this happens, it is no ſmall Difficulty to reſtore and retain it in its proper Situation. Sometimes this Bone is fractur'd in two Places, and then the Danger is great; for, if the Patient ſurvives, which is rarely the Caſe, he is generally lame: Sometimes the Fracture is tranſverſe, ſometimes oblique; and one Bone ſlipping over the other, renders the Cure difficult; for the Muſcles, being very ſtrong, and violently contracted, draw the inferior Part upwards, ſo that they are neither extended, nor reduc'd, without very great Force: So likewiſe oblique Fractures of the Femur ſlip out again more eaſily than the tranſverſe, and, for the moſt part, leave the Limb ſhorter than its oppoſite, though the Surgeon has perform'd his Office with the utmoſt Skill. It is, therefore, proper, beſides the Directions we ſhall immediately give, to retain an oblique Fracture of the Thigh by a ſtrict Bandage, leſt the Fragments ſhould ſeparate again.

In reducing the Os Femoris, conſider whether it is fractur'd near the Neck, or in any other Part; for an exact Knowledge of this is neceſſary to a ſucceſsful Reſtitution, and the Application of a proper Bandage; for, as often as it is fractur'd in the Middle, or nigh the inferior Head, it muſt be extended and reduc'd with the Hands, like other Bones; only here a greater Violence, eſpecially in ſtrong Men, is requiſite for the Extenſion; and, therefore, you muſt employ more and robuſter Aſſiſtants, to pull this Bone, in different Directions, with their Hands; and, if their Hands are not ſufficient, with Slings, Napkins, or Linen Bandages, tied round each Head of the Thigh, while you yourſelf reduce the Fragments properly.

When neither the Hands, Slings, nor Bandages, will extend this Bone ſufficiently, which ſeldom happens, you muſt uſe *Hildanus*'s Belt or Girdle (ſee *Tab.* XXIX. *Fig.* 17.). This is to be buckled very tight above the Knee, being firſt paſs'd through the Eyes of the Hooks A A, upon which you faſten a ſmall ſtrong Rope B B, which is to be extended, as far is requiſite, by the Hands applied to C, that the Fragments may be reduc'd to their proper Places. And this is as convenient for the Extenſion of the Cubit and Humerus, as for the Thigh-bone. If the Arm is to be extended, faſten it above the Hand; if the Humerus, above the Elbow.

But, if this Belt fails, it is neceſſary to have recourſe to the Pully, or Polyſpaſtus (ſee *Tab.* XXIX. *Fig.* 15.). One Hook, A, is to be faſten'd on the Cord of the Belt at C (in *Fig.* 17.); the other, B, to be hung on the Ring A, of the Screw (*Fig.* 16.); which is firſt to be ſcrew'd tight into a Beam; then the upper Parts of the Patient are ſecur'd by Slings, Napkins, or ſtrong Linen Bandages, that he may not give way; and the Rope C, (*Fig.* 15.) being put through the Polyſpaſtus, muſt be drawn till the Bone is ſufficiently extended, that is, till it can be conveniently reduc'd by the Surgeon. We muſt here obſerve, that the ſeveral Pullies, E, D, promote the attractive Power ſo far, that, by the Help of this Machine, one Man can do more than ten or twelve without it.

A Fracture of the Neck of the Femur.

When the Neck of the Femur is fractur'd, as it often is, partly by reaſon of its tranſverſe Situation, and partly becauſe of its ſpongy brittle Subſtance, according to *Hildanus* and others, the Reduction is not only difficult, but the Limb generally ſhorter than the other, and the Patient lame. For (1.) the prodigious Thickneſs and Strength of the Muſcles not only occaſion this Difficulty in the Repoſition; but, (2.) after that, though it is perform'd in the beſt manner, the Fragments will be very ſubject to ſeparate again, becauſe the inferior Part of the Femur will be drawn upwards by the Muſcles; which (3.) is the more eaſily accompliſh'd, becauſe the Neck of the Thigh is not join'd to the Head tranſverſely, or directly, but obliquely, and ſideways, as appears very manifeſtly in a Skeleton. It is, therefore, no Wonder, if bad Accidents, or even Lameneſs, attend theſe Fractures.

To theſe we may add, (4.) that a Fracture of the Neck of the Femur is difficult to be diſcover'd, and is generally miſtaken for a Luxation, by the Head of the Femur ſlipping out of the Acetabulum; though *Paré*, and after him *Schenkius* and *Ruyſch*, and then many famous Surgeons and Phyſicians, demonſtrated, that it is much more eaſy for the Head of the Thigh to be fractur'd, than for the Joint, guarded by ſtrong Ligaments, to be puſh'd out of the Acetabulum, by any outward Violence; but the Antients, as well as thoſe of the laſt Age, were ſo ignorant of this Obſervation, that, when it happen'd, they thought of nothing leſs than a Fracture, and us'd Machines proper for the reducing a Diſlocation, which put the Patient to inexpreſſible Torment. However, ſince this Extention of the Thigh is eſteem'd not only uſeleſs, but very cruel, it will not be amiſs to recommend a ſafer Method of treating this Fracture; that is, a Method not ſo liable to be attended with violent Pains, Inflammations, and other Diſorders.

When, therefore, after any conſiderable external Violence done to the Thigh, the Patient cannot ſtand on the affected Leg; when he feels acute Pains about the Joint; when that Leg is ſhorter than the other, looſe, as it were, at the upper Part; and when the Foot may, by a very ſmall Force, be turn'd either inwards or outwards; and during this Contorſion you hear a Craſhing, as of a broken Bone; you may ſafely conclude the Neck of the Thigh to be fractur'd. When theſe Symptoms appear, we muſt not extend the Leg violently, as the Practice was in Luxations, with Inſtruments invented for that Purpoſe, by *Scultetus*, and others; but rather, after having ſecur'd the Patient by a Napkin, or other proper Sling, between his Legs, extend the affected Limb by the Hands of robuſt Men, or a Napkin, or the Belt above-mention'd, till it becomes equal to the other, and the Neck is, if not perfectly, at leaſt as well as it can be, rejoin'd with the Head inherent in the Acetabulum. Tho' it is almoſt impoſſible to prevent a Shortneſs of the Limb, and Lameneſs, yet ſome are cur'd; and I have found it very ſerviceable to apply ſtrong Bandages, that the Neck may adhere to the Head, and, if poſſible, conſolidate. For which End, the *Spica Inguinalis* is to be us'd; then put a long and large Piece of Linen Cloth, or a Napkin, between the Thighs, to keep the Body from ſubſiding, and, upon the Ancles and Knee, ſuch Ligatures as faſten the Foot to the lower Part of the Bed, that it may not be drawn upwards: To this I add a Straw-caſe (ſee Fascia). When you have done this, and put the Patient in a proper Poſture, examine carefully, whether the Leg affected is equal to the ſound Leg, or not; for, if it appears ſhorter, there is room to conjecture, that the Neck is again ſlipped out; and you muſt extend it again, after unbinding it, till it becomes proportionable. On the contrary, if no Diſproportion appears, you may expect a complete Cure, provided the Patient keeps himſelf ſtill, and obſerves a regular Diet. For the reſt we muſt truſt to Nature.

It would be worth while to invent a Machine for preſerving the fractur'd Thigh in a due Extenſion, ſo that the injured Limb might be kept of an equal Length with the other for fourteen Days, or more, or indeed during the whole Time of the Cure; for then you might reaſonably expect a more certain and ſucceſsful Agglutination: And tho' *Hildanus*, as already quoted, has deſcribed an Inſtrument proper for the Extenſion of oblique Fractures; yet it is to be feared, this is ſomething imperfect. In the mean time, ſince we are without a better, and the Method of Bandage, above directed, is not thought ſufficient, it will not be amiſs to apply that Machine of *Hildanus*; or, if this ſhould not be in Readineſs, beſides the Straw-caſe, and the reſt of the Apparatus thereto belonging, the large four-headed Bandage, deſcribed, alſo, by *Hildanus*, may be us'd; or two long Napkins between the Legs, near the Inguen, and faſten'd either to the Side or Teſter of the Bed, with Nails or Rings, will keep the Body ſo firm, that it cannot deſcend; and, to prevent its aſcending, put upon the Knee and Ancles a Ligature or Bandage, which muſt be faſten'd to the lower Part of the Bed, in order to keep the Leg in a proper Poſition, till the fractur'd Bone is reunited: And this Method is not only commodious, but extremely neceſſary in all Fractures of the Thigh, but more particularly in oblique ones. Leſt, however, the Groin ſhould be preſs'd too hard, and gall'd by the Strictneſs of theſe Bandages or Napkins, you may put under them ſome Compreſſes of fine Linen, or ſometimes change them. For more particular Directions on this Head, ſee the Article Fascia.

When a Fracture of the Thigh is complicated with a Wound, it is dangerous, and generally incurable; and, if it happens near the Joints, Death, for the moſt part, enſues; eſpecially, when the large Blood-veſſels are affected, which appears from a violent Hæmorrhage. Nor is the Danger leſs, if the Wound be in the poſterior Part of the Thigh, becauſe it cannot be cleanſed and fomented without great Difficulty.

In treating theſe Fractures, apply the eighteen-headed Bandage, (*Tab.* XXX. *Fig.* 4.) which we have deſcrib'd under the Article Fascia. But, if the Part affected be violently contuſed, and Blood lies under the Skin, and in the Interſtices

terſlices of the Parts, you muſt, with Caution, make frequent and deep Inciſions, to open a Paſſage for this extravaſated Blood, which would ſoon putrefy. Afterwards waſh the Part affected with Lime-water, mixt with a fourth Part of Spirit of Wine camphorated, or ſome other reſolvent Liquor, till the Contuſion is digeſted.

When an Hæmorrhage attends this ſort of Fracture, and that not violent, nor near the Bone, you muſt fill the Wound with dry Lint well twiſted, as in other Hæmorrhages, and lay ſeveral thick Compreſſes on it, applying proper Bandage: If the Hæmorrhage is ſomething more violent, uſe aſtringent Liquors, eſpecially rectify'd Spirit of Wine, which I have found very ſerviceable; if it is very violent, ſearch diligently for the Artery, firſt applying the Tourniquet; and when you have found it, tie it up with a Thread. When this Fracture is cauſed by a Bullet, and attended with a copious Hæmorrhage, and great Commi u ion of the Bone, which is an Indication, that the crural Artery is lacerated, if the Surgeon has any Regard for the Patient's Life, he will amputate the Limb, and tie up the Artery, as the moſt probable Method of ſaving him; for the crural Artery will very rarely reunite; and, conſequently, the Hæmorrhage cannot be ſtopt without Amputation: Beſides, in this Caſe, a Gangrene is much to be apprehended. But when you have ſtopt the Bleeding, and cleanſed the Wound, reduce the fractur'd Bones, lay on Compreſſes and Splints, then bind them tight with the eighteen-headed Bandage, and put the Limb into a Straw-caſe. Afterwards the Wound muſt be unbound every Day, and dreſs'd with digeſtive Ointment, Balſam, or vulnerary Eſſence, till it is healed.

Fractures of the Patella.

That we may the more eaſily diſcover and cure a Fracture of the Patella, it is neceſſary firſt to learn, in what Manner it adheres to the Thigh and Leg, by the Aſſiſtance of the Muſcles and Tendons, and likewiſe how it aſcends, together with the Muſcles in an Extenſion of the Leg, and deſcends in an Inflexion; and, in violent Motions of the Body, ſuſtains a great Force. Whenever the Patella, therefore, is fractur'd by a Fall, a Blow, or any external Violence, it is either longitudinally, tranſverſely, or in ſeveral Directions; but the tranſverſe Fracture is the moſt frequent. And as the longitudinal is moſt uncommon, ſo is it the moſt eaſily cured; for the Fragments generally remain in their proper Situation. On the contrary, the tranſverſe Fracture, and that in many Directions, are very dangerous; for tho' the inferior Part, as having no Muſcles, preſerves its Situation, the ſuperior, by reaſon of the ſtrong Muſcles annexed to it, is attracted upwards, and, of conſequence, difficult to be reſtored.

It is very eaſy to diſcover a Fracture of the Patella; for the Fingers will ſhew, whether it is broken or not; and, if it is, whether longitudinally, tranſverſely, or in ſeveral Directions; and whether the Fragments are divided, or ſtill cohere. In this Search, be cautious of bending the Knee, becauſe ſuch Flexure is uſeleſs, painful, and very dangerous, as it ſeparates the Fragments wider: But when a ſmall Fragment of the Patella is attracted upwards, if the Patient is fat, the Diſcovery is not quite ſo eaſy. In general, this ſort of Fracture of the Patella is not ſo dangerous as ſome others, becauſe the Juice of the Bone, which produces the Callus, cannot ſo eaſily penetrate into the Joint, and make it rigid, as is common in other Fractures of this Bone, where the Knee is often render'd ſtiff and motionleſs.

A complete Cure of this Fracture, if we may believe experienced Surgeons, is ſcarce to be expected; for the Knee will generally become rigid, at leaſt, the Motion of this Joint will be impair'd. Beſides, the Juice of the Bone deſtin'd for the Formation of the Callus inſinuates itſelf into the latent Sinus of the Joint; and the very Liquor, which, at other times, lubricates it, unites with the Joint, and grows ſo hard, that the Bones of the Leg and Thigh, like Boards glued together, are rigid, and, uniting with each other, become one Bone. Moreover, as in this kind of Fracture, eſpecially the tranſverſe, the Patient muſt continue a long while at Reſt, even till the Bone is agglutinated, this conduces very much to the Inſpiſſation of the Liquor deſigned for Lubrication: And it often happens, that the Tendon, which ſupports the Patella, and principally directs the Motion of the Joint, is affected by the ſame Violence, and, conſequently, the Mobility of the Knee greatly impeded, if not entirely deſtroyed. Upon theſe Conſiderations, it is no Wonder, that thoſe, who have once fractur'd the Patella, ſhould be liable to frequent Falls, and new Fractures, as I have often ſeen; principally, becauſe an incurable Debility, for the moſt part, follows a Contuſion of that Tendon. I have, however, known Inſtances of tranſverſe Fractures of the Patella ſo perfectly completed, that the Patients have never after found the leaſt Inconvenience from them.

The Method of Cure is this: When the Fracture is direct, having laid the Patient on his Back, and extended the Leg, reduce the Fragments on each Side with your Hands; then apply the uniting Bandage, in the ſame manner, as directed under the Article Fascia, for Wounds of the Belly or Forehead: When it is tranſverſe, or into ſeveral Pieces, or Directions, lay him in the ſame Poſture; and after Extenſion depreſs the Fragments, which are attracted upwards, with your Hand, Thumb, or Fingers; and, having reduced them properly, ſtrengthen them with a Plaiſter in the Form of a Half-moon, (ſee *Tab.* XXX. *Fig.* 2.) or perforated (*Fig.* 3.); then let the injured Limb be ſo placed and fixed, that it can neither be inflected nor diſturbed. But this will appear more plainly by the Directions given under the Article Fascia. Tho' ſome Surgeons have invented Machines for retaining theſe Fractures, one of which *Selingen* has recommended, and *Garengeot* has deſcribed another; yet, to confeſs the Truth, they are ſo contriv'd, that they do not anſwer the End propoſed. But leſt the Patella, which is too often the Caſe, ſhould be fractur'd again, you muſt forbid the Patient to walk, or ſet his Foot to the Ground, in leſs than nine or ten Weeks; for it ſeldom agglutinates before that time; and whoever does not keep himſelf quiet, is generally lame ever after. See *Purmannus's Obſ.* on theſe Fractures.

Fractures of the Bones of the Leg.

As for Fractures of the Leg, and its two Bones, the Tibia and Fibula, no farther Directions are neceſſary, than thoſe already given relative to Fractures of Bones in general; which are, that they be extended by the Hands or Slings, and accurately reduced, then bound up, and placed in a proper Poſition. I will only obſerve, that ſometimes both Bones, ſometimes one only is fractur'd; if this Accident happens to both, it ſeldom is in the ſame Place, but one a little above the other. If the Tibia only is fractur'd, it is eaſily diſcover'd, becauſe it lies immediately under the Skin; but, if the Fibula only is fractur'd, the Diſcovery is more difficult, as it is concealed in the Fleſh or Muſcles. Beſides, this gives very little Pain, and ſcarcely diſqualifies the Patient for Walking. However, it may be known, by taking hold of the Leg under the Sura with one Hand, and with the other moving the Foot; for, by this Motion, the Hand, that comprehends the Leg, will diſtinguiſh, whether it is fractur'd or not, and in what Part. But if a Fracture of the Tibia, which often happens, is attended with an external Wound, the Cure muſt be perform'd in the following Manner: In the firſt Place, the Wounds and fractur'd Bones ſhould be cleans'd from the Sordes, looſe Fragments, and all foreign Matter; then, after Extenſion, be reduc'd; afterwards the Hæmorrhage, if there is any, muſt be ſtopt; and then all muſt be bound firmly with the eighteen-headed Bandage, (ſee *Tab.* XXX. *Fig.* 4.) which has been fully explain'd under the Article Fascia. If any prominent Fragments hinder the Reduction, they muſt be remov'd with a ſharp Forceps, or fine Saw; and afterwards the Fracture muſt be reduc'd, and bound up: Next, place the Limb in a Straw-caſe, or Braſs-caſe, ſuited to contain the broken Tibia (ſee *Tab.* XXX. *Fig.* 9.). Renew this Bandage every Day, till the Wound is heal'd. Sometimes little Pieces of the Bone, being looſe, will come away by Suppuration; theſe muſt be extracted, and then proceed as before.

Petit's famous Machine for Fractures of the Leg is repreſented in *Tab.* XXX. *Fig.* 11. and 12. and deſcrib'd under the Explication of that Table.

Fractures of the Bones of the Foot.

The Bones of the Foot, that is, the Tarſus, Metatarſus, and Toes, are as ſubject to Fractures as thoſe of the Hands; but from the violent Contuſion of the Nerves, Tendons, Ligaments, and Membranes, theſe Fractures are generally accompanied with Wounds, and very dangerous Symptoms; they are to be cur'd almoſt in the ſame manner, only there is a Difference in the Bandage, which ſee under the Article Fascia. But here we may obſerve, that Fractures of the Foot, as well as of the Hand, and Leg near the Ancle, eſpecially when the Malleolus recedes from the principal Bone, ſeldom admit of ſo complete a Cure, as to leave the Limb free from Stiffneſs, an Ulcer, Caries, or incurable Fiſtula. Theſe laſt Diſorders are ſeldom remedied without Amputation; nor does that always preſerve the Patient's Life. In theſe Fractures, therefore, it is adviſeable to give timely Notice of the Danger to the Patient, or his Friends, leſt his unhappy Condition ſhould be unjuſtly attributed to the Surgeon, which is often done. But, for a more exact Acquaintance with Fractures of the Bones, I would recommend *Petit's* Treatiſe on the Diſeaſes of the Bones. *Monro*, alſo, and *Boerhaave*, have wrote excellently on the Bones.

Of Bones broken by acute Inſtruments, which may be called Wounds of the Bones.

Thus far have we been treating of Fractures of the Bones, proceeding from blunt Inſtruments; it now remains, that we treat of ſuch as are caus'd by ſharp ones, as Darts and Swords, which may be properly term'd Wounds of the Bones; and of theſe few Authors have treated ſeparately. Not only the ſoft Parts, but, alſo, the hard Bones are divided by theſe Weapons; ſometimes ſlightly, ſometimes conſiderably, and ſometimes the Solution is equal to a Fracture. Theſe Wounds muſt neceſ-

ſarily

ſtrily be attended with Variety of bad Symptoms, according to the Size and Depth of the Wound, and the Force it was inflicted with; and as the Patient receives it, either in the Head, Noſe, Jaw, Fingers, Hand, Arm, Shoulder, Leg, or Thigh. Theſe are eaſily diſcover'd; but, as they require a different Method of Cure from other Fractures, I thought it not improper here to give ſome Directions with regard to the Manner of treating them.

Before we proceed, it muſt be obſerv'd, that ſlight Wounds, which do not penetrate deep into the Bone, are ſeldom dangerous, eſpecially if we treat them regularly, that is, if we cover the affected Bone, as much as poſſible, with its Integuments, to keep out the Air, and avoid oily fat Medicines as very noxious. When they penetrate deep, or entirely divide the Bone, and affect its neighbouring Parts, eſpecially thoſe which are immediately neceſſary to Life, as in the Head, Neck, Spina Dorſi, and Breaſt, or when they wound or ſeparate the larger Veins, Arteries, Nerves, and Tendons, of the Arms or Legs, the Danger is much greater, the Cure more difficult, and Death frequently enſues.

In the Cure of Fractures by acute Weapons, *Petit*, otherwiſe a very good Surgeon, in his Book on Diſeaſes of the Bones, inadvertently recommends joining the Lips of the Wound, and the uniting Bandage, for longitudinal Fractures of this Kind; for very oblique, or wholly tranſverſe ones, Suture, and the eighteen-headed Bandage. But, as this Method often fails, and may miſguide young Beginners, I will endeavour to ſet it in a clearer Light. In the firſt Kind, I am almoſt of his Opinion, particularly when the Wounds are inconſiderable, as when the Head is not entirely nor deeply penetrated, nor contus'd, nor the Brain affected. But, when the contrary happens, we muſt proceed with more Caution; for the Wound muſt be kept open with Lint, and cleans'd; and, after cleanſing, be heal'd with Balſams; for dangerous Symptoms, and often Death, are the Conſequence of too ſpeedy a Cloſure. I do not entirely agree with him in the Management of ſlight oblique or tranſverſe Wounds; for I am ſo far from thinking, that Suture, and the Bandage of eighteen Heads, are of general Uſe, that they appear to me to be ſeldom neceſſary; for I have myſelf cur'd, and ſeen others cure, many of theſe Wounds without them. For Example, ſlight oblique Wounds of the Head, Forehead, or Cranium, may be united by a Plaiſter and Bandage, without the Suture with Needle and Thread, which *Petit* recommends. But they may be generally cur'd by agglutinative Powders, Balſams, and Plaiſters, whether they happen in the Head, Jaw, Clavicle, Scapula, Shoulder, Arm, Hand, Thigh, Leg, or Foot. But when Pieces hang down in ſuch a manner, that they cannot be united without, the Suture is abſolutely neceſſary.

Wounds of the Finger-bones.

When the Finger-bones have been wounded and ſeparated by a Sword, ſo as to hang only by the Skin and Fleſh, I have cur'd them in the following Manner, without the Suture, and eighteen-headed Bandage: I join'd the ſeparated Portions accurately, and roll'd a Slip of Plaiſter round, to keep the Bones in that Situation; then applied a Compreſs dipt in Spirit of Wine, over which I laid ſome ſmall Splints of Paſteboard, to ſecure them in their proper Poſition; then I bound up the Whole firmly, with a long narrow Roller, and ſuſpended the Hand in a Sling about the Neck. I left it thus for ſeveral Days, and only preſcrib'd Reſt, and a proper Diet, to the Patient. At length, I loos'd the Bandage carefully, and gently remov'd the Compreſs, but not the Plaiſter; and, after cleanſing the Wound as well as I could, dropt in ſome vulnerary Eſſence; and, applying a freſh Compreſs dipt in Spirit of Wine, bound it up again, as before: Then I left it for ſeveral Days more. Afterwards I dreſs'd it in the ſame manner, about every third Day, till, in about a Month, it was perfectly cur'd.

Wounds of the Arm and Leg-bones.

If either of the Bones of the Cubit is divided, which is uſually the Ulna, becauſe that is moſt expos'd in fighting, the Suture, and eighteen-headed Bandage, are ſuperfluous. In this Caſe, I firſt cleanſe the Wound, then put in ſome vulnerary Eſſence or Balſam, and Lint dipt in the ſame; after this, I apply a Plaiſter, Compreſs, and Paſteboard-ſplint, moiſten'd with Spirit of Wine; theſe I apply round a great Part of the Cubit, near the Wound, that, when they are dry, they may ſuit themſelves the better to the Shape of the Part; after this, I apply a long Roller, and ſuſpend the Arm in a Sling about the Neck. In this manner I dreſs the Wound every other Day, or, if the Diſcharge requires it, every Day. Theſe Fractures conſolidate without any Suture, which I rather look upon as prejudicial. When either of the Bones of the Leg are cut, I make uſe of the eighteen-headed Bandage, as in other Fractures of the Leg or Thigh, but ſcarce ever the Suture, becauſe it is very ſeldom neceſſary in theſe Wounds of the Tibia only, as that is cover'd with ſcarce any thing but Skin; nor is it requiſite for the Fibula, unleſs ſome of the great Muſcles are divided. Sutures muſt be avoided as much as poſſible; for they are generally attended with Inflammations, Pains, Convulſions, and other hazardous Symptoms; and I always declare againſt them, unleſs a Wound cannot poſſibly be heal'd without them.

Wounds in the Arm and Thigh-bone.

If the Thigh-bone is cut with a Sword, for the better conjoining and ſecuring theſe ſtrong Muſcles, a Suture, as in other Wounds, may be ſerviceable. The Wound muſt be manag'd in the Manner directed under the Article Vulnus, applying the eighteen-headed Bandage, and the Straw-caſe. So, if the Bones of the Humerus, or Arm, be divided with a Sword, the Suture may be proper, for the above-mention'd Reaſons, and not the eighteen-headed Bandage, but a narrow long one, as in other Fractures of the Arm. Suſpend the Arm in a Sling about the Neck; for this will unite the Muſcles better, and complete the Cure ſooner and more eaſily.

If both the Bones of the Cubit, or Leg, are divided in ſuch a manner, that the Limb hangs only by Skin, Fleſh, and Blood-veſſels, (which is common without an entire Amputation of it) the Suture, and eighteen-headed Bandage, are convenient. But the Suture cannot be of the leaſt Service, when the Part hangs by the Skin alone, its Nerves and Blood-veſſels being wholly ſeparated, particularly if it be a large Limb, as the Leg or Arm, that is injur'd. In this Caſe, therefore, I would adviſe cutting off the Limb, ſtopping the Hæmorrhage, as in other Amputations, and dreſſing it in the ſame manner.

If the lower Jaw is ſo cut with a Sword, that the Pieces recede much from each other, and cannot be retain'd without the Suture, you may uſe it, adding a Balſam, Plaiſter, Compreſs, and proper Bandage. If the Clavicle, or Acromium Scapulæ, meet with the ſame Accident, you muſt proceed in almoſt the ſame Manner as we directed for a Fracture of theſe Bones, gently unbinding the Bandage, and dreſſing the Wound every Day, or every other Day, till the Cure is completed. The Hæmorrhage, which, in theſe Wounds, is commonly very profuſe, muſt be ſtopt by Compreſſes, Aſtringents, or a Ligature of the Arteries, as the Caſe ſhall require.

FRÆNATOR is a Name for ſome Muſcles, which ſerve the Head in different Motions upon the firſt and ſecond Vertebræ of the Neck. They were diſcover'd by Mr. *Dupré*, a Surgeon of *Paris*, in the *Hotel-dieu*; in *French* they are call'd *Rengorgeurs*.

FRÆNULUM, FRÆNUM. See Frenum.

FRAGA. Strawberries. See Fragaria.

FRAGARIA.

The Characters are;

The Root is fibrous and perennial; the Leaves ſtand three on a Foot-ſtalk, and are vein'd, and radiated; the Stalks trail on the Ground. The Calyx is monophyllous, and expanded, like a Star, into ten equal Segments. The Flower is roſaceous, pentapetalous, furniſh'd with many Stamina, ſtanding on the Margin of the Baſe of the Ovary. The Fruit is hemiſpherical, pulpous, and containing a Multitude of ſmall external Seeds, which are furniſh'd with an erect Tube.

Boerhaave mentions ſix Species of this Plant; which are,

1. Fragaria; vulgaris. *C. P. Pin.* 326. *Tournefort. Inſt.* 295. *Elem. Bot.* 245. *Boerh. Ind. A.* 41. *Hiſt. Oxon.* 2. 186. *Phyt. Brit.* 42. *Dill. Cat. Giſſ.* 50. *Rupp. Flor. Jen.* 86. *Buxb.* 116. *Park. Theat.* 758. *Fragaria.* Offic. Ger. 844. Emac. 997. Rali Hiſt. 1. 609. Synop. 3. 254. *Fragaria vulgaris, ſive Trifolium frugiferum.* Merc. Bot. 1. 36. *Fragaria ferens Fraga alba & rubra.* J. B. 2. 395. STRAWBERRY.

Strawberries have ſmall rediſh Roots, full of Fibres, from which ſpring many creeping ſlender Threads, which take Root, and propagate. The Leaves grow three together, upon one Foot-ſtalk, folded together at their firſt ſpringing up, and are full of Veins, of an oval Figure, deeply ſerrated about the Edges. The Flowers ſpring from the Root, on long Foot-ſtalks, four or five together, each of five ſmall, round, white Leaves, with ſeveral yellow Stamina in the Middle; and are follow'd by ſmall Fruit, of a round conical Shape, of a rediſh Colour, of a pleaſant, tart, grateful Taſte, and an agreeable Smell, having the Outſide beſet with a great many very ſmall green Seeds. They grow in the Woods, flowering in *May*, and the Fruit is ripe in *June*. The Leaves and Fruit are uſed.

Strawberries refrigerate and moiſten, reſiſt Poiſon, agree with bilious and thirſty Perſons; but, eaten plentifully, affect the Head, and inebriate, if we may believe *Cæſalpinus*; but we, ſays *Ray*, who have ſeveral times eaten large Quantities of Strawberries, never found any ſuch Effects from them: They have, indeed, a vinous Taſte, without an Affuſion of Wine, but a faint one: But the Reaſon why we ſhould abſtain from too freely eating them is, becauſe they are ſubject to putrefy in the Stomach: Therefore they ſhould not be eaten alone, but with Wine and Sugar, as is common with us, to correct their Coldneſs

Coldneſs and Humidity. In ſome Parts of *France*, as we are told by *Bruyer*, they eat them with Cream [as they do everywhere in *England*]; which, he ſays, has the ſame Effect upon them as Wine; but, ſays *Ray*, I am of another Opinion. The diſtil'd Water of Strawberries is ſaid to comfort the Heart, to amend the Diſorders of the Thorax, to purge the Blood, and, being us'd in Gargariſms, to heal the Ulcers of the Mouth, and the Quinſey, to break the Stone, with other good Effects, if we may believe *Tragus*.

They who, from a hot Diſtemperature, are affected with Puſtules in the Face, or a dry and pruriginous Scabies in all or ſome Part of their Body, are adviſ'd to take every Day about an Ounce of the Water, and the ſame would be proper for thoſe who are moleſted with the Stone; for it refrigerates the Kidneys, and cleanſes them of Gravel. For the Stone: Take ripe Strawberries, and put them into a Phial full of the pureſt boiling-hot Water; after about forty Hours ſtrain it, and put freſh Berries into the ſame Water boiling-hot, and ſo leave it very well cover'd and ſecur'd, that nothing may evaporate; ſqueeze the firſt Strawberries which remain after the Straining, thro' a Linen Cloth, and keep the expreſs'd Liquor by itſelf. When you have a mind to uſe it, take a Spoonful in a Morning, three or four times in a Month, mix'd with Powder of Sugar-candy: This is a grateful, approv'd, and moſt efficacious Remedy, and was recommended to *Geſner* by thoſe who were afflicted with the Stone for upwards of twenty Years, after innumerable Medicines which had been preſcrib'd for them by different Phyſicians. *J. B.*

The Herb is a Refrigerant, and moderately drying: It has a bitter Taſte, as well as its Root, with a manifeſt Aſtringency: It is alſo diuretic, and of frequent Uſe in the Jaundice, as alſo in Gargariſms, Baths, Cataplaſms, and other Ways, for Hæmorrhages and the Dyſentery, for cleanſing foul Ulcers, and for repreſſing Catarrhs and Diſtillations.

The *Decoctum cum toto*, as Phyſicians love to expreſs themſelves, that is, the Decoction of the entire Plant, with its Leaves, Roots, and Stalks, is adminiſter'd with very good Succeſs in the Jaundice, either ſeparately, or mix'd with other Things appropriated to that Diſtemper. *Rulandus* us'd to preſcribe it in the following Form, after purging with Extract of *Eſula*: Take of the Herb *Fragaria*, three Handfuls; of Raiſins ſton'd, three Drams: Boil them together in a ſufficient Quantity of Spring-water, and let the Patient drink it. I have ſeen, ſays *C. Hoffman*, after plentiful eating of Strawberries, many of their Particles in an Urinal, ſo as to cauſe a Suſpicion of a Colliquation of the Kidneys. This, ſays *Ray*, is ſomething rare and incredible. The ſame Author, *Hoffman*, aſſures us, that *Fragaria* is of excellent Service in colliquative Fevers, for deriving the Water infus'd into the Abdomen, and there giving an Appearance of a Dropſy, from thence to the Kidneys.

I am aſſur'd by an unknown Author, ſays *Sim. Pauli*, that *Fragaria*, boiled in red Wine, and apply'd as a Cataplaſm to the Pubes and Pecten, puts a Stop to the *Fluor albus*; and I have found the ſame myſelf, he ſays, to be very effectual in nocturnal Pollutions, and a Gonorrhœa not attended with Virulence.

Hildanus, *Cent.* 5. *Obſ.* 38. tells us of a Woman, who, after eating Strawberries, faſting, was immediately ſeiz'd with terrible Symptoms, as a Fainting, Vertigo, Tumefaction of the Hypochondria, and a Pain in the Stomach: But we muſt here obſerve, that this Woman eat the Strawberries crude, and unwaſhed, and without Wine or Sugar. I am really of Opinion, that this Fruit was poiſon'd by the Urine, Saliva, or Breath, of ſome Serpents or Toads, which are extremely delighted with Strawberries; or, perhaps, as Dr. *Robinſon* conjectures, ſome Inſect had infected the ſame with a noxious and venomous Juice.

Some have fallen into a fainting Fit from the Smell alone of Strawberries, as did the Preſident of the Hoſpital at *Eſſingen*. A Maid of *Auſtria* became epileptic, on eating of Strawberries; and, from that time, was every Year ſubject to a Paroxyſm at the Seaſon of their Floweriug. *Ray*, *Hiſt. Plant.*

Fragaria has the ſame Virtues as Cinquefoil: The Decoction of the Herb, and the immature Fruit, are ſtrengthening and aſtringent: The Fruit is emollient, nutritive, relaxing, cooling, diuretic, aperitive, and corrects Acrimony; hence it becomes proper in the higheſt burning Fevers, and under the greateſt Degree of an Inflammation, when the Thirſt is extremely urgent. The Fruit eaten cures a Gonorrhœa. A very good Drink in Fevers is thus prepar'd: Take of the Juices of Strawberries and Lemons, and of Spring-water, an equal Quantity; of Sugar, enough to render it grateful: Mix them together. The Pulp, apply'd in a Cataplaſm, is good for all external Inflammations; and I have frequently experienc'd its Virtue in a Relaxation of the Veſſels of the Uterus. In tertian and quartan Fevers, it does the Service of the *Peruvian* Bark: It is, alſo, a Lithontriptic. Take the ripe Berries, and put them in Water; then ſhake the Veſſel, and the Seeds will fall to the Bottom: Theſe dry'd, and taken to the Weight of one or two Drams in White-wine, in the Morning, faſting, are an excellent and uſual Remedy with Lithotomiſts, to prevent the Regeneration of the Stone in thoſe who have been cut for the ſame.

The Berries gather'd in watry and marſhy Places, though larger, are of leſs Virtue than the Mountain Strawberries, as *Geſner* obſerves. This uſeful Plant has one Inconvenience, in that it has always Toads conceal'd under it; which, as we are aſſur'd by Authors, have render'd it mortal to many who have eaten of the Fruit; for which Reaſon, ſome will never eat Strawberries before they are waſh'd. In *Italy* they bruiſe the Pulp in Roſe-water, and make it into a Conſerve with Juice of Citrons, for the Purpoſes before-mention'd. *Hiſt. Plant.* aſcrib'd to *Boerhaave*.

2. Fragaria; fructu albo. *C. B. P.* COMMON STRAWBERRY *with white Fruit*.

3. Fragaria; fructu parvi pruni magnitudine. *C. B. P.* 227. *M. H.* 2. 186. THE HAUTBOY STRAWBERRY.

4. Fragaria; fructu rotundo, ſuaviſſimo; flore duplici. *H. R. Par.* 72.

5. Fragaria; Virginiana; fructu coccineo. *M. H.* 2. 186. VIRGINIAN STRAWBERRY, *with ſcarlet Fruit*.

6. Fragaria; craſſis; rugoſis, foliis; flore & ſemine carens. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 236.

FRAGARIA STERILIS.

The Characters are;

It has the Appearance of the *Fragaria*: The Stalks are without Tendrils: The Calyx, Flower, and Fruit, are thoſe of Cinquefoil. *Boerh. Ind. alt. Part* 1. *p.* 42.

Boerhaave mentions eight Species of this Plant; which are,

1. Fragaria; ſterilis; Alpina; coaleſcens. *H. R. Par. Pentaphylloides*, *Fragariæ folio*. Bott. Monſp. App. 309.

2. Fragaria; ſterilis. *C. B. Pin.* 327. *Raii Hiſt.* 1. 611. *Synop.* 3. 254. *Tourn. Inſt.* 296. *Elem. Bot.* 246. *Boerh. Ind. A.* 42. *Dillen. Cat. Giſſ.* 60. *Buxb.* 116. *Fragarioides*, Offic. *Fragaria minime veſca*, Parkinſon Theat. 758. *Fragaria minime veſca, ſive ſterilis*, Merc. Bot. 1. 36. Phyt. Brit. 43. Mer. Pin. 39. Ger. Emac. 998. *Fragaria, non frugifera, vel non veſca*. J. B. 2. 395. Chab. 165. *Comaroides*. Pent. Anth. 290. *Pentaphylloides foliis ternis Quinquefolii albi effigie*. Herm. Flor. 2. 7. BARREN STRAWBERRY. *Dale*, *p.* 160.

The Virtues are ſuppoſ'd to be much the ſame as thoſe of Cinquefoil.

FRAGAROIDES. See FRAGARIA STERILIS.

FRAGMEN, FRAGMENTUM, ſignifies either the ſame as *Fractura*, or elſe means ſome Particles ſeparated from the main Subſtance of a Body: Thus, the Fragments of the Stone are Sand and Gravel. *Caſtellus.*

FRAMBŒSIA. The Raſpberry. See RUBUS IDÆUS.

FRANGULA. See ALNUS.

FRAXINELLA.

The Characters are;

The Root is perennial: The Leaves are pennated, like thoſe of the Aſh: The Calyx is monophyllous, and divided into five long, ſlender Segments: The Flower is pentapetalous and anomalous, four of the Petals turning upwards, and one downwards, ſo as to make it appear bilabiated: It is furniſhed with eight, nine, or ten crooked Stamina: The Fruit conſiſts of many little Pods, incurvated like a Ram's Horn, which burſt in two Places, and diſcharge great black Seeds. *Boerh. Ind. alt. Part.* 1. *p.* 299.

Boerhaave mentions three Species of this Plant; which are,

1. Fraxinella. *Ger.* 1056. *Emac.* 1245. *Tourn. Inſt.* 430. *Elem. Bot.* 341. *Boerh. Ind. A.* 299. *Hiſt. Oxon.* 3. 456. *Dictamnus albus*, *Fraxinella*. Offic. *Dictamnus albus vulgo, ſive Fraxinella*, C. B. Pin. 222. *Fraxinella vulgaris*. Park. Theat. 417. *Fraxinella flore purpureo & albo*, Park. Theat. 333. *Fraxinella Officinis Dictamnus*, J. B. 3. 494. Buxb. 217. Raii Hiſt. 1. 698. *Fraxinella, Dictamnus albus*. Chab. *Fraxinella & Dictamnus albus Officinarum*. Rupp. Flor. Jen. 235. BASTARD DITTANY. *Dale*, *p.* 177.

The Roots of this Dittany are pretty large, white, and ſpreading, ſending forth long pinnated Leaves, pretty much reſembling the Leaves of the Aſh-tree; whence it takes the Name *Fraxinella*: The Stalks ariſe to be about two Foot high, having ſmaller Leaves growing alternately on them: The Flowers grow at the Top of the Stalks, in Spikes, of an irregular Shape, conſiſting of five pretty long and narrow Leaves, ſet on like the Flowers of Violets; in ſome Plants of a pale-red Colour, and, in others, of a white, with darker Veins or Stripes, and ſeveral crooked Stamina coming out of the Middle, and turning upward: The Seed is black, roundiſh, and ſhining, growing in long horned Seed-veſſels. The whole Plant has a ſtrong ſomewhat reſinous Scent. It grows wild in ſeveral Places of *Germany* and *France*; but is only planted with us in Gardens, and flowers in *June* and *July*.

The Root is eſteem'd a Cardiac and Alexipharmic, and ſerviceable againſt peſtilential Contagions, if it be taken any way. *Matthiolus* affirms it to be good againſt Poiſons, and the Bites of

of venomous Animals. Drank to the Weight of a Dram, it kills Worms in the Inteſtines. It is preſcrib'd in cold Diſeaſes of the Uterus; for it provokes Urine and the Menſes, promotes Delivery, and brings away the Secundines, and the dead Child, if it be uſed either in a Peſſary, or in a Suffumigation with Peny-royal, or taken to the Quantity of two Drams in pure Wine; it is, alſo, good for the Gripes of the Belly, and to cleanſe the Kidneys of Gravel, and is a uſeful Ingredient in Potions for internal Wounds. The Women in *Rome* uſe the diſtil'd Water as a Coſmetic, and for Inflammations of the Eyes; which is a plain Argument, ſays *C. Hoffman*, that it cannot be uſed as a Succedaneum to the true Dittany; but, ſince it is bitter and acrimonious, ſays *Ray*, I ſee no Reaſon why it ſhould not be effectual for the ſame Purpoſes as this Plant. The Pods and Flowers excite an Itching by their Contact, and in hot Countries exulcerate the Skin: The Plant varies with reſpect to its Flower, which is ſometimes white. *Raii Hiſt. Plant.*

The whole Plant has a moſt fragrant Smell, abounding with Oil: The Flowers and Stalks are aromatic, balſamic, and ſweet; whence it is reckon'd among balſamic and vulnerary Herbs. This Species may be had in all the Shops: It has a balſamic Smell, and is very ſweet and fragrant in all its Parts: The Bark is much commended for facilitating Delivery, and purging the Lochia; and, on account of its intenſe Bitterneſs, is preſcrib'd againſt Worms: The Seeds, Leaves, and Roots, are uſed in the Shops; and the Plant, for want of the true Dittany, ſupplies its Place in the *Theriaca Andromachi*: The Conſerve of the Flowers, by its aſtringent Virtue, corroborates the Stomach and Inteſtines. *Hiſt. Plant.* aſcrib'd to *Boerhaave*.

2. Fraxinella; niveo flore. *Cluſ. H.* 100.

3. Fraxinella; purpurea; major; multiflora. *H. R. Par.* GREAT PURPLE FRAXINELLA, WITH MANY FLOWERS. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 229.

FRAXINUS.

The Characters are;

The Leaves are pennated, and grow to a common Rib, whoſe Top ends in an odd Leaf: The Flower is Male, apetalous, and conſiſts of Stamina, which are adorn'd with a double Apex: The Ovary is oblong, oval, flattiſh, furniſh'd with a bifid Tube; and ripens into a flat membranaceous Fruit, reſembling a Tongue, and containing a Seed of the ſame Figure.

Boerhaave mentions ſix Species of this Plant; which are,

1. Fraxinus; excelſior; flore petaloide; mas. *C. B. P.* 416. *Tourn. Inſt.* 577. *Elem. Bot.* 448. *Boerh. Ind. A.* 2. 171. *Dill. Cat. Giſſ.* 59. *Rup. Flor. Jen.* 269. *Buxb.* 117. *Jonſ. Dendr.* 290. *Fraxinus.* Offic. Ger. 1289. Emac. 1472. Raii Synop. 3. 469. Mer. Pin. 39. Chab. 62. *Fraxinus Ornus.* Mont. Ind. 43. *Fraxinus vulgaris*, Park. Theat. 1419. Merc. Bot. 1. 36. Phyt. Brit. 43. *Fraxinus vulgatior.* J. B. 2. 173. Raii Hiſt. 2. 1702. COMMON ASH-TREE. *Dale*, *p.* 332.

The Aſh-tree grows to a great Height and Bigneſs, with a ſtrait Body, cover'd with a whitiſh or aſh-colour'd Bark, which gives it its Name, as a Tree, whoſe Body is of the Colour of Aſhes. It grows with its Branches pretty upright and ſmooth. The Leaves are of a dark-green Colour, pinnated, the Pinnæ growing oppoſite; and are oval and ſharp-pointed, with an odd one at the End. The Flowers grow in ſmall ſtamineous Bunches, coming out early in the Spring, before the Leaves. The Seed is ſmall, long, flat, and narrow, growing in thin membranaceous Huſks, ſeveral growing together in Bunches. The Aſh-tree grows frequently in Woods and Hedges, and the Seed is ripe in *September* and *October*. The Bark, Leaves, and Seed, are uſed.

The Leaves of this Tree, by the chymical Analyſis, yield a great many acid Liquors, a little urinous Spirit, no concreted volatile Salt, a great deal of Oil and Earth, and a moderate Quantity of fixed Salt; by which the natural Salt of this Plant ſeems to reſemble that call'd by *Angelus Sala*, *Oxyſal diaphoreticum*; but in the Aſh it is join'd with a great deal of Sulphur and Earth: Thus it is no Wonder, if it ſhould be aperitive, diuretic, and ſudorific. *Tragus* ſays, its diſtil'd Water cures the Jaundice and Stone; and the Decoction of its Leaves in Wine removes Obſtructions of the Liver and Spleen. *Simon Paulli* commends the Uſe of the Salt of the Aſh, taken in *Cardous Benedictus* Water, mixt with a little Syrup of Pomegranates or Raſpberries, in the Small-pox and Meaſles. *Cæſalpinus* relates, that, in his Time, they uſed the Wood of the Aſh in Decoctions, after the Manner of that of Guaiacum: *Lobel* ſays, alſo, that it is alſo good for the Venereal Diſeaſe. The Aſhes of its Bark make a good Cauſtic. The Aſhes of the Bark of the Root, ſays *Lobel*, ty'd in a Knot, and moiſten'd, and then apply'd, ſupply the Place of a potential Cautery; and the Aperture thus made is kept open by introducing an Ivy-leaf.

He ſays, that the Perfume of its Leaves, Bark, or Seed, cures Deafneſs: It is certainly reſolving; and the very Water which drops out of a freſh Branch, that has the other End of it ſet on Fire, has the ſame Virtue: Syringe it into the Ear, and afterwards ſtop it with ſome Cotton dipt in the ſame Water; The Bark of the Root is preſcrib'd for the Dropſy, Rheumatiſm, Sciatica, and thoſe Diſeaſes which require to have the ſuperfluous Seroſities voided: This Bark is an Ingredient in the Potions, Broths, and Apozems preſcrib'd for the Green Sickneſs: They add to theſe Remedies the Tincture of Steel, or chalybeated ſoluble Tartar. *Martyn's Tournefort.*

The Seeds of the Fraxinus, bruiſed, and drank in Wine, provoke Urine, ſays *Hippocrates*. Feed a Pig, ſays *Galen*, with the Bark of Aſh, boiled in Wine for three Days, and kill it on the fourth, and you ſhall find it without a Spleen. The Bark and Wood are drying, attenuating, and are thought to have a ſpecific Virtue againſt Hardneſs of the Spleen; whence it is ſaid, that continual drinking out of a Cup made of its Wood extenuates that Part; for which Purpoſe ſome give the Decoction of the Bark, and others uſe the ſame, inſtead of Guiacum, with good Succeſs. Dr. *Tancr. Robinſon* obſerved the middle Bark or Rind of the Aſh frequently preſcribed in foreign Countries for intermittent Fevers; and ſays, that he has heard the ſame has been ſucceſsfully practiſed in *England*. The Juice of the Leaves, and of the tender Buds, drank in a ſmall Quantity every Morning, are ſaid to be effectual in the Dropſy. The Salt of the Aſh-tree, mix'd with Diuretics, provokes Sweat, as does alſo the Decoction of the Bark. The Seed called *Lingua Avis*, Bird's Tongue, potently heats and dries, and is good for hepatic Diſorders, Pleuriſies, and the Stone. The modern Chymiſts, and eſpecially *Glauber*, mightily extol the ſame for breaking the Stone in the Kidneys and Bladder. Eaten with Piſtachios, Pine-nuts, and Sugar, it imparts Venereal Abilities. The Powder of the Seed dry'd, after perfect Maturity, is an excellent Remedy, not only againſt the Stone, but the Jaundice and Dropſy, as we are aſſur'd by a famous Phyſician, Dr. *Bowles*. A Dram of the Seeds, taken in Wine, as *Pliny* ſays, cures the Dropſy, and extenuates thoſe who are exceſſively fat and corpulent: The *Arabians*, alſo, mightily commend it. In *England*, the green Seeds, or rather Fruit of the Aſh-tree, gather'd before Maturity, are pickled with Salt and Vinegar, and ſerve for Sawce. *Raii Hiſt. Plant.*

2. Fraxinus; excelſior; frugifera; fœmina.

3. Fraxinus; humilior; ſive altera Theophraſti; minore & tenuiore, folio. *C. B. P.* 416.

4. Fraxinus; folio rotundiore. *C. B. P.* 416. *J. B.* 2. 174. *Chab.* 62. *Raii Hiſt.* 2. 1703. *Jonſ. Dendr.* 291. *Boerh. Ind. A.* 2. 172. *Manniferа Arbor.* Offic. *Fraxinus*, Tourn. Inſt. 577. Elem. Bot. 448. *Alepenſis*, Herm. Cat. Hort. Lugd. Bat. 261. THE ROUND-LEAV'D ASH. *Dale*, *p.* 332.

The Leaves reſemble thoſe of the Piſtachio, are roundiſh, leſs than thoſe of the common Aſh-tree, ſerrated at the Edges, and often have the interior Half, towards the Bottom of the Rib, ſhorter than the exterior; which may be alſo, ſometimes, obſerv'd in the Piſtachio and Turpentine-tree.

For the medicinal Virtues of this Tree, ſee MANNA.

5. Fraxinus; Virginiana; caudice penitus nodoſo.

6. Fraxinus; major; foliis rotundioribus; ſplendentibus; undulatis. An Fraxinus, Alepenſis. H. L.? *Boerh. Ind. A. Plant. Vol.* 2. *p.* 171.

FRENA. A Name for the Sockets of the Teeth. *Caſtellus.*

FRENANS *Medicamentum*, a bridling Medicine, is one which moderates and reſtrains the Rage of the redundant and diſturb'd Humours. *Caſtellus.*

FRESUM. An Adjective frequently apply'd to Pulſe, importing, being hull'd, ſkin'd, or peel'd.

FRICIUM, *vel Fricatorium Medicamentum*, is a Medicine appointed for the Friction or Rubbing of the ſoft external Superficies of the Body.

This Medicine, with reſpect to its Conſiſtence, is of three Kinds, *dry*, *ſoft*, *liquid*: The firſt is adminiſter'd in dry Friction, in form of Fumes, or by way of Suffumigation: The two laſt ſerve for humid Friction.

Their Uſefulneſs, ſo highly celebrated by the Antients, and ſtill much regarded in the preſent Times, cannot eſcape the Obſervation of every one, who knows how greatly Friction contributes not only to the Conveyance of Remedies within the Superficies, but to their Action and Efficacy after Introduction. *Gaubius de Methodo concinnandi Formulas.*

FRICTIO, Friction, or Rubbing. A Species of Gymnaſtics; for which ſee the Article FIBRA.

FRIGIDARIUM. A Veſſel in the Baths of the Antients, appointed for holding cold Water, the *Caldarium* and *Tepidarium*, the other two Veſſels containing hot and tepid Water. *Caſtellus.*

FRINGILLA, the Chaffinch; a ſmall Bird well known: *Lemery* ſays, it contains much volatile Salt and Oil, and is thought to be good for the Epilepſy.

FRITTA. A technical Word belonging to the Art of Glaſs-making, and ſignifying the Maſs of Salt and Aſhes concreted

ereted in the Sand by Cold. By the Antients it was called *Hammonitrum*, or, perhaps more properly, *Ammonitrum*. *Plin. Lib.* 36. *Cap.* 26.

FRITILLARIA, the Fritillary, or chequer'd Tulip.

The Characters are;

The Flower is like a Lily, Bell-shap'd, hexapetalous, pendulous, naked, and generally chequer'd, furnish'd with six Stamina, and containing the Ovary: The Ovary is furnish'd with a trifid Tube, or Pointal, the triple Cavity extending to the Cavity of the Ovary: This Pointal becomes an oblong Fruit, full of flat Seeds, dispos'd in a double Row: The Root consists of two carnous Knobs, from the Middle of which arises the Stalk. *Boerhaave, Index alter, Pars* 2. *p.* 139.

The Flower of the Fritillaria, as *Paul. Renealmus* says, is not only good in burning Fevers, but to allay Thirst: Of its Juice is made an excellent Ointment for carcinomatous Ulcers. There is, also, a considerable Virtue in the Flower for strengthening the Heart and Brain, and correcting the Malignity of the Meconium. The Water, rightly distil'd, helps Inflammations of the Eyes. *Raii Hist. Plant.*

Boerhaave enumerates twenty-eight Species of this Plant.

FRIXUS, *frictus*, φρυκτὸς, φρυγόμενος, πηγόμενος, τηγανισμένος, τηγανισθὲς, fried, is apply'd to things dress'd or prepar'd in a Frying-pan; hence *Panis teganites* (τηγανίτης) is Bread bak'd in a Frying-pan. *Galen, de Al. Fac.* tells us, that all fry'd Meats afford a dry Aliment, and void of Flatulences. *Fricta vel frixa Resina*, call'd by the *Greeks*, simply, φρυκτὴ, (*Phryctè*) signifies *Colophony*, or black Rosin; and distinguishes it from liquid or humid Rosin, which they call ὑγρὰ (*Hygra*). It takes the Name *Phryctè*, from its being fry'd or burnt in the Manner describ'd by *Dioscorides, Lib.* 1. *Cap.* 93.

FRONDIPORA. A Name for the *Eschara marina*.

FRONDOSITAS, Frondosity; signifies Leafiness, Fulness of Leaves, or Aptness to bear Leaves.

FRONDOSUS, frondous; is full of, or apt to bear Leaves. *Idem.*

FRONS, μέτωπον, the Forehead, is the fore Part of the Head, situate above the Eyes, bare, or destitute of Hair, and reaching to the Temples. *Castellus.* See CAPUT.

FRONTALE, προμετωπίδιον, is a Name for any external Medicine or Topic apply'd to the Forehead: In particular it means a refrigerating and hypnotic Remedy, prepar'd of cold Cephalics bruis'd and ty'd up in a Linen Bag, four or five Fingers in Breadth: It is, also, put for ANACOLLEMA, which see.

FRONTALIS. The Name of a Muscle belonging to the Forehead. See CAPUT.

FRONTATUS, frontated, is a Term us'd by Botanists, relating to the Leaf of a Flower, which grows broader and broader, till, perhaps, terminated in a right Line; and is spoken in Opposition to *cuspidated*; that is, when the Leaves of a Flower end in a Point. *Miller's Dict. Vol.* 1.

FRONTO, from *Frons*, is one who has a large and ample Forehead. *Castellus.*

FRUCTUS, καρπὸς, Fruit, is the Production of a Tree or Plant for the Propagation or Multiplication of its Kind; in which Sense, Fruit includes all kinds of Seeds, with their Furniture. Botanists use it to signify, properly, that Part of a Plant wherein the Seed is contain'd. The Word *Fruit* is, also, used to signify an Assemblage of Seeds in a Plant, as in a *Pea, Bean, Ranunculus*, and the like; and, in its general Signification, for all kinds of Grain, whether naked, or inclos'd in Cover, Capsule, or Pod, whether bony, fleshy, skinny, membranous, or the like. *Fruit* is also describ'd to be the Product or Result of the Flower, or that for whose Production, Nutrition, and Perfection, the Flower is intended. *Miller's Dict.*

In the Language of the Chymists, Metals are call'd Fruits of the Earth, as proceeding, say they, from their own Mother the Water, and entering into another Mother the Earth; in which the Operation of their Trees is perfected, the Roots being fix'd in the Water. *Castellus.*

FRUMENTACEUS, frumentaceous, is a Term apply'd by Botanists to all such Plants as have a Conformity with Wheat, *Frumentum*, with respect either to their Fruits, Leaves, Ears, or the like. *Miller's Dict.*

FRUMENTUM INDICUM. A Name for the *Mays*; *granis aureis.*

FRUMENTUM SARRACENICUM. A Name for the *Fagopyrum*; *vulgare*; *erectum*; and the *Fagopyrum*; *vulgare*; *scandens.*

FRUMENTUM TURCICUM. A Name for the *Mays*; *granis aureis.*

FRUTEX. See the Explanation of Botanical Terms, under the Article BOTANY.

FRUTEX ÆTHIOPICUS. A Name for the CLUTIA; and also for the *Conocarpodendron*; *foliis argenteis, sericeis, latissimis.*

FRUTEX, AFRICANUS, CONIFER. A Name given to several Species of the CONOCARPODENDRON and LEPIDOCARPODENDRON.

FRUTEX AFRICANUS AMBARUM SPIRANS. A Name for the *Comæ aureæ similis Frutex*; *ambarum spirans.*

FRUTEX CORONARIUS. A Name for the *Syringa*; *alba*; *sive Philadelphus Athenæi.*

FRUTEX, PAVONINUS. A Name for the *Poinciana*; *flore pulcherrimo.*

FRUTICOSUS, fruticose, are those Plants which are of an hard woody Substance.

FUCA is a Sea-fish, which resembles our Perch: There are several Species of them, of different Colours. They are found upon the Shore amongst the Alga. They afford good Aliment, and are of easy Digestion; they purify the Blood, and provoke Urine. *Lemery des Drogues.*

FUCATUS, (from *Fucus*, Paint, or Varnish) colour'd, varnish'd: In a metaphorical Sense it means the same as *Palliativus*, palliative; and is spoken of an imperfect Cure, where the Subject is incapable of a perfect Restoration. *Castellus.*

FUCHSIA. This Plant was so nam'd by Father *Plumier*, who discover'd it in *America*, in Honour to the Memory of *Leonard Fuchsius*, a learned Botanist.

The Characters are;

It hath a Funnel-shap'd Flower, consisting of one Leaf, and divided into several Parts at the Brim; whose Cup afterward becomes a roundish, soft, fleshy Fruit, which is divided into four Cells, that are full of roundish Seeds.

We have but one Sort of this Plant; which is,

Fuchsia triphylla, flore coccineo. *Plum. Nov. Gen.* THREE-LEAV'D FUCHSIA, WITH A SCARLET FLOWER. *Mil. Dict. Vol.* 2.

There are no medicinal Virtues attributed to this Plant, that I know of.

FUCUS.

The Characters are;

It is a slimy, coriaceous, herbaceous Substance, and has a sort of foliaceous Appearance in every Part. The Seeds are often contain'd in Follicles. For a fuller Account of the *Fucus*, see the Explication of *Tenuis*, under the Article BOTANY.

Botanists mention a great many Species of the Fucus; none of which have any medicinal Virtues attributed to them, except the two following; which are,

1. Fucus; maritimus; vel Quercus; maritima; vesiculas habens, *C. B. P.* 365. *Tourn. Inst.* 566. *Boerh. Ind. A.* 9. *Quercus marina*, Offic. Ger. 1378. Emac. 1567. Park. Theat. 1294. Aldrov. Dendr. 160. *Fucus sive Alga marina latifolia vulgatissima*, Raii Hist. 1. 70. Synop. 3. 40. *Fucus marinus vulgatissimus latifolius, foliis Quercinis vesiculis donatis*, Hist. Oxon. 3. 647. COMMON SEA-WRACK.

The Herb is us'd, which agrees in Virtues with the ALGA. *Dale.*

2. Fucus; Lactucæ folio, *El. Bot.* 443. *Tourn. Inst.* 168. *Lichen marinus*, Offic. Ger. 1377. Emac. 1566. Raii Hist. 1. 77. Synop. 10. *Marinus Platyphyllos*, Pluk. Almag. 216. *Fucus marinus*; *Lactuca marina dictus*, Park. 1293. *Fucus primus*, Dioscor. *Fucus marinus Lactucæ folio*, Hist. Oxon. 3. 645. *Muscus marinus Lactucæ folio*, C. B. 364. *Lactuca marina*; *Bryon Theophrasti, Dioscoridis, & Plinii*, Chab. 572. *Bryon marinum Lactucæ foliis*, Calc. Mus. 19. *Lactuca Marina sive Intybacea*, J. B. 3. 801. OYSTER-GREEN. See BRYON. *Dale.*

Fucus, Offic. *Tertius*, Dioscor. *Fucus Marinus, Rocella tinctorum dictus Alga Tinctoria*, J. B. 3. 797. Raii Hist. 1. 74. Tourn. Inst. 566. *Fucus marinus, Rocella Tinctorum*, C. B. 365. *Alga Cornu Cervi divisura*, Ejusd. 364. *Alga Tinctoria* Hist. Oxon. 3. 646. *An Fucus, sive Alga membranacea purpurea parva*, Raii Synop. 3? PURPLE SEA-WRACK. *Dale.*

It is found in the *Mediterranean* Sea. See its Virtues under ALGA, where it passes under the Denomination of the red *Alga.*

Vitis marina, & *Lenticula marina*, Offic. *Lenticula marina*, Calc. Mus. 19. *Lenticula marina serratis foliis*, Ger. Emac. 1615. Park. Theat. 1281. *Fucus folliculaceus serrato folio*, C. B. Pin. 365. Tourn. Inst. 568. Raii Hist. 1. 72. Hist. Oxon. 3. 647. *Fucus folliculaceus, serratus, Sargazo*, Mont. Exot. 7. *Sargaso*, Pis. SEA-LENTILS.

It is found upon Rocks by the Sea-side. The Herb is us'd by the *Portuguese* and *Dutch* for a Dysury. *Dale.*

FUGAX. An Epithet sometimes apply'd to Fruits, importing the same as *Horeum*, perishable.

FUGILE imports the Excrement of the Ears, or Ear-wax; and, in *Paracelsus*, an Appearance in the Urine resembling Ear-wax. According to *Rulandus*, it signifies those Apostemations near the Ears call'd *Parotides*. *Forestus* makes it the same as *Bubo*. *Castellus.*

FUGITIVUS SERVUS. Mercury.

FULICA, Offic. Aldrov. Ornith. 3. 91. Will. Ornith. 239. Raii

Raii Ornith. 319. Ejusd. Synop. A. 116. Gesn. de Avib. 344. Jonst. de Avib. 98. Mer. Pin. 174. *Cotta major sive Calva*, Charlt. Exer. 107. *An Cotta, sive Cutta Anglorum*, Aldrov. Ornith. 3. 98? *Cotta Anglorum*, Jonst. de Avib. 99. *Poule d'eau*, Bellon. des Oyse. 181. THE COOT, or BALD-COOT.

The Heart is recommended against Epilepsies; and the Flesh is said to be good for the Poison of Serpents.

FULIGO. Soot.

Analysis of Soot.

Take of the blackest and driest Soot, gather'd in the Chimney of an Oven, where nothing but Bread is bak'd, and nothing burnt but Vegetables, and gather'd on a very dry Day; with this fill a large glass Retort almost to the Neck; apply a large glass Receiver, after the Neck of the Retort has been thoroughly cleans'd, on the Inside; and lute the Juncture with the common Linseed-paste; raise a Fire of an hundred and fifty Degrees, and keep it up equably: A large Quantity of transparent Water will thus come over, with considerable Violence; so that if the Fire was immediately made strong at first, the Receiver would easily crack. Continue in this manner, so long as any clear Water comes over, which it will long do, although the Soot was dry. Then taking away this first Water, and pouring it into a Glass, apply the Receiver again, and raise the Fire a little above two hundred Degrees; a white, milky, fat Water, will now come over in Quantity, and with considerable Violence; proceed with a slowly-increas'd Fire, so long as this continues; keep it apart; apply the Receiver again, and raise the Fire briskly; a yellow, volatile, copious Salt, will come over, and stick all round the Sides of the Receiver; continue the Fire thus brisk, so long as any Salt rises; then, with the strongest Heat, that Sand will give, and, with a Heat of Suppression, there arises a thick black Oil. Let all cool, and there will be found, in the Neck of the Retort, a Salt which could rise no higher, even by so violent a Fire; but, in the Bottom of the Retort, there remains a black feculent Matter; the upper Surface whereof is cover'd with a very thick, whitish, saline Crust, which, both in Colour, Figure, Concretion, and Striæ, resembles the common Sal Ammoniac. If the milky Water be rectify'd, it affords a very penetrating volatile Spirit, and some sharp volatile Salt.

REMARKS.

Here we are taught what the Agitation of an open Fire can move, change, expel, and drive through the Air by burning; first, in the Form of Smoke; then, of Flame; lastly, of Exhalation; and how high it may carry them. For a Chimney is a kind of Still-head, converging in an open Top; and sometimes rises to the Height of above thirty Feet, and carries Soot up to the Top; and, after this, discharges a black Smoke, at its upper Orifice, and disperses it through the Air, where it seems gradually to vanish. It may deserve to be consider'd, what an immense Quantity of such Matter is, by the Force of Fire, thrown up from the Surface of the whole habitable Globe, in the Places where Fire is constantly us'd: Whence we may learn, that combustible Vegetables, their Smoke, Flame, and Soot, and the black Clouds dispers'd in the Air, consist of one and the same Matter agitated by Fire. This Matter consists of several Parts; as (1.) a fetid, oily, bitter, unpleasant, nauseous Spirit, residing in the Water, that first comes over, and is afterwards constantly dispers'd through all the other Parts: This Spirit seems to be the oily and more subtile Part of the Vegetable, acted on by the Force of Fire. (2.) Water, which is here contain'd in great Plenty, residing in this Spirit, in the first limpid, and in the second milky Liquor, as also in the saline Spirit, the volatile Salt, and, in some measure, in the Oil itself. This Water can scarce be render'd pure by any Art, being always foul'd with the unalterable Bitterness, and the inseparably disagreeable Odour, of the Spirit. (3.) A sharp, volatile, alcaline, oily Salt, which first comes over, rises into the Receiver, and sticks to the Sides thereof; for this Salt is truly alcaline, as appears by its Taste, Smell, fiery Virtue, the violent Efferveſcence it makes with Acids, and, by concreting therewith into a compound Salt; and hence a volatile Alcali continally impregnates the Atmosphere, in great Plenty, by Conflagrations. (4.) A sharp, alcaline, fat Spirit, consisting of the Salt just now mention'd, dissolv'd in Water, and so resembling Spirit in Fluidity, Pungency, Subtilty, and Volatility. (5.) A fetid, black, bitter, nauseous, inflammable, thick, and almost caustic Oil, mix'd with an oily Salt. (6.) A true Sal Ammoniac, sticking in the lower Part of the Neck of the Retort, and mix'd to the Surface of the black Earth below. For, if this Salt be carefully collected and separated from the alcaline Kind, that first comes over, it proves a genuine Sal Ammoniac. It is of a whitish Colour somewhat transparent, makes no Efferveſcence with Acids, and, if mix'd with fix'd Alkalies, presently affords a true volatile alcaline Salt, as Sal Ammoniac does; whence the true Origin of this Salt is deriv'd from Soot. (7.) A black fix'd Earth, which, being afterwards calcin'd in an open Fire, and burnt from its Oil, which tenaciously adheres thereto, leaves a white earthy Calx behind.

This is the Analysis of Soot; by considering of which, we may learn what Parts of Vegetables are volatile, and fly off by an open Fire, and what are fix'd and remain behind, and what Fire throws off from Vegetables into the Air. Hence we see, that even Earth, which appears so fix'd in the most violent Fire, after being separated from the other Principles, yet, when mix'd with the rest, is, either by the Force of Flame, or Fire, thrown to the Distance of forty Feet through the Air, in the Form of a thin Cloud; but, there would be no End, if we should minutely pursue the physical Uses of this Process. Pills compos'd of dry Soot, and gilded, are recommended for the Cure of cold Distempers, and this often with Success. The volatile Salt of Soot is us'd with the same Success as that of Animals. *Hartman* recommends the Salt which rises last, for giving Relief in Cancers; and, certainly, Sal Ammoniac, prudently employ'd, is of Service against the Putrefaction of running Cancers. But the Soot produc'd by Oak-wood alone, the common *Dutch* Tufts, or Pit-coal, appears different upon chymical Analysis; and that again would be very different, which should be collected from the Chimney of a public Kitchen, which is continually fill'd with the Fumes, not only of the Fuel, but likewise of all kinds of boil'd, roasted, and fry'd Meats. And thus much may help us to form a Judgment of Soot. *Boerhaave's Chymistry.*

Spirit, and Salt of Soot, are rectify'd in the same manner as Spirit of Hartshorn.

FULIGO *Metallorum* is Arsenic, and sometimes Mercury.

FULMINATIO, Fulmination, in Chymistry, has two Significations: First, it imports an Explosion, and is the same as Detonation. Secondly, Fulmination, in the Depuration of the more perfect Metals, is, when, upon infusing them with Lead, a bright Colour succeeds a kind of sulphureous Cloud before appearing in the Metals, during the Fusion.

FUMANS NIX is Quick-lime.

FUMARIA.

The Characters are;

The Leaves are divided as in umbelliferous Plants; the Calyx is small, and bifoliated, in some lying under the Spur of the Flower, and in others wanting. The Flower, if curiously examin'd, in many Plants, appears tetrapetalous, the lower Petal running out in the Shape of a Keel from the End of the Pedicle: The upper, being bent in the Figure of a Spur, rises upwards, in the Form of an erect Galea; to this latter Petal grow the Calyx and Pedicle: The third and fourth Petals are lateral, and, by their Apposition, form the Representation of a very sharp-pointed Vagina, conceal'd between the two former Petals.

The Ovary, at the Extremity of the Pedicle, is short and contracted, and furnish'd with a long Tube, with a globous or discous Head: The whole Length of it seems carefully cover'd up, and conceal'd within the Vagina before describ'd. To the Tube, for its whole Length, grow two Stamina, so closely, that, in Conjunction with it, they are included in one very small, thin, pellucid Vagina, in such a manner, that nothing appears outwardly but the Apex of the Tube of the Ovary, and the two Testes. The Ovary, when ripe, becomes an unicapsular Pod, full of round Seed.

If the ripe Flower be cautiously open'd, as soon as the two interior Petals are disclos'd, the Testes discharge the Seed by a sudden Explosion.

Boerhaave mentions eleven Species of this Plant; which are,

1. Fumaria; viticulis & capreolis plantis vicinis adhærens; Neapolitana; flosculis subflavis in summitate nigricantibus. *C. B. P.* 143. *Var.*

2. Fumaria; Officinarum & Dioscoridis; flore purpureo. *C. B. P.* 143. *Tourn. Inst.* 422. *Boerh. Ind. A.* 308. *Fumaria Offic. Chab.* 377. *Fumaria purpurea. Get.* 927. *Emac.* 1088. *Fumaria vulgaris. Park.* 287. *J. B.* 3. 201. *Raii Hist.* 405. *Synop.* 3. 204. *Fumaria vulgaris latifolia, siliquis curtis, non breviobus. Hist. Oxon.* 2. 261. *Herba Melancholisuga. Cat. Altd.* FUMITORY. *Dale.*

This is a tender succulent Plant, hardly able to sustain itself, having many winged finely divided Leaves, of a whitish-green Colour. The Stalks are hollow, and corner'd, much branch'd, and seldom rising very high, having, on their Tops, long Spikes of Flowers, purple above, and whitish underneath, somewhat resembling the papilionaceous Kind, having a Heel or Spur in the

the hinder Part, the Foot-ſtalk being inſerted in the Middle of the Flower: They are ſucceeded by ſingle round Seed. The whole Plant has a bitter Taſte; whence it is call'd *Fel Terræ*. It grows every-where in Fields and till'd Grounds, and flowers in *May*. The whole Plant is us'd.

This Plant gives the blue Paper much ſuch a red Colour as Aloes; ſo that, probably, it contains very near the ſame Principles, ſuch as a Salt like that which is natural in the Earth, but in which the Sal Ammoniac predominates over the Nitre and marine Salt: Beſides, the Salt of the Fumitory is join'd with a great deal of Sulphur and Earth, and diſſolv'd in a conſiderable Quantity of Phlegm.

By the chymical Analyſis, Fumitory yields a great deal of concreted, volatile, fix'd, lixivial Salt, and very thick Oil.

All theſe Principles render this Plant laxative, diuretic, good to cleanſe the Blood, and remove Obſtructions of the Parts. It paſſes for a Specific in all Diſeaſes of the Skin, in hypochondriac Melancholy, in a Cachexy, and Dropſy: They give the Juice of Fumitory from two Ounces to ſix; the Infuſion in Whey, from ſix Ounces to ten, or twelve; the ſimple Syrup, to two or three Ounces, in Ptiſans; the compound Syrup, to one or two Ounces, if you would have the Patient purg'd. The Water, alſo, of Fumitory is deterſive, and good to dry up Ulcers of the Mouth. An Ointment is made of the Juice of this Plant, mix'd with equal Quantities of the Juice of Elecampane, thicken'd over the Fire with ſome Hog's Lard. Fumitory is us'd in the Electuary *de Pſyllio*, in that which they call *Sennatum*, in the Confection *Hamech*, and in the compound Syrup of Succory. *Martyn's Tournefort.*

Fumitory purges Bile, and aduſt Humours; but then it requires to be taken in a large Doſe. I am of Opinion, ſays *C. Hoffman*, with thoſe who believe, that *Meſue* and *Avicenna* intended, that the Juice ſhould be given from five to eleven Ounces; the Decoction, to the Quantity of fifteen Ounces; and the Powder, from four to five Ounces; by which means it clarifies and purifies the Blood. In *England*, we boil the Herb in Whey, in the Spring-time, and drink the Decoction for purifying the Blood. Hence it is admirably beneficial in all Diſeaſes proceeding from bilious and ſerous Humours, ſuch as the Leproſy, Scab, Itch, Impetigo, Herpes, and ſuch other cutaneous Diſorders, and, it is ſaid, in the Lues Venerea itſelf. It is diuretic, as well as ſudorific; for which Reaſon the Water is preſcrib'd in the Lues Venerea; and, mix'd with Theriaca Andromachi, in the Peſtilence. It opens Obſtructions of the Liver, and purges the Jaundice by Urine. I very much eſteem the Conſerve, ſays *C. Hoffman*, for opening Obſtructions of the Viſcera after univerſal Purgation.

The Juice, or diſtil'd Water, dropt into the Eyes, are believ'd to cure their Dimneſs: Hence the Plant takes its Name, *Fumaria*, becauſe it provokes Tears, and clears the Sight, after the Manner of *Fumus*, or Smoke. *Pliny.*

The Eſſence of Fumitory, or its Juice, may be taken in Whey, for ſome Days together, in atrabilious Diſorders. The Herb will not bear much Boiling, on account of its volatile Salts. *Raii Hiſt. Plant.*

Fumitory is juſtly accounted one of the moſt wholſome, as well as uſeful Herbs; for it abounds not only with a bitteriſh Juice, but with a copious, tartareous, and nitrous Salt. Boil'd in Beer or Whey, or taken in form of Pills, it is an admirable Remedy in all chronical Diſeaſes, and particularly thoſe which proceed from corrupted Lymph and Serum; as the Leproſy, Itch, Scurvy, the Lues Venerea, and many other cutaneous Diſeaſes; for, by promoting the Circulation of the Blood, it removes ſuch things as clog the Viſcera, opens Obſtructions, excites and facilitates Excretions by Stool and Urine, and cauſes a free Perſpiration; by which means it works a moſt effectual Depuration of the Lymph and Blood. And, indeed, in our Opinion, there can hardly be found a Simple of ſuch extraordinary Virtue, for depurating and cleanſing the Maſs of Blood and Humours, and corroborating the Tone of the Viſcera, as Fumitory. *Hoffman. de Præſtant. Remed. domeſt.*

3. Fumaria; Officinarum; foliis cæſiis; flore dilutè rubello.

4. Fumaria; minor tenuifolia. *C. B. P.* 143. *M. H.* 2. 261. LESSER NARROW-LEAV'D FUMITORY.

5. Fumaria; ſempervirens & florens, flore albo. *Flor.* 1. 91. EVERGREEN FUMITORY, *with a white Flower.*

6. Fumaria; lutea. *C. B. P.* 143. *Fumaria, lutea, montana.* M. H. 2. 260. *Fumaria, quæ Split dicitur.* J. B. 3. 26. 203. YELLOW FUMITORY.

It grows on the cultivated Hills, and in the Fields of *Apulia* and *Calabria*, and in other Parts of *Italy* and *Sclavonia*.

Achilles Gaſſerus, in his Obſervations, publiſh'd by *Volſchius*, *Obſ.* 99. makes the following Remarks on this Herb: When I travel'd in *Italy*, he ſays, for the ſake of Improvement, there was an Herb much in Requeſt, which, in *Sclavonia*, they call *Split*, but, at *Venice*, the *Sclavonian Herb*; it is of a bitter Taſte, and its Leaves much reſemble thoſe of Rue; whence by ſome it is reputed a Species of Rue, or the *Harmal* of the *Arabians*. It grows plentifully on the Borders of *Boſnia*, about the Caſtle of *Boſnaprina* and is much celebrated for its Efficacy in many Diſorders, as the Gout, Sciatica, Affections of the Nerves, Convulſions, Palſy, Epilepſy, Apoplexy, and the like. Of this I ſent an Account to a celebrated Phyſician my Friend, *G. Laubius*, and receiv'd for Anſwer as follows: The herb Split, as I am aſſur'd by *Vinceſ. Leviüus*, a *Moravian*, and a Man of Learning, is a Species of *Fumaria*, or *Corydalis*. It is gather'd on the Mountain of *Boſnia*, in a ſtony Soil; in Leaves, Flower, and Taſte, it reſembles *Fumaria*, but bears its Seed in Pods; it is an Evergreen, and has ſeveral Roots complicated one with another, and may be call'd *Fumaria Alpina*. It is of Service in all cold Affections of the Nerves, comforts the Brain, gently purges, provokes Urine, and opens Obſtructions of the Meſentery and Liver; the Root is bitter and acrimonious. The Form of Preparation is in the following manner:

> Take of the Roots of Split, one Ounce; bruiſe them ſmall, and put them in a Pint of White-wine, in a glaz'd Pot of ſufficient Capacity; and cover it with a Cruſt of Bread, well paſted round about at the Edges; and let it boil over a gentle Fire, for an Hour. Exhibit an Ounce of this Decoction warm, for five Days together, to the Patient, faſting.

At the firſt time of taking, it inebriates, but afterwards it moderately exhilarates, and, with the Help of a proper Diet, ſoon removes the Diſeaſe. It ſtrengthens the Brain; and a certain Phyſician is perſuaded, that it is good for melancholy and maniac Patients. *Greg. a Klo*, a *Bavarian* Phyſician, aſſures me of the Truth of all this, and further ſays, that he perfectly cur'd himſelf, with this Herb, of a great Weakneſs of the Joints, ſo that he could hardly walk; and dreaded, beſides, the Approach of an Epilepſy. The Doſe he preſcribes is two Ounces. *Raii Hiſt. Plant.*

7. Fumaria; claviculis donata. *C. B. P.* 143. *M. H.* 2. 260.

8. Fumaria; bulboſa; radice cava; major. *C. B. P.* See ARISTOLOCHIA ADULTERINA.

9. Fumaria; bulboſa; radice cava; major; flore albo. *C. B. P.* 143. *Var. J. B.* 3. 204. GREAT BULBOUS ROOTED FUMITORY, *with a white Flower.*

10. Fumaria; bulboſa; radice non cava major. *C. B. P.* 144. GREAT BULBOUS ROOTED FUMITORY, *with a Root not hollow.*

11. Fumaria; bulboſa; radice non cava; major; flore albo. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 308.

FUMARIA, *Africana.* A Name for the *Cyſticapnos*; *Africana*; *ſcandens.*

FUMIGATIO, Fumigation, implies the Application of Fumes to particularly Parts, as thoſe of factitious Cinnabar to Venereal Ulcers; or a kind of chymical Calcination, when Metals, or other hard Bodies, are corroded, or ſoftened, by receiving certain Fumes.

FUMUS *Albus.* Mercury.

FUMUS *Citrinus.* Sulphur.

FUMUS *Rubeus.* Orpiment.

FUMUS *Duplex*, in the Proceſs for the Philoſophers Stone, is Sulphur and Mercury.

FUNCTIO, Function, is the ſame as Action. See ACTIO.

FUNDA. The Sling. A ſort of Bandage. See FASCIA.

FUNDALIA. The ſame as FÆCULA; which ſee.

FUNDULUS. The Name of a Freſh-water Fiſh, call'd alſo *Gobites*, Gudgeon. See GOBIUS. The *Gobio Capitatus*, Bull-head, is alſo call'd *Fundulus.*

FUNDUS, in Anatomy, is the Bottom of any of the Viſcera. Thus the *Fundus Ventriculi* is the Bottom of the Stomach; and the *Fundus Uteri* is the Bottom of the Womb.

FUNGOIDES. See the Explication of Botanic Terms, and the Diviſions of *Fungi*, according to Mr. *Ray*'s Syſtem, under the Article BOTANY.

FUNGUS. See the Articles AMANITA and BOLETUS.

The *Fungi* conſtitute the firſt Genus of Plants in Mr. *Ray*'s Syſtem of Botany: For the Diviſions and Subdiviſions, ſee the Article BOTANY.

A prodigious Number of *Funguſes* are mention'd by Botanic Authors, of which thoſe that grow in *England*, are ſpecify'd in the laſt Edition of *Ray's Synopſis Stirpium Britannicarum*, *Londini* 1724, to which I muſt refer the curious Reader; none having any Medicinal Virtues, except the following: As,

1. *Fungus typhoides coccineus*, Offic. *Fungus typhoides coccineus Melitenſis*, Bocc. Plant. rar. 80. Raii Hiſt. 2. 1851. *Fungus Melitenſis*, Ejuſd. Muſ. di Fiſica 56. Tab. 4. *Fungus typhoides coccineus tuberoſus Melitenſis*, Ejuſd. 69. *Fungus typhoides Lubernenſis*, Filli Hort. Piſan. 64. *Cynomorium purpureum Officinarum*, Mich. Nov. Gen. 17. Tab. 12. SCARLET MUSHROOM.

It is found on a Rock near the Iſland of *Malta*; and is eſteem'd a very great Aſtringent: It is, therefore, given in the Quantity

Quantity of a Scruple, or more, in Wine or Broth, in order to ſtop Hæmorrhages. *Dale.*

2. FUNGUS ESCULENTUS. See AMANITA.
3. FUNGUS ROTUNDUS ORBICULARIS. See LYCOPERDON.
4. FUNGUS MAXIMUS ROTUNDUS. See LYCOPERDON.
5. FUNGUS SAMBUCINUS. See AURICULA JUDÆ.
6. FUNGUS LARICIS. See AGARICUS.
7. FUNGUS PHALLOIDES. See PHALLOIDES.

FUNGUS, in Surgery, is a ſpongy Excreſcence, which ariſes in Wounds and Ulcers.

Mr. *Sharp* ſays, that in Wounds made by a ſharp Inſtrument, where there is no Indiſpoſition of Body, the Cure is generally perform'd without any Interruption, but from the Fungus; ſo that the Buſineſs of Surgery will conſiſt principally in a proper Regard to that Point, and in Applications that will the leaſt interfere with the ordinary Courſe of Nature, which in theſe Caſes will be ſuch as act the leaſt upon the Surface of the Wound; and, agreeable to this, we find, that dry Lint only is generally the beſt Remedy through the whole Courſe of Dreſſing; at firſt it ſtops the Blood with leſs Injury than any ſtyptic Powders or Waters; and afterwards by abſorbing the Matter, which, in the Beginning of Suppuration, is thin and acrimonious, it becomes, in Effect, a Digeſtive: During Incarnation, it is the ſofteſt Medium that can be apply'd between the Roller and tender Granulations, and at the ſame time is an eaſy Compreſs upon the ſprouting Fungus.

If Ulcers ſhould be of ſuch a Nature as to produce a ſpongy lax Fleſh, ſprouting very high above the Surface, it will be neceſſary to deſtroy it by ſome of the Eſcharotics, or the Knife: This Fungus differs very much from that belonging to healing Wounds, being more eminent and lax, and generally in one Maſs; whereas the other is in little diſtinct Protuberances. It approaches often towards a cancerous Complexion; and, when it riſes upon ſome Glands, actually degenerates, ſometimes, into a Cancer, as has happen'd in Buboes of the Groin. When theſe Excreſcences have aroſe in Venereal Ulcers, I have par'd them with a Knife; but the Flux of Blood is ordinarily ſo great, that I do not recommend the Method, and rather prefer Eſcharotics. Thoſe in Uſe are the Vitriol, the Lunar Cauſtic, the Lapis Infernalis, and more generally the red Precipitate Powder; but even in this Caſe I do not think the Powder the beſt Remedy; for tho' I have ſaid it is always an Eſcharotic, yet, as the *Pulvis Angelicus*, which is a Compoſition of the Precipitate Powder and burnt Alum, eats deeper, I think it preferable to the Precipitate alone.

It is but ſeldom that theſe inveterate Fungi appear on an Ulcer; but it is very uſual for thoſe of a milder kind to riſe, which may often be made to ſubſide by Preſſure, and the Uſe of mild Eſcharotics: However, if the Aſpect of the Sore be white and ſmooth, as happens in Ulcers with a Dropſy, and often in young Women with Obſtructions, it will anſwer no Purpoſe to waſte the Excreſcences, till the Conſtitution is repair'd, when moſt probably they will ſink without any Aſſiſtance. In Ulcers, alſo, where the ſubjacent Bone is carious, great Quantities of looſe flabby Fleſh will grow up above the Level of the Skin; but, as the Caries is the Cauſe of the Diſorder, 'twill be in vain to expect a Cure of the Excreſcence, till the rotten Part of the Bone is remov'd; and every Attempt with Eſcharotics will be only a Repetition of Pain to the Patient, without any Advantage. In ſcrophulous Ulcers of the Glands, and indeed of almoſt every Part, this Diſorder is very common; but, before Trial of the ſevere Eſcharotics, I would recommend the Uſe of the ſtrong Precipitate Medicine, with Compreſs as tight as can be born without Pain, which I think generally keeps it under.

When the Excreſcence is cancerous, and does not riſe from a large Cancer, but only from the Skin itſelf, it has been uſual to recommend the actual Cautery; tho' I have found it more ſecure, to cut away quite underneath, and dreſs afterwards with eaſy Applications; but the Caſes, where either of theſe Methods are practicable, occur very rarely. See CANCER.

Fungous Excreſcences, alſo, frequently ariſe after Wounds of the Head which penetrate the Scull, and after the Operation for the Trepan; for an Account of which ſee CAPUT.

Certain Tumors of the Joints, generally call'd White Swellings, are alſo call'd *Fungi*, by ſome Authors, particularly *Heiſter*, who gives the following Directions relative to them.

Excreſcences of the Joints very nearly reſemble œdematous Tumors, are attended with Danger, and therefore require a peculiar Examination; nothing but an Ignorance of the Nature, and Origin of them, that is, whether they proceed from the Blood or Serum, from a corrupted Matter, Flatus, or any other Cauſe, could have tempted ſo many Authors to paſs them over in Silence, or treat of them ſo ſuperficially. A Fungus in the Joints is a Tumor in the Articulations of the Limbs, without Heat or Pain, ſo ſoft, that it eaſily yields to the Preſſure of the Fingers; but, upon the Removal thereof, expands itſelf immediately, like a Muſhroom, without retaining any Marks. Tho' no Joints either of the Arms or Legs are exempt from this Diſorder, the Knees, from the Quantity of Glands and latent Fat between the Ligaments and Tendons, are moſt ſubject to it. There are ſeveral Kinds of theſe Fungi; ſome are ſmall, others large; ſome ſoft, others hard; according as the Humours producing it by their Stagnation and Inſpiſſation, are either thin or glutinous. In ſome the noxious Fluids are without-ſide the Articulation; theſe are properly termed Fungi: In others they ſtagnate within the very Joint, as the Serum in the Scrotum, when there an Hydrocele, which I have both ſeen and cur'd: This laſt may juſtly be call'd, A Dropſy of the Joint; and, by its Diſtention of the entire Joint, may be diſtinguiſh'd from the Fungus, as that occupies rather one Side. Theſe two Diſeaſes, then, may be eaſily diſtinguiſh'd from what has been ſaid.

A Fungus undoubtedly ariſes from an Inſpiſſation of the viſcid, glutinous Serum about the Ligaments of the Joints, which, being collected after a Fall, or violent Blow, immediately raiſes a Tumor externally, or in the very Joint; and, by debilitating the Ligaments, deſtroys the natural Mobility of the Part. When the Nerves, Arteries, or Veins, are affected by theſe Swellings, the uſual Conſequence is, that the ſubjected Parts are deprived of their Nutriment, and the Joint, being preternaturally inlarged, is by degrees inſenſibly conſumed.

We have already obſerved, that, in Excreſcences of the Joints, the Ligaments are too much extended and relaxed, and, conſequently, the natural Strength of the affected Limb is more or leſs weakened, in proportion to the Violence of the Injury received: Now, ſince it is very difficult to remedy this Diſorder, and theſe Tumors cannot eaſily be reſolved or ſuppurated, every one muſt acknowledge, that the Surgeon lies under great Difficulties, who attempts their Cure; for, beſides the Difficulty of bringing them to ſuppurate, there is Danger in the Suppuration, as it is often attended with a Caries, or incurable Fiſtula, which induce a Neceſſity of Amputation. Recent, ſmall, and ſoft Fungi are often remedied by reſolvent and corroborating Medicines, tho' they are generally irritated by Emollients; whereas great and inveterate ones reſiſt all the Power of Medicine, and depend entirely on the Knife for Relief, and this does not always prove ſucceſsful; for tho', by Inciſion, you may extract the noxious Humours, the Swelling often returns, after the Wound is healed.

But the propereſt Method for the Cure ſeems to be this: Rub the Part affected ſeveral times in a Day with warm Cloths; then foment it with the beſt tartariſed Spirit of Wine, or Linen dipt in the ſame; continue this, till the natural Form and Vigour of the Limb is reſtored. *Purmannus*'s Fomentation is likewiſe a very noble Remedy: Take of the Pickle of Herrings, two Pints; of the ſtrongeſt Vinegar, one Pint; Leaves of Sage, two Handfuls; Roman Vitriol, an Ounce and an half; crude Alum, ſix Ounces: Boil theſe together for half an Hour; then apply them. When the Tumors begin to be diſperſed, and the former Vigour of the Limb a little recover'd, the Reſolution is greatly promoted by fomenting with tartariſed Spirit of Wine, or fetid Oil of Tartar, ſeveral times in a Day; then, to keep out the Cold, which is very injurious, bind it up firmly with Compreſſes and Bandages. Laſtly, I cannot but recommend one Fomentation above all others; which I have uſed myſelf, with great Succeſs: Take of Litharge, half a Pound; Armenian Bole, an Ounce; Maſtich, Myrrh, each half an Ounce; Wine-vinegar, a Pint: Boil theſe together for a Quarter of an Hour. You muſt uſe this Decoction warm, and every Morning and Evening dip Compreſſes, or thick Linen Cloths, into it, and foment the Part; obſerving to order, internally, proper purging, attenuating, and ſudorific Medicines.

If none of the Medicines recommended anſwer the Purpoſe, *Wurtzen* and *Purman* place their ſole Confidence in an Inciſion into the tumefy'd Joint, towards the lower and moſt commodious Part, but with the utmoſt Circumſpection, leſt any of the Ligaments or Tendons ſhould be injured; for, by the Help of this, if the ſtagnating Serum is collected in one Cavity only, it will immediately diſcharge itſelf; if it is diſperſed into ſeveral, it will gradually flow out in a few Days. This may be promoted, by applying Tents dipt in ſome Digeſtive, and ſprinkled with Alum. But before the Inciſion, you ſhould preſs the Tumor hard with your Fingers, and retain it with a Bandage plac'd above it, to prevent its giving way; for this will not only expoſe the Part more commodiouſly to your Sight, but, after Inciſion, promote the Efflux of the Serum, and make it burſt out, as the Blood does after Veneſection, or the Water after an Inciſion of the Hydrocele. When you have done this, if any Swelling ſtill remains, lay on a Diachylum or Oxycroceum-plaiſter, or *Wurtzen*'s red one, which, in this Caſe, he ſtrongly recommends Lime-water, or Spirit of Wine: This will reſolve the Remainder. Thus, when the Member is reſtored to its priſtine Form, the Wound is healed by vulnerary Balſams; carefully avoiding the Uſe of fat oily Medicines, as very prejudicial to the Ligaments and Tendons. But if the Serum be found too tenacious and glutinous to diſcharge itſelf voluntarily, apply ſome attenuating Injections at every Dreſſing. A Decoction of Agrimony, Alchimilla, and Birth-

wort, mixt with Honey of Roſes, or of Celandine, is the beſt. Theſe Injections will generally reſolve the Tumors ſurprifingly.

Though Inciſion is the more ready way of Cure, ſome prefer Cauſtics; and, when the Eſchar is ſeparated, they turn out the collected Humours; proceeding afterwards as directed above. During this Proceſs, I would adviſe anointing the affected Joints with a nervous Unguent, or ſome aromatic Spirit, till it has recover'd its natural Strength.

As it is very common for the inſpiſſated Serum, after the Formation of the Cicatrix, to collect again; in order to prevent this, you muſt obſerve, not only to preſcribe internal reſolvent, purging, and ſudorific Medicines, but likewiſe to keep the Wound open with Tents for ſome time, and cleanſe it daily with a vulnerary Injection of a Decoction of Birthwort, Agrimony, Alchimilla, or the like, mixt with Honey of Roſes, or of Celandine; for in *Purman*'s Opinion this Method is the moſt expeditious, inſomuch that the Sinus of the Wound is not only cleanſed, but filled up alſo with new Fleſh, ſometimes in ſix Days. It will, however, not be improper to inject ſome Lime-water into the Wound, and to apply the ſame, or a digeſtive Plaiſter, externally, always binding up the Knee carefully, to prevent a Collection of the Serum. This will prevent a Return of the Fungi, as *Wurtzen*, who had been very converſant in theſe Cures, teſtifies.

Every Excreſcence of the Joints is not form'd, ſo as to admit of an Inciſion ſafely; for, when it is inveterate, hard, or very large, or the Patient is weak, you muſt forbear it, as rather more prejudicial than ſerviceable, becauſe it is frequently attended with new Diſorders, as a Caries, Fiſtula, and Gangrene, by which the Man is deſtroy'd, who might otherwiſe have arrived at a good old Age.

FUNICULUS UMBILICALIS, the umbilical Chord, or Navel-ſtring. See PLACENTA.

It is the conſtant Practice to make an exact Ligature upon the Navel-ſtring of a new-born Infant, leſt it ſhould bleed to Death thro' the umbilical Veſſels. As ſoon as the Infant and Secundines are deliver'd, a ſtrong Thread, of about an Ell long, folded together four times, and ty'd in Knots at each End, is carried twice round the umbilical Chord, about two or three Fingers-breadth from the Navel, and faſten'd with a double Knot; then, for the better Security againſt too copious an Hæmorrhage, a ſecond String, at about a Finger's-breadth Diſtance from the former, towards the After-birth, is paſs'd in the ſame Manner. After this, the umbilical Cord and Placenta muſt be cut off with Sciſſars, below the ſecond Ligature; then the wounded Part muſt be wrapt up in a Linen Rag, on which a Compreſs is to be laid, and the Whole ſecur'd with a proper Bandage. For the reſt, it may be left to the Nurſe, till it becomes dry, and falls off ſpontaneouſly.

Some Moderns look upon this Ligature as ſuperfluous, becauſe they have ſeen it omitted without any ſubſequent Danger. This, I muſt own, may ſometimes happen. But we have numberleſs Inſtances to the contrary, and therefore thoſe Women are deſervedly ſtigmatiz'd with the Character of Murderers, who, being deliver'd privately, and alone, deſignedly neglect this Operation, and, by that means, induce Convulſions, with other bad Symptoms, which are too generally follow'd by Death itſelf.

FUNIS, χοῖνιξ, χοινίον, a Rope, a Cord: It is reckon'd among the Inſtruments neceſſary to a Surgeon, as appears from *Hippocrates*, *Lib. de Artic.* The *Arabians* call the *Vena mediana*, *Funis Brachii*, the Cord of the Arm. *Caſtellus.*

FURCALA. The ſame as CLAVICULA.

FURFUR, πίτυρον, Bran, is properly the Pellicle or Cortex which comes off from Wheat in grinding; in which Senſe it occurs in ſeveral Places in *Hippocrates*, and alſo in *Galen*; where he recommends Bran for its deterſive Faculty, in a Gargariſm. For the ſame Reaſon the *French* frequently uſe it in Clyſters, as we learn from *Phil. Guibert*'s *Medecin charitable*. From a Mixture of Bran, or πίτυρον, Bread is call'd πιτυρίας, furfuraceous. See ARTOS. *Galen* aſſerts every thing furfuraceous, πιτυρώδες, to have a deterſive Virtue. From a Similitude to Bran, alſo, thoſe excrementitious Particles which are evacuated with the Urine are call'd πίτυρα, *Furfures*, *Hippoc. de Nat. hum.* And hence we read πιτυρώδης ὑπόστασις, "a "furfuraceous (or branny) Hypoſtaſis;" and πιτυρώδες οὖρον, "furfuraceous Urine." *Coac. & Progn. Furfuroſi* are Patients afflicted with a ſort of Scabies or Scurf in the Head, which, upon Combing or Scratching, diſcharges a ſcaly Subſtance like Bran, whence the Affection is call'd πίτυρα, *Furfures*; or πιτυρίασις, *Furfuratio. Galen, de C. M. S. L. Lib.* 1. *Cap.* 6. by *Serenus Samonicus*, *Porrigo*, and *Farrea Nubes.* See FARINA.

FURFURACEUS, furfuraceous, branny. See the preceding Article.

FURFURATIO, πιτυρίασις. See FURFUR.

FURNUS. The ſame as FORNAX, which ſee.

FURO. The ſame as VIVERRA, which ſee.

FUROGI. A Cock. *Rulandus.*

FUROR, μανία. A Species of violent Delirium without a Fever. See MANIA, and UTERINUS FUROR.

FURUNCULUS, a Boyl.

Furunculus, among the *Latin* Writers, imports what we commonly call a Boyl, which is a ſmall hard Tubercle riſing in the Fat under the Skin, and accompanied with Inflammation, Redneſs, and Pain. As no Part of the Body is exempted from this Species of Tubercle, ſo the whole Body is ſometimes ſo over-run with them, that the Patient does not know on which Side to lie, how to turn himſelf, or in what Poſture to keep his Body. Not only Adults, but alſo young Perſons, and even Infants newly born, are ſubject to theſe Tubercles, which produce violent Cries, Watchings, and Loſs of Strength.

Though theſe Tubercles are not dangerous when they afflict Adults, yet it ſometimes happens, that, when a large Number of Boyls appear on tender Infants, they produce a moſt intenſe Pain, accompanied with Crying, Watching, Weakneſs, Convulſions, Epilepſies, and, at laſt, Death. And as in all other Inflammations, ſo the principal Cauſe producing the Symptoms which accompany Boyls ſeems to be a too glutinous and inſpiſſated Blood. The greater, therefore, this Inſpiſſation is, the more virulent and numerous the Boyls produc'd generally are.

For this Reaſon, the principal Intention of Cure in Boyls is, by proper Remedies to reſtore the inſpiſſated and ſtagnant Blood to its natural Motion and Circulation, with all poſſible Expedition. When a Patient is afflicted with few Boyls, internal Medicines are rarely exhibited, ſince they are generally cur'd by external Applications. But, when a large Number of Boyls appear, or return frequently, there is a Neceſſity for uſing Purgatives, and ſuch Medicines as attenuate and purify the Blood. For which Purpoſe, in Adults, 'tis expedient to take away a proper Quantity of Blood, either by Veneſection or Cupping with Scarification: At the ſame time Decoctions of the Woods, and ſuch other Subſtances as attenuate the Blood, are often to be exhibited, and a proper Regimen obſerv'd. Perſons afflicted with Boyls ought carefully to abſtain from generous Liquors, eſpecially Wine and Brandy, as alſo from the Uſe of Tobacco.

Recent Boyls are generally capable of being cur'd by external Remedies. This Intention is excellently anſwer'd by mixing Spirit of Vitriol with Honey, till it is highly acid, and anointing the Boyl with it. It is alſo of great Service to touch the Boyl frequently with pure Spirit of Vitriol, or of Sulphur: Digeſting Plaiſters, ſuch as ſimple Diachylum, Melilot-plaiſter, the Emplaſtrum de Spermate Ceti, or the Emplaſtrum Diaſaponis, are alſo found highly efficacious in the Cure of Boyls.

But if, in conſequence of a Delay in attempting the Cure, or any other Cauſe, the already enumerated Medicines ſhould not be ſufficient for reſolving the Boyl, it muſt neceſſarily be brought to a Suppuration: And in ſome Caſes the Maturation of an highly peccant and coagulated Matter is found ſo difficult, that the Boyl remains hard for ſome Weeks. Sometimes this ſtagnant Matter, in conſequence of its long-continued Inſpiſſation, becomes ſo acrid, that the Inflammation degenerates into malignant Ulcers, which ſpread gradually; or into Fiſtulas, which cannot be cur'd without the greateſt Difficulty. The Suppuration, however, is, for the moſt part, remarkably accelerated by a Plaiſter prepar'd of Honey and Meal, or by the Diachylum-plaiſter with the Gums. When theſe are not ſufficient for anſwering the End, maturating Cataplaſms are to be us'd; tho' 'tis to be obſerv'd, that for Children Plaiſters ſeem to be far more proper than Cataplaſms. When the Boyl is ſufficiently maturated, which may be known from its Softneſs, and the yellow Colour of its ſuperior Part, we are forthwith to have recourſe to the Knife, and opening the Abſceſs, to ſqueeze out the corrupted Matter lodg'd in it: After this, a Diachylum-plaiſter is to be apply'd, and the Ulcer daily cleans'd from Pus, till the Whole is eliminated, and the Wound conglutinated.

When ſucking Children are afflicted with Boyls, 'tis moſt expedient to exhibit Purgatives to the Mother or Nurſe, who are to be enjoin'd an exact and proper Regimen; but, to the Infants themſelves, gentle Laxatives muſt be frequently exhibited, and Preparations of Crabs-eyes, Shells, Mother of Pearl, Powder of Aniſe and Antimony, which are highly efficacious in correcting the Acrimony of the Blood. We muſt, alſo, obſerve, that as *Vari*, which are ſmall Puſtules or Pimples of the Face, are only diminutive and minute Boyls, they may be cur'd in the ſame Manner. The Uſe of Whey and mineral Waters is, alſo, highly beneficial to Perſons afflicted with Pimples. *Heiſt. Chirurg.*

FUSANEUS, κυτὸς, *pudr.* An Epithet of ſuch kinds of Fiſh as ſwim in Shoals, and are caught by Multitudes in Nets.

When

When apply'd to Diſeaſes, it imports the ſame as SPORADICUS; which ſee.

FUSANUS. The ſame as EUONYMUS; which ſee.

FUSIO, χύσις, from χέω, to fuſe, Fuſion, in general, is any kind of Reſolution or Liquefaction by Fire, whence *Fuſion*, and *Solutio per Ignem*, mean the ſame thing; but, in the common Way of Speaking, by *Fuſion* we underſtand a Solution or Liquation of Metals and Minerals; and, by *Liquefaction*, a Solution of pinguious and concreted Subſtances.

FUSTERNA, from *Fuſtis*, a Club, or Cudgel. The upper Part of a Fir-tree; ſo call'd, becauſe full of Knobs and Joints, and ſo adapted for the making of Staves and Cudgels; as the lower Part, on the contrary, is call'd, by *Vitruvius*, *Sapines*. *Blancard.*

FYADA. Mercury. *Rulandus. Johnſon.*

G.

G, Γ. The *Greek* Letter Γ, among the *Greek* Phyſicians, is a Mark for an Ounce. *Rhodius ad Scribonium Largum, N.* 71. *Galen. de Compoſ. Med. & de Pond. & Menſ.*

For the Signification of G in the Chymical Alphabet, ſee ALPHABETUM CHYMICUM.

GABAL. See CABALES.

GABIREA, γαβίρεα. A very pinguious Species of Myrrh. *Dioſcorides, Lib.* 1. *Cap.* 77.

GABRICU. A Spagiric Term, ſignifying the *philoſophic Husband*, that is, the *Sulphur of Philoſophers*, whoſe Wife is call'd BRYA, that is, *Mercurial Water*. *Theat. Chym. Vol.* 3. *p.* 667. and *Vol.* 4. *p.* 736.

GADOS, γάδος. The ſame as GALEUS, which ſee.

GÆODES, γαιώδης. A Stone, which is a Species of Ætites; though *Dioſcorides* treats of them ſeparately. It contains in its Subſtance Earth, which is generally white, but ſometimes pale, and ſometimes yellow, and differs only in Figure from the Belemnites; for this latter is oblong, like an Arrow; but the Gæodes is round: The Maſs which adheres to it ſmells like Violets. This Stone, as *Dioſcorides* ſays, is aſtringent, drying, deterges ſuch things as darken the Sight, and, rub'd on the Parts with Water, cures Inflammations of the Breaſts and Teſtes. *Dioſcorides, Lib.* 5. *Cap.* 169.

GAGATES, *& ſuccinum nigrum.* Offic. *Gagates.* Mer. Pin. 217. Boet. 335. Worm. 31. Aldrov. Muſ. Metal. 418. Gæbal. 29. *Lapis Gagates.* Charlt. Foſ. 14. Calceol. Muſ. 355. JET.

It is a kind of black, ſtony, cruſty Earth, ſo full of Bitumen, that it ſmells ſtrongly of it, and, being kindled, flames almoſt like Pitch, and emits a very black Smoke. It differs from the *Terra Ampelitis*, in that this latter ſends forth no Flame, unleſs excited by Bellows, and has no bituminous Smell; whereas the Gagates, held to the Fire, catches Flame, and emits a Smell like Bitumen.

It is mollifying and diſcutient, and is ſuppos'd to cure the Colic, and other Diſtempers. *Schroder.* It is of great Efficacy in Hyſterics, and the Epilepſy; and is, alſo, a Diuretic. The Oil thereof is good for the Palſy: *Tournefort* commends it in hyſteric, epileptic, hypochondriac, and paralytic Diſorders; the Doſe is from ſix Drops to twelve. *Wormius* makes the Gagates only a harder Species of Ampelitis, and ſays, that, when it is poliſh'd, it is call'd, by *Pliny*, the *Gemma Samothracica*; by *Nicander*, *Lapis Thracius*; and, by ſome, *Lapis Obſidianus*. Though *Agricola*, ſays *Aldrovandus*, ſuppoſes the *Lapis Obſidianus* to be a Species of Gagates, and *Lapis Thracius*, I believe it to be a Subſtance very different from them both.

Dioſcorides ſays, that, us'd in Suffumigation, it cures the Fit of an Epilepſy, and revives the Patient under hyſteric Diſorders; and that the Fume thereof drives away Serpents: It is an Ingredient in antiarthritic Medicines, and in Acopa. It is produced, he ſays, at the Mouth of a River in *Cilicia*, near a City call'd *Plagiopolis*; and the Place, or River, where it is found, is call'd *Gagas*. *Dioſcorides, Lib.* 5. *Cap.* 146.

GAGEL. The ſame as GALE, which ſee.

GAIDEROTHYMUM. A Name, in *Raii Hiſt. Plant.* for the *Stachys, ſpinoſa, Cretica.*

GALA, γάλα. Milk. See FIBRA.

GALACORTA. A Species of SCORZONERA; which ſee.

GALACTINA, γαλάκτινα, from γάλα, Milk. Milk-meats. See LACTICINIA.

GALACTITES *Lapis*, γαλακτίτης λίθος, from γάλα, Milk. The Galactites-ſtone. It grows out of a Lime-ſtone, as does, alſo, the MELITITES, (ſee that Word) which it very much reſembles too in other reſpects. It is of an Aſh-colour, and, being rub'd on a Whetſtone, yields a milky and ſweet Juice; whence it takes its Name. It increaſes almoſt every Year, ſo as at laſt to be as big as a Child's Head. It is ſomewhat heating and abſterſive; whence it is proper to anoint the Eyes with it in Defluxions and Ulcers. After bruiſing it in Water, it ought to be repoſited in a Leaden Box, becauſe of the glutinous Quality which it retains. Triturated, and drank in Water, or ſweet Wine, after Bathing, it generates Plenty of Milk in the Breaſts of Women. *Dioſcorides.*

GALACTODES, γαλακτώδης, from γάλα, Milk, ſignifies either tepid, or milk-warm, like Milk juſt drawn from the Cow, or a milky Colour, in which Senſe it is applied to Excrements and Urine. The Word has both theſe Significations in ſeveral Places of *Hippocrates* and *Galen.*

GALACTOPHOROS, γαλακτοφόρος, from γάλα, Milk, and φέρω, to carry. Lactiferous. An Epithet applied to Canals, or Veſſels, ſuppos'd to convey Milk to the Breaſts, or rather to thoſe Ducts, or little Tubes, which, proceeding from the glandulous Subſtance of the Breaſts, are concentred at the Nipples.

Galactophora Medicamenta are Medicines which generate Plenty of Milk, and determine its Influx to the Breaſts. *Blancard.*

GALACTOPOETICA, γαλακτοποιητικὴ, from γάλα, Milk, and ποιέω, to make, Milk-making, is an Epithet applied to that Faculty, which is ſuppos'd to be in the Breaſts, of generating Milk. *Caſtellus.*

GALACTOPOSIA, γαλακτοποσία, from γάλα, Milk, and πόσις, of πίνω, to drink, is a Method of curing Diſeaſes, for Inſtance, the Gout and Phthiſis, by drinking of Milk.

GALANGA.

Galanga major. *Offic. Ger. Emac.* 33. *C. B. P.* 35. *Chab.* 245. *J. B.* 2. 734. *Park. Theat.* 1585. *Raii Hiſt.* 2. 1338. *J. Comm. Hort. Amſtel.* 136. *C. Com. Plant. Uſu.* 91. *Ari Wanhom*, Kemph. Amœn. Exot. 901? *Acorus.* Pharm.

GREAT GALANGAL.

This is a tough woody Root, of about an Inch, or an Inch and an half, thick, of a brown Colour on the Outſide, and whitiſh within, having a very thin Bark, which is beſet, at about a Quarter of an Inch diſtant, with Rings, or Circles; it is of a bitteriſh Taſte, ſomewhat aromatic, but not near ſo much as the ſmaller Galangal. This is ſold by the Druggiſts under the Name of *Radix Acori*, or *Acorus-root*; and is ſaid to grow in *Java* and *Malabar.*

It is hot and dry, cephalic and carminative, and good for Flatulences, and cold Diſeaſes of the Stomach. It is an Ingredient in the *Pulvis Ari compoſitus*, or elſe it is not much us'd. *Miller's Bot. Off.*

It is planted like Ginger, by ſetting the Root in the Earth.

The Root of the great Galangal is uſeful for all the ſame Purpoſes as Ginger, and is preſerv'd after the ſame manner. It is preſcrib'd to excite an Appetite, as Capers and Olives are amongſt *Europeans*: For which Purpoſe, the freſh Roots of both Sorts of Galangal are cut into thin Slices, and boil'd with Fiſh or Fleſh. They are, alſo, eaten raw, being ſprinkled with Vinegar, Oil, and Salt, with fried or roaſted Fleſh or Fiſh, in order to promote Concoction. The Inhabitants of *Malabar* and *Java* make uſe of it againſt cold Diſeaſes, not only in Men, but Cattle. They commonly make Puddings, or Loaves, of the Flour of the Root, which, being prepar'd with the Juice of the Cocoa-nut, they exhibit againſt Diſorders of the Uterus and Bladder. It is of great Uſe in cold Diſeaſes, ſtrengthens the Stomach, and promotes Concoction. Eaten, it cures acid Eructations, diſcuſſes Flatulences, and mends the Breath; it helps the Colic, heats the Reins, and excites to Venery. Preſerv'd with Sugar, it is effectual in cold Diſeaſes of

of the Brain and Nerves, the Cephalæa, and Pains of the Joints. Mix'd with the Juice of Plantain, it cures the Palpitation of the Heart. And, taken in generous Wine, Baum-water, or the Juice of Borrage, it is effectual in fainting Fits, if occasion'd by Cold; for which Reason the *Germani* exhibit it to be chew'd in the Mouth, during Venesection.

Raii Hist. Plant.

Galanga minor. Offic. Ger. Emac. 33. Raii Hist. 2. 1338. Park. Theat. 1585. J. B. 2. 735. Chab. 245. C. B. Pin. 35. COMMON GALANGAL.

This is a much less Plant than the former, coming over cut in short Pieces, scarce an Inch long, and not half so thick, of a reddish-brown Colour, having several circular Rings on the Outside, of an hot aromatic Taste and Smell. This is said to grow in *China*; but it is not known what Plant either this or the former are the Roots of; though, by the best Judges, they are supposed to be Species of the Iris.

This is much more in Use than the former, being more stomachic, and of greater Virtue against Diseases of the Head and Bowels, expelling Wind, provoking Urine and the Menses, and helping Digestion.

The Galangas have exactly the same Fructification with the *Bengela* of the *Indians*, the greater and lesser Cardamoms, Zedoary, the Zerumbeth of *Garcias*, and Ginger; for which Reason it would be proper to reduce them all under one Genus. They abound with a volatile oleous Salt immers'd in mild viscid Parts. *Dale.*

GALARIAS. A Fish, the same as CALLARIAS; which see.

GALARICIDES, GALARACTIS. A Stone, the same as GALACTITES; which see. *Castellus.*

GALATURÆ. Mucilages of the Seeds of Quinces, or Fleawort, made in Waters, for Instance, of Crabs, or Frog-spawn, and useful in Affections of the Eyes. *Castellus.*

GALAX. The same as GLAUX, or NOCTUA; which see. It is a Species of Owl.

GALAXA, GALACIA. Terms coin'd by *Paracelsus*, by which he means what he calls *Spina Ignis*, *Lib. de Gallic. Pust. Cap.* 5. The Word *Galaxa* usually means the white Circle in the Heavens, call'd the *Via lactea*, or Galaxy, whose Principle the same profound Philosopher asserts to be a very subtile Sulphur, which is, also, the Cause of Winter, and produces Mists. He has, also, discover'd a sort of Galaxy, by Analogy, in Man, and has bestow'd that Name on the Porosities in the Cranium, *Lib. de Podagricis.* The Name *Galaxia* has also been us'd to signify the Ways of Distribution of the Chyle. *Castellus.*

GALAXIAS, γαλαξίας. The Name of a Stone, which *Galen*, *Lib.* 9. *de S. F.* confounds with the Galactites. But they are distinguish'd from each other by *Dioscorides*, *Lib.* 5. *Cap.* 150. 152. who makes the Galaxias a Name for the MOROCHTHOS; which see.

GALBANETUM *Paracelsi.* See the Prescription for this, under the Article ARTHRITIS, in the Part which treats of the *Arthritic Colic.*

GALBANUM, γάλβανον, χαλβάνη. Galbanum. The Juice, or Gum, of a ferulaceous Plant; whose Description see under the Article FERULA.

Galbanum is the Juice of a ferulaceous Plant growing in *Syria*, call'd by some *Metopium.* The best is what resembles Frankincense, is grumous, pure, pinguious, free from Chips, retaining some of the Seed, and of the Plant, of a strong Smell, not very humid, nor yet quite dry. It is adulterated with Rosin, blanch'd Beans, and Ammoniacum.

Galbanum heats, burns, draws, and discusses; us'd in a Pessary, or a Suffumigation, it provokes the Menses, and brings away the Child; rub'd on the Parts with Vinegar and Nitre, it removes Freckles in the Skin. Taken inwardly, it is good for an inveterate Cough, Difficulty of Breathing, Asthma, Ecchymoses, and Spasms. Drank in Wine [for ὀξει I read οἴνῳ, on *Pliny*'s and other Authorities] with Myrrh, it resists Poison; and, taken after the same manner, expels the dead Child. It is apply'd in Pains of the Side, and to a Boyl. The Smell of it raises those who labour under an Epilepsy, Hysterics, or Scotomia; being burnt, the Fume thereof drives away venomous Animals; being rub'd on the Body, it preserves it from the Bites of Serpents; and, us'd with Sphondylium and Oil, kills those noxious Creatures by its Application to them. Apply'd as a Litus to the Gums, or put into the Cavity of a putrid Tooth, it eases the Tooth-ach. It is dissolv'd, in order for a Potion, with bitter Almonds and Water, or Rue, or Hydromel, or hot Bread; or, for other Purposes, with Meconium, burnt Copper, or liquid Gall.

If you have a mind to cleanse your *Galbanum*, put it into boiling-hot Water; and, when it is melted, the Sordes will swim on the Top, and be easily separated; or put it into a thin clean Linen Cloth, and, tying it up, hang it in a Copper Pot, or Earthen Vessel, so as that neither the Cloth, nor the String, may touch the Bottom of the Vessel; then, covering the Vessel, immerge it in boiling-hot Water; by which means the pure *Galbanum* will melt, and run through the Cloth, but the ligneous Parts will stay therein. *Dioscorides*, *Lib.* 3. *Cap.* 97.

It is a very good antihysteric, emmenagogue, and forcing Medicine; and, even when apply'd in a Plaister to the Navel, will cure hysterical Convulsions. It is likewise sudorific, when taken inwardly; and, when outwardly apply'd, it softens and digests Tumors, and brings them to Suppuration. For inward Use it ought to be strain'd, but not for outward. It is the Basis of the *Ceratum de Galbano*, and is an Ingredient in the *Emplastrum Matricale.*

Galbanum is a pinguious Juice, soluble, not in Oil, but in Water, being of a kind of middle Nature between a Gum and a Rosin; for it kindles at the Fire like a Rosin, and is soluble in an aqueous Liquor like a Gum. It is of a yellowish or reddish Colour, of a soft Substance, and ductile like Wax, of a bitterish and acrimonious Taste, and of a strong and somewhat rank Smell. He who anoints his Hands with a Solution of *Galbanum*, may handle Serpents, and receive no Injury from them, if the Antients are to be credited. *Raii Hist.*

GALBEUM, *plural* GALBEI, or CALBEI, a sort of Bracelets worn among the *Romans*, as well for the sake of Health as Ornament, as appears from *Suetonius*, *Vit. Galbæ*, *C.* 3. *Castellus.*

GALBULA, Offic. *Galbula sive Picus nidum suspendens*, Aldrov. Ornith. 1. 854. Will. Ornith. 147. Raii Ornith. 198. Ejusd. Synop. A. 68. *Picus nidum suspendens*, Jonst. de Avib. 80. *Oriolus, seu Picus nidum suspendens*, Gesn. de Avib. 645. THE WITWALL, by *Salmon* absurdly call'd THE YELLOW HAMMER, which is the *Emberica lutea.*

Pliny commends this Bird for the Jaundice. *Dale.*

We read also *Galbula* in the plural Number for Cypress-nuts. *Castellus.*

GALBULUS. The same with the preceding.

GALE.

The Characters are,

The Leaves are alternate; the Male Flowers are produc'd on Pedicles from the *Alæ* of the Leaves, and dispos'd on a Stalk, in the Form of a long Spike; these Flowers are naked, and adorn'd with six Stamina, which appear like Branches from them. The Ovary is seated in another Place of the same Plant, on a much shorter Pedicle, being lodg'd within a tetraphyllous caducous Calyx, and surrounded with other Male Flowers; it is of a globous Figure, here-and-there irregular, and containing one Seed.

Boerhaave mentions three Species of this Plant; which are,

1. Gale; quæ Myrto Brabanticæ similis; Carolinienſis; baccifera; fructu racemoso, sessile, monopyreno. *Plukn.* 48. 9. See AMBULON.

2. Gale; frutex odoratus; Septemtrionalium, *Boerh. Ind. A.* 2. 261. *Elæagnus*, Offic. *Gale frutex odoratus Septentrionalium*, *Elæagnus Cordo*, Raii Synop. 3. 443. *Gale frutex odoratus Septentrionalium*, *Elæagnus Cordo*; *Chamælæagnus Dodonæo*, J. B. 1. 224. Chab. 66. *Myrtus Brabantica sive Elæagnus Cordi*, Ger. 1228. Emac. 1414. Mer. Pin. 82. *Rhus Myrtifolia Belgica*, C. B. Pin. 414. Raii Hist. 2. 1707. Jonst. Dend. 293. *Rhus sylvestris, sive Myrtus Brabantica, vel Anglica*, Park. Theat. 1451. DUTCH MYRTLE, or GAULE. *Dale.*

It delights in Heaths, and uncultivated Soils, as well as in watery and marshy Places; and is found in great Plenty in the Isle of *Ely*, among the Marshes, in a boggy Soil, and in many such Places in the North of *England*, and near the Town of *Wareham*, in *Dorsetshire.* The Flowers appear in *May* and *June*, and the Seed is ripe in *July* and *August.*

Its extraordinary Bitterness demonstrates it to be of a drying and discussive Quality; but we are told, that it is principally serviceable in killing and expelling Worms, whether it be taken inwardly, or outwardly apply'd. The Leaves and Branches are us'd in Summer to adorn the Windows and Chimneys of Chambers and Parlours, for the sake of the extraordinary sweet Smell diffus'd by the Flowers and Buds; the same, laid in Chests among Clothes, not only render them sweet-scented, but keep away Moth. *Simon Paulli* tells us, that the *Polanders* use to destroy the Lice in their Swine by this Plant; which being strew'd in the Hogsties, all the Lice die in the Space of a few Hours, and the Knits never come to be animated. And Serpents are never known to settle, or have their Nests, in those Marshes where *Gale* grows, or ever to approach, much less to creep over them. Some boil the Flowers, instead of Hops, in their Beer; which, for that Reason, affects the Head, and soon induces Ebriety. In *Bergen*, and other Places of *Norway*, they commonly prepare an Ointment of *Gale* pulveriz'd, and *May* Butter, which is found to be very efficacious in the most stubborn Itch. *Raii Hist. Plant.*

3. Rhus Myrtifolia; Monspeliaca, *C. B. P.* 414. *Boerh. Ind. alt. Plant. Vol.* 2.

It

It grows plentifully about *Montpelier*; it is much us'd by the Tanners to ſtrengthen their Leather; and, by the Dyers, to give a black Colour: But I find no medicinal Virtues aſcrib'd to it. *Ray, Hiſt. Plant.*

Boerhaave doubts, whether this laſt be a Species of *Gale*, or whether it ought to conſtitute a new *Genus*.

GALEA, κράνος, γαλέα, in Anatomy, is a Name apply'd to the *Annies*; it ſignifies alſo a ſort of Bandage made on the Head. *Galen, de Faſciis. Galea*, and *Galeus*, are Names for the Fiſh call'd *Aſellus*; *Galea* is alſo a Term for a ſort of *Cephalalgia*, which encompaſſes the Head like a Helmet. In *Botany*, the upper Lip of a labiated Flower is call'd the *Galea*, or Creſt.

GALEANTHROPIA, γαλανθρωπία, from γαλῆ, or γαλὴν, a Cat, and ἄνθρωπος, a Man, is a Species of Madneſs, in which the Patient imagines himſelf a Cat, and imitates its Manners. *Caſtellus.*

GALEATA *& verticillata Perſicæ Folio*, in *Ray*, is a Species of *Sideritis*, ſo call'd from its galeated Flowers. *Ray, Hiſt. Plant.*

GALEGA.

The Characters are;

The Root is perennial, the Pod round, cylindrical, and full of oblong Kidney-ſhap'd Seeds. The Leaves grow by Pairs to a Rib terminating in an odd Leaf.

Boerhaave mentions four Species of this Plant; which are,

1. Galega vulgaris; floribus cœruleis, *Tourn. Inſt.* 398. *Elem. Bot.* 317. *Boerh. Ind. A.* 2. 45. *Rupp. Flor. Jen.* 214. *Galega, Ruta caproria*, Offic. Chab. 154. *Galega*, Ger. 1068. Emac. 1253. Raii Hiſt. 1. 911. Hiſt. Oxon. 2. 91. J. B. 2. 342. *Galega vulgaris*, C. B. Pin. 352. Park. Theat. 417. GOATS-RUE. *Dale.*

Goats-rue has many tall, hollow, ſtriated Branches, a Yard or more in Height, with long pinnated Leaves growing alternately on the Joints, conſiſting of ſix or eight Pair of long oval Pinnæ, ſmooth, and not indented about the Edges, which are ſubject to be folded together. The Flowers grow in long Spikes, hanging downwards in the Shape of Peaſe-bloſſoms, but leſs, of a pale, whitiſh, blue Colour: The Seed grows in long erect Pods: The Root is thick, ſpreading on the Earth, and abiding long. It grows in ſeveral Parts of *Italy* by Riverſides; but, with us, only in Gardens; and flowers in *June* and *July*.

Goats-rue is accounted cordial, ſudorific, and alexipharmic, and good againſt peſtilential Diſtempers, expelling the Venom through the Pores of the Skin; and is of Uſe in all Kinds of Fevers, the Small-pox and Meaſles; it likewiſe kills Worms, and cures the Bites of all Kinds of venomous Creatures. *Miller's Bot. Off.*

2. Galega; vulgaris; floribus penitus candicantibus, *C. B. P.* 352. COMMON GOATS-RUE, WITH WHITE FLOWERS.

3. Galega; Africana; floribus majoribus; & ſiliquis craſſioribus, *T.* 399. AFRICAN GOATS-RUE, WITH LARGE FLOWERS, AND THICK PODS.

4. Galega; facie Barbæ Jovis; ſericea; repens; flore pallidè luteo denſè ſpicato. *Boerh. Ind. alt. Plant. Vol.* 2.

GALENA, γαλήνη, is the ſame as *Molybdæna*, or *Plumbago*; it was alſo the antient or firſt Name for the *Theriaca*, which was ſo call'd by *Andromachus*, and others before him, when it had as yet no Addition of Vipers Fleſh. The Reaſon of the Name was, as *Galen* tells us, becauſe it induces a kind of Calm, γαλήνη, over the Blood and Spirits, when diſturb'd and agitated, as it were, under a Storm and Tempeſt, by Diſeaſes. *Caſtellus.*

GALENICA *Medicina*. Medicine founded upon the Principles of *Galen*; for which ſee the *Preface*.

GALENION, γαλήνιον. The Name of an anodyne *Malagma* deſcrib'd by *P. Ægineta, Lib. 7. Cap.* 18.

GALENUS.

Claudius Galenus was a Native of *Pergamus*, a City of *Aſia Minor*. The Time of his Birth may be eſtimated by a Circumſtance mention'd by himſelf, which is, that when he was thirty-eight Years of Age, he was call'd by *Marcus Aurelius* and *Lucius Verus*, then at *Aquileia*; and particularly by what he ſubjoins, which is, that he no ſooner arriv'd there, than he ſet out for *Rome* with theſe two Emperors, the latter of whom died on the Road a few Days after. If, therefore, we reckon thirty-eight Years backwards from the Death of *Lucius Verus*, which happen'd in the Year of *Chriſt* one hundred and ſixty-nine, we find that *Galen* muſt have been born in the Year one hundred and thirty-one, about the fifteenth Year of the Reign of *Adrian*. Beſides, it appears from his Writings, that he liv'd under the Emperors *Antoninus, Marcus Aurelius, Lucius Verus, Commodus*, and *Severus*.

Galen, in his younger Years, had the Advantage to be under the Inſpection of *Nicon* his Father, who was no Stranger to Philoſophy, Aſtronomy, Geometry, and Architecture. When he was ſomewhat farther advanced in Years, he ſtudied both the *Belles Lettres* and Philoſophy under the beſt Maſters. He was firſt initiated in the School of the *Stoics*: Thence he paſs'd into that of the *Academics*, and afterwards took his Turn in thoſe of the *Peripatetics* and *Epicureans*. The three firſt of theſe Sects he reliſh'd pretty much, and took from each of them what he thought beſt; but the *Epicurean* Notions were entirely rejected by him.

After having laid ſuch Foundations of Learning, influenc'd by a Dream of his Father's, he choſe Medicine as a Profeſſion when he was only ſeventeen Years of Age: Two Years after, he became Auditor to a Diſciple of *Athenæus*, at whom he was ſoon diſguſted; becauſe he was ſo far from reckoning Logic neceſſary to a Phyſician, that he accounted it a Glory to be ignorant of it. After this he had ſeveral Maſters, *Ælianus Meccius, Numeſianus, Pelops, Stratonicus, Satyrus, Pheſianus, Heraclianus*, and *Æſchiron*; ſome of whom were the Diſciples of one *Quintus*, the moſt celebrated Phyſician of his Time.

Galen, in his Youth, travel'd a great deal, both with a Deſign to improve from the Converſation and Precepts of the moſt learned Phyſicians, and to inform himſelf with reſpect to many Peculiarities relating to the Drugs of different Countries: He reſided for ſome Years at *Alexandria*, the Capital of *Egypt*, where all the Sciences then flouriſh'd: He travel'd into *Cilicia, Paleſtine, Crete*, and *Cyprus*. Among his other Voyages, he made two to the Iſle of *Lemnos*, in order to diſcover what the *Lemnian* Earth was: He alſo went to *Cæloſyria*, with a View to examine the Opobalſamum. When he was twenty-eight Years of Age, he return'd from *Alexandria* to *Pergamus*; and was ſo much a Maſter of his Art, that he had acquir'd a perfect Knowledge of the Wounds of the Nerves, and found out a ſucceſsful Method of treating them, before unknown. He try'd his Skill in this reſpect upon the Gladiators entruſted to his Care by the Pontiff of *Pergamus*; theſe he treated with ſuch Succeſs, that never any of them died of a Wound of the Nerves; a Circumſtance which proves, that *Galen* underſtood Surgery as well as Phyſic.

Four Years after his Return to *Pergamus*, he left it on account of a Sedition, and ſet out for *Rome*: Being now thirty-two Years of Age, he was inclin'd to fix in this great City; but, like moſt other great Geniuſes, became the common Butt of the Malice and Envy of his cotemporary Dunces. The Phyſicians of *Rome* hated him; and this Circumſtance oblig'd him to quit their City, a few Years after he had ſettled in it. Notwithſtanding his ſhort Stay among the *Romans*, his Merit had procur'd him not only the Acquaintance, but alſo the Veneration and Eſteem, of ſome of the moſt conſiderable of them; for he was intimate with *Eudemus*, a *Peripatetic* Philoſopher of great Reputation, whom he cur'd of a Fever contracted by the prepoſterous Uſe of the Theriaca, by means of that very Medicine; and, which is ſurpriſing, predicted the Symptom which would be firſt remov'd, and the preciſe Time in which *Eudemus* would be perfectly recover'd: He was alſo highly eſteem'd by *Sergius Paulus*, the Prætor, by *Barbarus*, Uncle to the Emperor *Lucius*; by *Severus*, then Conſul, and afterwards Emperor; and, by *Boethus*, a Man of conſular Dignity; before all of whom he had Occaſion to make Diſſections, and exhibit the Organs ſubſervient to Reſpiration, and the Modulation of the Voice. Happy was it for *Galen*, that he had *Romans* who were not blind to Merit for his Patrons; for he might have liv'd at a time when a little low Cunning, and diſhoneſt Artifice, would have been a more effectual Recommendation, than all the Knowledge in the World.

Galen's Penetration, his Skill in Medicine, and his Acceſs to the Great, were the Circumſtances which render'd him ſo odious to the *Roman* Phyſicians, that he was forc'd to quit *Rome*, after a four or five Years Stay in it, and to return to his native Country, being now thirty-ſeven Years of Age, ſo that he muſt not have been long at *Pergamus*, till he was call'd to *Aquileia* by *Marcus Aurelius* and *Lucius Verus*, with the former of whom he went to *Rome*; and the Emperor deſiring him to accompany him into *Germany*, he excus'd himſelf, by pretending that *Eſculapius*, for whom he had a great Veneration, becauſe he had cur'd him of an otherwiſe mortal Apoſtem, had warn'd him in a Dream not to depart from *Rome*. Here, then, he ſtay'd during the Abſence of the Emperor, and wrote ſeveral Books, among which was that excellent Performance *de Uſu Partium*. But, as the Hearts of Phyſicians, as well as of Courtiers, are full of Diffidence and Jealouſy, the wary *Galen* liv'd, for the moſt part, at a Country-ſeat, to which *Commodus* the Emperor's Son had retir'd, under the Inſpection of *Pitholaus*, who had Orders from the Emperor to conſult *Galen*, if the young Prince ſhould fall ill: Accordingly, *Galen* had an Opportunity of raiſing his Reputation, by curing him of a violent Fever. He, alſo, cur'd *Sextus*, another Son of the Emperor, and prognoſticated the Termination of his Diſeaſe in a Manner directly contrary to the Judgments of all the other Phyſicians conſulted.

'Tis not abſolutely certain how long *Galen* ſtaid at *Rome* this ſecond time, nor, perhaps, whether he ſtaid all his Life there, or return'd into *Aſia*. This Point is involv'd in ſo many Difficulties and Intricacies, that the Truth is hard to be diſcern'd; ſince ſome Authors, who have wrote the Life of *Galen*, affirm, that he return'd from *Rome* to *Pergamus*, when he was thirty-ſeven, or, at moſt, forty Years of Age, and that he never after quitted his native Country; whilſt others maintain, that he did not return home till extremely old. The Opinion of the former is inconſiſtent with the Facts already mention'd, and that of the latter ſeems more conſonant to Truth, tho' its Favourers advance no Proofs for its Support, any more than they who aſſert, that he dy'd in *Paleſtine*.

Suidas informs us, that *Galen* liv'd ſeventy Years. If it is true, that this Phyſician was born about the fifteenth Year of the Reign of *Adrian*, as we have ſuppos'd, he muſt have died, according to *Suidas*, in the ninth Year of the Reign of *Severus*, which was the firſt of the third Century, after the Birth of *Chriſt*. He muſt have liv'd longer, if his Life was protracted to the Reign of *Caracalla*, as *Tzetzes* would have it; but not ſo long as thoſe pretend, from whom *Cœlius Rhodiginus* has borrow'd his Aſſertion, that *Galen* liv'd an hundred and forty Years. This is palpably an Exaggeration, as well as the immediately ſubſequent Aſſertion, "That *Galen* arriv'd "at this advanc'd Age without ever having ſuffer'd the "Shock of a Diſtemper. The Reaſon aſſign'd for it is, that "this Phyſician had obſerv'd ſo ſtrict a Regimen, that he "had never eat or drank too much, or taſted any crude "Aliments; which not only procur'd him an uninterrupted "Series of Health; but, alſo, render'd his Breath ſo ſweet, "that he ſeem'd to breathe nothing but Balm and Aroma-"tics." *Galen*, 'tis true, informs us, that by living on Aliments which are eaſily and equally concocted, and uſing proper Exerciſe, he had found the happy means of preſerving an uninterrupted State of Health for many Years: Beſides, he tells us, that after he arriv'd at the twenty-eighth Year of his Age, as he was then Maſter of the Art of preſerving Health, and follow'd the ſtricteſt Rules of that Art, he had been exempted from all Diſeaſes, except an Ephemera, or Fever of one Day's Continuance, produc'd by too much Study or Fatigue: But he confeſſes, that he had before labour'd under ſeveral Diſorders, ſuch as the Apoſtem, of which *Æſculapius* cur'd him, by warning him in a Dream to open the Artery between the Thumb and fore Finger of the Right Hand; a Colic, of which he was cur'd by a Clyſter conſiſting of Oil, and a Decoction of Rue. He alſo informs us, that, before he was twenty-eight Years of Age, he was almoſt every Year afflicted with ſome Diſorder or other; but that afterwards, by abſtaining from Summer-fruits, and not eating Fruits promiſcuouſly, but only Figs and Raiſins, he was exempted from them.

Galen was highly and juſtly eſteem'd, not only by the Antients, but alſo by the Moderns. *Athenæus* his Contemporary not only teſtifies his Regard for him, by introducing him in his Feaſt of Philoſophers, as one of the Gueſts invited; but alſo mentions with Honour the great Number of his Works, and extols him for Eloquence and Perſpicuity. *Euſebius*, who liv'd about an hundred Years after him, in the laſt Chapter of the fifth Book of his Eccleſiaſtical Hiſtory, informs us, that the Veneration paid him amounted almoſt to religious Worſhip. *Trallian* calls him the divine *Galen*. *Oribaſius*, who was himſelf a Phyſician, teſtifies the Regard he bore him at once by the Extracts he has made from his Works, and the Encomiums he beſtows on him. *Aetius* and *Paulus Ægineta* were ſo fully convinc'd of his Merit as an Author, that they faithfully copied him in moſt things they wrote. Whatever is valuable in the Writings of *Avicenna*, *Averroes*, and the other *Arabian* Phyſicians, is borrow'd from the immortal *Galen*, on whom theſe Authors beſtow the higheſt Encomiums. It would be an endleſs Taſk to recount the Praiſes beſtow'd on *Galen* by the Moderns, that is, by thoſe who have wrote for a Century or two paſt: The incredible Number of Commentators on his Works, during this Time, is a Circumſtance ſufficiently expreſſive of the general Senſe of the Moderns with reſpect to the incomparable *Galen*. But, as the moſt perfect Characters are neither free from Faults in themſelves, nor Proof againſt the Caprice of others, ſo *Galen* not only had powerful Oppoſers in his own Time, but has, alſo, ever ſince, had a Croud of formidable Adverſaries. The Doctrines of *Hippocrates*, which he endeavour'd to re-eſtabliſh, did not in all Probability triumph over the Methodic and other Sects, as ſoon as *Galen* declar'd himſelf againſt them. The Methodic Sect, in particular, ſubſiſted for ſome Centuries after him; and was in ſo great Reputation as to furniſh Phyſicians for the Emperors.

That *Galen* had his Faults, is certain; for an intolerable Fund of Vanity, and, which is ſtill worſe, an unaccountable Daſh of Superſtition and Bigotry, are to be diſcover'd in numberleſs Paſſages of his Works; but, as it is inconſiſtent with Humanity and Good-nature, maliciouſly to dwell upon the Imperfections of a Character, eſpecially when a thouſand Beauties may be laid in the Balance againſt one Blemiſh, we ſhall finiſh this Life of *Galen*, by giving ſome Account of his Works.

The great Number, then, of his Works ſtill extant, beſides thoſe which are loſt, convince us, that it was an eaſy thing for him to write. *Suidas* informs us, that he wrote not only on Medicine and Philoſophy, but alſo on Geometry and Grammar. He is ſaid to have wrote above five hundred Books on Medicine alone; and about half as many on other Sciences. He has compos'd two Books, with no other View but to enumerate ſuch as he had wrote, to ſpecify the Time and Place in which ſome of them were compos'd, the Motive which induc'd him to write them, and the Order to be obſerv'd in reading them. We are inform'd by himſelf, that a Part of his Works was loſt during his own Life, by a Fire which happen'd in the Temple of *Peace* at *Rome*. But, without enumerating all the particular Treatiſes wrote by *Galen*, whether loſt, or ſtill extant, it is ſufficient for all the Purpoſes of the Reader to enumerate the ſeveral Editions made of his Works in a Body.

There are, then, two *Greek* Editions of *Galen*; one at *Venice* by *Aldus* and *Andreas Aſulanus*, publiſh'd in the Year 1525, in five Folio Volumes; another, and more correct Edition, tho' not without numberleſs Faults, was publiſh'd at *Baſil*, by *Andreas Cratandrus*, *Johannes Hervagius*, and *Johannes Bebelius*, in the Year 1538, in five Folio Volumes.

There are various *Latin* Editions, tranſlated by different Hands; one, for Inſtance, at *Lyons*, by *Simon Colinæus*, in the Year 1536, in Folio; and the ſame was publiſh'd, much enlarg'd, and far more correct, by *Joh. Frellonius*, in the Year 1554, Folio. Another Edition is publiſh'd at *Baſil*, in 1541, by *Joh. Frobenius*, and, in 1549, by the ſame *Frobenius*, in four Volumes; and in the Year 1562, with a Preface of *Conradus Geſnerus*, in which he writes with a great deal of Judgment concerning *Galen*, his Writings, and the ſeveral Tranſlators of them. There is another publiſh'd at *Venice*, by the *Juntæ*, who have given ten Editions of *Galen*, the firſt in Octavo, in the Year 1541; and all the others in Folio, in ſome ſubſequent Years: The beſt and fulleſt of all theſe are the ninth and tenth, which are exactly the ſame.

We know of no *Greek* and *Latin* Edition of *Galen*, hitherto publiſh'd, but one at *Paris*, in the Year 1639, under the Inſpection of *Renatus Charterius*, in thirteen Volumes, Folio: Which elegant Work comprehends not only the Works of *Galen*, but alſo all thoſe of *Hippocrates*, and ſome other Phyſicians, together with a correct Tranſlation, by comparing the Text with other Editions and Manuſcripts.

GALEOBDULON. A Name in *Oribaſius* and *Dieſcorides*, for the GALEOPSIS.

GALEONYMUS. A Fiſh, the ſame as the GALEUS; which ſee.

GALEOPSIS.

The Characters are;

The Calyx is quinquefid, and Funnel-ſhaped; the upper Lip, or Galea, is entirely hollow; the lower Lip, or Beard, trifid; the middle Segment being the greateſt.

Boerhaave mentions fourteen Species of this Plant, none of which have any medicinal Virtues particularly attributed to them, except the four following.

1. Galeopſis; procerior; fœtida; ſpicata, *Tourn. Inſt.* 185. *Elem. Bot.* 154. *Boerh. Ind. A.* 162. *Rupp. Flor. Jen.* 182. *Dill. Cat. Giſſ.* 97. *Galeopſis*, Offic. *Galeopſis vera*, Ger. Emac. 704. Mer. Pin. 44. *Galeopſis legitima Dioſcoridis*, Park. Theat. 908. Raii Hiſt. 1. 548. Synop. 3. 237. *Galeopſis Dioſcoridis*, Merc. Bot. 1. 37. Phyt. Brit. 45. *Galeopſis ſive Urtica iners magna fœtidiſſima*, J. B. 3. 853. *Lamium maximum ſylvaticum fœtidum*, C. B. Pin. 134. *Stachys ſylvatica*, Rivin. Irr. Buxb. 312. *Stachys fœtida ſepium flagellis reptatricibus*, Hiſt. Oxon. 3. 382. HEDGE-NETTLE.

The *Galeopſis* ſmells of Bitumen, or fetid Oil: It has an herby Taſte, a little ſaltiſh, aſtringent, and does not ſtain the blue Paper; which makes us conjecture, that its Salt participates very much of the natural Salt of the Earth, which in this Plant is involved in a great deal of Sulphur, and terreſtrial Parts.

It is vulnerary, and very ſweetening: An Oil made of it by Infuſion is excellent for Burns, and for Wounds of the tendinous Parts. In the Country, they uſe ſucceſsfully the Infuſion of its Leaves and Flowers for a nephritic Colic, ſcrophulous Tumors, and the Pleuriſy. An Extract may be prepared of it to ſerve during the Winter. *Martyn's Tournefort.*

It has the Reputation of diſcuſſing hard Tumors, Cancers, Pani, and Parotides; and is recommended againſt Putrefactions, Gangrenes, and ſpreading Ulcers. *Boerhaave* eſteems it excellent in hyſteric Fits.

2. Galeopſis; paluſtris; folio Betonicæ; flore variegato, *Tourn. Inſt.* 185. *Dill. Cat. Giſſ.* 109. *Boerh. Ind. A.* 162. *Rupp. Flor. Jen.* 183. *Panax Coloni*, Offic. Ger. 858. It is commonly found in Fiſh-ponds, near great Mens Houſes: The Parts us'd in Medicine are, the Craw, the Feathers, and their Aſhes.

The Craw is recommended in the Aſthma; the Smoke of the Feathers is ſuppos'd to be good for hyſteric Fits, and their Aſhes dry up old Ulcers and Fiſtulas. *Dale*.

GALLINA DOMESTICA.

Gallus & Gallina, Offic. Schrod. 5. 317. THE COCK AND HEN.

The Parts in Uſe are, the whole Bird, the Brain, the Coats of the Ventricle or Craw, the Teſticles, the Gall, the Fat, the Throat, the Dung, and the Eggs.

An Hen ſlit, and apply'd to the Head while the Blood is hot, is of good Effect in the Phrenſy, Cephalalgia, and other Diſorders of that Part: It is alſo ſaid to cure the Bites of venomous Animals, being us'd in the ſame Manner. Laid on a Carbuncle, it draws out the Poiſon; and, what deſerves Obſervation, ſtops an Hæmorrhage in recent Wounds, being apply'd thereto: The living Hen, ſtript of its Feathers about the Anus, and apply'd, extracts the Poiſon of Buboes. The Brain is of an incraſſating Quality, and ſtops Fluxes. The inner Coat of the Ventricle, extracted, dry'd, and pulveriz'd, has a Virtue of binding and ſtrengthening the Stomach, and, by that means, of reſtraining Vomiting and Fluxes of the Belly; and is, alſo, a Lithontriptic. The Teſticles of the Cock are ſaid to have a wonderful Effect in reſtoring loſt Strength in Diſeaſes, in ſupplying prolific Semen, and Venereal Vigour. The Gall deterges Spots in the Skin, being rub'd thereon, and is good for the Eyes. The Fat of Hens and Capons heats, moiſtens, mollifies, and is lenitive, and of a middle Nature between the Fats of a Swine and a Gooſe, correcting their Acrimony: It is of Uſe in Fiſſures of the Lips, Pains of the Ears, and Puſtules of the Eyes. The Throat of a Cock burnt, and not conſum'd, but ſcorch'd and dry'd, and given at Night before Supper, cures involuntary nocturnal Diſcharges of Urine, by a ſpecific Property. *Solenand. S.* 4. *Conſ.* 11. The Dung is ſaid to perform all the ſame Effects as Pigeons Dung, tho' in an inferior Degree; but it is particularly uſeful in Pains of the Colon and Uterus; it is, alſo, efficacious in the Jaundice, Stone, and Suppreſſion of Urine; the white Part of the Dung is obſerv'd to be beſt. The Aſhes dry up Achors of the Head, and other running Sores, being ſprinkled thereon: The yellow Part of the Dung conſolidates an Exulceration of the Bladder. The Eggs afford, for medicinal Uſes, the Shells, Membranes, Albumen, and Yolk: The Shells are lithontriptic, and are endu'd with the Virtue of inciding a tartareous Mucilage: The Membranes have a diuretic Quality, us'd either inwardly or outwardly, and are apply'd to the Prepuce of Infants: The Albumen is refrigerating, aſtringent, and agglutinant, and is of frequent Uſe in Redneſs of the Eyes, in Conglutination of Wounds (with the common Bole). In Fractures, and the like Caſes, it is, alſo, of Service for *Anaſtellmas*. *Hippocrates* exhibited three or four Whites of Eggs to Perſons in a Fever, as a Refrigerant and

Expellent;

Expellent: The Yolk of an Egg has an anodyne, maturating, digeſting, and relaxing Virtue; for which Reaſons, it is a very frequent Ingredient in Clyſters, and, mixt with a little Salt, is uſually apply'd, in the Shell of a Walnut, to the Navel of Infants, to provoke Excretion of the Fæces. *Schrod. Dale.*

See ALIMENTA, CAPO, ALBUMEN, and FIBRA.

GALLINAGINIS CAPUT. A Caruncle or Eminence in the Urethra, near which the Semen is excreted from the ſeminal Veſicles into the Urethra. Its Uſe is to prevent the Semen burſting out at one Side, from daſhing againſt the Oriſice of the other Side. It is, alſo, call'd, GALLI GALLINACEI CAPUT, the Names being taken from the Similitude.

GALLINAGO, Offic. *Scolopax*, Charlt. Exer. 112. Raii Ornith. 281. *Scolopax, Gallinago maxima.* Ejuſd. Synop. A. 104. Will. Ornith. 213. *Becaſſine*, Bellon. des Oyſe 116. *Scolopax ſive Perdix ruſtica*, Aldrov. Ornith. 3. 471. Jonſ. de Avib. 110. *Ruſticula, vel Perdix Ruſtica major*, Geſn. de Avib. 444. *Ruſticola major, Scolopax, Gallinago*, Mer. Pin. 173. THE WOODCOCK.

The Aſhes of a Woodcock, burnt, are ſaid to be lithontriptic. The Woodcock, conſider'd as Food, is ſaid to be nouriſhing, ſtrengthening, and reſtorative, but not quite ſo eaſy of Digeſtion, as ſome other Birds, whoſe Fleſh is white. The Salts of this Bird are highly exalted by their habitual Exerciſe, which renders it a very proper Aliment, where there is a Redundance of Acid.

The GALLINAGO MINOR is the Snipe or Snite, which agrees with the Woodcock in Virtues, except that it is more eaſily digeſted, and eſteem'd more delicate to the Taſte.

GALLIVASSA, in the *Indian* Language *Tropillo*, is a kind of *Mexican* Crow, almoſt as large as an Eagle. It contains much volatile Salt and Oil; and its Fleſh eaten is thought to be good for the Small-pox. *Lemery des Drogues.*

GALLINULA. See GALLINA AQUATICA.

GALLITRICHO AFFINIS. A Name for the *Lamium*; *maximum*; *fœtens*; *purpureum*; *galea hormini.*

GALLITRICHUM. A Name given to ſeveral Species of SCLAREA; which ſee.

GALLITRICHUM, FOLIO ROTUNDIORE. A Name for the *Meliſſa*; *peregrina*; *caule brevi*; *plantaginis folio.*

GALLIUM.

The Characters are;

It reſembles the *Mollugo* in every thing; only its Leaves are even ſofter than thoſe of that Herb.

Boerhaave mentions five Species of this Plant; which are,

1. Gallium; luteum, *Ger.* 967. *Emac.* 1126. *Park. Theat.* 564. *C. B. Pin.* 335. *Raii Hiſt.* 1. 442. *Synop.* 3. 224. *Dill. Cat. Giſſ.* 82. *Hiſt. Oxon.* 3. 327. *Tourn. Inſt.* 115. *Elem. Bot.* 94. *Boerh. Ind. A.* 148. *Rupp. Flor. Jen.* 2. *Mer. Pin.* 44. *Merc. Bot.* 1. 37. *Phyt. Brit.* 45. *Buxb. Gallium*, Offic. Chab. 548. *Gallion verum*, J. B. 3. 70. CHEESE-RENING. *Dale.*

This Plant, from a long ſlender ſpreading Root, ſends forth many ſquare weak Stalks, a Foot or two high, beſet at the Joints with ſlender narrow Leaves, about an Inch long, ſet in a Circle; the Stalks of a dark-green Colour. On the Tops of the Stalks, as well as on the ſmaller Branches, which come out of the Sides, grow thick Spikes of ſmall, yellow, monopetalous Flowers, divided into four Segments, of a pleaſant Smell; each of which is ſucceeded by two ſmall globular black Seeds: It grows on Banks, and dry barren Places, flowering in *June* and *July*. The whole Herb is us'd.

This Plant is drying and incraſſating, good in ſtopping all kinds of Fluxes and Hæmorrhages, and for the Cure of Wounds: Some commend a Decoction of it for the Gout; and a Bath made of it is refreſhing to waſh the Feet of Perſons tir'd with over-walking. In the Northern Countries they uſe this Herb for the making their Cheeſes, inſtead of Rennet, whence it is call'd Cheeſe-rennet; the Flowers containing an Acidity, which may be got by Diſtillation. This is a Plant but ſeldom us'd in the Shops.

This Plant is vulnerary and deterſive; it is us'd in *Catalonia* for the Epilepſy: The Syrup made with the Juice of its Flowers is very aperitive and emmenagogic. *Tabernæmontanus* ſays, that the Decoction of it is excellent for the dry Scab of young Children, provided you bathe them often with it. *Martyn's Tournefort.*

An Infuſion by way of Tea is recommended for the Gout and Epilepſy.

2. Gallium; ſaxatile; glauco folio. *Bocc. Muſ. Part.* 2. *Tab.* 116. *F.* 115. LADIES-BED-STRAW *of the Rocks, with a glaucous Leaf.*

3. Gallium; rubrum. *C. B. P.* 325. RED LADIES-BED-STRAW.

4. Gallium; nigropurpureum; montanum; tenuifolium. *Col.* 1. 298.

5. Gallium; album; linifolium. *Barr. Obſ.* 99.

Boerh. Ind. alt. Plant. Vol. 1. *p.* 149.

GALLOPAVO, the Peacock. See PAVO.

GALLOS, γάλλος, an Eunuch; alſo the Name of a Dropax in *P. Ægineta, Lib.* 7. *Cap.* 19.

GALLUS. See GALLINA.

GALREDA. A kind of Jelly made of the cartilaginous Parts of Animals boil'd. In *Paracelſus, Lib.* 2. *de Morb. Metalliſoſſer.* it ſignifies an excrementitious Mouldineſs. *Caſtellus.*

GALTIHENUM, GALITHENUM. A Term us'd by *Paracelſus*, obſcure enough: He would ſeem, however, to have us underſtand by it the occult Virtue, in the Cure of the Epilepſy, which ought to be induc'd in the Eſſence of the MUMIA. See MUMIA.

GAMAHEU, *Gamahæi, Gamathæi*, are Stones on which celeſtial Virtues, and ſuperior Conſtellations, are impreſs'd in wonderful Characters, Images, and Figures, as we ſometimes obſerve, wrought by the Hand of Nature, in thoſe which are digged out of Mountains, or found by the Banks of Waters. *Rulandus. Johnſon. Gamaheu* has an aſtral Force in moving the Spirits, and the Principles of the Microcoſm. *Paracelſus* aſcribes very much to thoſe *Gamahæan* Images and Characteriſms, as being effected by the Influence of Heaven, as appears every-where in his Works; whence he calls a fourth Species of the Magic Art *Gamaheos*, which is otherwiſe nam'd *Taliſmanica. Gamaheum Conjugium* was an Expreſſion us'd by the *Magi* to ſignify the Conjunction of the celeſtial Virtues and Properties with the Elementary. *Caſtellus.*

GAMANDRA. A Name for the GUTTA GAMBA.

GAMATHA. See GAMAHEU.

GAMBOGIUM. See GUTTA GAMBA.

GAMBOIDEA, (*Gutta*). The ſame as GUTTA GAMBA.

GAMMAROS. See CANCER.

GAMMATA (*Ferramenta*). Chirurgical Inſtruments for cauterizing in an *Hernia aqueſa*, mention'd by *P. Ægineta, Lib.* 6. *Cap.* 62. and ſo call'd becauſe they were made after the Figure of the *Greek* Letter Gamma (γ).

GAMMAUT. So the *Italians* call a ſort of crooked Knife, for opening Abſceſſes, blunt on the gibbous or back Part, and ſharp in the hollow. *Scultet. Armament.*

GAMPHELE. The ſame as *Gena*, or *Maxilla*, the Cheek; for which ſee the Article CAPUT.

GAMPSONYX, γαμψώνυξ, from γαμψὸς, crooked, or bent, and ὄνυξ, a Claw, or Talon, having crooked Claws. An Epithet of Beaſts of Prey, who are obſerv'd to be provided with ſuch Claws.

GANGAMON. A Name for the *Omentum*, given it on account of the various Contexture of Veins and Arteries with which it is interſpers'd, and made, as it is fancy'd, to reſemble a Fiſhing-net, which the *Greeks* call γάγγαμον, *Gangamon.* Some call, by this Name, that kind of *Plexus Nervorum*, or Contexture of Nerves, which is obſerv'd about the Navel. *Gorræus.*

GANGILA. A Name in *Ray* for the *Seſamum Africanum.* See SESAMUM.

GANGITIS. The ſame as GAGATES. *Gorræus.*

GANGLION, γάγγλιον, is a nodous and renitent Induration of a Nerve, of a natural Colour, void of Pain, proceeding from a Concretion of the nervous Juice, thro' ſome Diſturbance of the Order of the Fibres from an external Cauſe, as a Stroke, or too great a Compreſſion of the Nerves. *Galen, in Def. Med. & Com.* 1. *de Artic.* Or it is deſcrib'd to be a preternatural Tumor, not deeply ſeated, but juſt under the Skin, unequal, and, on Compreſſion, receding ſideways. It affects many Parts of the Body. There often happens ſuch a Concretion in the Hands and Feet, as *Actuarius* ſays: And *Paulus* tells us, that a *Ganglion* may ariſe on the Ancle-bone, the Carpus, and the Joints. *Celſus* ſays, that *Ganglia* may affect the Head, and calls them *Tubercula*, "Tubercles." And *Galen, Com.* 2. *Lib. de Artic.* writes, that they are Concretions about the Cartilages and Nerves, form'd of their nutritious Juices; and that they ariſe from a glutinous and mucous Humour. *Hippocrates, Lib. de Artic.* ſays, it is cuſtomary to open τὰ γαγγλιώδεα, "thoſe ganglious Tubercles," which contain a looſe and mucous Fleſh, expecting to find an Humour in them, but are deceiv'd, tho' without any bad Conſequence to the Patient.

The Moderns, by this Word, generally mean no more than any hard, and, for the moſt part, moveable Tumor, form'd both on the internal and external Surface of the Carpus, moſt frequently near the Tendons or Ligaments of the Muſcles, but without any conſiderable Pain or Uneaſineſs to the Patient. The *Germans* call this Diſorder *Oberbein*, which correſponds to the Word *Hyperoſtoſis*; either becauſe this Species of Tumor generally ariſes upon the Bones, or becauſe it ſometimes aſſumes, in a great meaſure, the Hardneſs of a Bone. But though a Ganglion bears ſo near a Reſemblance to encyſted Tumors, that *Celſus* did not heſitate to refer the former to the latter; yet they differ in this, that, what we at preſent call a Ganglion, ſcarcely appears any-where but on the Wriſts, or Hands; whereas

whereas encyſted Tumors are form'd in any Parts of the Body whatever. Some of the Moderns, however, continue to give the Name of *Ganglion* to hard and moveable Tumors on the Bones of the Head in general, but more eſpecially of the Forehead. See a Diſſertation *de Ganglio*, publiſh'd at *Alterf*, in the Year 1717.

As for the Cauſe of a Ganglion, this Species of Tumor ſeems generally to ariſe, as *Sennertus* ſays, in the fifth Book of his *Praxis Medica*, from thick and inſpiſſated Humours, which, in conſequence of a Blow, a Fall, a Contuſion, a Diſtortion, a Luxation, or any other external Violence done to the Tendons or Ligaments of the Hands, are collected between the Fibres and the Coats, and gradually ſo increas'd as to form a Tumor as large as a Filbert, a Nutmeg, or Walnut, and ſometimes a Pigeon's Egg. *Blancard*, in his *Collect. Med. Phyſ.* informs us, that the celebrated *Ruyſch* once found in a Carcaſe a Ganglion, which was pellucid like the cryſtalline Humour of the Eye. One of the ſame Kind, as large as a Nutmeg, and form'd upon the external Part of the Carpus, in a young Woman, I ſaw extirpated by my own Son, at *Helmſtadt*, in the Year 1736. *Cyprianus*, in his Treatiſe *de Fœtu Tuba Fallopiana extracto*, informs us, that Ganglions are form'd by a certain Lymph, not unlike the Whites of Eggs, ſecreted within the Vaginæ of the Tendons, but never coming to a Suppuration. Inſtances of this I myſelf have ſeen.

As Ganglions differ very conſiderably with reſpect to Bulk, ſo they generally vary no leſs manifeſtly with reſpect to their Number. For the moſt part, one Ganglion is only form'd; but ſometimes a great many appear, and that in both Hands: Of this we have a memorable Inſtance in the *Miſcellanea Acad. Nat. Curioſ. Decur.* 1. *An.* 3. *Obſ.* 326. As for the Figure of Ganglions, ſome of them are globular, while others reſemble an Acorn, or a ſmall Egg. Some, again, are ſmooth and plain, whilſt others have rough and unequal Surfaces; ſome are greatly, and others little, or not at all, prominent; ſome, eſpecially when recent, are eaſily reſolv'd, whereas others, eſpecially of the inveterate Kind, are not to be cur'd without the utmoſt Difficulty.

In recent Ganglions, the inſpiſſated Matter is generally ſucceſsfully digeſted by careful Frictions of the prominent Part, rubbing it ſufficiently every Morning with *faſting Spittle*, and applying over it a Plate of Lead, to be wore for ſome Weeks ſucceſſively, and ſecur'd by proper Bandages. Some think the Lead poſſeſs'd of a ſtill more diſcutient Quality, if it is previouſly rub'd with Mercury. Others, more ſuperſtitious than wiſe, attribute a peculiar, but unaccountable Virtue to thoſe Balls with which wild Beaſts, eſpecially Deer, have been kill'd. Others, with *Foreſtus*, in his *Obſ. Chirurg. Lib.* 3. *Cap.* 9. order the Ganglion to be cover'd with the *Emplaſtrum de Ammoniaco*; and others, with the *Emplaſtrum de Ranis cum Mercurio*; whilſt others, as the moſt effectual means of Relief, order the Part affected to be carefully and frequently rub'd with the Oleum Petræ, the Oleum Philoſophorum, or the Oil of Soap. Sometimes Ganglions, eſpecially when recent, or treated for ſome time with the above-mention'd Digeſtives, ſuddenly diſappear, upon the Surgeon's preſſing them with all his Strength with his Thumb: See *Aetius*, *Tetrabibl.* 4. *Serm.* 3. *Cap.* 9. and *Add. Muyſius*, in his *Prax. Chirurg. Dec.* 2. *Obſ.* 8. *Meekren*, in his *Obſervat. Chirurg. Cap.* 44. informs us, that a Ganglion may be equally happily and expeditiouſly cur'd by laying the Patient's Hand on a Table, and ſtrongly ſtriking the Tumor ſeveral times with the Fiſt, as in *Tab.* LVII. *Fig.* 1. This ſeems to be the Reaſon why *Muyſius*, in the Book laſt quoted, orders inveterate Ganglions, which can neither be digeſted, nor diſcuſs'd by Preſſure, to be diſpers'd by ſtriking them with a Club or Mallet of Wood, arm'd with Lead; afterwards applying the *Emplaſtrum de Ranis cum Mercurio* to the Part affected, in order to prevent the Return of the Diſorder. *Helvetius* is, alſo, ſaid to have us'd a kind of wooden Mallet for this Purpoſe. The Reaſon why a Cure is brought about in this Manner, ſeems principally to be this, that the Membrane or Bag of the Tubercle being ruptur'd by the Strokes, the Matter, collected and inſpiſſated within it, is, by the Blows, expel'd, and afterwards gradually diſſipated by Frictions, and digeſtive Medicines. But in ſtriking the Ganglion, we ought to be highly careful not to wound other Parts of the Hand, or ſhatter the Bones; by which means the Patient might be expos'd to other terrible Misfortunes. When theſe Meaſures prove ineffectual, or when, by reaſon of the dubious Event, we do not care to uſe this Method, the Ganglion is, like an encyſted Tumor, to be cut out by the Knife, or extirpated by proper Corroſives. That, in this Caſe, the Knife was ſucceſsfully us'd by *Solingen*, is ſufficiently obvious from the fourteenth Chapter of the fouth Book of his *Chirurgia:* And I myſelf have frequently extirpated Ganglions in this Manner. But, in performing the Operation, we ought to be highly careful not to injure the adjacent Tendons, or Ligaments. As for applying to the Part affected the Hand of a dead Man, or that of a Seventh-ſon, muttering ſome particular Words, in the Night-time, when the Moon is in her Decreaſe, it is a Practice which beſpeaks ſo much Superſtition, and Want of Reaſon, though recommended not only by old Women, but alſo by ſome Phyſicians, that every Perſon, in his Senſes, muſt neceſſarily deſpiſe it: The Reader may, however, for the ſake of Curioſity, conſult *Clucius*, in his *Obſervationes*, where Methods of this Nature are recommended for the Cure of a Ganglion. *Hriſter Chir.*

Beſides the above-explain'd Significations of *Ganglion*, it imports a Knot, frequently found in the Courſe of the Nerves, which is not morbid. For, where-ever any Nerve ſends out a Branch, or receives one from another, or where two Nerves join together, there is generally a *Ganglion* or *Plexus*, either leſs or more, as may be ſeen at the Beginning of all the Nerves of the Medulla Spinalis, and in many other Places of the Body.

GANGRÆNA. A Gangrene. See INFLAMMATIO.

A Gangrene is a Diſorder of any ſoft Part of the Body, tending to a Mortification, in conſequence of the Influx of the vital Humours into the Arteries, and their Return through the Veins being prevented; whereas a Sphacelus deſtroys all the vital Action of the Part affected, whilſt Life remains in the other Parts.

Galen, in the eleventh Chapter of his ſecond Book *de Method. Medend. ad Glaucum*, gives a very accurate Definition of a Gangrene, in the following Words: "A Gangrene, ſays he, is a Mortification not already form'd, but "which, in conſequence of the Degree of Inflammation, will "afterwards be form'd." This Paſſage he elſewhere paraphraſes, in the following Words: "A Gangrene is ſaid to be "induc'd, when any Part of the Body, not yet mortified, is "nevertheleſs ſo inflam'd, that it muſt neceſſarily become ſo." *Paulus Ægineta*, in the nineteenth Chapter of his fourth Book, in his uſual Manner, gives the ſame Definition from *Galen*; but premiſes, that an Inflammation, neither reſolv'd [διαφυγμένη] nor converted into Pus, for the moſt part degenerates either into a Gangrene, or a Sphacelus. A Gangrene, therefore, imports a beginning Mortification of any Part. A legitimate Gangrene is eaſily diſtinguiſh'd from an Inflammation, by the Signs hereafter enumerated. But when a violent Inflammation will be chang'd into a Gangrene, or when a Gangrene begins to be form'd by an Inflammation, is a Point not eaſily determin'd by this Definition; for, at the very Inſtant, that a violent Inflammation of a ſoft Part tends to a Mortification, the entire Life of the Part is not utterly deſtroy'd by a Gangrene. *Galen*, in *Commen.* 4. *in Hippocrat. de Artic.* has taken notice of this Circumſtance; for, after he has obſerv'd, that a Gangrene is a Diſorder of a middle Nature betwixt a Sphacelus and a violent Inflammation; and that it is much more violent than an Inflammation, as it is more mild than a Sphacelus, he adds the following Words: "We ſometimes ſo confound and abuſe the Names of Diſeaſes "which have a Dependence on each other, as to apply the "Name of one to another, though it does not totally come up "to its genuine Nature: Thus we ſometimes call a violent "Inflammation, when it no longer retains its Colour and Pain, "a Gangrene, though it is not really ſuch, but will, if neg-"lected, ſoon become ſuch."

Celſus ſeems to have us'd the Words *Cancer* and *Gangrene* promiſcuouſly; for, in the twenty-ſixth Chapter of his fifth Book, he uſes the following Words: "Sometimes a "Cancer is form'd either by a violent Inflammation, im-"moderate Heat, exceſſive Cold, too tight Bandage of a "Wound, Old-age, or a bad Habit of Body." Then he gives ſuch a Deſcription of a Cancer as perfectly agrees with a Gangrene and Sphacelus; for *Celſus* made a Diſtinction between a Cancer and a Carcinoma; and, at laſt, ſubjoins the following Words: "Sometimes, what the *Greeks* call γαγγραίνη, is "form'd; the former, that is, a Cancer, happens in any Part "of the Body, whereas the latter, that is, a Gangrene, happens "in the prominent Parts of the Body, as betwixt the Nails and "the Arm-pits, or betwixt the Toes and the Groin; and gene-"rally in old Perſons, or thoſe of a bad Habit of Body." Then he goes on to deſcribe all the Signs of a Gangrene, which ſpreads, and, at laſt, terminates in a Sphacelus. Hence we have juſt Reaſon to conclude, that what, in the Extremities of the Body, *Celſus* call'd a Gangrene, he, in other Parts, call'd a Cancer. However, in the twenty-ſixth Chapter of his fifth Book, when deſcribing the Meaſures to be taken for the Cure of a Gangrene, he gives the following Cautions: "Sometimes all the "Means of Relief, prove ineffectual, and the Cancer ſpreads, "notwithſtanding their Uſe. In this Caſe the deplorable, "though only remaining, Method of Relief, is to amputate "the Member, which gradually becomes mortified, that, "by this Means, the reſt of the Body may be ſav'd." But it is ſufficiently obvious, that *Celſus*, in this Paſſage, means the Amputation of the Extremities, when corrupted by a *Sphacelus*, which he calls a *Cancer*.

A Gangrene is ſubſequent to an Inflammation, when the Obſtruction is ſo great, that it cannot, by any means, be reſolv'd; and ſo diffuſive, as to poſſeſs all the Veſſels of the affected Part; or when, though, at the Beginning of the Diſorder, ſome Veſſels were free from the Obſtruction, they are, nevertheleſs, ſo compreſs'd by the adjacent, obſtructed, and tumid Veſſels, as to ſtop all Circulation of the Humours through the Arteries, and, conſequently, prevent their Return through the Veins, which are only Continuations of them. The ſame Misfortune will happen, if, by the Impetus and Velocity of the Circulation, or by the Acrimony of the circulating Humours, or a Concurrence of both theſe Cauſes, the Veſſels ſhould be ſuddenly ruptur'd in the inflam'd Part, and the diſcharg'd Humours become putrefy'd. In both Caſes, the Influx of the arterial Fluids into the Part is prevented, and their Return through the Veins conſequently cut off; for which Reaſon, the whole Part ſo affected has no longer any vital Communication with the reſt of the Body, and will, therefore, by a ſpontaneous Principle of Change, common to all the Parts of Animals, tend to Putrefaction. In this Caſe, therefore, a quite different Method of Cure is requir'd from that proper in a Suppuration, in which there is only a gentle Separation of the Ends of the obſtructed Veſſels, together with an Immeability of the obſtructing Matter, and ſome Degree of Depravation in the Fluids, but ſuch as may be overcome by Nature; whereas Putrefaction ſhews, that Nature is baffled in her Efforts, as *Galen* juſtly obſerves: For, ſays he, if the natural Heat recedes much from its due Temperature, then the Blood becomes putrid, as in a Carcaſe; but, when this Heat retains ſome Degree of Force, a kind of mix'd Change is produc'd, partly by a preternatural, and partly by a natural, Cauſe. The preternatural Cauſe produces Putrefaction; and the natural Cauſe, Concoction. In Suppuration, therefore, there is a Concoction, ſince the Principles of Life remain in the Part; and this is a natural Cauſe: Whereas, in a Gangrene, Putrefaction alone, which is a preternatural Cauſe, operates. So long as the ſoft Parts alone are thus mortify'd, the Diſorder is call'd a Gangrene, and is principally ſeated in the Membrana Adipoſa, as will afterwards appear; but, when the Muſcles, Tendons, Ligaments, Perioſteum, and Bones, are thoroughly mortify'd, the Diſorder is call'd a *Sphacelus*. But, becauſe, in a Carcaſe, every Degree of vital Action is deſtroy'd, as well in the Whole, as in every particular Part, 'tis therefore mention'd in the Definition, that a Sphacelus ſuppoſes a perfect Mortification in the Part affected, whilſt a Principle of Life remains in the reſt of the Body. But ſince, in a Gangrene, there is generally a remaining Heat, ſupply'd by the neighbouring and ſubjacent Parts, as yet alive; ſince a Gangrene generally ſucceeds a violent Inflammation, which burns, as it were, the Parts affected; and ſince, as we obſerv'd before, a violent Inflammation is ſometimes call'd a Gangrene, when it is juſt about to degenerate into it; Surgeons, for theſe Reaſons, generally call a Gangrene *Ignis Calidus*, or a hot Fire; and a Sphacelus, in which all the vital Action ceaſes, *Ignis Frigidus*, or a cold Fire; becauſe the Part thus affected ſoon becomes as cold as the ſurrounding Air; for the Cauſe exciting Heat, which is the Motion of the Humours through the Veſſels, is entirely wanting in a ſphacelated Part.

But the Word *Sphacelus* does not, among the antient Phyſicians, ſeem to have denoted a perfect Mortification of the Part affected. Thus *Hippocrates*, in the ſeventh Chapter of his firſt Book *de Morbis*, deſcribes a Sphacelus of the Brain, but does not pronounce it abſolutely mortal; and only adds, that few eſcape from it: And ſo far was he from thinking it irretrievably fatal, that, in the very next Chapter, he lays down the Meaſures to be taken for its Cure. But 'tis ſufficiently obvious, that, in this Part, a Sphacelus, properly ſo call'd, muſt neceſſarily prove ſpeedily mortal, if, by the Word *Sphacelus*, an abſolute Mortification of ſo noble an Organ as the Brain is meant. *Galen*, in the eighth Chapter of his ſecond Book *de Locis affectis*, when conſidering a Paſſage of *Archigenes*, an antient Phyſician, in which the Word σφακελῶδες occurs, obſerves, that the Meaning of this Word is highly ambiguous; ſince ſome meant no more by it than a violent Pain; others, ſuch an exceſſive Inflammation as endanger'd the Corruption of the Part affected; and others, the actual Corruption of it. There are ſeveral other Paſſages of *Hippocrates* and *Galen*, which ſhew, that various Ideas are affix'd to this Word enumerated by *Gorræus* and *Foeſius*; but thoſe already mention'd are ſufficient for our Purpoſe.

A Gangrene, therefore, generally affects only the Membrana Adipoſa; whereas a Sphacelus affects all the Parts, as far as the Bone. A Gangrene is previous to a Sphacelus, which generally ſucceeds it, unleſs it derives its Origin from the Corruption of the Bone, the Marrow, or the Perioſteum. But a ſingular kind of Gangrene, which is without Fever, Inflammation, or Loſs of the natural Colour, may be produc'd in the Parts, inferior to the ſpinal Marrow, by a Contuſion of that Part.

'Tis ſhewn, under the Article INFLAMMATIO, that an Inflammation happens no-where more frequently than in the Membrana Adipoſa: But, ſince a Gangrene almoſt always follows a violent Inflammation, 'tis ſufficiently obvious, that the former muſt have the ſame Seat with the latter. This is carefully to be adverted to; becauſe Surgeons ſometimes think a Sphacelus preſent, where there is only a Gangrene; when, for Inſtance, a Phlegmon ariſes on the Back of the Hand, where there is ſcarcely any Fat, the Membrana Celluloſa often becomes incredibly tumid; and, when ſuch a Phlegmon is ſucceeded by a Gangrene, and the Part found mortify'd conſiderably deep, they think all the Parts corrupted by a Sphacelus; whilſt, at the ſame time, under the tumid Membrana Celluloſa, the Tendons and Muſcles are entire, as afterwards appears upon a Separation of the corrupted Parts. If, therefore, in ſo lean a Part, ſo large a Tumor may be produc'd by Inflammation, ſtill larger Tumors muſt be produc'd, by the ſame means, in the Buttocks, Thighs, Legs, and Arms, where there is naturally ſo large a Quantity of Fat laid over the greater Muſcles, in order to facilitate their Motions, by a pinguious and lubricating Oil.

Though frequently the Parts are for a conſiderable Depth corrupted by a Gangrene, yet numberleſs Caſes in Surgery convince us, that the Whole of the Tumor is only lodg'd in the Membrana Adipoſa, which, after its Separation from the ſubjacent live Parts, may be extracted in large Pieces. Thus Members of the Body are ſometimes preſerv'd, when their Extirpation ſeem'd to be the only remaining Means of Relief. But a Sphacelus mortifies not only the Membrana Adipoſa, but alſo the Muſcles, Tendons, Ligaments, Perioſteum, and Bones.

If we conſider, that the highly tumid Membrana Adipoſa, pent up and confin'd by the Skin, compreſſes all the ſubjacent Parts, it is ſufficiently obvious, that, by this Cauſe alone, the vital Influx and Efflux of the Humours in the ſubjacent Parts may be totally deſtroy'd. Beſides, a Putrefaction, ſucceeding a Gangrene, may convey its Taint to all the adjacent Parts; for which Reaſon, a Gangrene is generally previous to a Sphacelus. There are, however, ſome Caſes, in which a Sphacelus is form'd without any preceding Gangrene; when, for Inſtance, by a violent Contuſion in any Part of the Body, all the Parts are at once deſtroy'd, as far as the Bone; or when, by any Cauſe whatever, the Bones, the Marrow contain'd in them, or the Perioſteum, which conveys Veſſels to the Bones, and receives thoſe ſent out from them, are ſo affected, that the vital Motion of the Humours through the Arteries and Veins in theſe Parts is totally deſtroy'd. The Lues Venerea, and Spina Ventoſa, have been often obſerv'd to corrupt the Bones in this manner, even whilſt the external Parts have as yet remain'd ſound; in which Caſe, the Diſorder diffuſes itſelf from the ſubjacent Parts, and ſpreads, till it has corrupted all around them; whereas, in a Gangrene, the external Parts are firſt affected, and then the ſubjacent Parts are, as it were, gradually ſuffocated.

Why a Gangrene ſhould enſue, when, by a violent Contuſion, Wound, or any other Cauſe, the ſpinal Marrow is ſo diſorder'd, that the Influx of the nervous Fluid into the Parts below the Wound is entirely prevented, is ſhewn under the Articles CONTUSA and VULNUS; where 'tis alſo obſerv'd, that the Deſtruction of the larger Nerves produces the like Misfortunes; whereas other Gangrenes generally ſucceed violent Fevers, or Inflammations; or, in extreme old Age, ariſe purely from the Defect of natural Heat. This laſt Species, ariſing without the previous Signs before-mention'd, preys on all the Parts in a ſlow, but irreliſtible Manner.

A Gangrene, therefore, and a Sphacelus, have one common Cauſe; but theſe Diſorders differ with reſpect to Violence, Duration, and the Parts they affect.

When the Arteries of the human Body are ſo chang'd, that they cannot tranſmit the Blood, and other Humours, which, in a State of Health, move through them, duly carry on the Secretions, and then convey the Fluids to the Veins, Death enſues. When this happens only in the Membrana Adipoſa, and Skin, the Diſorder is call'd a Gangrene; but, when the vital Action, in any Part of the Body, is totally deſtroy'd, then a Sphacelus is form'd. The Cauſe, therefore, of a Gangrene and Sphacelus is the ſame; that is, every thing which deſtroys the Influx and Efflux, the Secretion and Excretion, of the Humours, in any Part of the Body.

But the Force of the Cauſe which produces a Sphacelus, muſt be greater than that of the ſame Cauſe when producing a Gangrene; becauſe, by the former, far more ſolid Parts are corrupted, ſuch as the Muſcles, Tendons, and Bones; whereas the latter generally only induces a total Mortification on the tender Membrana Adipoſa, and Skin.

The ſame Cauſe which produces a Gangrene, continuing to act, may alſo produce a Sphacelus. Thus, for Inſtance, if, by an external Compreſſion, the vital Influx and Efflux of the

Humours in the Skin, and Membrana Adipoſa, are entirely deſtroy'd, 'tis ſufficiently obvious, that, unleſs the compreſſing Cauſe can be remov'd, all the ſubjacent Parts, as far as the Bone, muſt be, as it were, ſuffocated; and, conſequently, that a Sphacelus ariſes from the ſame Cauſe with a Gangrene; only it muſt operate longer to produce the former, than the latter.

The Place or Seat of a Gangrene is the Membrana Adipoſa; whereas a Sphacelus affects all the Parts: Another Circumſtance which ſerves to diſtinguiſh between a Gangrene and a Sphacelus.

A Gangrene and Sphacelus may, therefore, be form'd by all thoſe Cauſes which produce an Inflammation, eſpecially if the Fluids become ſtagnant, and if the Action of the circulating Blood upon them is ſtrong. Among the Cauſes of this Kind are, a Ligature of the Veins; their Compreſſion by any Cauſe, a Tumor for Inſtance; intenſe Cold; an obſtructed Perſpiration in a Phlegmon by Aſtringents, emplaſtic Medicines, cold Subſtances, Repellents, or ſtupefying Remedies, eſpecially if acrid Subſtances are either exhibited internally, or mix'd with external Applications; internal or external Inflammations, Wounds, Contuſions, Luxations, and Fractures, eſpecially when the Bandage is apply'd too tight; oleous Subſtances of an acrid Nature apply'd to ſound Parts, long lying in Bed, and Hernias of the confin'd or incarcerated Kind.

In this, and ſome ſubſequent Paragraphs, we ſhall treat of the Cauſes capable of producing a Gangrene and Sphacelus. Firſt, then, we have here enumerated all the Cauſes capable of producing an Inflammation; for every Inflammation preſuppoſes an Obſtruction of the ſmall arterial Ducts, by which the free Circulation of the Fluids is prevented; ſo that, if this Misfortune was to happen to all the Veſſels of any Part of the Body, a Sphacelus would be form'd; ſince all vital Motion of the Humours is deſtroy'd in the Part ſo affected. Now, if we conſider, that, according to the Definition of an Inflammation, there is, in this Diſorder, not only a Stagnation and Immeability of the Fluids, but, alſo, that the Impetus of the ſucceeding Blood acts powerfully on the obſtructed Parts, 'tis obvious, that the ſmall Veſſels may frequently be ſuddenly ruptur'd, the Fluids diſcharg'd, and become putrefy'd, and, conſequently, a Gangrene form'd, as is ſhewn under the Article INFLAMMATIO. But as the Arteries ought to convey the Fluids to the Veins, which carry them back to the Heart, from which they ought to be again forc'd through the Arteries, in order to maintain the due Circulation of the Blood through the whole Body, and all its Parts, all thoſe Cauſes, therefore, which hinder the Arteries from evacuating their Contents freely into the Veins, are capable of ſuffocating and preventing the vital Motion in the Part, and, conſequently, of producing a Gangrene and Sphacelus. Now, an Obſtruction of the Veins can never happen, except by ſome external Compreſſion. Of this Kind, therefore, are

Ligatures of the Veins. *Boerhaave*, in explaining this Paſſage, us'd to give his Auditors the following Caſe: A young Gentleman of Diſtinction, returning drunk from an Entertainment, with a View to enjoy the Benefit of the Air, laid his Elbows on the inferior Part of an open Window, where he continu'd all the Night, drown'd in Wine, and overpower'd by Sleep. But, waking next Morning, and attempting to move his Body, he dropt down, as if he had loſt his Legs; for, unfortunately, his Garters, being too tight, had ſo compreſs'd the Veins, that the Blood could not return through them, whilſt, at the ſame time, the Blood was forc'd through the Arteries by an increas'd Impetus, in conſequence of the Intoxication: Hence aroſe a Tumor of the Parts, which render'd the Garters ſtill tighter. As, by this Means, the vital Motion of the Humours was entirely deſtroy'd, a Gangrene was form'd in each Leg; which, ſoon aſcending to his Thighs, prov'd fatal to him.

Compreſſion of the Veins by any Cauſe: As Ligatures, ſo other Cauſes compreſſing the Veins, may, for the ſame Reaſon, produce a Gangrene. Medicinal and chirurgical Obſervations convince us, that incurable Gangrenes and Sphaceluſes have drawn their Origins from latent Tumors, which could neither be remov'd, nor eaſily known: Thus *Hildanus*, in *Cap. 4. de Gangræna & Sphacelo*, tells us, that he ſaw a memorable Inſtance of this Kind. A certain Man, in the Flower of his Age, and of an excellent Conſtitution, began to perceive an unuſual Coldneſs, Heavineſs, and Stupor, in both his Legs, without any known previous Cauſe. Theſe Symptoms increaſing gradually, a Gangrene enſued, which was ſucceeded by a Sphacelus, which aſcended to his Knees, and prov'd mortal. Upon diſſecting the Body, there was found a ſcirrhous Tumor, compreſſing that Part of the *Vena Cava deſcendens*, where it is divided into the two Iliacs. The Author adds, that, for the ſake of Brevity, he omitted more Inſtances of the ſame Kind. I myſelf, ſays *Van Swieten*, ſaw a memorable Inſtance of this Kind, in a Man, whoſe Left Leg, two Weeks before his Death, began to be painful, tumid, and, at laſt, all over œdematous, the Tumor aſcending above the Knee. As his Foot began to grow cold, and the Points of his Toes livid, I ſuſpected that a Gangrene would ſoon enſue: I therefore order'd the whole Part to be perpetually wrapt up in antiſeptic Fomentations. A ſkilful Surgeon, who attended this Patient, believ'd, as well as I, that a latent Collection of Pus compreſs'd the Iliac or Crural Vein; and therefore thought the Diſorder incurable, unleſs the compreſſing Cauſe could be remov'd. We could not, however, by the ſtricteſt Examination, diſcover where the Cauſe of the Diſorder was lodg'd; for which Reaſon, we concluded that the Uſe of Antiſeptics alone was to be perſiſted in. Next Day we were ſurpris'd to find the Leg warmer, and the Swelling much abated. The Patient, however, and thoſe who attended him, told us, that he had diſcharg'd by the Anus ſeveral large Quantities of Wind, with great Violence and Noiſe. The Swelling of the affected Leg was hourly diminiſh'd, and, in the Space of two Days, by gentle Frictions, was totally remov'd: The Patient, however, died. Upon opening his Body, I found no Pus in the larger Cavities of his Body: But, in the Abdomen, I found the Inteſtinum Colon not lying under the Stomach, as it uſually does, but preſſing upon it, and diſtended with Wind; but that Part of it which deſcends from the Spleen, behind the ſmall Inteſtines in the Left Side, was ſo contracted, that it was ſcarce ſo large as one's Thumb; but, as ſoon as it emerg'd again below the ſmall Inteſtines, it appear'd inflated. Hence, 'tis highly probable, that the Colon, highly diſtended with Wind, and touching the Iliac Vein, had compreſs'd it in that Part. Hence aroſe the Tumor of the Leg on the ſame Side, which again diſappear'd upon the Exploſion of the Wind. Unleſs I myſelf had ſeen theſe Phenomena in the Carcaſe, I could have ſcarcely thought, that ſo large a Vein could have been ſo compreſs'd by Flatulences, as to endanger a Gangrene.

Intenſe Cold: The Molecules of the Blood are, by Cold, ſo compacted, as to become incapable of circulating thro' the Veſſels, and, conſequently, to form Obſtructions. Now, if an intenſe Cold acts ſo powerfully on any Part of the Body, as to congeal the Fluids which ought to move in them, 'tis ſufficiently obvious, that the vital Influx and Efflux of the Humours muſt, in ſuch a Part, be totally deſtroy'd, and, conſequently, a legitimate Gangrene form'd, or even a Sphacelus, if the Force of the Cold has penetrated as far as the Bones. 'Tis true, the Blood, and its Serum, require a greater Degree of Cold to coagulate them, than Water; and the native Heat of a ſound human Body reſiſts a very intenſe Cold; eſpecially if a briſk Motion is us'd. There are, however, daily and melancholy Examples, in the Northern Climates, of the Extremity of the Body being ſo diſorder'd by an intenſe Cold, as ſuddenly to fall off, corrupted by a true and legitimate Sphacelus. Hence the Effects of intenſe Cold are, in a great meaſure, the ſame with thoſe produc'd by the Action of live Fire on the Parts of the human Body; that is, they are ſuddenly deſtroy'd, both by the one, and the other. For this Reaſon, perhaps, *Hippocrates*, in his Treatiſe *de Aere, Locis, & Aquis*, ſpeaking of the Complexion of the *Scythians*, ſays, they are *burnt* by the Cold. And *Virgil*, ſpeaking of burning the Stubble on the Ground, uſes this Expreſſion;

Ne tenues pluviæ, rapidive potentia ſolis
Acrior, aut Boreæ penetrabile frigus adurat.

A Gangrene and Sphacelus, however, produc'd by intenſe Cold, have certain peculiar Signs, by which they may be diſtinguiſh'd from other Gangrenes, as will afterwards be ſhewn. They, alſo, require a different Method of Cure, as will afterwards appear. But, among all other Cauſes, none produces a Gangrene ſo ſuddenly, as a Cold ſucceeding an intenſe Heat. Thus *De la Motte*, in the third Volume of his *Traité Complet de Chirurg.* informs us, that, in the Month of *July*, whilſt a Servant was cleanſing a deep Well, he perceiv'd an intenſe Cold, and a violent Pain, in the great Toe of his Left Foot, which ſoon after aſcended to the Ancle. All this Part was corrupted by a Sphacelus; and, about an Hour after, the Diſorder reach'd the Middle of his Leg, and would ſoon have put an End to his Life, unleſs the Member had been ſeaſonably amputated.

An obſtructed Perſpiration: That an obſtructed Perſpiration is highly prejudicial to Inflammations, and that Inflammations of the worſt Kind ſometimes ariſe from the external Application of pinguious Subſtances, eſpecially when mix'd with thoſe of an acrid Nature, is ſhewn under the Article INFLAMMATIO. 'Tis alſo ſhewn, under the ſame Article, that Aſtringents, cold Subſtances, and emplaſtic Medicines, ſoon change an Inflammation into a Gangrene; for a Phlegmon, properly ſo call'd, is only lodg'd in the narrow Parts of the larger Veſſels, which are either naturally, or by their Dilatation, capable of receiving the red Blood. Hence, tho' the Circulation of the Humours through the larger Veſſels ſhould be obſtructed, it may ſtill be carried freely on through the

the ſmaller Veſſels. But a Gangrene is only form'd, when the vital Efflux and Influx of the Humours, in all the Series of Veſſels, in any Part of the Body, is deſtroy'd. For this Reaſon, all thoſe Things which obſtruct Perſpiration in the inflam'd Part, produce a Gangrene; becauſe they deſtroy the Motion of the Fluids through the ſmalleſt Veſſels, whilſt the larger Veſſels are already become impervious by the Inflammation. Practical Obſervations ſufficiently convince us, that Subſtances of this Kind are productive of highly unluckly Effects, when apply'd to Parts affected with a Phlegmon, as may be ſeen in *Hildanus*, and the *Miſcellanea Curioſa*.

But no Cauſe more frequently produces a Gangrene, than the Application to an inflam'd Part of ſuch Subſtances, as by their acrid Stimulus augment the Motion in it; as alſo the accelerating of the circulatory Motion by the internal Exhibition of the like Medicines: For 'tis ſhewn under the Article INFLAMMATIO, that the Acrimony, and violent Motion, of the Humours, change an Inflammation into a Gangrene. Hence, ſo fatal Effects have often been produc'd, whilſt in inflammatory Diſeaſes the Chymiſts have boldly exhibited their volatile oleous Salts, and other highly acrid Subſtances, as the moſt powerful Reſolvents, or whilſt the Surgeons have apply'd Spirit of Sal Ammoniac, or Alcohol, to inflam'd Parts.

Internal or external Inflammations: 'Tis ſhewn under the Article INFLAMMATIO, how a Phlegmon degenerates into a Gangrene. But there, ſuch a Diſorder is only treated of, as affects the external Parts, and by the various ſenſible Changes of Symptoms, manifeſts the Tranſition of an Inflammation into a Gangrene. 'Tis, however, certain, that a legitimate Phlegmon, together with all its Terminations, whether in a Suppuration, Gangrene, or Scirrhus, may alſo be found in the internal Parts of the Body, as is ſhewn under the Article INFLAMMATIO.

Wounds, Contuſions, Luxations, and Fractures: With reſpect to theſe, ſee their reſpective Articles. But how frequently a Gangrene is produc'd by the too tight Application of Bandages, is ſufficiently obvious from daily Experience, and a Reflection on the Compreſſion of the Blood-veſſels thereby occaſion'd.

As for Subſtances of an oleous and acrid Nature; the Reader, with reſpect to theſe, may conſult the Article INFLAMMATIO: For, as Subſtances of this Kind are often of an highly acrid Nature, and ſtrongly adhere to the Part to which they are apply'd, they may produce a Gangrene, where there was no previous Inflammation; but much ſooner, where there is one. Thus *Boerhaave* gave his Pupils an Account of a Lady afflicted with a Palſy of her Right Leg and Thigh; and, when a Liniment of the *Galbanetum Paracelſi*, Oil of Hartſhorn, and other ſtimulating acrid Subſtances, was order'd to be gently rub'd on the Parts affected, the Patient, fond of a ſpeedy Cure, apply'd a large Quantity of the Liniment, and cover'd all the Part with a Cerate, in order to retain the Virtues of the Medicine the longer. Next Day, however, her whole Thigh and Leg were found affected with a Gangrene. Hence it appears, how dangerous the Uſe of oleous and acrid Subſtances, in Conjunction, often is, if they are unſkilfully apply'd.

As for long lying in Bed; this is a very frequent Cauſe of a Gangrene; for whilſt we lie in Bed, the whole Weight of the Body is ſupported by a few Parts. Hence, in conſequence of the Compreſſion of the Veſſels, a gentle Inflammation, and Pain, are produc'd; which, however, are immediately remov'd, on changing the Poſture of the Body. Hence the ſoundeſt and moſt healthy Perſons, now-and-then, change the Poſture of their Bodies in Sleep; by which this Misfortune is eaſily prevented. But, when in intenſely painful Diſorders, ſuch as the Gout and arthritic Pains, the Patients are forc'd to lie without changing their Poſture, ſince the Pain is greatly augmented by Motion, the Arteries and Veins are compreſs'd in the Parts which ſuſtain the Weight of the Body; and by this means the vital Motion of the Humours is prevented, and a Gangrene form'd. But a Gangrene is never more frequently or ſuddenly excited by lying in Bed, than in acute Diſeaſes, in which there is ſuch an Inſenſibility produc'd, as renders the Patient incapable of perceiving the Pain and Uneaſineſs excited by the Compreſſion of the Parts; in which Caſe his Strength being impair'd, he generally lies on his Back. Now, when a Perſon lies thus horizontally, his Bed is always ſunk in the Middle, and elevated both at the Head and Foot. Hence, the whole Weight of the Body is almoſt ſupported by the *Os Sacrum*, and *Os Coccygis*, which are only cover'd with the Integuments, and a ſmall Quantity of Fat. The ſoft Parts, therefore, which cover theſe Bones, are by the ſtrong Compreſſion totally depriv'd of the Influx and Efflux of the vital Humours, and, conſequently, ſoon become mortify'd. And even theſe Bones themſelves are ſometimes corrupted. Hence, if the Patients ſhould eſcape the Fury of theſe dangerous Diſeaſes, they are afterwards ſubjected to the Diſadvantages of a tedious and long-protracted Cure. In order to prevent all theſe Misfortunes, the Change of Poſture alone is ſufficient; for, if the Body is only turn'd ſix times, for Inſtance, in twenty-four Hours the Parts will be freed from the Preſſure of the incumbent Body, the Veſſels will be dilated by the impel'd Humours, and the Life of the Part will return. Care is, alſo, to be taken, that the Patient be laid immediately, and without the Interpoſition of a Shirt, on the ſofteſt Sheeps-ſkins to be had, than which nothing is more beneficial in this Caſe. When there is a Separation of the Epidermis, and a gentle Excoriation produc'd, the Part is to be cover'd with the *Emplaſtrum Diapompholyges*, or ſome other of a like Nature, ſprinkled with the fine Powder of Ceruſs, or Lapis Calaminaris. If, on account of the great Weakneſs of the Patient, or any other Cauſe, it ſhould be impoſſible to change the Situation of his Body ſo often, his Body is to be ſupported by Girths; or a Ring form'd of Straw, and cover'd with ſoft Sheeps-ſkins, is to be laid under his Body in ſuch a manner, as to free the Parts in Danger from all Compreſſion. It cannot, therefore, be too carefully inculcated to Phyſicians, always to ſuſpect a Gangrene in acute Diſeaſes, when they find their Patients lying long in one Poſture, dull, and as it were, half aſleep; for frequently, in a few Hours, all the Parts about the Os Coccygis become corrupted. By lying long in one Poſture, a Gangrene may not only be form'd about this Part, but alſo about the Scapulæ, the Tubercles of the Os Iſchium, the large Trochanters of the Os Femoris, and about the Spines of the Vertebræ, in highly emaciated Patients. Terrible Effects are often produc'd, whilſt, in the Cure of Fractures, Surgeons often deſpiſe the Complaints of the Patient, and neglect to change the Poſture of the Part. *Hippocrates*, in his Treatiſe *de Fracturis*, when treating of the Cure of Fractures of the worſt Kind, gives the following Caution: "We muſt remember, ſays he, that when fractur'd "Parts lie long in the ſame Poſture, Excoriations, not to be "cur'd without great Difficulty, are produc'd." In this Paſſage he uſes the Word ἐκτρίμματα, which ſignifies Excoriations, Corroſions, or Gallings; for, when any Part of the Body begins to be diſorder'd by long lying, a red Spot appears; ſoon after the Epidermis is, as it were, worn away, and at laſt ſeparated: But, the Unſkilful thinking the Diſorder ſlight, a few Hours after, a black Spot appearing indicates a Mortification of the worſt Kind.

Hernias of the confin'd and incarcerated Kind: Tho' the Name Hernia is given to widely different Diſeaſes, whilſt that, for Inſtance, in which the Coats ſurrounding the Teſtes, or the Scrotum itſelf, are fill'd with extravaſated Lymph, is call'd *Hernia aquoſa*; that in which the ſpermatic Veins are become varicoſe and tumid, *Hernia varicoſa*; and that in which the Teſtes are become ſcirrhous, or, as it ſometimes happens, ſurpriſingly concreted into a fungous Maſs, *Hernia carnoſa*; yet, in this Place, ſuch Hernias are only underſtood, as are form'd by the Parts contain'd in the Abdomen deſcending in conſequence of a preternatural Dilatation, or a Rupture of the Peritonæum. Hernias may happen in all the Parts of the Abdomen, and other Parts beſides the Inteſtines and Omentum may, ſometimes, ſlip out of the Cavity of the Abdomen; but the Hernias which happen moſt frequently, are thoſe form'd by the Deſcent of theſe thro' the dilated Peritonæum at the Navel, or thro' the Rings of the abdominal Muſcles in the Groin, in which Caſes they are call'd umbilical and inguinal Hernias; and, when theſe laſt fall down into the Scrotum, they are diſtinguiſh'd by the Epithet Scrotal; but if they fall towards the Thighs, which frequently happens in Women, they are call'd Herniæ Femorales. Now, if the dilated Peritonæum, together with a Part of the Inteſtine, ſhould ſlip through the Rings of the abdominal Muſcles, 'tis ſufficiently obvious, that the doubled Inteſtine is lodg'd in theſe Rings, except in rare Caſes, where the Part of the Inteſtine, oppoſite to the Meſentery, being gradually dilated, paſſes thro' theſe Rings, and becomes an Appendix or Sack, which is gradually render'd longer. By the periſtaltic Motion, therefore, the Chyle, and other things contain'd in the Cavity of the Inteſtine, muſt be forc'd into this Appendix, and frequently cannot return from it, whilſt the Inteſtine is compreſs'd by the Rings of the abdominal Muſcles. The ſame Effect may be produc'd by Flatulences diſtending the prolaps'd Inteſtine. Such a Hernia is call'd a confin'd or incarcerated Hernia, becauſe neither the prolaps'd Inteſtine, nor the Subſtances contain'd in its Cavity, can return into the Abdomen. In this Caſe, violent Pains are excited, the periſtaltic Motion is diſturb'd, Vomitings and Hiccup happen, and, frequently, in a few Hours, the ſtrangulated Inteſtine becomes gangrenous; and, which is ſtill more ſurpriſing, the ſoundeſt and moſt robuſt Men are often ſuddenly cut off by this means; for, after the moſt racking Torments, all Pain ſuddenly ceaſes, and the Patient, when he thinks himſelf paſt Danger, dies unexpectedly. But theſe fallacious Periods of Reſpite will not eaſily impoſe on a ſkilful Phyſician or Surgeon, ſince the Coldneſs of the Extremities, the cadaverous Appearance of the Countenance, the cold Sweats, and frequently the livid Colour of the Inteſtine ſhining thro' the Skin, are ſufficient Proofs, that Death is not far off. From the Knowledge we have hitherto acquir'd of the Structure of the human Body, I think we cannot aſſign ſatisfactory Reaſons, why an incarcerated Hernia ſhould be ſo ſuddenly and frequently ſucceeded by Death;

Death; tho' we know, from medicinal and chirurgical Obſervations, that the abdominal Nerves have a ſurpriſing Influence over the vital Functions. Thus *Ruyſch* gives us an Account of a Caſe, in which a Wound of the Abdomen, after violent Pains, prov'd mortal in a few Days; though, upon opening the Body, there was no conſiderable Injury obſerv'd to be done to any other Part than the Meſentery. 'Tis, however, certain from the Hiſtories of Wounds of the Abdomen given us by the beſt Authors, that large Portions of the Inteſtines may be either cut off, or ſpontaneouſly ſeparated, without deſtroying the Life of the Patient. 'Tis, alſo, certain, that the lacerated Inteſtines may be ſew'd together; and that the Meſentery may, by paſſing a Thread thro' it, be brought to the Aperture of the abdominal Wound, that the two Extremities of the Inteſtine may be brought into Contact, and grow together. In ſuch a Caſe, when a Gangrene is dreaded from an incarcerated Hernia, the Patient is to be ſo weaken'd by liberal Veneſection, that the Inflammation may be depriv'd of too ſtrong a vital Motion: Then let Narcotics be exhibited in ſmall Doſes at a time, but let them be repeated every eight Hours, till the Patient is reliev'd, and a Reſpite procur'd: Let the Hernia, in the mean time, be fomented with the moſt emollient Fomentations. Let Clyſters prepar'd of the like Materials be injected each Hour, and let the Reduction be attempted; but, if it cannot be reduc'd by theſe means, the only remaining Step to be taken is, to make an Inciſion thro' all the abdominal Integuments and Peritonæum, in order to ſet the ſtrangulated Inteſtine at Liberty, and return it into the Cavity of the Abdomen. But, when a Gangrene has already ſeiz'd an incarcerated Hernia, Death generally ſoon enſues; or, if the Patient ſhould eſcape, the corrupted Part of the Inteſtine being ſeparated, the Extremity of the remaining ſound Part is to be faſten'd to the Aperture, leſt the Fæces ſhould fall down into the Cavity of the Abdomen; and in this Caſe there remains an artificial Anus in this Place, during the Remainder of the Patient's Life, unleſs, which rarely happens, the Extremities of the Inteſtines ſhould again ſo unite, as to make the inteſtinal Tube one continued Paſſage from the Stomach to the Anus.

Secondly, Such Things as render the Fluids ſo acrid, as to corrode and deſtroy the Veſſels, may cauſe a Gangrene; ſuch as the long Stagnation of a pent-up and warm Humour, whence ariſe Acrimony and Corroſion: Hence Blood in an Aneuriſm, Pus in an Abſceſs, Water in the Cranium, the Thorax, the Abdomen, or the Scrotum; Contuſions, the Fluids diſcharg'd in wounded Parts; bad, morbid, acrid, and totally peccant Humours perpetually brought to the Parts, ſuch as Lymph long flowing about tendinous Parts, the Ichor of a Cancer, the Matter of a Dyſentery, or Dropſy; the Afflux of a febrile peſtilential, variolous, or ſcorbutic Matter to any fleſhy Part, eſpecially to the Gums.

The human Blood, and all the Humours ſecreted from it, except the Bile and Urine, in which, by Stagnation, Acrimony is either produc'd, or, at leaſt, much augmented, are in a State of Health of ſo mild a Nature, as to produce no Pain when dropt into the Eye, or a recent Wound. This Condition of the Humours was requiſite, that they might paſs with a ſufficiently rapid Motion thro' the tender Veſſels. If, therefore, by whatever Cauſe, the Fluids ſhould become acrimonious, the Veſſels will be deſtroy'd, the vital Influx and Efflux of the Humours prevented, and, conſequently, a Gangrene form'd. Hence, under the Article INFLAMMATIO, the Acrimony of the Humours is juſtly claſs'd among the Cauſes which make an Inflammation tend to a Gangrene. The principal Cauſes of ſuch an Acrimony in the human Fluids are theſe:

Stagnation: The human Fluids, by means of Reſt and Heat alone, ſpontaneouſly tend to Putrefaction in the ſoundeſt Bodies; the Aliments, alſo, tho' they have naturally no Tendency to any Degree of Putrefaction, become putrid in twenty-four Hours. A ſound Man, when drown'd, becomes totally putrify'd in a few Days, only by the Stagnation of the Juices, and the Heat of the Atmoſphere. This Tendency to Putrefaction in our Humours is increas'd in proportion to the Degree of Heat, provided the Heat is not ſo intenſe as to diſſipate the Fluids, and render all the Parts dry: Thus, in an highly hot and dry Air, the Fleſhes of Animals do not ſoon become putrid, but are ſometimes ſo dry'd, as to be preſerv'd entirely from every Degree of Putrefaction; whereas in a hot and moiſt Air they become putrid very ſoon. Beſides, 'tis obſervable, that the ſtagnant Humours of the Body may be preſerv'd a long time without Putrefaction, if no Air is admitted to them: For this Reaſon, the Stagnation of the pent-up and warm Humour muſt be long continued, before it can produce its Effect.

Blood in an Aneuriſm: 'Tis certain from undeniable and well-vouch'd Obſervations, that Blood, becoming ſtagnant in the Sack form'd by the Dilatation of an Artery, has acquir'd ſuch a Degree of Acrimony, as not only to corrupt the ſoft Parts, but, alſo, totally to deſtroy the moſt ſolid Bones.

Pus in an Abſceſs: As to the Effects of Pus in an Abſceſs, ſee ANCESSUS.

Water in the Cranium, Thorax, Abdomen, or Scrotum: 'Tis certain from daily Experience, that Water may be collected in the large and ſmall Cavities of the Body; whether this happens by a Rupture of the lymphatic Veſſels diſcharging their Contents, or in conſequence of the bibulous Veins not abſorbing the Matter exhal'd from the adjacent Parts into the Cavities: Such a Water may remain for a long time without Corruption, ſo long as no Air has Acceſs to it; but at laſt it begins to grow putrify'd, and corrode the Parts it touches. 'Tis certain from Obſervation, as will afterwards appear, that the Omentum, Liver, and Spleen, have been ſo long macerated in ſuch a Water, as to be quite decay'd and waſted; and, upon opening the Bodies of thoſe who have dy'd of that Species of Dropſy call'd *Aſcites*, an inſupportable Stench has been ſometimes perceiv'd by all who were preſent. But in no Caſe is a Gangrene more frequently produc'd by this Cauſe, than when that Species of Dropſy call'd *Anaſarca* ſeizes the Thighs and Legs; for as dropſical Patients are always cold, and frequently ſit much over the Fire, or keep their Feet warm by means of Stoves, the Epidermis is rais'd in Bliſters; and when theſe break, a large Quantity of Water is diſcharg'd, and the Patient is greatly reliev'd; but it frequently happens, that a Gangrene is form'd about thoſe Apertures by the Serum, which is now render'd more acrid by an Acceſs of the Air; the Membrana adipoſa, which was before highly diſtended, collapſes, becomes flaccid, and is partly corrupted by the Acrimony of the Serum, and partly mortify'd, in conſequence of the Weakneſs of the vital Influx.

As for Contuſions, and the Fluids diſcharg'd in Wounds; ſee the Article CONTUSIO.

As for an acrid, morbid, and totally peccant Humour acting upon the Parts; that ſound and mild Humours may become acrid by Stagnation, is obvious from what has been already ſaid; but it ſometimes happens, that the Blood, and Fluids ſecreted from it, become acrimonious, tho' they circulate in a natural and legitimate Manner. 'Tis true, there is rarely or never a great Degree of Acrimony in the Blood itſelf, otherwiſe the tender Veſſels would ſoon be deſtroy'd. Sometimes, however, there is a certain Degree of Acrimony in it, which does not produce any ſenſible Effects ſo long as it is mix'd with the whole Maſs of Blood; but, when it is ſecreted from it, and collected in particular Parts of the Body, it often produces the moſt terrible Effects: Thus, for Inſtance, ſo long as the Taint of a Venereal Lues remains mix'd with the circulating Humours, it ſcarcely gives any Proofs of its Exiſtence in the Body; but, when this latent Poiſon is depoſited on ſome Parts, it corrodes them ſo violently, that the hardeſt Bones are not Proof againſt its virulent Quality. If, therefore, any Matter of an acrid and morbid Quality lodg'd in the Blood is depoſited in particular Parts of the Body; or, if the Humours ſecreted from the Blood being more acrid than uſual, act for a conſiderable time upon any Part, 'tis obvious that the Veſſels may be corroded and deſtroy'd by theſe Means; and, conſequently, the vital Influx and Efflux of the Humours will be obſtructed; that is, a Gangrene will be form'd.

As for Lymph acting for a long time upon tendinous Parts; 'tis ſhewn under the Article VULNUS, that in Caſes where the tenſe or tendinous Nerves are only partially cut, there often enſues a large Evacuation of a thin and acrid Serum; 'tis, alſo, there obſerv'd, that in ſuch Caſes a benign Suppuration never happens, but that ſinuous Collections of ſuch an ichorous Matter ſo corrupt the Fat lying between the Muſcles, that, becoming gangrenous, it often comes away in large Portions; and that the pinguedinous *Vaginæ* of the Tendons are deſtroy'd by this Means: Hence a future Immobility of the Muſcles is produc'd, and the Uſe of the Member frequently deſtroy'd. *Celſus*, in the twenty-ſixth Chapter of his fifth Book, calls this Matter an Ichor; for, ſays he, "A thin whitiſh Ichor is "diſcharg'd from malignant Ulcers, eſpecially when an Injury "done to a Nerve is ſucceeded by an Inflammation; whereas "the *Melicera* is thicker, more glutinous, whitiſh, and reſem-"bling white Honey. This Species of Matter is, alſo, diſ-"charg'd from malignant Ulcers, when the Nerves about the "Articulations are injur'd; and this happens in no Part ſo "frequently as in the Knees." But becauſe Wounds about the Joints are accompany'd with a Diſcharge of ſuch an Ichor, and which is often ſucceeded by an incurable Immobility of the Joint, *Hildanus*, in the third Chapter of his Treatiſe *de Ichore & Melicera*, has given this Diſorder the Name of *Hydrarthros:* And as in this Diſorder, the Patients perceive a burning Pain, they generally aſcribe this Symptom to the Acrimony of the diſcharg'd Lymph; tho', perhaps, this intenſe Pain ariſes from the ſlow Dilaceration of the nervous or tendinous Fibres. 'Tis, however, certain from many well-vouch'd Obſervations, that after a long-continued Diſcharge of

ſuch a Lymph about tendinous Parts, a Gangrene almoſt always enſues; whether this happens on account of the Acrimony of the Lymph; or whether, becauſe the Blood, when depriv'd of this diluting Vehicle, produces obſtinate Inflammations.

As for the Ichor of a Cancer; in this terrible Diſorder the Humours diſcharg'd are often ſo highly acrimonious, that, like Aqua-fortis, they not only burn the Linen Cloths apply'd, but alſo deeply corrode the adjacent Skin over which they run: But theſe acrimonious Humours have not only been found in the external, but alſo the internal Parts of Cancers; whence 'tis ſufficiently obvious, what terrible Evils muſt be produc'd, when ſuch virulent Humours prey upon the internal Parts of the Body.

As for the Matter of a Dyſentery; if the virulent Matter, for Inſtance, of a cancerous Liver, or Pancreas, falling into the Inteſtines, excites a continual Teneſmus, accompanied with violent Gripes, it is ſufficiently obvious, that, the Inteſtines being, by this means, corroded, a Gangrene may be produc'd. When the black Bile becomes turgid by the Heat of the Atmoſphere, the Motion of the Body, or any other Cauſe, atrabilarious Dyſenteries, accompanied with intolerable Pain, are produc'd, and, ſoon after, ſucceeded by a Gangrene of the Inteſtines, and at laſt a gentle Death, without any Pain.

As for the Water of a Dropſy; we have already obſerv'd, that the Serum of dropſical Patients is ſometimes totally evacuated by the Apertures caſually or artificially made in their Legs; but, that, during this Diſcharge, the Parts adjacent to the Apertures are often corrupted. Now it is certain, from medicinal Obſervations, that the ſame Serum is abſorb'd by the Veins, mix'd with the circulating Humours, and diſcharg'd by Stool and Urine. Thus *Hippocrates*, in his *Coac. Prænot.* informs us, "that dropſical Patients are reliev'd by a Diſcharge "of the Water from the Veins, by Stool and Urine." Now if, by a long Confinement and Stagnation, theſe Waters begin to become putrid, before they are abſorb'd into the Veins, the Putrefaction will be augmented, whilſt they are carried along with the Maſs of Blood through the Veſſels; and if they ſhould be diſcharg'd through the meſenteric Veſſels into the Cavity of the Inteſtines, the villous Coat of the Inteſtines will be macerated and waſted, whilſt this putrid Water continually acts upon it. Hence Putrefaction, Gangrene, and often Death, enſue. Hence the general Senſe of the above-quoted Paſſage of the *Coac. Prænot.* is limited by *Hippocrates*, in another Place: "For, ſays he, when a beginning Dropſy is ſucceeded by a "watery Flux without Crudities, the Diſeaſe is determin'd;" for, in this Caſe, a Putrefaction is not to be dreaded.

As for a febrile Matter; a Fever often ſo changes and alters the material Cauſe from which it draws its Origin, or by which it is ſupported, that the Integrity of all the Functions is reſtor'd without any ſenſible Evacuations: Sometimes, alſo, the peccant Matter, conceal'd in the Body, is ſo chang'd as to be render'd moveable: But, as this Matter would continue to diſturb the Functions, if it was retain'd, it is either eliminated from the Body, or depoſited, by way of Abſceſs, in ſome particular Parts of it. It is a matter of no Moment, whether what is thus depoſited by way of Abſceſs, exiſted before the Fever, or whether it was only form'd in the Body during the Time of the Fever; for in both Caſes it is call'd febrile Matter. When, therefore, this febrile Matter is depoſited, by way of Abſceſs, in particular Parts of the Body, it not only produces Eryſipelas, Phlegmons, and Suppurations, but, ſometimes, ſuffocates, and deſtroys the Life of a Part: Hence a Gangrene and Sphacelus quickly enſue.

As for a peſtilential Matter; all the Authors who have wrote of this terrible Diſorder, affirm, that if the virulent Matter was depoſited, by way of Abſceſs, in any Part of the Body, that Part would ſuddenly be deſtroy'd; ſo that, becoming mortified, and adhering to the live Parts, it muſt be afterwards ſeparated, by a Suppuration happening in the Circumference, or the Parts in which the mortified and ſound Fleſh are join'd to each other. Peſtilential Carbuncles are ſuch Marks on the Surface of the Body, that they appear as if made by Fire. But far more terrible were the Diſorders ſubſequent to that Plague among the *Athenians*, ſo beautifully deſcrib'd by *Thucydides*, in his ſecond Book of the *Peloponneſian* War, and with which he himſelf was afflicted; for, all on a ſudden, the ſoundeſt Perſons were ſeiz'd with this horrid Lues, accompanied with a Pain of the Head, together with a Redneſs and Inflammation of the Eyes. Soon after, their Tongue and Fauces became bloody, and their Breath nauſeous and fetid. Theſe Symptoms were ſucceeded by a Sneezing, and intolerable Hoarſeneſs; ſoon after, the Diſeaſe affected their Breaſt, and was attended with a violent Cough. Then ſucceeded a Vomiting of Bile, an uneaſy Hiccup, and an intolerable internal Heat; externally the Body did not appear very hot, but was reddiſh, or livid, and full of minute Puſtules and Ulcers. Thus the Diſeaſe ſeem'd gradually to deſcend through all the Parts; and thoſe who ſurviv'd the ſeventh or ninth Day, the Diſeaſe deſcending to the Abdomen, died after being weaken'd by a violent Exulceration, and a copious Flux. But if the Fury of the Diſeaſe attack'd the Extremities of the Body, in this Caſe the Patients, indeed, eſcap'd the greateſt Dangers, and preſerv'd their Lives; but as they loſt their Hands, their Feet, their Eyes, and ſometimes their Pudenda, their Lives were more calamitous than Death would have been. *Galen*, alſo, in the fifth Chapter of his third Book *de Uſu Partium*, makes mention of a Plague which ſeiz'd the Feet.

As for variolous Matter; in the worſt Sort of the confluent Kind of the Small-pox, the whole Face is elevated in a gangrenous Bliſter; and, when the Pellicle is broken, a thin, and, often, an highly fetid Ichor is diſcharg'd, and the ſubjacent Skin and Membrana Adipoſa are miſerably prey'd upon by this gangrenous Matter. And *Van Sweiten* informs us, that he has frequently ſeen, what *Sydenham* before obſerv'd, that is, Bliſters rais'd on the Thighs of ſuch Patients, as large as an Hen's Egg, which, when broken, diſcharg'd a thin Ichor, or a bloody Sanies, and the ſubjacent Fleſh appeared highly black.

As for an Afflux of ſcorbutic Humours to any muſcular Part, eſpecially the Gums; in a Scurvy, it is pretty ſurpriſing, that the Coheſion of the Veſſels ſhould be ſo diminiſh'd, that they may be broken by the ſlighteſt Force. Thus, in Patients labouring under this Diſorder, rude Squeezing is always ſucceeded by an Ecchymoſis; ſince, in conſequence of a Rupture of the Veſſels, the Blood is diſcharg'd under the ſound Skin. And, even without any external Force, the Veſſels being ſpontaneouſly ruptur'd by the Motion of the adjacent Muſcles, or corroded by the acrid Blood, theſe ſcorbutic Spots appear blue, and ſometimes black; for, in this Diſeaſe, the diminiſh'd Coheſion of the Veſſels is always accompanied by an acrid State of the Blood. It is not, therefore, to be wonder'd at, if, in conſequence of a Deſtruction of the Veſſels, an Afflux of ſcorbutic Matter to any muſcular Part, eſpecially to the Gums, ſhould produce a Gangrene. In ſcorbutic Patients, malignant Ulcers of the Legs are frequently found to become gangrenous, and incurable by the beſt choſen Remedies. But in no Part are the Signs of a preſent Scurvy ſooner diſcover'd, no-where does this Diſorder more quickly corrupt the Parts, than about the Gums, which, when ſeiz'd with this Diſorder, become hot, painful, or itch, and, upon the ſlighteſt Touch, diſcharge Blood. Then here-and-there appear white Spots, red and inflam'd at the Circumference, which, if neglected, eſpecially in young Perſons, often ſpread, and prey upon all the adjacent Parts, and are accompanied with an intolerable Stench, and a copious Diſcharge of thin and fetid Saliva from the Mouth. In *Holland* this Diſeaſe is call'd the Water-cancer, becauſe, like a Cancer, it corrodes all around it, and is accompanied with a continual Diſcharge of Saliva. Unleſs this Diſorder is check'd in due time, which is moſt efficaciouſly done by Spirit of Sea-ſalt diluted in Water, as alſo with other foſſil Acids, or with the Brine of Sea-ſalt, it not only affects the Gums, but alſo the Cheeks, the Lips, and the Tongue. It alſo corrupts the Teeth and Jaw-bone, and makes them fall out. The free Acceſs of the Air, the Heat and Moiſture of the Place, together with the highly acrid, and often putrid, Lymph acting on the Parts in a malignant Scurvy, greatly augment the Corruption already begun.

Thirdly, Thoſe things which produce a Mortification of the Extremities, ſuch as the languid State of Old-age, great Weakneſs, violent Contuſions of large Nerves, of the Spina Dorſi, of the ſpinal Marrow, and large nervous Ganglions, will cauſe a Gangrene.

As a Gangrene is ſuch a Condition of the ſoft Parts of the Body, as, by a Deſtruction of the Influx of the vital Humour into the Arteries, and their Efflux by the Veins, tends to a Mortification, it is ſufficiently obvious, that this Diſorder muſt be produc'd, when the Cauſes which move the Humours through the Veſſels, become ſo weak, that they cannot continue this Motion to the Extremities of the Body. But the Force of the Heart filling and dilating the Arteries, together with the Energy of the Arteries, by which they contract themſelves, and propel the Blood through their narroweſt Parts into the Veins, are the Cauſes which carry on and finiſh the Motion of the Blood through the Veſſels. But the Return of the venous Blood to the Heart is promoted by the Action of the Muſcles adjacent to the Veins: When, therefore, in Old-age, or great Weakneſs, produc'd by any Cauſe, the Force of the Heart is ſo impair'd, that it cannot, by the impel'd Blood, dilate the Arteries to the very Extremities of the Body, this languid State of Old-age begins, and hence a Gangrene of the Extremities ariſes. Beſides, ſuch a Flexibility is requiſite in the Arteries, that they may yield, and be dilated by the Blood impel'd from the Heart; and, at the ſame time, ſuch a Strength, that, when the Action of the Heart ceaſes, they may, by their Elaſticity, and the Action of the muſcular Fibres, propel the Blood contain'd in their Cavities. Hence it is evident, that the ſame Effect may

be

be produc'd by the oppoſite Faults of the ſolid Fibres, and of the Veſſels compos'd of them; that is, an Impediment to the equable Motion of the Blood, and Stagnation.

It is ſhewn, under the Article FIBRA, that the Motion of the Humours through the Veſſels is hinder'd by too great a Weakneſs and Laxity of the Fibres; as alſo, that the ſame Misfortune may be produc'd by their too great Rigidity.

But, in decrepit Old-age, when many Canals, which, in Youth, were pervious, are concreted, the Veſſels become too ſtrong and callous, by which means they reſiſt Dilatation. Hence, at laſt, the Heart is no longer able to evacuate the Blood contain'd in its Cavities; and is, therefore, oppreſs'd, and its Motion ſtopt.

Another Cauſe of an incurable Gangrene is, when the Arteries, though the Force of the Heart remains entire, become ſo rigid, and ſometimes bony, that they can neither yield to the Blood impel'd from the Heart, nor contract themſelves.

Why Gangrenes ſhould be produc'd by violent Contuſions, or other Wounds of large Nerves, nervous Ganglions, the Spina Dorſi, or the ſpinal Marrow, is ſhewn under the Article VULNUS.

Fourthly, Poiſons of a particular and ſurpriſing Quality, may produce Gangrenes.

Beſides the Cauſes of a Gangrene already enumerated, there are ſtill others, which could not be reduc'd to the former Claſſes; for there are in Nature ſuch Subſtances, as, being applied to the human Body, infallibly and ſpeedily produce not only the Mortification of the particular Part, but alſo of the whole Body; though we are ignorant of the real Manner in which they produce their Effects.

We obſerve, that, in particular Diſeaſes, a Matter of ſo hoſtile a Quality to the human Conſtitution is ſometimes form'd, that it forthwith produces a Mortification in the Part where it is depoſited. Thus, the Small-pox is ſometimes capable of converting the whole Body into a gangrenous Corruption, even in the ſoundeſt Habits. Beſides, medicinal Obſervations convince us, that the ſlighteſt Bites of venomous Animals are capable of producing a Gangrene, and Sphacelus.

The Signs of a future Gangrene are its preceding Cauſes, already enumerated.

Theſe have been already conſider'd, ſo that we now come to treat of thoſe Signs by which a preſent Gangrene is known, and diſtinguiſh'd from an Inflammation, which frequently precedes it, as well as from a Sphacelus, which is ſometimes ſubſequent to it.

The Signs of a preſent Gangrene are, firſt, A Removal of the Symptoms of Inflammation, without any Correction of the Cauſe. Secondly, A faint Senſation of the Part. Thirdly, A pale, cineritious, dark, livid, or black Colour. Fourthly, Such a ſoft and flaccid State of the Part, that it does not riſe when compreſs'd by the Fingers. Fifthly, Puſtules, full of a lymphatic, yelloviſh, or rediſh Ichor, in the inflam'd Part. Sixthly, When a Gangrene is produc'd by Cold, an Itching, and violent Senſe of Puncture, together with an intenſe Redneſs, which is ſoon ſucceeded by a Blackneſs, which indicates Mortification.

If thoſe things which have been ſaid concerning the preceding Cauſes, the Nature, and Seat of a Gangrene, are well underſtood, it will be no difficult Taſk to diſcover, whether a Gangrene is preſent, or not, by the following Signs.

Firſt, *The Symptoms of the Inflammation* ariſe from the Principle of Life forcing the Blood into the obſtructed Veſſels with great Celerity, as is ſhewn under the Article INFLAMMATIO, where theſe Symptoms are enumerated. If, therefore, theſe Symptoms increaſe every Moment, and, at laſt, ceaſe all of a ſudden, we know that they have not ceas'd in conſequence of a Correction of the Cauſe; that is, a Reſolution of the inflammatory Concretion; becauſe this never happens, except when all the Symptoms of the Inflammation are highly gentle. Nor in this Caſe can there be a Suppuration; becauſe by it the Symptoms of an Inflammation are not deſtroy'd, but gradually, and not ſuddenly, chang'd and alleviated. Much leſs could a Scirrhus be expected in this Caſe; ſince in it all the Symptoms are much more ſlowly chang'd. It, therefore, only remains, that the Inflammation muſt terminate in a Tendency to a Gangrene, that is, the Death of the Part. But, why, in this State, the Symptoms accompanying an Inflammation ſhould ceaſe, is ſhewn under the Article INFLAMMATIO. When an Inflammation ſeizes the external Part of the Body, the Change of Colour, and the other Signs of a Gangrene, produc'd by the Inflammation, may be perceiv'd by our Senſes. But, when this Diſorder ſeizes the internal Parts, the State of it is to be judg'd of by the Heat, the Pain, the Fever, and the ſudden Removal of the Symptoms.

Secondly, *As to the languid Senſation of the Part*; the inflam'd Part was highly painful, in conſequence of the Diſtraction of the nervous Fibres diſtributed through the Coats of the diſtended Veſſels. When, therefore, the diſtending Cauſe, that is, the vital Influx of the Humours into the Veſſels, ceaſes, the Pain will be remov'd, or, at leaſt, conſiderably diminiſh'd; for it ſometimes happens, that, when the Membrana Adipoſa is corrupted by a Gangrene, the Skin is not as yet mortify'd. Hence ſome Senſation will remain in it, as well as in the ſubjacent Parts, which, by the Interpoſition of this mortify'd and inſenſible Subſtance, but faintly perceive the Action of external Bodies.

Thirdly, *As to the Paleneſs, or other Variations of the Colour*; 'tis ſhewn under the Article INFLAMMATIO, that the inflam'd Part is red, and the Skin ſhining, in conſequence of its Tenſion. But, as ſoon as the Motion of the Humours thro' the inflam'd Parts is deſtroy'd, the florid red Colour begins to be loſt, a Paleneſs enſues, which is ſucceeded by a cineritious, a dark, or a black Colour; ſo that, according to the various Colours of the Part affected, there is a different Degree of Corruption, which is always worſe, in proportion as it recedes from Paleneſs, and tends to that Blackneſs which indicates a Mortification.

Fourthly, *As to the Softneſs and flaccid State of the Part*; ſo long as the Inflammation laſts, there is in the Part a hard and reſiſting Tumor, which, when preſs'd, forthwith reſtores itſelf; becauſe the Blood, acting on the obſtructed Veſſels, diſtends all around them: When, therefore, this Force is remov'd, the Part, being now mortify'd, becomes flaccid; and the Membrana Adipoſa, before highly diſtended, appears ſoft, and retains the Impreſſion of the Fingers: If, in this State, the Part is touch'd, a viſcid Matter ſeems to fluctuate under the Skin, or, at leaſt, a manifeſt Vacillation of the Parts under the Skin is perceiv'd, which is only owing to the Corruption of the Membrana Adipoſa, of which large Portions come away, when, by a benign Suppuration, the mortify'd Parts are ſeparated from ſuch as are ſound.

Fifthly, *As for Puſtules on the inflam'd Part*; this is generally accounted the pathognomic Sign by which a preſent Gangrene, in the external Surface of the Body, may be known; for, as is ſhewn under the Article INFLAMMATIO, whilſt the Inflammation degenerates into a Gangrene, the Veſſels are ſuddenly ruptur'd, and the Humours diſcharg'd will be ſoon corrupted; the Connection between the tender Epidermis, and ſubjacent Skin, is deſtroy'd; and the former, by the diſcharg'd Humours, is rais'd in Puſtules, which are turgid with a yelloviſh, or, ſometimes, a rediſh Ichor, like the Waſhings of Fleſh. But, in the worſt Kinds of Gangrenes, which ſoon tend to a Sphacelus, theſe Bliſters are full of a black Ichor.

Sixthly, *As for Gangrenes produc'd by Cold*; this peculiar Species of Gangrene is known by diſtinct Signs in the Northern Climates: When the Winters are ſevere, miſerable Inſtances of it frequently occur; for the Extremities of the Body, ſuch as the Toes, the Fingers, the Tip of the Noſe, and the Lobes of the Ears, are, by the intenſe Cold, ſo corrupted with a Gangrene, as to fall off. This Diſorder proceeds in the following manner: By the Cold, is firſt produc'd a Paleneſs, which is ſucceeded by a Redneſs, accompanied with a troubleſome pungent Pain, or an uneaſy Itching. Then the Redneſs is increas'd almoſt to a purple Colour. Then the Part affected becomes black, and, being corrupted with a true Sphacelus, as far as the Bone, at laſt falls off. But, becauſe a Gangrene, ariſing from this Cauſe, ſoon mortifies the Parts, and requires a widely different Method of Cure from other Gangrenes, we are, therefore, to be highly careful, that no Error be committed with reſpect to the Diagnoſtic of this Diſorder.

A future Sphacelus is known by the continual Augmentation of the Signs of a preſent Gangrene.

We have already obſerv'd, that a Gangrene is generally previous to a Sphacelus, which ſucceeds it: If, therefore, all the Signs of a preſent Gangrene, already enumerated, are increas'd, we know that a Sphacelus is to be dreaded; for the gangrenous Parts may, by compreſſing the ſubjacent live Parts, ſuffocate them, or corrupt them by their ſpreading Putrefaction.

The Signs of a preſent Sphacelus are, firſt, A violent previous Gangrene. Secondly, A Ceſſation of Senſation and Motion; ſo that the Part, when cut, prick'd, or burnt to the Bone, feels nothing, but remains inſenſible. Thirdly, A livid, dark, or black Colour. Fourthly, Softneſs, Flaccidity, Coldneſs, a Separability of the Skin; at laſt, Dryneſs and Hardneſs. Fifthly, A cadaverous Stench. Sixthly, A mortify'd deep-ſeated Corruption, preying on all the adjacent Parts, as far as the Bone.

As

As for a previous Gangrene; this Sign ought only to awaken the Attention of the Phyſician or Surgeon; for a violent Gangrene is not always ſucceeded by a Sphacelus, which, however, is juſtly to be dreaded.

As to the Ceſſation of the Senſation in the Part; it is frequently no eaſy Taſk to determine, whether a Sphacelus is preſent or not; for ſometimes the Membrana Adipoſa, ſeiz'd with a violent Phlegmon, is diſtended to an incredible Thickneſs, even in thoſe Parts where there is no great Quantity of Fat, ſuch as the Back of the Hand, the Fingers, and the upper Part of the Foot. If a Gangrene ſeizes theſe Parts, a Knife may be thruſt very deep into them without exciting any Senſe of Pain. The diſtended Membrana Adipoſa, pent up by the ſound Skin, may alſo ſo compreſs the ſubjacent Parts, as to render their Senſation faint, or ſcarce any at all, though they are not as yet entirely mortify'd; and may again revive, when freed from this Compreſſion. Hence we cannot conclude, that a Sphacelus is preſent, unleſs we are ſure, from the deepeſt Scarifications and Punctures, that no Degree of Pain is excited; for, if there are any live Parts under the Membrana Adipoſa corrupted by the Gangrene, a Separation of the corrupted Parts may ſtill be expected. Beſides, 'tis to be obſerv'd, that a Power of Motion frequently remains in a Part, though 'tis entirely corrupted by a Sphacelus.

As to the livid, dark, or black Colours; theſe are already conſider'd.

As to the Softneſs, Flaccidity, and other Conditions of the Part; why any Part of the Body, affected with a Gangrene and Sphacelus, ſhould become ſoft and flaccid, is alſo already explain'd. But, ſince Heat is produc'd by the Motion of the Fluids through the Veſſels, when this Motion is deſtroy'd, the Part thus affected muſt neceſſarily be reduc'd to the ſame common Temperature with the circumambient Air; but then it is ſaid to be cold, becauſe the Heat of a ſound Body always exceeds that of the Atmoſphere. But, ſo long as only a Gangrene is preſent, the ſubjacent Parts, as yet alive, may, by their Heat, convey a gentle Warmth to the Part affected; but, when, as deep as the Bone, the vital Influx totally ceaſes, 'tis obvious, that a Coldneſs of the Part muſt be produc'd.

In this Caſe, the Epidermis is always ſeparated, which is highly tough, and not eaſily corrupted by Putrefaction. Thus, alſo, upon Burns, or the Application of Cantharides, the Epidermis remains entire; but as ſoon as its Connection with the Skin is deſtroy'd, it is rais'd in Bliſters by the diſcharg'd Humours: And, even, when any Part of the human Body is macerated in Water, till it becomes putrid, the Epidermis is not corrupted, but ſeparates from the ſubjacent Parts reſolv'd into a putrid Matter.

But though, in a beginning Sphacelus, the Part affected ſhould appear ſoft and flaccid, yet afterwards, when the moſt fluid Parts are diſſipated, all the reſt are ſo dry'd and contracted, as to appear very hard; for the ſame happens to Parts corrupted by a Sphacelus, which happens to the Fleſh of kill'd Animals long ſuſpended in the Air, and which is obſerv'd by thoſe, who, in order to train up a Breed of fierce Dogs, feed them with the Fleſh of Horſes; for, firſt, this Fleſh is reduc'd to a putrid Matter, which afterwards becomes incredibly hard: And, in parch'd and dry old Bodies, a ſphacelated Part may, for a great while, be preſerv'd without Putrefaction; but it will be dry.

As for a cadaverous Stench; this muſt neceſſarily happen; becauſe the ſphacelated Part is as much acted upon by the Heat of the common Air, as a Carcaſe: Hence the like fetid Smell, and Corruption, will be produc'd in both.

As for a mortifying and deep-ſeated Corruption; as, in a Carcaſe, by a ſpontaneous Principle of Corruption, all the Parts are deſtroy'd, except the Bones, which have been found to remain for Ages; ſo, in a Sphacelus, all the ſoft Parts, unleſs dry'd, are converted into a putrid Matter, and ſeparated from the Bone. 'Tis alſo obſervable, that, in a Sphacelus, unleſs a kind of Limit is plac'd, either by Nature or Art, between the mortify'd and live Parts, and unleſs the ſoft Parts, by a Chaſm form'd at this Boundary, recede from each other, the mortifying Corruption proceeds to prey upon all the adjacent Parts, and that ſo much the ſooner, the more briſk the Principle of Life is. Hence it is, that, in young Bodies, eſpecially when a ſtrong Fever is preſent, a Sphacelus ſpreads ſo ſoon; but, in decrepit Old-age, the Diſorder is often ſupported for a long time, provided the Part is preſerv'd from Corruption by Antiſeptic Medicines; for the Fluids, propel'd through the Veſſels to the Sphacelus, are ſtopt, and the corrupted Miaſmata are abſorb'd by the Veins. Hence the live Part, contiguous to that which is mortify'd, is farther affected. *Celſus*, in the twenty-ſixth Chapter of his fifth Book, beautifully deſcribes the Progreſs of a Gangrene and Sphacelus in the following Words: "In "this Species of Ulcer the Fleſh is black, or livid, but dry "and parch'd, and the external Skin is generally full of "blackiſh Puſtules; then that which is next to it, is pale, or "livid, and almoſt æruginous, and without Senſation. 'Tis "ſtill worſe in an Inflammation, ſince all the Symptoms "ſpread at once; the Ulcer into the puſtulous Place; the "Puſtules into that which is pale or livid; the pale or livid "Part into that which is inflam'd; and that which is inflam'd, "into that which is ſound."

The imminent and ſpeedy Danger of this Diſorder requires juſt Prognoſtics.

As ſoon as the Signs of a preſent Sphacelus appear, after duly weighing all Circumſtances, we ought, without Delay, to reſolve upon the Meaſures to be taken in order to preſerve the Life of the Patient. If nothing remains but the Extirpation of the mortified Part, that is to be ſet about with all poſſible Expedition; ſince, in the Space of an Hour or two, the Diſorder may ſpread ſo far as to admit of no Cure: Frequent Inſtances of this occur in the Writings of practical Authors.

Theſe juſt Prognoſtics are to be taken, firſt, From a due Conſideration of the Age, Temperament, Diſorder, and Strength of the Patient. Secondly, From the quick-ſpreading Nature of the Diſeaſe. Thirdly, From a Knowledge of the internal or external Cauſe. Fourthly, From the Seaſon of the Year. Fifthly, From the Part affected, according as it is more or leſs neceſſary to Life; or according as it is moiſt, ſinuous, or dry.

In order to form a due Prognoſtic of what is to be either fear'd or expected, the following Circumſtances are to be attended to:

The Age of the Patient: As in young Perſons the Fluids predominate over the Solids, almoſt all the Parts are capable of being diſſolv'd. Hence it is, that in them the Progreſs of a Putrefaction, once begun, is often ſo quick. This is highly obvious in that Gangrene of the Gums by ſome call'd the *Water-cancer*, which, in this Age, ſoon preys upon all the adjacent Parts. In middle-aged Perſons a Gangrene, and Sphacelus, only ſucceed violent Inflammations, or are ſometimes obſerv'd to happen in acute Fevers. But in Old-age theſe Misfortunes happen from an Exceſs of Reſt, and a Defect of ſufficiently ſubtile Fluids; in which Caſe they are rarely or never cur'd, becauſe the Cauſe producing them cannot be corrected.

As for the Temperament of the Patient. This is either ſound or morbid. Thus, in Perſons of a fat Temperament, if a Sphacelus is produc'd, unleſs, either by Nature or Art, a Stop is put to the ſpreading Evil, it will ſoon prey upon all the adjacent Parts. But in Perſons of cold Habits, all other Conditions being alike, the Progreſs of a Gangrene and Sphacelus is obſerv'd to be ſlower. But if a morbid Temperament, tending to Putrefaction, predominates, as in a putrid Scurvy ariſing from a Species of black Bile, the worſt Conſequences are to be dreaded.

As for the particular Circumſtances of the Diſorder; the Prognoſtics are alſo to be drawn from them. Thus, for Inſtance, after a long-continued Dropſy, a Gangrene of the Feet is rarely cur'd. But when, in an acute Diſeaſe, the febrile Matter ſeizes the Extremities, and renders them totally mortified, there is great Hope, that, if the other Signs are ſalutary, the Patient may eſcape, though depriv'd of that Member.

As for the Strength of the Patient; it is carefully to be obſerv'd, that, after the quickeſt Motion of the Humours in a burning Fever, and after their Stagnation and Reſt, in decrepit Old-age, a Gangrene and Sphacelus ariſe. In the former Caſe, the ſtronger the vital Powers are, the Diſorder will ſpread the ſooner; but, in the latter, the weaker the vital Principle is, the leſs Hopes remain. But it is ſufficiently obvious, that great Weakneſs is more to be dreaded, than too quick a Motion of the vital Humours through the Veſſels; ſince the latter may be diminiſh'd by proper Remedies. But, to rouſe the languid and drooping Strength, eſpecially in decrepit Old-age, is not only a Taſk far more difficult, but often abſolutely impoſſible.

As for the quick-ſpreading Nature of the Diſorder; the Progreſs of an Inflammation, which may be cur'd by a benign Reſolution, is never quick, but all the Symptoms are ſlowly, or ſcarce at all, augmented. When it tends to a Suppuration, the Heat, the Pain, and Redneſs, are more quickly increas'd; but moſt quickly of all, when it is about to degenerate in a Gangrene; and, in a Gangrene, the Danger is greater, the more quickly it ſpreads; the ſame, alſo, holds true in a Sphacelus. Skilful Surgeons, therefore, juſtly dread this Diſorder, when it ſpreads quickly, eſpecially when the Gangrene ariſes from internal Cauſes.

As for a Knowledge of the internal or external Cauſe; this is neceſſary, becauſe it enables us to know, whether ſuch a Cauſe is capable of being remov'd, or not. Thus, for Inſtance, if we know, that a ſcirrhous Tumor ſo compreſſes the *Vena cava deſcendens*, that a Gangrene, in the inferior Extremities, muſt be produc'd by it, 'tis ſufficiently obvious, that the Diſorder is incurable. But if, by lying long in Bed, the Weight of the Body has ſo compreſs'd the Os Sacrum, and the Os Coccygis,

as to produce a Gangrene, the Progreſs of the Diſorder may be ſtopt by changing the Situation of the Body; and, by proper Remedies, the corrupted Part may be ſeparated from thoſe which are ſound.

As for the Seaſon of the Year; 'tis certain, that a Gangrene may be produc'd by intenſe Cold, as well as by exceſſive Heat, whether excited by the Application of Fire, or by a violent Inflammation. The beſt Seaſons, therefore, are thoſe in which there is neither a pinching Cold, nor a ſcorching Heat; that is, the Spring, or Autumn. But the Winter-ſeaſon is highly prejudicial to thoſe Gangrenes produc'd by the Languor of old Age. Whereas the Summer is, in a peculiar manner, hurtful to thoſe Gangrenes which are ſubſequent to violent Inflammations, or putrid Corruptions of the Humours; and eſpecially, if an intenſe Heat is accompanied with a moiſt State of the Atmoſphere.

As for the Part affected; unleſs a beginning Gangrene is ſuddenly check'd, the Solids are deſtroy'd, the Fluids extravaſated, and corrupted; by which means the Part is ſo putrefy'd, that its Soundneſs cannot poſſibly be reſtor'd. In this Caſe, the only remaining Step to be taken is, with all Expedition, to ſeparate the mortify'd from the adjacent live Parts. If the Part affected is of ſuch a Nature, that its Soundneſs is abſolutely requiſite to Life, 'tis ſufficiently obvious, that no Hopes of Recovery are left: When, for Inſtance, the *Cerebellum*, the *Medulla oblongata*, or the *Medulla Spinalis*, are corrupted by a Gangrene. Beſides, the Cure will be more difficult, when a Gangrene is produc'd in moiſt Parts of the Body; for the Putrefaction produc'd, will be much increas'd by the continual Afflux of the Humours. Hence it is, that Gangrenes, in the internal Parts of the Mouth, are with ſo much Difficulty cur'd, ſpread ſo ſoon, and are accompanied with ſo intolerable a Stench. But, when the Part affected is ſinuous, ſuch as the Genitals in both Sexes, or the *Inteſtinum Rectum*, 'tis always to be dreaded, leſt the mortify'd Part ſhould, with Difficulty, be ſeparated from that which is alive: And tho' this Separation ſhould happen, yet 'tis ſtill to be dreaded, leſt the Diſorder ſhould degenerate into a fiſtulous Ulcer. But when the dry and tendinous Extremities of the Body are corrupted by a Gangrene or Sphacelus, in old Perſons, or others of a naturally dry Conſtitution, the like Misfortunes happen; the Diſorder, however, ſpreads more ſlowly, nor will ſo great a Putrefaction enſue. But the Separation of the corrupted Parts from thoſe which are ſound and alive, will be more difficult, becauſe this muſt be carry'd on by the ſound Fluids convey'd in a due Quantity, and with a ſufficient Impetus, to the Limits of the Gangrene.

From what has been ſaid, ſome Axioms, which in theſe Diſorders conſtitute the juſt Prognoſtic, may be deduc'd; and are as follows:

From a Gangrene ariſes a Sphacelus.

From a Sphacelus, the Mortification of the Part, and the ſudden Infection of the adjacent Parts.

A Gangrene is to be reliev'd with all Expedition.

A Sphacelus is to be extirpated with all Expedition.

A Sphacelus ariſes from a Gangrene. As a Gangrene generally poſſeſſes only the *Membrana Adipoſa*, it is generally previous to a Sphacelus; for frequently under the *Membrana Adipoſa*, already highly tumid, and corrupted by a Gangrene, the Muſcles remain alive, and the Perioſteum and Bone ſound. But 'tis ſufficiently obvious, that a Gangrene may, by its Bulk, ſo compreſs the adjacent live Parts, or ſo affect them by the Propagation of the Diſorder, as to render them mortify'd, in which Caſe a Sphacelus ariſes from a Gangrene.

From a Sphacelus the Mortification of the Part, and the ſudden Infection of the adjacent Parts. So long as there is any Circulation of the Humours thro' the Parts of the affected Member, a Sphacelus is not preſent, and there ſtill remain ſome Hopes, that the corrupted Parts may be ſeparated from thoſe which are ſound: But, when the Influx and Efflux of the vital Humours is totally deſtroy'd, the Mortification of the Part is produc'd. But this mortify'd Part adheres to thoſe which are ſound; and frequently the ſame Cauſes which produc'd the Sphacelus, continue to deſtroy the adjacent Parts: And, tho' theſe Cauſes ſhould ceaſe, the adjacent Parts will nevertheleſs be ſoon infected; for the Fluids, by reaſon of the Continuity of the Veſſels, will be convey'd to the corrupted Part. Hence they will act on this Putrefaction every Moment, and become ſtagnant, becauſe, in conſequence of the Mortification of the Part, they cannot paſs thro' its Veſſels. But, by reaſon of the Continuity of Subſtance, the Diſorder will ſpread in the ſolid Parts.

A Gangrene is, with all Expedition, to be reliev'd: For, as *Galen* obſerves, a Gangrene is in an intermediate State between a violent Inflammation, and a Sphacelus. Since, therefore, a Gangrene tends to a Mortification of the Part, that is, a Sphacelus; 'tis for this Reaſon to be remov'd as ſoon as is poſſible.

A Sphacelus is to be extirpated with all Expedition: For, by the ſpreading of the Diſorder, the ſound and live Parts will be ſoon affected. Hence, the longer the Extirpation is delay'd, the more of the Body muſt of courſe be loſt. It cannot, however, be deny'd, that there are medicinal and chirurgical Obſervations, which ſhew us, that Nature has, in ſuch Caſes, perfected a Cure, where Extirpation ſeem'd abſolutely neceſſary. Many Inſtances occur, which inform us, that ſphacelated Parts have been ſpontaneouſly ſeparated from the Sound. But it more frequently happens, that the Sphacelus ſpreads, and ſoon proves mortal, unleſs extirpated in due Time. Since, therefore, a ſphacelated Part muſt be always remov'd, whether by ſpontaneous Separation, or Extirpation; and ſince the Event is highly dubious, when committed to Nature, it appears that this Axoim is true, that a Sphacelus is forthwith to be extirpated. Theſe Caſes, however, inform us, that we are not abſolutely to deſpair, even in Inſtances where the Extirpation cannot be made, either on account of extreme Weakneſs, or any other Cauſe. In Caſes of this kind, the Strength is to be ſupported by good Aliments, and Cardiacs. The Part affected is, in the mean time, to be dreſs'd with ſuch Things as prevent and correct all Putrefaction.

A Gangrene of the Brain, Viſcera, and Bladder, is mortal, and, in acute Diſeaſes, proves the Cauſe of a ſudden Death, whilſt the larger Parts ſcarcely appear to be injur'd.

As for a Gangrene of the Brain; if we conſider how ſoft and tender the Subſtance of the Brain is, it will appear ſufficiently obvious, that a Gangrene produc'd in it muſt ſoon reduce it to a putrid Maſs. Nor in this Caſe is a Depuration poſſible, tho' the mortify'd Parts were ſeparated from the ſound, ſince the hard Cranium muſt on all Sides prevent the Diſcharge. Under the Article CAPUT, it is ſhewn, that a great Part of the Brain, eſpecially of its cortical Subſtance, has ſometimes been deſtroy'd by Wounds, fungous Excreſcences, or Suppuration; Life, in the mean time, being preſerv'd, and no Diſorder of the Functions of the Brain remaining. 'Tis alſo ſhewn, that, by an Evacuation from the Ears or Noſe, all thoſe Symptoms have been reliev'd which generally ariſe from a Diſcharge of Humours compreſſing the Brain under the Cranium. But in order to preſerve a Man, whoſe Brain is affected with a Gangrene, a great Number of lucky Circumſtances muſt concur, which rarely happen ſingly and apart; for the Gangrene muſt be ſtopt, and the corrupted Parts ſeparated from thoſe which are as yet ſound. Then the ſeparated Part muſt no longer continue to infect the tender Pulp of the Brain, which is contiguous to it: So that it muſt be evacuated by ways, which the Induſtry of Anatomiſts has not as yet diſcover'd, tho' ſome Obſervations ſeem to evince, that there are ſuch ways, tho' not naturally, yet in certain Diſeaſes. It would be, alſo, neceſſary, that the Portion of the Brain, deſtroy'd by the Gangrene, ſhould be reſtor'd. If all theſe Circumſtances are duly conſider'd, it will ſufficiently appear, that no Hope remains, when the Brain, and much more the Cerebellum, or Medulla oblongata, are ſeiz'd with a Gangrene.

As for a Gangrene of the Viſcera; ſince a Gangrene deſtroys thoſe Parts of the Body on which it ſeizes, and often ſpreads itſelf very quickly, unleſs ſeaſonably check'd, it is ſufficiently obvious, that ſcarcely any Hopes of a Recovery are left, when this Diſorder ſeizes the Viſcera, eſpecially thoſe whoſe Subſtance is ſoft; ſuch as the Liver and Spleen, which, in a ſhort time, will be reduc'd to a putrid Maſs. But if the vital Viſcera, lodg'd in the Cavity of the Thorax, are, after violent Inflammations, ſeiz'd with a Gangrene, Death ſeems unavoidably to follow, becauſe Life is, as it were, check'd in its firſt Spring and Source. Thus, *Hildanus*, in the fourth Chapter of his Treatiſe *de Gangræna & Sphacelo*, informs us, that, in his own Son, who dy'd of a Retention of Urine, he found the Kidneys, and adjacent Parts, affected with a Gangrene. 'Tis, however, certain from Experience and Obſervation, that every Gangrene of the Viſcera does not prove mortal; for, if the Viſcera affected are of a firm and membraneous Subſtance, ſuch as the Inteſtines, for Inſtance, and if the Separation of the corrupted gangrenous Part from the live Parts is not only poſſible, but alſo its Elimination from the Body, the Patients are often preſerv'd. In thoſe Viſcera, therefore, whoſe firm Subſtance is not eaſily reſolv'd into a putrid Maſs, and in which the Elimination of the gangren'd Part may be expected, a Gangrene is highly dangerous, but not always productive of certain and infallible Death.

As for a Gangrene of the Bladder; violent Inflammations, or other Injuries, of the Bladder, produc'd by Wounds, or Lacerations in rude Extractions of the Stone, are ſucceeded by Gangrenes, which generally terminate in an unlucky manner; partly becauſe the acrid Urine, always acting on the Bladder thus affected, augments the Putrefaction already form'd; and partly becauſe the Bladder, being furniſh'd with an incredible Number of Nerves, ſurpriſingly affects the Brain, and all the nervous Syſtem.

Now, if, in acute Diſeaſes, the Humours render'd immoveable by an inflammatory Denſity, or by an *Error Loci* lodging in Veſſels they ought not to be in, ſhould ſo obſtruct the tender Veſſels of the Brain, on which Life and the animal Functions depend,

depend, as totally to deſtroy the Influx and Efflux of the vital Humours, ſudden Death will enſue, nor can any ſenſible Injury be diſcover'd, becauſe theſe minute Parts eſcape the Cognizance of our Senſes. It is a matter of no Moment, whether the Diſorder immediately ſeizes theſe Parts, or whether the Inflammation has been tranſlated from other Parts of the Body to the Brain.

This is the Reaſon why *Hippocrates* ſo carefully collected all the Signs, by which a future Delirium might be prognoſticated, in order to prevent a Misfortune, which, when it happens, generally produces certain Death. Thus, in a continued Fever, *Van Sweiten* informs us, that he knew a Pain ariſe in one of the Patient's Legs, which ſuddenly diſappear'd; but, immediately after, a Phrenitis ſeiz'd the Patient, and carried him off on the third Day. In the Writings of *Hippocrates* there are ſeveral Caſes, which confirm this. Thus, in the third Book of his *Epidemics*, *Ægrot.* 5. he gives us the Caſe of *Phalacrus* of *Lariſa* [the bald Man] in the following Words: "He was ſud-"denly ſeized with a Pain in his Right Thigh, which yielded "to no Remedies; the firſt Day an acute burning Fever came "on by ſlow Degrees, by which the Pains were alleviated; the "ſecond Day the Pains of his Thigh were ſtill more mitigated; "but his Fever increas'd, and he became reſtleſs, and could "not ſleep. His extreme Parts were cold, and he diſcharg'd "a large Quantity of Urine, but not of a laudable Kind. The "third Day the Pains of his Thigh entirely ceas'd, but he be-"came delirious with much Reſtleſneſs, and Jactation of the "Body; and on the fourth Day, about Noon, he died ſud-"denly." We have already obſerv'd, that the febrile Matter is ſometimes depoſited on the Extremities of the Body, where it quickly corrupts, not only the ſoft Parts, but alſo the Bones. The ſame is alſo obſerv'd in the Plague, as we have already ſhewn. If, therefore, ſuch a corrupted Matter was depoſited about the Heart, the Brain, the Lungs, or the Viſcera, 'tis ſufficiently obvious, that the Death of the Patient muſt enſue.

A Gangrene of the internal Part of the Mouth, Lips, Noſtrils, and Genitals, is not to be cur'd without great Difficulty.

'Tis certain, from anatomical Obſervations, that the Skin ceaſes to cover the Parts about the Lips, and that the Epidermis alone covers the Lips, the internal Surface of the Cheeks, and the other Parts of the Mouth and Fauces. If in theſe Parts an Inflammation incapable of Reſolution ſhould ariſe, a benign Suppuration rarely follows, but almoſt always a gangrenous Putrefaction, which preys upon all the adjacent Parts; for the Parts, being expos'd to the Air, and continually moiſten'd with a Saliva, which is frequently pretty acrid, are reduced to a highly fetid Subſtance; and, as in this Caſe there is generally a great Diſcharge of the Saliva, and as this Diſorder, when form'd, corrodes all the adjacent Parts, unleſs ſpeedily cur'd, it is for this Reaſon, by ſome, call'd the Water-cancer: There ariſes, firſt, in the internal Parts of the Mouth, the Lips, the Gums, the Tongue, or the Tonſils, a gentle Redneſs, accompanied with no great Degree of Pain, but a conſiderable Heat. Soon after, on the Middle of this Part, appears a white Speck, which often deceives Surgeons into an Opinion, that a Suppuration is about to follow: Then the Pain is increas'd, eſpecially in that Part where the white Speck appears, as alſo in its Margins, which now appear highly red. Beſides, this Part is corroded deep; and the whole white Portion, which is only a gangrenous Eſchar, falls off, if the Diſorder is ſlight, and the Patient an Adult; But if the Malignity is great, eſpecially in young Patients, where all the Parts are ſoft, the Diſorder ſpreads, and the white Spot is diffus'd around on all Sides. The Breath, in the mean time, is highly putrid, and a fetid Saliva continually drivels from the Mouth. In this Caſe, unleſs efficacious Medicines are ſoon apply'd, the Diſorder quickly corrodes all round it. As this Diſtemper frequently ariſes from a Scurvy, 'tis therefore cuſtomary to waſh the Mouth with Spirit of Scurvy-graſs and *Spiritus Theriacalis*; but theſe almoſt always do more Harm than Good. If the Diſorder is ſlight, and only beginning, which may be known, if the Redneſs, Heat, and Pain, are preſent, without the fetid Smell, *Sal Ammoniac*, or Nitre, diluted in a large Quantity of Water, with the Addition of a little Vinegar, or Citron-juice, will be of ſingular Service to waſh the Mouth; or Linen Cloths, impregnated in this Preparation, may be gently applied to the Parts affected: But Surgeons have an unaccountable Cuſtom of rubbing the Parts, ſtrongly, with Bruſhes dipt in theſe Liquors; but this Practice is always pernicious, ſince it augments the Pain, and deſtroys the tender Veſſels. But if the Diſorder begins to ſpread, and is accompanied with a fetid Stench, the above-mentioned Remedies will not prove ſufficient; for, in this Caſe, the Putrefaction muſt be ſubdued by Spirit of Sea-ſalt: Let twenty Drops of this Spirit be mix'd with half an Ounce of the Honey of Roſes, and let the Part affected be frequently every Day anointed with a Pledget dipt in this Preparation. The Quantity of the Spirit of Sea-ſalt may be increas'd, if the Putrefaction is very great; and, in deſperate Caſes, *Van Sweiten* informs us, that he has applied this Spirit alone, with excellent Succeſs; for, ſays he, the Progreſs of the Gangrene was immediately ſtopt by it; and, ſoon after, the gangrenous Eſchar was ſeparated from the live Parts. He alſo ſays, That Medicine never fruſtrated his Hopes, unleſs when, the Gums being entirely corrupted, the Jaw-bone happens to be affected; for then, he ſays, it was not in his Power to prevent its becoming carious; but it infallibly eradicates a Gangrene of the ſoft Parts of the internal Mouth.

When this Diſorder ariſes in the Lips, there is ſtill an additional Danger; for when the Epidermis, which covers the ſoft Subſtance of the Lips, is corroded, the nervous Papillæ are diſtended to an immenſe Bulk, and degenerate into a malignant Cancer; but, if the Membrane ſurrounding the internal Noſtrils is corrupted, the Bones become bare, in which, as they are highly tender, no Exfoliation can be expected; but they always become carious, and fall away: 'Tis therefore obvious, that the Cure of a Gangrene in theſe Parts muſt be highly difficult.

As for Gangrenes of the Genitals; theſe Parts are of a ſurpriſingly cellular Structure, and even in ſound Bodies afford a Smell ſomewhat putrid, becauſe they are adjacent to the Bladder and Anus, by which Nature eliminates the corrupted Matter lodg'd in the Habit. Hence a Gangrene, in theſe Parts, muſt not only ſpread quickly, but alſo be cur'd with Difficulty. By means of difficult Births the Pudenda of Women are ſometimes ſo contus'd and lacerated, as to produce a Gangrene, which is not without the greateſt Difficulty to be cur'd; but this Caſe, however deplorable, is not altogether deſperate.

A Sphacelus of the extreme and tendinous Parts is mortal in Old-age.

Theſe Gangrenes, incident to old Age, generally ariſe from ſuch Cauſes as admit of no Cure; for they generally draw their Origins from an exceſſive Rigidity of the Veſſels, or from an impair'd and diminiſh'd Strength of the Heart. In this Caſe, therefore, no Separation of the corrupted Part is to be expected, ſince it depends on the briſk Motion of the ſound Humours through Veſſels poſſeſs'd of a due Degree of Flexility: Nor will the Extirpation of the Part affected be of any Service; for the Diſorder will return upon the mutilated Part. The only Method to be taken is, to dreſs the Part affected with ſuch Subſtances as are uſed in embalming, for preſerving the Bodies of the Dead from Putrefaction. By this means mortified Parts, in old Perſons, may be kept from conveying the Contagion to thoſe which are ſound, for ſeveral Months. A purple or livid Spot generally appears on the Toes firſt; and, unleſs this is dreſs'd in the manner now mention'd, it ſoon ſpreads, and produces a mortal Sphacelus. *Van Sweiten* tells us, that he knows no Inſtances of the Cure of Gangrenes ariſing ſpontaneouſly in the Toes of extremely old Perſons; but gives us an Inſtance of a Man of Seventy, but of a robuſt Conſtitution, who was cur'd of a Gangrene ſpontaneouſly ariſing about the internal Malleolus of the Right Foot, by Infuſions of Wine, Salt, and recent Rue, by continually fomenting the Part with which, a Separation of the gangrenous and corrupted Part was made, and the Cure ſucceeded.

In dropſical, phthiſical, and ſcorbutic Patients, a Gangrene is ſo highly virulent as to produce the Death of the Patient.

Gangrenes ariſe in dropſical Patients, either becauſe the collected Waters, by their Preſſure, ſuffocate the Parts; or becauſe, being render'd putrid and acrid, they corrode the contiguous Parts. But in either of theſe Caſes there remain no Hopes of the Patient's Recovery; for, if the Water remain, the Diſorder will be increaſed, ſince the ſame Cauſes, which produced it, continue to act. If, on the contrary, the Waters ſhould be evacuated, the flaccid and almoſt waſted Parts, being no longer ſuſtained by the equable Preſſure of the Fluids, will be diſſolved, the Veſſels ruptured, the Mortification of the Part, and the Death of the Patient, produced.

But in phthiſical Patients, who already labour under an Atrophy, ariſing from a purulent Cacochymy of the Blood, and who at laſt generally die of a highly putrid Diarrhœa, 'tis ſufficiently obvious, that no Hopes of Recovery are left when a Gangrene ſeizes any Part of the Body; for the natural Strength is daily impair'd, and the State of all the Humours becomes more and more acrid. Hence neither the Separation of the corrupted Part, nor conſequently the Regeneration of what is loſt, can be obtain'd.

As for ſcorbutic Patients, we have already obſerv'd, that in them the Coheſion of the Veſſels was ſo diminiſh'd, that they were capable of being ruptur'd by the ſmalleſt Force; and that the Fluids were of too acrimonious a Nature; and in a violent Scurvy all the Parts become putrid. Since, therefore, the Acrimony of the Humours, the Rupture of the Veſſels, and the Patrefaction of the diſcharg'd Humours, may produce a Gangrene, this Misfortune muſt be with the greateſt Difficulty cur'd,

if the Blood is infected with a ſcorbutic Cacochymy. Hence, in Ulcers of the Legs, ſo common in the Scurvy, gangrenous Cruſts are almoſt always found, which immediately grow afreſh when taken away by the Application of Detergents; and, for this Reaſon, a good Cicatrix can hardly ever be form'd on Ulcers of this kind.

A Sphacelus aſcending to the ſuperior Parts, or producing Watchings, Deliriums, Syncopes, Eructations, Hiccups, Spaſms, Pains, cold Sweats, and Drowſineſs, preſages the Death of the Patient.

Here all theſe Symptoms are enumerated, which generally accompany a mortal Sphacelus, and that in the ſame Order in which they uſually happen; for, if the Sphacelus is ſtopt, either by the ſpontaneous Workings of Nature, or by the Aſſiſtance of Art, a Separation happens between the live and mortified Parts; neither does the Diſorder ſpread any farther. But, when the Diſorder proceeds, it is ſaid to aſcend to the ſuperior Parts; becauſe, beginning in the laſt Articulation of the Toe, it gradually aſcends through the Foot, the Leg, and at laſt the Thigh. But, if it begins in the Fingers, it generally aſcends through the whole Arm, before it proves mortal. But the Functions of the Brain are always obſerv'd to be diſturb'd when the Sphacelus is about to prove mortal; then the vital Functions begin, alſo, to be affected, and at laſt the Patient dies, as it were, in a gentle Sleep. 'Tis, therefore, a bad Sign, if in a Gangrene, or Sphacelus, of the Extremities, the Symptoms of a diſturb'd Brain appear. Hence *Hippocrates*, in the ſeventh Book of his *Epidemics*, tells us, "That a violent Sphacelus is "dangerous; but, if it is attended with bilious Vomitings, An-"xiety, a Stupor of the Eyes, a Privation of Voice, little "ſpeaking, or any Degree of a Delirium, theſe are Signs, that "the Patient is convulſive, and will die." But Watchings are generally the firſt Sign, which warn the Phyſician to uſe all his Endeavours to divert the Force of the Diſeaſe from the Head. Theſe Watchings are followed by a Delirium; then the Cerebellum being affected, a Syncope enſues: After this, by the inordinate Motion of the animal Spirits through the abdominal Viſcera, Eructations and Hiccups happen, and laſt of all Spaſms and Pains. Then appears that viſcid cold Sweat, which ſtands in Drops on the Skin, and is an infallible Preſage of preſent Death: Of which Sweat *Helmont* ſaid, "That it was not a recrementitious Fluid, but the alimentary "Dew reſolv'd and ſubdued by Death." In this Caſe the Patient, at laſt, dies, as it were, in a gentle Sleep. According to the various Cauſes from which a Sphacelus may proceed, ſo it ſpreads with a proportionably greater or leſs Celerity; for, if this Diſorder ariſes purely from the languid State of Old-age, it ſpreads ſlowly, and may be ſometimes born for ſeveral Months before it proves mortal; provided the Part be dreſſed with ſuch Subſtances as prevent Putrefaction. But if in a young and robuſt Conſtitution, after a violent Inflammation, a Gangrene ſhould be form'd, and if a Sphacelus ſhould ſucceed this Gangrene, it quickly aſcends to the ſuperior Parts, and in a few Hours becomes incurable. Moſt of the Symptoms accompanying a mortal Sphacelus are by *Celſus*, in the twenty-ſixth Chapter of his fifth Book, beautifully enumerated; for, after having deſcrib'd the Method in which a Gangrene ſpreads, he adds, "In the "mean time an acute Fever, accompanied with an intenſe "Thirſt, ariſes; in ſome Patients a Delirium alſo happens. "Others, though they retain the full Uſe of their Reaſon, can "yet hardly expreſs their Sentiments, by reaſon of a Stammer-"ing in their Speech. Then the Stomach begins to be affected, "and the Breath becomes fetid. This Diſorder, when begin-"ning, admits of a Cure; but, when it is inveterate, it is in-"curable; and thoſe who labour under it, are ſeiz'd with a "cold Sweat at the time of their Death."

A livid or black Colour, or Dryneſs, about Ulcers, preſage a Gangrene, a Sphacelus, and the Death of the Patient.

Hippocrates, in his Prognoſtics, where he recounts the moſt material Circumſtances, to which a Phyſician ought to advert, in order to enable him to prognoſticate the Events of Diſeaſes, gives us the following Caution: "We muſt, ſays he, conſider "whether the Patient has had an Ulcer before the Diſorder "commenc'd, or whether the Ulcer was form'd during the "Diſeaſe; for 'tis a Sign, that the Patient will die, when the "Ulcer appears livid and dry, or pale and dry." 'Tis certain, that a laudable Pus is produc'd by the Principle of Life remaining in the Part, and by the Humours convey'd to the Wound, or Ulcer, provided Fluids of a good Quality are in a ſufficient Quantity, and with a due Impetus, conveyed to it; but if otherwiſe, another Fluid is obſerv'd in the Wound, which degenerates from the Condition of laudable Pus. Hence it is, that, in cacochymic Habits, the Formation of a laudable Pus, and the Conſolidation of Ulcers and Wounds, are ſo highly difficult. But when by a Fault of the Veſſels, or Humours, or of both, nothing is conveyed to the Wound, its Surface will be render'd dry, by the Air, and the Heat of the adjacent Parts; and, before a Cure can be produc'd, the Whole of this dried Part muſt be ſeparated. The Dryneſs, therefore, of an Ulcer denotes, that the vital Influx and Efflux of the Humours in the Part are ſtopt: But the livid or black Colour denote a legitimate Mortification, and are, therefore, juſtly accounted among the worſt Signs.

The Intentions of Cure in a Gangrene are, firſt, To confirm the Strength. Secondly, To prevent the Ingreſs of the putrid Matter into the Veins. And, thirdly, To check and remove the Putrefaction form'd.

Having conſider'd the Diagnoſtics and Prognoſtics of a Gangrene, we now proceed to conſider the Intentions of Cure, and the Medicines proper for removing the Diſorder: But, leſt a Confuſion ſhould ariſe in this reſpect, we are to remember, that it is hard to judge of the preciſe Period of Time which diſtinguiſhes a beginning Gangrene, from the Phlegmon which produces it. Since, therefore, a beginning Gangrene approaches very near to a Phlegmon, but differs very much from it, when it is about to degenerate into a Sphacelus, 'tis obvious, that in this intermediate Time there are various Degrees of Malignity in a Gangrene; and that different Methods of Cure are requir'd, according to the different Symptoms; for a beginning Gangrene may ſometimes be happily remov'd, by correcting the Juices; but, when the Diſorder is confirm'd, the corrupted Part cannot be render'd ſound, but muſt be ſeparated from the live Parts, to which it adheres: The general Intentions of Cure are, therefore, enumerated in this Paragraph.

As for confirming the Strength; ſo long as laudable Humours move with a due Impetus and Velocity through the Veſſels, Health and Strength remain entire; but, when this equable Motion is interrupted, either totally, or in part, the Strength is impair'd either in the whole Body, or, at leaſt, in the Part affected. Hence *Hippocrates*, in the fifth Aphoriſm of his ſecond Section, affirms, that ſpontaneous Laſſitude, in conſequence of which Perſons cannot, without Uneaſineſs, bear their accuſtom'd Labours, preſages Diſeaſes, though the Perſon ſeemingly appears to be, as yet, in a pretty good State of Health; for theſe Laſſitudes are frequently obſerv'd, when the Blood, being render'd leſs fluid, by an inflammatory Spiſſitude, cannot, without Difficulty, paſs through the narrow Extremities of the Veſſels: The Strength will, therefore, be confirm'd by all thoſe things which promote the free Circulation of the Humours through the Veſſels, and remove thoſe Impediments which are capable of obſtructing it. According to the Diverſity of Cauſes, various Remedies contribute to confirm the Strength.

As for the Ingreſs of the putrid Matter into the Veins; the Urine naturally waſhes out of the Body thoſe things, which, approaching to Putrefaction, would prove hurtful, if they were any longer to be carried through the Veſſels, with the other Fluids: But, when a perfect Iſchury prevents the Secretion and Excretion of the Urine, the retain'd Fluids, becoming acrid and putrid, ſeem, in a particular manner, to injure the tender Veſſels of the Brain; and the Patients labouring under this Diſorder, after having ſuffer'd almoſt the ſame Misfortunes with thoſe who die of a Sphacelus, are in like manner cut off in a profound Sleep. 'Tis, therefore, juſtly to be dreaded, leſt a putrefied Matter, ſucceeding a Gangrene, and being abſorb'd by the contiguous Veins, ſhould prove injurious in the like manner: We are, therefore, to uſe all our Endeavours to prevent this Accident.

As for removing and correcting the Putrefaction form'd; every Part of the human Body, that is depriv'd of the vital Influx and Efflux of the Humours which it before enjoy'd, by a ſpontaneous Principle of Change, tends to Putrefaction. 'Tis, therefore, requiſite, that a future Putrefaction ſhould be prevented, and a preſent one ſo corrected, as that it may not infect the adjacent ſound Parts. When the Hands have Acceſs to the Part affected, ſuch Medicines are to be apply'd, as are thought moſt proper for producing this Effect: But, if the Diſorder is lodg'd deep, 'tis ſufficiently obvious, that the Cure muſt be difficult.

The Strength is confirm'd, firſt, By ſuch things as contribute to deſtroy the internal Cauſe producing the Gangrene, rouſe the Spirits, and preſerve the Circulation of the Fluids, at the ſame time having due Regard not only to the Age, the Sex, and the Temperament of the Patient; but alſo to the State of the Weather: Theſe are, therefore, to be either of the refrigerating, or heating Kind, according as the particular Circumſtances of the Patient ſhall require. Secondly, By Aliments, and Drink of an analeptic Nature. Thirdly, By Epithems, as toaſted Bread, impregnated with Medicines which reſiſt the internal Cauſe, excite the Spirits, and preſerve the Circulation of the Fluids, applied to the Veins, or about the Noſtrils.

As for thoſe Medicines which deſtroy the internal Cauſe; in order to anſwer this Intention, we muſt neceſſarily pay a due Regard to the Nature of the Cauſe which produc'd the Gangrene,

grene. But all these Causes are already enumerated, and reduc'd to their respective Classes: Thus, for Instance, if a putrid Scurvy affects the Blood with a violent Cacochymy, those Things which resist such a Putrefaction will be of Service to confirm the Strength, such as *Rhenish* Wine, and the Juices of Citrons and Oranges; and the poorer Class of People may use Butter-milk, or its Serum, boil'd with a little Mace, or Nutmeg. As all Gangrenes, though arising from different Causes, always produce a Putrefaction, it is obvious, that the Use of these Acids contributes very much to the Cure of such Disorders.

Boerhaave, in his *Materia Medica*, recommends the following exciting Spirit to be us'd in a Gangrene proceeding from a hot Cause, or an alcaline Temperament:

Take of the express'd Juice of Citrons, two Ounces; of the Juice of Oranges, one Ounce; of the recent Syrup of Mulberries, two Ounces; of Water distil'd from the whole Citron, four Ounces; of Baum-water, two Ounces; of Cinnamon-water, one Ounce; and of *Rhenish* Wine, six Ounces; adding Sugar, if there is Necessity for it: Mix these together, and let the Patient drink an Ounce of the Spirit every Hour, or Half-hour.

Or,

Take of the Robs of Currants, and Barberries, each two Ounces; of the Spirit of Salt, half a Dram; of distil'd Baum-water, six Ounces; and of *Rhenish* Wine, ten Ounces: Mix these together, and let the Patient drink an Ounce of the Mixture every Hour.

If the Patient labours under a Gangrene proceeding from a cold Cause, or is of a phlegmatic or acid Temperament, the following Preparation is to be us'd.

Take of the Sal volatile oleosum, three Drams; of the Elixir Proprietatis, prepar'd with Salt of Tartar, two Drams; of distil'd Aqua Vitæ of *Matthiolus* [in the *Leyden* Dispensatory], three Ounces; of the distil'd Water of Citron-peel, six Ounces; of the Syrup of the Five aperient Roots, and of *Fernelius*'s Syrup of Mugwort, each one Ounce; and of the Confectio Alkermes, two Drams: Mix, and use like the preceding.

As for those Medicines which rouse the Spirits; it is certain, from Experience, that there are in Nature such Substances as, entering into the most subtile Fluids of the human Body, commonly call'd the Spirits, are of singular Efficacy, and capable of disturbing the whole Body in a surprising Manner. This Efficacy, in the mean time, often depends upon Corpuscles, or Effluvia, so subtile and minute, that they not only escape the Notice of our Senses, but even exceed our Imaginations. Thus, Asa-fœtida, by its Exhalations alone, often checks the inordinate Motions of the Spirits in hysteric Women; and yet, after, during several Months, it has fill'd a pretty large Room with its Effluvia, scarce any sensible Diminution of it Weight appears. On the contrary, the Fragrance of Musk frequently so disorders the whole nervous System of delicate Women, as sometimes to throw them into violent Convulsions; and yet Musk does not sensibly lose its Weight, though it be kept for several Years, and imparts an almost incredible Smell to all the adjacent Bodies. There are, in the *Materia Medica*, such Medicines as, only by their Exhalations, rouse the languid Spirits, and, as it were, inspire new Life into the weakest Patients. If an highly fragrant Citron is applied to the Nostrils of a Woman about to fall into a Deliquium, she immediately revives: The same Effect is produc'd by the Fragrance of Vinegar, and of almost all the grateful Aromatics. But those Things, which rouse the languid Spirits, are, in a particular manner, beneficial in a Gangrene and Sphacelus, because nothing more quickly destroys the Strength, even of sound Constitutions, than putrid Effluvia. If, in the Summer-time, the soundest Man happens to be near the Body of a large drown'd Animal, when it is tumid and breaks, he is immediately so affected with the noxious Exhalations, as to fall into a Deliquium; and will, all the remaining Part of the Day, languish under a terrible Nausea. When, in any Disease, the corrupted Bile is lodg'd about the Præcordia, the Patient is observ'd to be highly weak; and, when these Sordes are remov'd, his Strength returns. When, therefore, in a Gangrene, a Putrefaction is either present, or its Formation dreaded, it is obvious, that these fragrant Aromatics, especially when mix'd with Acids, are of singular Service. *Hildanus*, in his Treatise *de Gangræna & Sphacelo*, *C.* 12. together with other Authors, recommend the bezoardic Powders, prepar'd Pearls, the Bone of a Stag's Heart, and other Medicines of a like Nature. But *Rhenish* Wine, with the Peel and Juice of Citrons, Cinnamon, and Nutmeg, are far more efficacious. And if a violent Fever, or an intense Heat, contraindicate the Use of hot Medicines, Elder-rob, and Rose-leaves, with Vinegar, will excite the Spirits, and produce a grateful Coolness.

As for those Medicines which preserve the Circulation of the Fluids; as a Gangrene is such a Disposition of the soft Parts, as, after the Abolition of the Influx and Efflux of the vital Humours, tends to produce Death, the Circulation of the Blood thro' the Vessels is, with the utmost Care, to be maintain'd, in order to prevent this. Now the Circulation of the Humours is stopt, either through a Fault of the Fluids to be transmitted, or of the Vessels transmitting, or a Defect of the Causes producing Motion. All those Substances, then, which dilute and attenuate the Fluids, open the Vessels, and, by their gentle Stimulus, excite the moving Cause, are highly proper in Cases of this Nature. Hence Decoctions of the Roots of Grass, Burdock, and Scorzonera, as also of the aperient Roots, together with Infusions of Sanders and Sassafras, are of singular Service in these Disorders; because, by their diluting, resolvent, aromatic, and stimulating Quality, they answer all these Intentions.

As for the Age of the Patient; quite different Measures are requir'd in decrepit Old-age, where every thing is languid, and the State of the Blood cold and mucous, from those to be taken in a robust young Man. The Bodies of Women are, if all other Circumstances are alike, more lax than those of Men, and easily chang'd by the slightest Causes; and yet they more easily bear the greatest and most sudden Changes: This is sufficiently obvious from the menstrual Discharge, Gestation, the Birth of the Fœtus, the Lochia, and excessive uterine Hæmorrhages. Hence the Female Sex require a different Treatment from Men. A Difference, also, arises from the various Seasons of the Year; for, in the Summer-heats, especially if the Constitution of the Air is moist, all the Parts tend to Putrefaction; whereas in the Winter they may be kept uncorrupted.

As for Substances of the refrigerating Kind; we are first to examine, whether the Patient's Strength is defective, or not. If the Pulse is strong, large, and hard; if there is still a sufficient Degree of Heat in the Extremities of the Body; and if the Urine is red, and of an high Colour; we know that the Tone of the Circulation is sufficiently great, and, therefore, not to be increas'd. But if the Pulse is weak, and a Series of Symptoms, opposite to those already enumerated, present, we may conclude, that the Circulation of the Humours is to be accelerated. We must, also, examine, whether the Fluids tend to a putrid alcaline State; or whether a cold mucous Cacochymy predominates in the Habit. In the former Case, grateful stimulating Acids are to be exhibited; and, in the latter, volatile oleous Salts, Elixir Proprietatis, and other Medicines of a like Nature. But the Medicines proper in both these Intentions are specified under the Articles ACIDA and ALCALI.

Those who, after the Shocks of violent Disorders, begin to acquire fresh Degrees of Strength, are said to recover: But though, after the Force of the Disease is subdued, Health returns; yet it is necessary, that, by laudable Aliments, those Parts should be restor'd, which were destroy'd by the Shock of the preceding Disease. Now the Weakness of such Patients renders it necessary, that such Aliments and Liquors should be exhibited as contain a sufficient Quantity of Matter for affording a fresh Supply of Chyle and Blood; but, at the same time, these Substances must be of such a Nature, as to require little or no Action at all of the Vessels and Viscera, in order to transform them to the State and Condition of sound and laudable Juices. The Aliments and Liquors possess'd of these Qualities are distinguish'd by the Epithet *analeptic*: With respect to these, see the Article FIBRA. But in the Choice of these a due Regard must be had to the Age, the Sex, and the usual Method of Living, of the Patient. And as in a Gangrene a Putrefaction is, for the most part, to be dreaded, the Analeptics for this Purpose are generally prepar'd from acescent Substances, such as milky Decoctions of Bread, Barley, and Oats; or of Veal-broth, with Citron-juice. See the Article FIBRA.

As for Epithems of toasted Bread; 'tis certain from physiological Observations, that, in the whole external Surface of the human Body, the Mouths of the bibulous Veins are open, and may, consequently, absorb the contiguous Fluids, and mix them with the Blood: Hence 'tis obvious, that, in order to confirm the Strength, such Medicines as are apply'd to the Skin may be of singular Service. If, therefore, those Substances recommended in the Beginning of this Paragraph are apply'd by way of Epithem, they insinuate their most subtile and fragrant Parts into the bibulous Veins, which convey them forthwith along with the venous Blood to the Heart, from which they are, by means of the Arteries, distributed thro' all the Body: Hence a sudden Restoration of Health ensues; since, by the grateful stimulating Particles of these Bodies, which remain unchang'd by the Action of the Viscera, the Spirits are excited, and the Force of the Heart augmented. These Preparations are principally to be apply'd to those Places adjacent to the larger Veins, such as under the Arm-pits, the Hams, and to the Neck, that the Effluvia absorb'd by the bibulous Veins may be soon

ſoon convey'd to the larger Veins. Theſe Epithems appear beneficial not only in this reſpect, but alſo when apply'd as nearly as poſſible to ſome of thoſe Nerves which we know from Experience to have the greateſt Influence over the vital Functions of the Body. Of this Kind are the Nerves diſpers'd thro' the internal Surface of the Noſtrils: Thus a Perſon ſo fatigu'd, as to be ready to fall into a Syncope, is forthwith recover'd by the fragrant Smell of Bread, immediately taken from the Oven. The ſame holds true of almoſt all Aromatics, whoſe Fragrance, perceiv'd by the Organs of Smell alone, immediately reſtores the Strength. Hence ſimilar Preparations are, with great Succeſs, apply'd to the Region of the Stomach, near the large cardiac Nerves. Theſe are alſo of ſingular Service, when apply'd to the Navel. Medicinal Obſervations ſufficiently prove, that Remedies, apply'd externally to theſe Parts, are ſometimes incredibly efficacious. But, in order to confirm the Strength, ſuch an Application of theſe Epithems is requiſite, as that the Heat of the Body may not diſſipate their ſubtile Fragrance externally. For this Reaſon Bread, ſo toaſted as to become highly bibulous, is to be immers'd with ſuch an Epithem, and apply'd to the naked Skin; then it is to be cover'd with a Sheep's or Swine's Bladder, as ſoft as can poſſibly be found, previouſly anointed with Oil, and ſecur'd by proper Bandage. Thus, in order to confirm the Strength, in Caſes where the Diſorder proceeds from an alcaleſcent hot Cauſe,

Take of *Rheniſh* Wine, one Pint; of Cinnamon, Cloves, Leaves of the Macer, and Nutmeg, each two Drams. Boil in a tall glaſs Phial, plac'd in a Sand-heat; and, with the Decoction, impregnate the toaſted Bread.

In Caſes proceeding from an acid cold Cauſe,

Take of Sal volatile oleoſum, half an Ounce; of the Spirit of Citron-peel, two Ounces; of the Spirits of Lavender, and Mint, each one Ounce; and of the Spiritus Theriacalis, two Ounces: Mix all together, and immerſe the toaſted Bread in the Mixture.

The Ingreſs of the putrid Matter into the Veins is prevented, firſt, By confirming the Strength, and, conſequently, increaſing the Motion of the peccant Matter to the exterior Parts. Secondly, By procuring its free Diſcharge externally: And this Intention is anſwer'd by Fomentations and Cataplaſms, prepar'd of diaphoretic, emollient, and laxative Subſtances; as alſo by Scarifications, Cuppings, Leeches, and external Warmth.

The ſecond Intention of Cure, in a Gangrene, is to hinder the Ingreſs of the putrid Matter into the Veins; for the gangrenous Part either every-where adheres to the ſound Veſſels, or, at leaſt, is contiguous to them, and is generally diſſolv'd gradually into a putrid Gore. Hence the putrid Matter will be eaſily abſorb'd by the Veins, from which terrible Diſorders may ariſe; ſuch as putrid Fevers, Deliriums, and ſudden Loſs of Strength. But the Abſorption of this Matter may be prevented,

Firſt, *By confirming the Strength:* Thoſe Things which render the Circulation of the Humours through the Veſſels free and eaſy, confirm the Strength, as has been already obſerv'd; and, conſequently, the Medicines enumerated above will ſo augment the vital Force, if languid, as all over the Surface of the Body to diſcharge, through the exhaling Arteries the recrementitious Matter, which ought naturally to be eliminated through theſe Emunctories. So long as there is no Obſtruction in theſe minute exhaling Ducts, we obſerve, that, according as the Impetus and Velocity of the Blood are increas'd, a proportionably larger Quantity of Fluids is diſcharg'd from them, either by inſenſible Perſpiration, or Sweat. The Reaſon of this is, becauſe, within the ſame time, a greater Quantity of Fluids is apply'd to the ſecretory and excretory Veſſels. But whilſt theſe minute exhaling Arteries are, by a greater Momentum of the impel'd Fluids, diſtended and dilated, the ſmall abſorbent Veins, contiguous to theſe, muſt of courſe be render'd narrower, and, conſequently, the Ingreſs of the Fluid to be abſorb'd into them, render'd proportionably more difficult. Beſides, the Heat, accompanying an increas'd Motion of the Fluids through the Veſſels, diſſipates the Matter which would have been otherwiſe abſorb'd. In all Diſeaſes, therefore, in which the Circulation of the Humours is increas'd, a Dryneſs is produc'd, in conſequence of the Diſſipation of the moſt ſubtile Parts; whereas, in languid Diſorders, where the Circulation is too ſlow and weak, the Body becomes turgid by an Accumulation of the Humours. But how much the bibulous Veins, in the Surface of the Body, are capable of abſorbing, ſo long as the vital Force remains weak, is ſufficiently obvious from medicinal Obſervations; for 'tis certain, that the Bodies of dropſical Patients, after all the Waters have been eliminated, again become tumid in a ſhort time, though they carefully abſtain from drinking, and uſe only the moſt dry Aliments. Hence Patients of this Kind ſeem to imbibe the Water, contain'd in the Air, through the bibulous and abſorbent Veins. It will, therefore, be of great Uſe, to render the Circulation ſomewhat briſker, in order to prevent the Ingreſs of the putrid gangrenous Matter into the Veins. And if, unfortunately, any of it ſhould enter, it is to be carried off by Urine, or through the Emunctories of the Skin, till the Strength being confirm'd, the Motion of the Humours to the exterior Parts is increas'd.

As for procuring a free Diſcharge of this Matter externally; in the Cure of Abſceſſes, 'tis abſolutely neceſſary, that, after the inflammatory crude Matter is maturated, it ſhould be convey'd to the exterior Parts of the Body, leſt, being abſorb'd, it ſhould infect the Blood with a purulent Cacochymy, and give Riſe to a great Number of very terrible Diſorders. But, in the Cure of a Gangrene, the Conveyance of the Matter to the exterior Parts is ſtill more carefully to be procur'd; becauſe a gangrenous Matter is far more virulent than Pus. But nothing more effectually prevents this Conveyance to the external Parts, and, at the ſame time, ſuffocates thoſe which are ſubjacent, than when the Skin is indurated, and becomes gangrenous, and parch'd like Leather; for if, in this Caſe, a ſufficiently briſk Motion of the Humours remains in the live Parts, every thing will be corrupted under this Skin, which reſembles a Cruſt. It will, therefore, be highly expedient, by Fomentations and Cataplaſms, continually to keep the gangrenous Part moiſt, and ſo to open all the Pores, that all the live Veſſels may perſpire freely. Water, and all Remedies, in which that Fluid predominates, excellently anſwer this Intention: Emollient and laxative Subſtances are to be added at the ſame time. But ſince, in a gangrenous Part, the Circulation of the Humours is defective, and, conſequently, the Heat which depends on this Circumſtance, external Heat is neceſſary, leſt the Fomentations and Cataplaſms apply'd ſhould become cold. This is obtain'd by the Application of Bricks warm'd; which are alſo of ſingular Service in alleviating Colic Pains. 'Tis true, by the Heat and Moiſture, the Putrefaction is augmented in the Parts already mortify'd; but, at the ſame time, their Separation from ſuch as are alive, is facilitated. Hence theſe Remedies are never us'd, except when there are ſome Hopes of obtaining ſuch a Separation. *Celſus*, in the 26th Chapter of his fifth Book, when treating of the Cure of a Gangrene, gives us the ſame Caution in the following Words: "So long "as the Diſorder ſpreads, no Medicines, which promote the "Formation of Pus, are to be us'd; and, therefore, warm "Water is to be rejected;" for, ſo long as the Diſorder ſpreads, the Putrefaction would be augmented by theſe, and the adjacent Parts more quickly infected. But Fomentations and Cataplaſms, intended againſt Gangrenes, are generally mix'd with ſuch Subſtances as effectually reſiſt Putrefaction, and, at the ſame time, by their penetrating aromatic Quality, put the ſtagnant Fluids into Motion. But, ſince all theſe are eaſily reſolv'd in Water, and, at the ſame time, have ſo ſubtile a Fragrance, by which they open all the Veſſels, without too great an Increaſe of the Motion, and as they alſo generally increaſe the Evacuation by the cutaneous Pores, they are therefore call'd Diaphoretics. Thus a Fomentation againſt a Gangrene may be prepar'd in the following manner:

Take of recent Rue, four Handfuls; of Mallows, two Handfuls; of *Alliaria* [Jack by the Hedge], one Handful; and of the Meal of Linſeed, one Ounce. When theſe are boil'd in a cloſe Veſſel, with a ſufficient Quantity of Water, to four Pints of the Decoction, add two Drams of Venice Soap for a Fomentation, to be apply'd with woolen Cloths.

Or,

Take of the Vinegar of Elder, two Ounces; of Elder-flower-water, ten Ounces; of Sal Ammoniac, two Drams; and of white *French* Wine, ſix Ounces: Mix for a Fomentation.

A Cataplaſm againſt a Gangrene may be prepar'd in the following manner:

Take of the Flowers of Elder, Melilot, Marſhmallows, Chamomile, and Marigolds, each three Ounces. When theſe are boil'd in Water to a Cataplaſm, towards the End, add of the Meal of Linſeed, one Ounce; and of the Oil of Linſeed, an Ounce and an half.

As for Scarifications; theſe are of ſingular Uſe, if the Membrana Adipoſa, diſtended to a great Thickneſs with an inflammatory Matter, becomes gangrenous; for, in this Caſe, the whole Bulk of the corrupted and mortify'd Portion ſo lies upon the ſubjacent live Parts, as, by its Compreſſion, to ſuffocate them; whilſt, at the ſame time, the Fomentations or

Cataplaſms apply'd cannot penetrate ſo far as to prevent the Entrance of the putrid Matter into the Veins. Hence, by means of Scarifications, Emunctories are, as it were, made in the gangrenous Part, through which, in conſequence of an Increas'd Motion, the corrupted Matter may be expel'd, and thoſe things admitted, which not only correct a preſent, but alſo prevent a future, Putrefaction. But theſe Scarifications ought only to be made in the mortify'd Part, but to penetrate, however, as near as poſſible, to the live Parts, without hurting them. Thus they may be made without any Pain, and as, by this means, a crude Wound is not made in the live Parts, the Ingreſs of the putrid Matter into the Veins will not ſo eaſily happen, as it would have otherwiſe done; for we are taught, by the Bites of venomous Animals, how eaſily the Poiſon is receiv'd into the Veins in a crude Wound.

As for Cuppings; when the Preſſure of the Atmoſphere is remov'd from the Part to which the Cupping-glaſs is applied, the Impetus of the Blood as yet moving through the live Parts, it will diſtend the Veſſels, raiſe the mortified Portion lying over them, and repel the putrid Matter. Beſides, ſince the adjacent Veſſels, being compreſs'd by the mortified Part, could not be diſtended by the impel'd Humours, moſt Part of this Preſſure being taken off by the Cupping-glaſs, the Paſſage will again become free to the Fluids which ought to move through theſe Veſſels. Thus Life will be reſtor'd to thoſe Parts, which, in conſequence of a deſtroy'd Influx and Efflux of the Humours, tended to a Mortification. The Efficacy of Cuppings, in order to reſtore defective Life and Nutrition, is ſufficiently obvious from medicinal Obſervations. Cuppings are alſo of ſingular Service, when applied to the live Parts adjacent to a Gangrene, in order to increaſe, at once, the Impetus and Quantity of the vital Humours convey'd thither; for by this means, as we ſhall afterwards ſhew, the Fibres uniting the Gangrene to the Parts will be divided, and a Separation obtain'd.

As for Leeches; theſe Animals wound the Part of the Body, to which they are applied, with their Mouths, ſuck out the Blood, and often keep themſelves ſo obſtinately fix'd as not to quit their Hold, till, being full of Blood, they can retain it no longer; or till, being ſprinkled with Nitre, Salt, or ſome other ſuch Subſtance, they drop from the Part to which they adher'd. And, after theſe Animals are remov'd, the Blood often continues to be diſcharg'd, eſpecially when they have been applied to the hæmorrhoidal Veins; and that ſo copiouſly, that Authors, who have wrote concerning the Uſe of Leeches, have ſpecified Medicines, by which this exceſſive Diſcharge may be ſtopt. The whole Action of Leeches, therefore, is to wound the Veſſels, and, by Sucking, extract the Blood; ſo that, by diminiſhing the Reſiſtance, the Blood is convey'd to the Parts in a larger Quantity, and with a greater Impetus. Leeches, therefore, produce the ſame Effect with Cupping; eſpecially if the Part to which the Glaſſes are applied, is previouſly ſcarified. They are, therefore, principally us'd in Caſes where the Patients are afraid of Scarification; or when the Situation of the Part is ſuch, that Cupping-glaſſes cannot be applied. Theſe Animals will not, however, readily fix on a mortified Portion of the Body, but may be applied hard by the gangrenous Part.

From what has been ſaid, it is obvious, that, in theſe Caſes, ſuch a Method is recommended as the Antients us'd againſt the Bites of venomous Animals. *Celſus*, in the 27th Chap. of his 5th Book, in Bites of this Kind, recommends Cupping, and an Inciſion made with a Knife, about the Edges of the Wound, that more of the corrupted and contaminated Blood may be extracted. If Cupping-glaſſes cannot be had, he adviſes a Man to ſuck the Wound; which, he ſays, may be ſafely done, provided he has no Ulcer in his Mouth. Then he order'd the bit Patient to be lodg'd in a warm Place, the Wound to be fomented with live Animals, ript up, and applied warm, and then proper Antidotes to be exhibited. And, if theſe laſt could not be had, he orders unmix'd Wine, with a little Pepper, to be exhibited, or any other Thing capable of exciting Heat.

A beginning Putrefaction is corrected, firſt, by removing its ſenſible Cauſes.

In this Caſe nothing general can be determin'd; but it is requiſite we ſhould previouſly inveſtigate the Cauſes before enumerated, from which the Gangrene, and the ſubſequent Putrefaction have drawn their Origins. For thoſe Meaſures, which, in one Caſe, are highly beneficial, are, in another, highly injurious and deſtructive. Thus, for Inſtance, in that Species of Gangrene which is ſubſequent to great Weakneſs, or the languid State of Old-age, hot Cardiacs, of a ſtimulating and rouſing Nature, are of the greateſt Service: But theſe very Medicines would be highly prejudicial in Gangrenes ariſing in hot young Conſtitutions, after violent Inflammations.

Secondly, By correcting its proximate Cauſe, which conſiſts in the Stagnation and Heat; firſt, By guarding the ſtagnating Fluids againſt Putrefaction. Secondly, By fortifying the Solids againſt the ſame Misfortune. And, thirdly, By procuring a due Degree of Motion to the corrected ſtagnant Liquors, through the Veſſels thus fortified and ſecur'd againſt Putrefaction.

How much Stagnation and Heat contribute to Putrefaction, is ſufficiently obvious from Experience. A ſound Man may live for eighty Years, without having any Putrefaction form'd in his Body; but the whole Carcaſe of the moſt wholſome Youth will become putrid in two Days time, eſpecially if the Atmoſphere is intenſely hot. Stagnation alone does not produce Putrefaction, or, at leaſt, very ſlowly, as we obſerve in the Fleſh of kill'd Animals, which, in the Winter-time, may be kept uncorrupted for ſeveral Weeks. Nor does Heat alone eaſily produce Corruption, unleſs Stagnation concur. Rivers, whoſe Waters flow continually, are pure and limpid, under the moſt ſcorching Heat; whereas the Waters of Ponds and Lakes diffuſe a diſagreeable Stench, during all the Summer. Hence *Galen*, in *Comment. 3. in Lib. 3. Epidem.* juſtly took notice of this Circumſtance, in the following Words: "All "Putrefaction ſeems to be produc'd from a moiſt and humid "Matter, and to have, for its efficient, external, and preter-"natural Cauſe, Heat, which operates more powerfully, and "augments the Putrefaction, when Immobility or Stagna-"tion concurs with it." That the Putrefaction may, therefore, be check'd and remov'd, it is requiſite, the intenſe Heat ſhould be mitigated, and the ſtagnant Fluids put in Motion.

As for guarding the ſtagnant Fluids againſt a Putrefaction; ſince, in order to the Cure of a Gangrene, 'tis neceſſary the ſtagnant Fluids ſhould be put in Motion, and again circulate through the Veſſels, with the other Humours, 'tis ſufficiently obvious, that the Phyſician ought carefully to guard againſt their Putrefaction; for, if they ſhould be put in Motion, after they are become putrid, they would deſtroy the tender Veſſels, and corrupt the laudable Humours, with which they ſhould be mix'd. 'Tis certain, that the Blood is diſſolv'd, and the minute Veſſels deſtroy'd, by putrid Subſtances; and conſequently, that all the Actions of the Solids and Fluids are, by this means, deprav'd; from which numberleſs Diſorders may ariſe. In caſe of putrid Scurvies, and where there is a Redundance of black Bile, the corrupted and ſtagnant Humours cannot, without the greateſt Danger, be put in Motion, as we learn from daily Experience.

As for fortifying the Solids againſt Putrefaction; not only the Humours alone are chang'd and corrupted by Putrefaction, but the ſolid Parts alſo loſe their Coheſion, ſo that the Fleſh of Animals, in an hot and moiſt Air, are diſſolv'd into an highly fetid Gore. But, according to the various Degrees of Putrefaction, the Coheſion of the ſolid Parts is more or leſs chang'd, as is daily obſerv'd in preparing Aliments; for newly-kill'd Fleſh is generally tough, if us'd in this Condition; but, when kept for ſome Days, loſes much of its Toughneſs. But, when it remains in the open Air, till it acquires the ſlighteſt Degree of Putrefaction, it becomes ſo highly tender as to diſſolve almoſt in the Mouth, whilſt it is eaten. Hence *Pliny*, in the fifth Chapter of his twenty-fifth Book, informs us, "that the *Gauls*, when they went a "hunting, ting'd their Arrows with Hellebore, and affirm'd, "that, by this means, and making an Inciſion round the "Wound, the Fleſh of the Animal kill'd was render'd "more tender;" becauſe the poiſonous Quality of the Hellebore brought on a beginning Putrefaction in the Fleſh.

As for procuring the Motion of the corrected ſtagnant Fluids thro' the Veſſels fortified againſt Putrefaction; after the two before-mention'd Ends are obtain'd, then the Motion of the Humours may ſafely be excited; for, if the putrefied ſtagnant Humours have acquir'd a conſiderable Acrimony, or if the Coheſion of the Veſſels is much weaken'd by the Putrefaction, or if both theſe Misfortunes ſhould concur, by exciting this Motion the Veſſels will be ruptur'd, the Humours diſcharg'd, the Putrefaction augmented, and, conſequently, the Gangrene ſo far from being cur'd, that it will rather increaſe, as is obvious from what is ſaid under the Article INFLAMMATIO.

The Fluids are preſerv'd from Putrefaction by Applications of Salt, Vinegar, Wine, Spirits of Wine, and Aromatics.

In the *Materia Medica* there are Subſtances capable of preſerving the Parts of Animals from every Degree of Putrefaction; but ſince, beſides this Circumſtance, it is neceſſary the ſtagnant Fluids, corrected and preſerv'd by theſe Medicines, ſhould afterwards be mov'd through the Veſſels duly fortified, it is ſufficiently obvious, that theſe Antiſeptics ought to be of ſuch a Nature as neither to deſtroy thoſe Qualities of the Veſſels, nor of the Fluids, which are requiſite to this Motion. Hence the Parts ought to be preſerv'd, like a Carcaſe embalm'd; but the Life of the Part muſt be kept up, and reſtor'd, if defective. Theſe Intentions are principally obtain'd by the Application of the following Subſtances.

As for Salt; the Fleſh of Animals, which in a few Days becomes putrid, may be kept long uncorrupted, if ſprinkled with Sea-ſalt, or immers'd in its Brine: But 'tis obſervable, that, by theſe means, the Fleſh is render'd harder. Sea-ſalt, Sal Gemmæ, Sal Ammoniac, and Nitre, are, for theſe Purpoſes, to be diſſolv'd in Fomentations, and apply'd to the gangrenous Parts.

As for Vinegar; this Fluid is an excellent Antidote againſt all Putrefaction; for which Reaſon it was ſo much us'd by the antient Phyſicians in all putrid Diſorders: Even the very Smell of it refreſhes Patients labouring under Diſeaſes of this kind. Beſides, 'tis certain, from daily Experience, that the Fleſh of Animals is as well preſerv'd from Putrefaction by Vinegar, as by Salt. Vinegar, alſo, is attended with this additional Advantage, that it neither greatly indurates the Solids, nor coagulates the Fluids, but rather reſolves and attenuates the Blood. The other more draſtic Acids, obtain'd by the Force of Fire from foſſile Subſtances, ſuch as the Spirits of Nitre, of Sea-ſalt, of Sulphur, and of Vitriol, prevent Putrefaction, but at the ſame time coagulate the Fluids, and contract and indurate the Solids, which they even deſtroy, if they are intenſely ſtrong. Hence 'tis obvious, that Vinegar, an Acid prepar'd by a gentle Fermentation, muſt be far preferable to them.

As for Wine, and the Spirits of Wine; 'tis ſufficiently known, that in *Germany* the Fleſh of Boars, immers'd in Wine, is not only preſerv'd from Putrefaction, but alſo remains tender. Hence 'tis obvious, that there is in Wine an antiſeptic Virtue, which excellently anſwers this Intention. The Spirit of Wine alſo, and Alcohol prepar'd from it, are efficacious Remedies againſt all Putrefaction, but, at the ſame time, they coagulate the Blood and its Serum, corrugate and contract the Veſſels, for which Reaſon they may preſerve the mortify'd Part, and keep the Putrefaction from ſpreading: But Life can never return to thoſe Parts which have been long preſerv'd with Alcohol of Wine. Spirit of Wine, therefore, diluted with Water, will be more proper, ſince, though 'tis weaker, it is yet capable of preſerving the Parts from Corruption, and will neither contract the Solids, nor coagulate the Fluids.

As for Aromatics; in *Boerhaave*'s *Materia Medica* there are a great many Aromatics enumerated, which are of ſuch a Quality, that, when ſprinkled upon Carcaſes, they not only preſerve them long from Putrefaction, but alſo prove refreſhing by their grateful Odour. Among theſe, the moſt extol'd are, Scordium, *Alliaria* [Jack-by-the-Hedge], Rue, Sage, Horehound, Wormwood, and Tanſey. *Galen*, in the twelfth Capter of his firſt Book *de Antidotis*, tells us, that Authors of unqueſtionable Veracity have affirm'd, that after Battles, when the Bodies of the Slain have been for many Days unbury'd, thoſe who fell on Scordium, caſually growing on the Field, were much leſs corrupted than others; and that thoſe Parts of their Bodies, which immediately touch'd this Herb, were abſolutely free from Corruption. *Hildanus*, in his *Obſervat. Chirurg. Cent. 2. Obſervat.* 94. beſtows the like Virtues on Alliaria; and, tho' he prefers Scordium to it, yet he depended ſo much on its Efficacy in the Cure of a Gangrene and Sphacelus, as alſo of putrid and ſordid Ulcers, that he expreſs'd its Juice in the Spring, and preſerv'd it in glaſs Phials, by pouring Oil on its Surface, that he might not be deſtitute of ſo ſalutary a Remedy in the Winter-time. In all theſe Plants there is a ſubtile Fragrance, on which their medicinal Virtues depend; but by long boiling, eſpecially in open Veſſels, this Fragrance is diſſipated in the Air, and the remaining Decoction is poſſeſs'd of ſcarcely any Virtues at all. 'Tis, therefore, moſt expedient to infuſe theſe Herbs in cloſe Veſſels, with Water almoſt boiling; and then, expreſſing the Liquor, to add Wine-vinegar, or Salt. The recent Herbs, alſo, triturated to a Poultice, with an Addition of Salt and Vinegar, may be apply'd to the gangrenous Parts, by way of Cataplaſm. How beneficial theſe, and other Subſtances of a like Nature, are, in Diſorders of this kind, is obvious from the Article CONTUSA. The Salts, the Vinegars, and the Aromatics, proper for theſe Intentions, are, according to *Boerhaave*, theſe following:

Sal Ammoniac, Borax, Sal Gemmæ, Nitre, Sea-ſalt, Regenerated Salt remaining after the Diſtillation of Spirit of Sal Ammoniac, Vinegar, Vinegar of Marigolds, diſtil'd Vinegar, Vinegar of Garden Tarragon, Vinegar of Lavender, Vinegar of Roſes, Vinegar of Rue, Elder-vinegar, Vinegar of Squills, and the Acetum Theriacale; Spirit of Nitre, of Salt, of Sulphur by the Bell, and of Vitriol, either ſimple, or with three times the Quantity of Alcohol; *Rheniſh* Wines are, in a particular manner, proper for this Purpoſe.

The Aromatics anſwering this Intention are the following: Southernwood, Wormwood, Alliaria, Angelica, Balſamita, *Carduus Benedictus*, Leſſer Centaury, Germander, *Cretan* Dittany, Herb Robert, Lavender, Marjoram, white Horehound, Myrtle, Origanum, Polium, Penyroyal, Roſemary, Rue, Savine, Sage, Water Germander, Tanſey, Thuya. Thus:

Take of the Leaves of Rue, Water Germander, and Wormwood, each four Ounces; and, of Mint, one Ounce: Boil in a cloſe Veſſel, with a ſufficient Quantity of Water and Vinegar; and, to every four Pints of the Decoction, add, of Sal Gemmæ, four Drams; and, of the Spiritus Vini Theriacalis, two Ounces, for a Fomentation. Or, for a Cataplaſm,

Take the ſame Ingredients, boil up to the Conſiſtence of a Cataplaſm; adding towards the End, of Sal Ammoniac, four Drams; of the Meal of Linſeed two Ounces, and of the Oil of Rue, by Infuſion, an Ounce and an half; make into a Cataplaſm, at the time of Uſe, to be ſprinkled with a little of the Spiritus Vini Theriacalis, or camphorated Spirit of Wine.

By the ſame Medicines the Solids are preſerv'd untouch'd, and free from Putrefaction.

This is ſufficiently obvious; for the Solids are not naturally very ſubject to Corruption, but only become ſo, becauſe they are acted upon by the Fluids they contain in their Cavities. Hence, when the Fluids are diſſipated by drying, the Parts of Animals are capable of being long preſerv'd without Putrefaction.

The ſtagnant Fluids are put in Motion by diluting them with aqueous Liquors copiouſly drank, and apply'd; by ſtimulating the Arteries by ſuch Medicines as are oppoſite to the Diſorder; by putting the Fluids in Motion, by means of Heat, Friction, and cardiac Medicines; and, laſtly, by removing the Redundance of the Blood, which diſtends the Veſſels too much, by Veneſection.

From the Definition of a Gangrene, 'tis obvious, that the Fluids ſtagnate in their Veſſels in a Part affected with a Gangrene, ſince the vital Influx of the Humours thro' the Arteries, and their Efflux thro' the Veins, ceaſe. Now, by Stagnation and Reſt, 'tis certain, that the Molecules of our Fluids are mutually united to each other, ſo that, in order to put the ſtagnant Fluids in Motion, 'tis neceſſary theſe concreted Molecules ſhould be ſo divided, as to be capable of paſſing thro' the narrow Extremities of the Veſſels. Beſides, when the Molecules are divided, 'tis requiſite a certain Motion ſhould be procur'd to them, which they wanted whilſt they were in a State of Stagnation; and, if the Cavities of the tranſmitting Veſſels ſhould happen to be diminiſh'd by any Cauſe, this Cauſe is to be remov'd. All theſe Ends are obtain'd by the following Means.

As for diluting the Fluids with aqueous Liquors; almoſt the whole Surface of the Skin is furniſh'd with the Mouths of the minute abſorbent Veins. Hence, diluting Medicines, apply'd externally to the Part affected, may inſinuate themſelves into theſe Mouths, and conſequently be mixt with the Blood, and by the common Laws of the animal Œconomy diſtributed thro' all the Parts of the Body. Now, 'tis certain, not only, that diluting Medicines are of ſingular Efficacy in reſolving the Concretions of the ſtagnating Blood, but alſo that diluent Fomentations, apply'd to the Part affected, are not only beneficial, in ſo far as they inſinuate their diluting aqueous Parts into the abſorbent Veins, but alſo, becauſe, by relaxing all the Veſſels, they increaſe the Quantity and Impetus of the vital Fluid in the Part, and conſequently the diluting Liquid mixt with the whole Maſs of Blood will be more deriv'd to theſe Parts. 'Tis alſo certain, that Diluents, when externally apply'd, may alſo enter the Extremities of the exhaling Arteries, if the greater Ramifications, from which theſe minute Arteries are diſtributed, ſhould be obſtructed; for then their laſt Terminations, being empty, will abſorb the contiguous Liquids, juſt as all ſmall Tubes imbibe Fluids. If, whilſt Subſtances of this kind are apply'd externally, a large Quantity of theſe Fluids is drank, the Reſolution of the concreted Humours will be obtain'd, ſo far as that End can be anſwer'd merely by diluting Liquors.

As for ſtimulating the Arteries by Medicines oppoſite to the Nature of the Diſorder; ſince, with reſpect to our Fluids, Water is almoſt the only diluting Liquor; and ſince it is of itſelf languid and inactive, the Motion of the Heart and Arteries is requiſite, in order to render it active, and capable of producing the deſign'd Effect. In the gangrenous Part the Fluids are ſtagnant. Hence, tho' Diluents ſhould be us'd both internally and externally, yet no good Effect can be produc'd, unleſs this Motion is excited. Hence, on this Occaſion, a pretty briſk Motion in the whole Body, that is, a gentle Fever, is always beneficial. Hence, in Conjunction with Diluents, ſuch Medicines, as by their gentle Stimulus ſomewhat increaſe the Motion, are to be exhibited; ſuch as Infuſions of Saſſafras-wood, the three Sanders, Rue, and Alliaria. And, as the ſpontaneous Corruption of our Humours, whilſt they ſtagnate, always tends to Putrefaction, to theſe Infuſions are to be added the moſt grateful Acids, and eſpecially the expreſs'd Juices of Vegetables, ſuch as thoſe of Lemons, Oranges, and Currants; or fermented Acids, ſuch as Wine and Vinegar; all which are ſo far from coagulating, that they rather attenuate and dilute the Blood,

Blood. According, therefore, as the Danger of a Putrefaction is greater or leſs, Acids are proportionably more or leſs to be exhibited, both among Aliments, and by way of Medicine. But when a Gangrene ariſes from the faint and languid State of Old-age, and when there are as yet no Signs of Putrefaction, volatile oleous Salts, aromatic Elixirs and Tinctures, may be of Service.

As for putting the Humours in Motion by Heat; an equable Heat, diffus'd over all the Parts of the Body, to the very Extremities, always attends a State of Health. As the Powers of Life are either increas'd or diminiſh'd, the Heat is in like manner proportionably augmented or impair'd. At laſt, when, in a Carcaſe, all Principle of Life ceaſes, Cold is produc'd, and all the Parts are in a State of Reſt. But Heat is not only the Sign and Concomitant of Life, but alſo the latent and languid Principle of Life is, by its means, rous'd, and render'd more active and vigorous. Frogs are not only render'd torpid by the Winter Cold, but often retain'd immoveable by being buried in the Middle of the Ice; however, when they are put into a Stove, their Agility returns. The vital Stamen of a Chick, contain'd in the Colliquamentum, remains there inactive, and without Growth, till, by a due Degree of Heat, the latent Principle of Life is rous'd; and, from the Obſervations of the accurate *Reaumur*, it is ſufficiently obvious, that the Life of Inſects may be rous'd, depreſs'd, prolong'd, or ſhorten'd, at Pleaſure, according to the greater or ſmaller Heat they happen to be expos'd to. Much, therefore, is to be expected from external Heat, in order to put the ſtagnant Fluids in Motion; provided, at the ſame time, ſuch Medicines are us'd, as are capable of preventing the Putrefaction, which is otherwiſe to be dreaded.

As for Frictions; their various Uſes, and the Methods in which they excite greater Heat, either in the whole Body, or in any particular Part of it, are ſpecify'd under the Article FIBRA. For our preſent Purpoſe, 'tis ſufficient to obſerve, that the alternate Compreſſion and Relaxation of the Parts, which happens in all Friction, ſupplies the natural Action of the Fluids they contain; and, therefore, the ſtagnant Fluids may be put in Motion by Friction, which, in this Caſe, is ſo highly neceſſary. Frictions will, therefore, be of the greateſt Service, when Gangrenes of the Extremities, ariſing from the weak and languid State of Old-age, are either preſent or dreaded. But, when Gangrenes are apprehended after violent Inflammations, the ſofteſt and moſt gentle Frictions are only beneficial, ſince, by rude handling, the Veſſels diſtended by the ſtagnating Fluids might be ruptur'd.

As for cardiac Medicines; ſince the Heart is the principal Cauſe of all thoſe Motions on which the vital Force depends, all Remedies, therefore, which increaſe theſe Motions, are call'd Cardiacs, though they do not always act immediately on the Heart itſelf. Theſe Cardiacs are principally of two Kinds; that is, ſuch as reſtore a ſufficient Quantity of ſound Juices, and ſuch as increaſe their Motion through the Veſſels; but 'tis of this latter we here principally ſpeak, ſince the Intention of Cure is to put the ſtagnating Fluids in Motion. Wine, the Juices of Oranges and Lemons, and other grateful Acids of a like Nature, are of ſingular Service in Caſes of this Kind, becauſe they prevent the Putrefaction to be dreaded.

As for Veneſection; as we have now obſerv'd, that, in the Cure of a Gangrene, the vital Strength is to be excited, in order to put the ſtagnating Fluids in Motion, it may poſſibly ſeem ſtrange, that we ſhould recommend Veneſection on this Occaſion, ſince, by it, the Quantity of the Humours is leſſen'd, and the Strength impair'd. But this Evacuation will be beneficial, either when the whole Body is plethoric, or when the Veſſels of the affected Part, being fill'd with a ſtagnant Fluid, are, by the Force and Impetus of the ſucceeding Blood, too much diſtended; for a Stoppage of the Circulation, a Rupture of the Veſſels, and a Gangrene, are to be dreaded from too great Repletion. The ſame Misfortunes are alſo to be dreaded from too violent a Motion of the Blood through the Veſſels. Beſides, by Veneſection, the diſtending Liquid is diminiſh'd, and the Elaſticity of the Veſſels reſtor'd, which is abſolutely neceſſary to the Motion of the ſtagnating Fluids.

It may, perhaps, be thought by ſome, that, by Veneſection, the Ingreſs of the putrid Matter into the emptied Veins is render'd more eaſy. But this ought not to be adminiſter'd, unleſs when there is a pretty violent Fever, by which the Motion to the exterior Parts is render'd briſker, and the Ingreſs of the putrid Matter into the Veins hinder'd. Beſides, there cannot be a great Putrefaction, ſo long as there are any Hopes, that the ſtagnant Fluids may again move through the Veſſels as yet entire and ſound. Hence, though ſomething of this beginning Putrefaction ſhould enter the Veins, it would eaſily be waſh'd out of the Maſs of Blood by diluting Liquors liberally drank, and be eliminated from the Body either by Urine or Sweat.

By theſe Medicines, ſoon apply'd, and frequently repeated, a beginning Gangrene is often happily corrected, and ſucceſsfully remov'd, by a Diaphoreſis.

Though a Gangrene ſeems to be preſent, yet we ought not to deſpair, ſo long as it is not accompanied with thoſe Signs which indicate the Rupture of the Veſſels, and the Effuſion of the putrefy'd Humours; for, if all the Medicines before enumerated are ſoon apply'd, and their Uſe carefully perſiſted in, Life often returns into the Part which was thought mortify'd. Nor will it do any Harm, to make a proper Trial of their Efficacy, provided there are but the faineſt Hopes left; becauſe theſe Remedies will often prove effectual in Caſes where nothing could be expected but the Separation of the mortify'd from the ſound Parts, as we ſhall afterwards obſerve. Though, therefore, the Signs of a violent Inflammation are ſuddenly remov'd, without a Correction of the Cauſe; though the Colour of the Part, before highly red, begins to be chang'd; and even though ſome ſmall Puſtules, full of a lymphatic Ichor, appear on the Skin, which only indicate, that the tender Veſſels, connecting the Skin and Epidermis, are ruptur'd; this Method may, nevertheleſs, be tried; for we have already obſerv'd, that it is not always eaſy to diſtinguiſh a violent Inflammation, from the firſt Beginning of a Gangrene ariſing from it; becauſe a violent Inflammation tends to a Mortification, and the beginning Gangrene has not as yet deſtroy'd all Life in the Part. When, therefore, the Diſorder conſiſts, as it were, in this Boundary between a Gangrene and an Inflammation, the moſt efficacious Remedies are to be applied; for, if the ſame Cauſes continue to act, the Veſſels will ſoon be deſtroy'd, and the diſcharg'd Humours will ſtagnate, and become putrid: But, when the Veſſels are deſtroy'd, there remain no more Hopes, that the ſtagnant Humours can again be put in Motion. Under the Article CONTUSA, there are ſome memorable Caſes related, which teach us, what unexpected Succeſs has ſometimes attended this Method, even in the moſt deſperate Caſes.

But, if the Fluids are already putrefy'd, their moſt moveable Parts exhal'd, and the Veſſels deſtroy'd, the Diſorder will not yield to theſe Remedies, nor will Soundneſs be reſtor'd to the corrupted Part; but the adjacent Veſſels will be much deſtroy'd by the mov'd Humours, whilſt, at the ſame time, the live Parts are not capable of exhaling.

Whilſt the Phyſician or Surgeon tries all the Remedies recommended in the two preceding Paragraphs, he ought, every fourth Hour, to inſpect the Part affected, if it is ſubjected to his Senſes, in order to diſcover, whether the Signs of an increas'd or returning Life appear, or whether every Circumſtance becomes worſe, and the Colour is chang'd into a pale, dark, livid, or black Colour; for then he knows infallibly, that the Part is mortify'd, and the Veſſels ſo deſtroy'd, that there remains no Hope of reſtoring a vital Motion in the Part. The ſtagnant Liquors will, therefore, by a ſpontaneous Tendency of their Nature, become putrid, the Veſſels will be deſtroy'd, and, as the Air acts on the extravaſated Fluids, they will be ſo much the ſooner corrupted. 'Tis ſhewn, under the Article ALCALI, that, by Putrefaction, our Humours are ſo chang'd, that their aqueous Parts are exhal'd, the native, mild, ſaponaceous, and ſufficiently fix'd Salts become acrid, alcaline, and volatile; and the Oils are ſo attenuated, as to become fetid and volatile, whilſt the remaining Part of the Oil, diveſted of its moſt moveable Particles, and united with the more terreſtrial and fix'd Portion of the Humours, conſtitutes a tenacious and viſcid Sordes. All theſe Things happen in a confirm'd Gangrene; and the mortify'd Parts becoming dry, by the Exhalation of the moſt moveable Portion of the Fluids, form a hard, and, frequently, a coriaceous Covering, which is call'd a gangrenous Cruſt. Under this Cruſt, or Eſchar, the live Parts remain, as it were, buried. If, in this Caſe, therefore, by ſtimulating the Arteries, either by cardiac Medicines, Frictions, or external Heat, the Motion of the Fluids through the live Veſſels ſhould be much increas'd, theſe will be preſs'd againſt this hard and impervious Cruſt, and, by the Attrition, a new Inflammation will be produc'd in them, which ſoon tends to a Gangrene; ſo that the Diſorder will ſoon be increas'd to a Sphacelus, whilſt all the Parts, as far as the Bone, are perfectly mortify'd; or the putrid Matter, being put in Motion in the Membrana Adipoſa, will be propagated to the adjacent Parts; and thus the Gangrene will ſpread.

In this Caſe, therefore, the whole Intention is, to ſeparate the mortify'd from the live Parts.

For, as the Circulation of the Humours no longer remains in the Part thus affected, ſo neither can it be reſtor'd, as is obvious from what has been ſaid. The only thing remaining is, therefore, to remove the mortify'd Part, left, by its Preſſure, it ſhould injure the ſubjacent live Parts, or, by its Contagion, infect thoſe which are adjacent.

This Separation is always produc'd by the Force of the vital Fluid flowing to the Boundaries of the gangrenous Eſchar,

Eſchar, ſuffocated there, and forc'd into a Suppuration; by which means the Fibres connecting the Gangrene to the ſound Parts will be divided.

The Manner in which this Separation of the mortified and gangrenous from the live Parts is brought about, is not eaſy to account for; ſince the vital Motion of the Humours thro' the Veſſel, cannot act upon the mortified Part, becauſe it is abſolutely wanting in it; and ſince, by a ſpontaneous Principle of Change, the Separation of this mortified Part cannot be obtain'd, becauſe it is never obſerv'd in a Carcaſe. It, therefore, only remains, that the live Part, contiguous to the gangrenous Eſchar, ſhould ſeparate from it: But, ſo long as the vital Functions continue briſk and ſtrong, a Redneſs and Inflammation are always obſerv'd in that Part where the gangrenous Eſchar touches the live Parts; becauſe, in the Boundary between the mortified and live Parts, the Humours convey'd through the live Veſſels are ſtopt, becauſe they cannot paſs through the gangrenous Eſchar: But an Inflammation ariſing, in this Caſe, cannot be cur'd by Reſolution; becauſe the Terminations of the obſtructed Veſſels cannot be open'd. Hence it will tend either to a Gangrene, or a Suppuration; for, in this Caſe, a Scirrhus is not to be dreaded. The Surgeon is, therefore, to uſe all his Endeavours to bring about a Suppuration, which will be obtain'd, if the Conditions requiſite for a Suppuration, enumerated under the Article INFLAMMATIO, are either ſpontaneouſly preſent, or brought about by the Aſſiſtance of Art. The vital Motion is, therefore, to be ſo regulated, as that it may be greater than in a State of Health, and yet not too great; a mild Quality is to be procur'd to the Humours, and Putrefaction is to be carefully prevented; for, in this Caſe, by the continual Action of the vital Humours, propel'd as far as the gangrenous Part, through the live and pervious Veſſels, the Sides of the Veſſels will be gradually relax'd, and the Coheſion between the live and mortify'd Parts deſtroy'd. From the Extremities of the live Veſſels the Humours will be diſcharg'd, and converted into Pus, as is ſhewn under the Article INFLAMMATIO. And as the gangrenous mortified Part, when no longer moiſten'd with the vital Fluids, and when the moſt moveable Parts are diſſipated, muſt neceſſarily be dried by the Heat of the circumambient Air, and that of the adjacent Parts, it will, of courſe, be contracted in all its Dimenſions; ſo that it will be the more effectually ſeparated from the live Parts, as ſoon as the Extremities of the live Veſſels begin to be, as it were, diſſolv'd, by a Suppuration. In this Caſe, a Gap is form'd, which moſt perfectly ſeparates the gangrenous and mortified from the live Parts; and then there is no longer any Fear, leſt the Gangrene ſhould ſpread; for the gangrenous Eſchar remains, as it were, like an Iſland ſurrounded by the live Parts. But the inferior Part of this gangrenous Eſchar generally remains longer fix'd to the live Parts, though in its Circumference it is perfectly free; till at laſt, the ſame Cauſes continuing to act, it is daily more and more contracted, till it falls totally off, and leaves a ſimple Ulcer. But that a Suppuration is the only Method by which the Parts, ſo corrupted, that they can no longer obey the Laws of the animal Œconomy, can be ſeparated from thoſe which are ſound and alive, is ſhewn under the Article VULNUS. They who have imagin'd, that by cutting, burning, and corroding, they could more ſpeedily procure this Separation of the mortified from the live Parts, have certainly err'd, ſince by all theſe Methods either ſome of the mortified Part is left, or, together with it, the live adjacent Parts are deſtroy'd; for, by touching that Part of the gangrenous Portion, which is next to the live Parts, with Butter of Antimony, or with a cauſtic Liquor, prepar'd of Quick-ſilver diſſolv'd in Aqua-fortis, and ſo much extol'd by *Belloſte*, we may ſometimes hinder the Putrefaction from ſpreading, and affecting the adjacent Parts; but we can never, by this means, obtain the Separation of the mortified from the ſound Part; for, when live Parts are touch'd with theſe acrid Corroſives, they are forthwith render'd mortified, and muſt afterwards be ſeparated from the live Parts by a Suppuration. All, therefore, which can be obtain'd by theſe means is, to place Boundaries, within which the mortified Parts remain; but theſe Parts are, at the ſame time, ſo impregnated with theſe highly concentrated acid Spirits, as totally to hinder the Progreſs of the Putrefaction. Thus there is a kind of Boundary made, which cuts off all the Commerce and Communication between the live and the putrid gangrenous Parts. But this Boundary is itſelf mortified, and muſt be ſeparated from the live Parts, to which it adheres; and this Separation is only accompliſh'd by a Suppuration brought about by Nature, as we have already obſerv'd.

'Tis certain, from chirurgical Obſervations, that the Scarification of gangrenous Parts is often of ſingular Service, ſince, by this means, the Force of antiſeptic Medicines penetrates more deeply, and Putrefaction is the more effectually prevented. 'Tis, at the ſame time, equally certain, from Experience, that the cutting the gangrenous from the ſound Parts, by a Knife, is always an unſafe and dangerous Method: But where gentle Scarifications are us'd, Putrefaction prevented, by proper Fomentations, and the Buſineſs of Separation left to Nature, after the Force of the Diſeaſe is ſubdued, and the Strength reſtor'd, the Cure almoſt always proves ſucceſsful, even in pretty deep Gangrenes. *La Motte* informs us, that he had frequently ſeen gangrenous Cruſts, form'd about the Os Coccygis, and the adjacent Parts, by long lying in Bed, ſpontaneouſly ſeparated, in poor Perſons, who had no Care taken of them. *Van Sweiten* informs us, that he has often ſeen Inſtances of the ſame Kind, though no Scarifications were uſed, but the Parts only fomented with Wine, Vinegar, and Salt, in order to prevent Putrefaction.

'Tis, therefore, obvious, that the Art of treating a Gangrene muſt conſiſt, firſt, In taking the Meaſures already directed. Secondly, In haſtening the Suppuration. And, thirdly, In ſoftening the Eſchar.

Since, from what has been ſaid, 'tis obvious, that, by a Suppuration alone, a perfect Separation of the mortified from the live Parts can be produc'd, this Suppuration is carefully to be promoted and accelerated. And, whilſt it is expected, and forming, we are to take care, leſt too great a Putrefaction ſhould be produc'd, which may either infect the adjacent Parts, or, being abſorb'd into the Veins, diſorder the whole Body. But of this we have already treated: And as a gangrenous Eſchar, after the moſt fluid Parts are diſſipated, ſometimes acquires the Rigidity of dry'd Leather, it is obvious, that it muſt be more eaſily ſeparated, after 'tis previouſly ſoften'd, and render'd moiſt.

In order to accelerate a Suppuration, a Scarification of the putrified Part, to the very Beginnings of the live Parts, is conducive; for, by this means, the too great Suffocation being diminiſhed, an Abſceſs is form'd, inſtead of a ſpreading Gangrene, by which the Skin, and gangrenous Fat, are, for the moſt part, ſeparated from the ſubjacent live Parts.

In ſome Parts of the Body the Membrana Adipoſa, the principal Seat of a Phlegmon and Gangrene, is conſiderably thick; and, even when it is thin, it is ſometimes diſtended to an incredible Bulk, by ſtagnating Blood. Now, if a Gangrene ſeize the Whole of this Maſs, the live Muſcles and Tendons will remain buried under this mortified Part, which they are not capable of removing. Hence a Suffocation is to be dreaded, and there is great Danger, leſt all the Parts ſhould be corrupted, as far as the Bone, and the Gangrene degenerate into a Sphacelus. In order to prevent this, Surgeons generally make Inciſions in the gangrenous Part, parallel to each other, and differing in Number and Length, according to the Bulk of the Part affected: Sometimes to theſe longitudinal Inciſions they add tranſverſe ones, which decuſſate them. The Depth of theſe Inciſions ought to be ſuch, as not to injure the ſubjacent live Parts, but, at the ſame time, to divide the mortified, as near as may be, to the ſound; for it would be cruel, and often dangerous, to divide the live Parts with the Knife; and the Ingreſs of the gangrenous and putrid Matter into the Veins would become more eaſy, by its touching upon ſuch a crude Wound, which, however, is carefully to be guarded againſt. Hence the Antients order'd Inciſions to be made in gangrenous Parts, as far as the live ſubjacent Parts. Thus *Celſus*, in the 26th Chapter of his fifth Book, when treating of the Cure of a Gangrene, uſes the following Words: "Whatever Part is dry, and, in any "meaſure, prejudicial to the adjacent Part, is to have an In-"ciſion made in it, as far as the ſound Parts." By this means, Vents are, as it were, made, through which the ſubjacent Veſſels may riſe, and not only remove the mortified incumbent Parts, but alſo ſupply what was corrupted by the Gangrene. The ſame happens in this Caſe, which happens in Wounds of the Head, when the Cranium is perforated with ſmall Holes, to different Depths, according to the different Degrees of Corruption; for the ſubjacent Veſſels riſe through theſe Punctures, the Parts of the corrupted Bone are ſeparated, and what was loſt is reſtor'd. Beſides, when gangrenous Parts are thus divided, an eaſier Ingreſs is procur'd to antiſeptic Fomentations, the mortify'd Parts are impregnated with theſe, and effectually defended from all Degrees of Putrefaction: The Softneſs of the Eſchar may alſo be more eaſily obtain'd, whilſt Emollients apply'd may inſinuate themſelves into theſe Apertures. After theſe Meaſures are taken, if the vital Force is ſtrong about all the Circumference of the gangrenous Portion, the live Parts will be inflam'd, and a Suppuration will happen; by means of which the whole mortify'd Part, ſoften'd and divided by Scarifications, will be gradually ſeparated; and then the Gangrene becomes an Ulcer, but of the ſordid Kind, which, however, is daily more and more cleans'd, whilſt the Skin and Membrana Adipoſa, which are, for the moſt part, only affected with a Gangrene, wither away, as it were, and are ſeparated from the ſubjacent live Parts. But, when a Gangrene ſeizes ſuch Parts as are only cover'd with little Fat, the gangrenous Cruſt is not ſo thick as to require theſe Scarifications, which could not be commodiouſly made,

without injuring the ſubjacent live Parts. Thus, when, lying in Bed, Gangrenes ariſe about the Os Coccygis, and the Os Sacrum, ſuch a gangrenous Cruſt is rarely found, becauſe theſe Bones lie almoſt immediately under the Skin, without the Interpoſition of any Fat.

But, that the more Blood may be convey'd into theſe Boundaries, Leeches, Cupping-glaſſes, and other Remedies of an attracting Nature, often applied, are of Service.

Concerning theſe we have already ſpoke; but we muſt here obſerve, that they are to be us'd when the Force of the vital Humours is languid; for where there is a violent Fever, it is often more expedient to diminiſh the Force of the Circulation. Beſides, attracting Remedies, applied to theſe Parts, may be beneficial in ſo far as they derive the Efficacy of antiſeptic and diluting Remedies taken inwardly to theſe Parts. Mr. *Ruſhworth*, a celebrated Surgeon of *Northampton*, ſome Years ago, wrote a Letter to the Company of Surgeons in *London*, concerning the Uſe of the *Peruvian* Bark, in putting a Stop to a Gangrene and Sphacelus. And, next Year, Mr. *Amyand* inform'd Mr. *Ruſhworth*, in a Letter, that he had made ſeven Trials of his Medicine in a Sphacelus, and found it accompanied with Succeſs. Afterwards, other celebrated Surgeons confirm'd the Opinion of Mr. *Ruſhworth*, and the Value of the Bark, by their Teſtimonies. In the *Philoſophical Tranſactions*, *N.* 426. *p.* 429. 434. there are various Inſtances, by which it is ſhewn, that, by the Uſe of *Peruvian* Bark, Gangrenes and Sphaceluſes have been ſtopt, and hinder'd from ſpreading to the adjacent Parts, and the mortified Parts have happily ſeparated from the ſound, though there were no Symptoms of an intermittent Fever through the whole Courſe of the Diſorder. There are, alſo, Inſtances, in which every thing ſucceeded well, ſo long as this Medicine was us'd; and the Symptoms increas'd upon giving it over, whilſt, upon reſuming the Uſe of it, the Events have been obſerv'd to be ſucceſsful and happy. There are, alſo, various Operations in the third Volume of the *Medical Eſſays*, publiſh'd at *Edinburgh*, which prove the Efficacy of the *Peruvian* Bark, in curing Gangrenes and Sphaceluſes. There are, alſo, ſome Inſtances of its having fail'd of Succeſs.

The Part in which the Inciſions are made is to be fomented with warm Liquors, proper for reſiſting Putrefaction; and the Eſchar is to be diminiſh'd by Emollients.

In order to produce a Separation of the mortified gangrenous Parts from thoſe which are alive and ſound, it is expedient ſo to ſoften and moiſten the gangrenous Cruſt, that it may almoſt diſſolve. But, whilſt this Intention is carrying on, a Putrefaction is almoſt always to be dreaded. Emollients are, therefore, to be applied; but they are to be previouſly mix'd with Antiſeptics. Whilſt, therefore, a gangrenous Part is fomented with Alcohol of Wine, or other Liquors of a like Nature, Putrefaction is prevented; but, at the ſame time, all the Parts are indurated. And when, after pretty deep Inciſions are made, theſe are capable of penetrating to the ſubjacent live Parts, they mortify them, and thus produce new mortified Cruſts. But, when theſe Parts are fomented with Emollients, the ſmall mortified Portion, which covers the ſcarified live Parts, is ſo relax'd, as to be almoſt diſſolv'd, ſo that it ſcarce any longer adheres to the live Veſſels. Hence it will eaſily be ſeparated by the Force of the vital Humours, carried to the Part through the live ſubjacent Veſſels. In *Boerhaave's Materia Medica*, there is a Liquor recommended, which powerfully reſiſts Putrefaction; as alſo a Cataplaſm proper for ſoftening gangrenous Eſchars, which conſiſts partly of highly emollient, and partly of aromatic antiſeptic Herbs. Before the Application of ſuch Cataplaſms, Surgeons generally ſprinkle them with antiſeptic Liquors. Thus the Effects of theſe two Remedies are happily join'd. Both theſe Intentions are excellently anſwer'd by a ſimple Cataplaſm of the Meals of Oats or Rye, which ſoon become aceſcent, boil'd in Buttermilk, adding, towards the End, recent Rue triturated, a ſmall Quantity of Sal Ammoniac, and ſome of the Oil of Lindſeed, or any other proper Oil, leſt the Cataplaſm ſhould become dry too ſoon.

The Liquor above-mention'd, proper for reſiſting Putrefaction in a Gangrene, is thus prepar'd:

Take of the Vinegar of Taragon, ſix Ounces; of the Vinegar of Roſes, two Ounces; of the Spiritus Vini Theriacalis, four Ounces; of Sea ſalt, one Ounce; and of a Decoction of Scordium, prepar'd with Water, twelve Ounces: Mix all together.

The Cataplaſm for ſoftening gangrenous Parts is thus prepar'd:

Take of the Leaves of Scordium, two Handfuls; of Mallow-leaves, one Handful; of the Flowers of Lavender, and Marſhmallows, each one Ounce: Boil theſe to a Cataplaſm, with Vinegar; and then add, of the Meal of Linſeed, three Ounces; of the Oil of Lindſeed, one Ounce; and of Sal Ammoniac, one Dram.

The *Unguentum Aureum*, and *Baſilicon*, are, in this Caſe, alſo, recommended.

The pendulous, mortified, diſengag'd, and ſoften'd Parts of a gangrenous Eſchar, are to be remov'd by the Forceps or Sciſſars.

In the Courſe of this Diſorder, the gangrenous Cruſts, eſpecially when divided into various Parts by Scarification, begin to be diſengag'd and ſeparated, not only from each other, but alſo from the live Parts; and then, cohering only in a few Points, they hang down. In this State of things, Surgeons, too fond of cleanſing the gangrenous Part, pull away theſe gangrenous Shreds with the Forceps, by which means they not only often create unneceſſary Pain, but alſo excite a Convulſion and Tetanus about the tendinous Parts, whilſt they irritate and draw the Tendons, which, in this Caſe, are often uncover'd, and depriv'd of their mucous Vaginæ, as may be ſeen in the Article VULNUS. How cruel and hurtful it is to cut off the mortified Parts, as yet not ſoften'd, but adhering to thoſe which are ſound, we have already ſhewn. Nature, who, in the Cure of Diſeaſes, is ſo often ſufficient for bringing about her own Meaſures, will accompliſh that Separation of the mortified from the ſound Parts, which ſhe has already begun. All that Art can do, is, by a laudable Regimen, and proper Remedies, to convey a ſufficient Quantity of good Humours, with a due Force, to the Part, which, by their continual Impulſe, may throw off theſe gangrenous Cruſts, previouſly relax'd by emollient Fomentations and Cataplaſms. The Putrefaction, in the mean time to be dreaded, is to be prevented by antiſeptic Medicines. But whatever is totally diſengag'd from its Coheſion with the ſound Parts, is to be remov'd, leſt, being left, it ſhould become putrid, and injure the ſubjacent tender Veſſels. If pendulous gangrenous Shreds, in ſome meaſure, ſtill adhere to the live Parts, all that Part, which is diſengag'd, is to be cut off with a Pair of Sciſſars; but that which ſtill adheres, is to be left, ſince, by pulling it away, a crude Wound is form'd, which diſcharges Blood, and may be unhappily affected by the gangrenous Matter; for the gangrenous Putrefaction may be eaſily abſorb'd by ſuch a crude Wound. It is, therefore, a general Rule, to be obſerv'd in this Caſe, that nothing is to be taken away, in conſequence of which, either Pain is produc'd, or Blood diſcharg'd.

Warm Cataplaſms, which act by a continual and uninterrupted Heat, and which conſiſt of emollient, diaphoretic, and anodyne Subſtances, are to be kept continually applied to the whole Part affected.

Since, in a gangrenous Part, there is no Motion of the vital Humours through the Veſſels; the Heat depending on this Circumſtance muſt, of courſe, be wanting. This Defect is, therefore, to be ſupplied by external Heat. But it is obvious, that this is only neceſſary when the gangrenous Cruſts are thick; for, when they are thin, the Heat of the ſubjacent Parts is ſufficient. For this Purpoſe, therefore, Cataplaſms are preferable to Fomentations, becauſe they retain the Heat longer, do not become dry ſo ſoon, and, conſequently, need not be renew'd ſo often. By means of the heated Bricks before-mention'd, the Heat of theſe Cataplaſms may be preſerv'd. But, in theſe Cataplaſms, as we have already obſerv'd, an emollient Quality is not only requir'd, but they muſt alſo contain Ingredients capable of preventing Putrefaction, and gently ſtimulating the live Veſſels by their grateful aromatic Particles. Theſe Applications, therefore, muſt be various, according to the different Conditions of the Part affected; for, if it is exceſſively dry, emollient and moiſtening Subſtances are moſt proper; but, if the Signs of a violent Putrefaction are preſent, a large Proportion of antiſeptic Ingredients is neceſſary. If Paleneſs, Cold, and Liſtleſſneſs, are obſerv'd, either in the whole Body, or in the Part affected, a large Quantity of ſtimulating Aromatics is proper. On the contrary, if there is a violent Inflammation about the Boundaries of the Gangrene, Elder-flowers, Houſleek, and other refrigerating Subſtances, are moſt beneficial. To theſe Cataplaſms are generally added ſome anodyne Ingredients, which obtund and alleviate the Pain, whilſt the gangrenous Eſchar is ſeparating from the live Parts; for this Species of Eſchar, by numberleſs Connections, adheres to the live and ſenſitive Parts: Whilſt, therefore, this Eſchar gradually contracts itſelf, and is leſſen'd in all its Dimenſions, the ſenſible nervous Fibres in the live Parts, ſurrounding the gangrenous Eſchar, are diſtracted by a kind of ſlow Dilaceration. Hence the Pain, uſual on thoſe Occaſions, ariſes. It is, therefore, obvious, that emollient and laxative Subſtances muſt be of ſingular Service in Caſes of this Nature; ſince, by their means, the gangrenous Eſchar is not only ſooner diſengag'd, but alſo the Pain, ariſing from the Diſtraction of the nervous Fibres, mitigated. To theſe Cataplaſms ſuch Subſtances may be added as alleviate the Pain, though its Cauſe ſtill continues, ſuch as

Henbane, the Solanum of the Shops, and others of a like Nature. A Cataplaſm for theſe Intentions may be prepar'd in the following Manner:

Take of the recent Leaves of Male Southernwood, of *Pontic* Wormwood, of Garden Rue, Scordium, *Alliaria* [Jack-by-the-Hedge], Hemp-agrimony, white Horehound, and Tobacco, each half an Handful; of Henbane, one Handful; of the Flowers of Marigold, the leſſer Centaury, Melilot, Feverfew, and Tanſey, each two Ounces; of the Flowers of Marſhmallows, and wild Poppy, each one Ounce. When theſe are boil'd with Water, in a cloſe Veſſel, for a quarter of an Hour, mix with them, of the Meal of Linſeed, four Ounces; of the Oil of Rue by Infuſion, two Ounces; of the Acetum Theriacale, and the Spiritus Vini Theriacalis, each one Ounce; and of Sal Ammoniac, one Dram.

The Cure is alſo much promoted by a leſs frequent Inſpection of the Part than is uſually practis'd.

How quickly a Gangrene and Sphacelus frequently ſpread, we have already obſerv'd: For this Reaſon, Surgeons, always dreading the worſt, frequently inſpect gangrenous Parts; and this Practice is juſt, and well founded, ſo long as we are not certain, that the Gangrene is ſtopt. But, after the Appearance of this Diviſion, all around the Gangrene, a Stop is put to the ſpreading Diſorder; becauſe the Continuity is deſtroy'd, by means of which the mortify'd Parts adher'd to thoſe that were ſound. There is, therefore, no Danger in ſuffering the Cataplaſms to remain for a conſiderable time, without being renew'd; for they conſiſt of ſuch Ingredients as prevent the Putrefaction to be dreaded. Thus, by ſuch a continual Maceration, the gangrenous Cruſts will decay, and the Suppuration, ſo neceſſary in this Caſe, will be promoted. But, when the Apparatus is often renew'd, the free Acceſs of the Air to the live Parts, now diveſted of the gangrenous Cruſt, will prove injurious, as is ſhewn under the Article VULNUS; eſpecially if Surgeons ſpend a conſiderable Time in examining and cleanſing the gangrenous Part with their Inſtruments, as they ſometimes do. 'Tis ſufficient, if the Surgeon, three or four times a Day, ſmells whether he perceives any Degree of a putrid Smell; and, if he perceives no ſuch thing, the whole Apparatus may remain unchang'd for twenty-four Hours.

When, after theſe Meaſures are taken, the Eſchar begins to be contracted, the ſcarify'd Parts to become moiſt, the ſound Margins to grow tumid, red, and to ſuppurate, and the mortify'd Part to move up and down, 'tis a Sign, that the Separation is carrying on, that the ſpreading Diſorder is ſtopt, and that the Part will ſoon become pure and free ſtom the gangrenous Taint.

When, by the Force of the vital Fluid carried to the Boundaries of the gangrenous Eſchar, the Fibres joining the Gangrene to the ſound Parts are divided, the Extremities of the live Veſſels will be retracted. The gangrenous Eſchar, in the mean time, which receives no more Supply from the Veſſels, will, by the Heat of the adjacent Parts, loſe its moſt fluid and moveable Parts; in conſequence of which, it will become dry, and have its Bulk every way diminiſh'd: Hence it will be contracted in its Circumference, and recede from the live Margins to which it before adher'd. Theſe two Circumſtances, concurring, produce that Chink or Gap which fixes the Bounds between the mortify'd and live Parts, and puts a certain Stop to the ſpreading Diſorder. But, in this Place, the live Veſſels, now diveſted of their mortify'd Covering, begin to perſpire, and diſcharge a Fluid from their open Orifices: Hence a certain Moiſture appears in this Aperture, which is an excellent Sign of returning Life in the Part. If the gangrenous Part has been divided by Scarifications, the Bottoms of theſe Diviſions, which at firſt were very dry, will afterwards begin to become moiſt: But this Moiſture will eaſily be diſtinguiſh'd from that which is produc'd by Fomentations and Cataplaſms; for, if, theſe being remov'd, the Part is duly cleans'd and inſpected, it appears perfectly dry, ſo long as the Separation of the mortify'd Part, from that which is ſound, is not begun; whereas, if the ſubjacent live Veſſels have already, in ſome meaſure, remov'd the mortify'd ſuperincumbent Portion, a manifeſt Moiſture will appear in the Bottoms of the Diviſions, which, though wip'd away, will forthwith appear afreſh. Soon after, a Suppuration will begin; and, when this happens in the Aperture dividing the gangrenous and mortify'd Part from the live Margins, there appears a Pus, which is not laudable, but ſeems to partake of a middle Nature between a gangrenous Matter, and a good Pus; for that Fluid which is convey'd through the live Veſſels, now free and unobſtructed, would, in conſequence of its Continuance, Heat, and the Diſſipation or Abſorption of its moſt liquid Part, be converted into Pus; but the mortify'd gangrenous Part, being diſſolv'd into a kind of thin Ichor, will mix itſelf with it; for, in the Beginning of the Separation, a thickiſh and ſomewhat unctuous Ichor is diſcharg'd; but, on the ſubſequent Days, it gradually approaches, more and more, to the Conditions of laudable Pus, till at laſt it acquires all its Qualities. In this Caſe, the live Margin, every-where diſengag'd from the mortify'd gangrenous Portion, to which it adher'd, is exactly in the ſame State with the Lips of a Wound: Hence it will begin to grow tumid, and become red, painful, and hot, for the Reaſons aſſign'd under the Article VULNUS. The ſame will happen to the live Parts lying under the gangrenous Eſchar; for they will, alſo, be gradually ſeparated from the mortify'd Part. Hence the Cruſt, which before adher'd pretty ſtrongly, will become moveable, and begin to yield, when touch'd with the Fingers; and, by a gentle Preſſure, the Liquor, collected under it, is diſcharg'd all around it. Thus, when all the Fibres, joining the mortify'd to the live Parts, are gradually divided, the former falls off, and leaves a ſimple Wound, with Loſs of Subſtance, which is to be incarn'd and conſolidated in the uſual manner.

Then lenitive, anodyne, balſamic, and digeſtive Subſtances, are to be apply'd; the Ulcer is to be dreſs'd. All Medicines, which render the Fibres rigid, are to be avoided. The Part is to be kept in a State of Reſt; and the Diſorder, in other reſpects, is to be treated like an Ulcer.

After the ſpreading Diſorder is ſtopt, and the gangrenous Cruſt, ſeparated from the live Margins, remains like an Iſland in the Middle of them, we are to conſider it as a ſordid Ulcer, which firſt demands Depuration, then the Regeneration of the loſt Subſtance, and, laſtly, Conſolidation. Hence *Celſus*, in the 26th Chapter of his 5th Book, when treating of the Cure of a Gangrene, juſtly adviſes, "that, when the Diſorder "is ſtopt, we ſhould apply thoſe Medicines which are proper "in a putrid Ulcer." But the Cleanſing of this Ulcer conſiſts in taking ſuch Meaſures as may, as ſoon as poſſible, make the gangrenous Cruſts fall off, after they are ſeparated from the live Parts to which they adher'd, by the Impetus of the vital Humours convey'd through the Veſſels. This Intention will be beſt anſwer'd by ſuch Medicines as relax and mollify theſe gangrenous Cruſts. Hence the Unguentum Aureum, Baſilicon, and freſh Butter, are of ſingular Uſe for this Purpoſe. Nor is it to be apprehended, that the Veſſels, being too much relax'd by theſe emollient Applications, ſhould degenerate into fungous and luxuriant Fleſh; for this will be prevented by the ſuperincumbent gangrenous Cruſt; and, when this is remov'd, and, by that means, the Place freed from a gangrenous Taint, ſuch Medicines are to be apply'd, as gently corroborate and check the exceſſive Dilatation of the Veſſels. Theſe Emollients are of an anodyne Nature, for the Reaſons before-mention'd. But if, after theſe gangrenous Cruſts are, in ſome meaſure, ſeparated, the bare live Veſſels ſhould begin to riſe too much, this Symptom may be remov'd by ſprinkling Powder of Maſtich upon them; and the Emollients are, in the mean time, to be apply'd to the other Parts of the Wound. Dreſſing the Part affected very ſeldom, is a Circumſtance of ſingular Service, as we have already obſerv'd. But all ſpirituous Subſtances, ſuch as Alcohol of Wine, camphorated Spirit of Wine, and the Spiritus Vini Theriacalis, prevent Putrefaction, but retard the Cure; becauſe they coagulate the Fluids, and render the ſolid Fibres highly rigid; in conſequence of which, the Separation of the mortify'd from the live Parts will be more difficult; ſince, by this means, the Coheſion of the ſolid Parts is augmented. The ſame Misfortune will happen, if the Part is continually fomented with acrid Lixiviums of Sea-ſalt, or Sal Ammoniac; for 'tis certain, from daily Experience, that the Fleſh of Animals become hard by being immers'd in Brine or Pickle. The Part affected ought to be kept in a State of Reſt, that the Dreſſings may the better remain in their Situation, and that the pulpous and ſoft Veſſels may not be deſtroy'd by their Attrition on the gangrenous Eſchars. The other Meaſures, requiſite for the perfect Cure of a Gangrene, are the ſame with thoſe to be taken in the Cure of an open Ulcer. See the Article ULCUS.

When a Gangrene ariſes from an intenſe Cold, the Part affected is to be cover'd, either with Snow, or with Linen Cloths ſoak'd in cold Water, till, the Spicula of the Cold being abſorb'd by the Snow, or the cold Water, the Part begins to be thaw'd, and its Life to return.

If the Cure of this Species of Gangrene was attempted by the Meaſures already directed, the Part affected would ſoon be ſphacelated to the very Bone; a Caſe which frequently happens in the northern Climates. This Species of Gangrene is, therefore, to be carefully diſtinguiſh'd from others, which may be eaſily done by attending to the preceding Cauſe, and the Signs of this Gangrene, when preſent.

The Heat of the human Body, when in a ſound and healthy State, ſurpaſſes the Heat of the circumambient Air, even in the hotteſt Summer Months. Hence 'tis obvious, that an intenſe Degree of Cold is requiſite to render the Parts of the Body rigid. But, ſince, all other Circumſtances being alike, the Heat is leſs in the Extremities, becauſe the Velocity of the Blood is diminiſh'd in proportion to the Diſtance from the Heart; the Effects of the cold Air are, for this Reaſon, principally obſervable on the Toes and Fingers, the Point of the Noſe, and the Ears. But, ſince Cold converts Water, which was before fluid, into rigid Spicula, it follows, of courſe, that it muſt produce a ſimilar Effect on the Fluids of the human Body, which contain a large Quantity of Water. The Influx and Efflux of the Humours will, therefore, be totally deſtroy'd, when the congeal'd Humours loſe the Nature of a Fluid. In this Caſe, therefore, a Gangrene will be form'd, as is obvious from the Definition already given. Since theſe congeal'd Spicula are lodg'd in the tender Veſſels, 'tis ſufficiently obvious, that all the Parts muſt be deſtroy'd, if theſe are put in Motion, either by Heat or Frictions; for, if we ſhould ſuppoſe, that, theſe Spicula being partly reſolv'd, the Circulation of the Blood ſhould, in ſome meaſure, return, thoſe Parts, which are not as yet render'd fluid, muſt neceſſarily ſtick in the narroweſt Parts of the Veſſels; and, ſince the Force of the ſucceeding vital Fluid acts upon theſe Obſtacles, the Coheſion of the Veſſels muſt neceſſarily be ſoon deſtroy'd by theſe ſharp and rigid Molecules; in conſequence of which, the Diſorder will ſoon become incurable, and the only Means of Safety will conſiſt in a Separation of the corrupted and mortify'd Parts from thoſe which are ſound and alive. Perhaps theſe Diſorders are increas'd, becauſe the ſaline Molecules of the human Fluids are ſeparated, and form'd into larger Maſſes; and, when theſe Maſſes are put in Motion, before they are again render'd fluid, they may prove prejudicial, both by their Figure and Rigidity. At leaſt we learn from Experience, that Water, richly impregnated with Salt, cannot be congeal'd without an intenſe Degree of Cold; and that, before it is congeal'd, the Salt is ſeparated from it, and collected in the Bottom of the Veſſel.

Experience has taught us, that, in cold Countries, theſe Diſorders are happily cur'd by the Application of Water ſo cold, that it is very near to a State of Congelation; for this Water, acting as a phyſical Cauſe, extracts the Particles which had congeal'd the Fluids; and that Part of the Water, which is next to the Part affected, is, by their means, congeal'd. By this means the Humours are reſtor'd to their natural Fluidity; and then a due Motion may be procur'd to them, by ſtimulating Cardiacs and Frictions. Thus *Hildanus*, in the thirteenth Chapter of his Treatiſe *De Gangræna & Sphacelo*, informs us, that before the Inhabitants of the Northern Climates approach the Fire, or enter into Stoves, they rub their Hands, Noſes, and Ears, with Snow. The ſame Author tells us, that he was inform'd by a Perſon of unqueſtion'd Veracity, that when a Traveller was brought to an Inn, rigid with Cold, and as it were dead, the Landlord immers'd him in cold Water, after which the Spicula of Cold, were ſo copiouſly diſcharg'd, that his whole Body ſeem'd to be cover'd with a Cruſt of Ice: Then, by exhibiting a large Quantity of Hydromel, together with the Powder of Cinnamon, Mace, and Cloves, a Sweat was excited in a warm Bed, and the Patient recover'd, without any farther Loſs than that of the laſt Articulations of his Fingers and Toes.

In Caſes of this Nature, the Part becomes putrid by the Application of Heat; becauſe the Spicula of Cold are put in Motion, without being reduc'd to a due Degree of Fluidity.

Whilſt, the phyſical Cauſe, producing the Congelation, not being extracted, Motion is procur'd to the Spicula of Cold by external Heat, the tender Stamina of the Veſſels muſt neceſſarily be deſtroy'd. This plainly appears in what we call froſted Apples; for, if theſe are laid before the Fire, in order to be thaw'd, they loſe all Taſte, are ſoon corrupted, and transform'd into a ſoft Pulp: But, if they are immers'd in cold Water, near to a State of Congelation, a Cruſt of Ice begins, every-where, to cover them: And, after this Cruſt is fallen off, they are again to be immers'd in cold Water, and this Method is to be repeated, till no more Ice is diſcharg'd from them. After this they have their uſual Taſte, and, when dry'd, may be preſerv'd for a conſiderable time. The ſame happens in the Parts of the human Body, when conſtricted with Cold, if they are imprudently expos'd to Heat, before the Spicula of Ice are extracted by the Application of Snow, or cold Water; for ſuch Parts, becoming corrupted by a legitimate Sphacelus, fall off. *Hippocrates* ſeems to have given a Caution, with reſpect to this, when, in the firſt Chapter of his Treatiſe *De Liquidorum Uſu*, he tells us, "That Feet benumb'd with Cold fall off by an "Affuſion of any warm Liquor."

After theſe Meaſures are taken, the Patient is to have his Strength recruited by cardiac Medicines, of a hot Quality; and a Heat, ſo intenſe as to produce a Sweat, is to be excited.

After the Spicula of Cold are extracted, there is no Fear of deſtroying the Parts by exciting the Motion of the Fluids; and ſuch Medicines may be ſafely exhibited, as excite a pretty briſk Motion, and conſequently diffuſe an equable Heat, either thro' the whole Body, or the Part affected; for, by this means, the Circulation of the Humours will, moſt quickly, be reſtor'd through theſe Parts, in which, a little before, they were ſtagnant, and at Reſt. Hence, *Hildanus*, in the thirteenth Chapter of his Treatiſe *De Gangræna & Sphacelo*, recommends gentle Frictions, and afterwards Fomentations of ſweet Milk, boil'd with Leaves of Bays, Roſemary, Sage, and Lavender; and, after this, he orders Sudorifics to be exhibited to the Patient, in a warm Bed: Theſe Fomentations are, in the mean time, to be continually applied, that the Motion, created by the internal Remedies, may be principally determin'd to the Part affected. *Van Sweiten* informs us, that he has ſeen ſingular Service done, only by an Infuſion of Saſſafras, in poor Perſons, who have been ſeized with Gangrenes during intenſely cold Winters.

A Sudorific, proper in a Gangrene, may be thus prepar'd.

Take of diſtil'd Treacle-water, one Ounce; of the prophylactic Water of *Sylvius*, ſix Drams; of the Aquavitæ of *Matthiolus*, one Ounce; of Rue-water, nine Ounces; of *Fernelius*'s Syrup of Mugwort, and of the Syrup of the Five aperient Roots, each an Ounce and an Half; and of Elixir Proprietatis, prepar'd with Salt of Tartar, two Drams: Mix all together. Let the Patient take a Spoonful, every Half-quarter of an Hour, drinking after, an Ounce or two of the following Mixture:

Take of Barley-water, two Pints; of French-wine, one Pint; of powder'd Ginger, two Drams; and of the Syrup of Jeruſalem-oak, three Ounces: Mix all together.

Of a Sphacelus.

If a Gangrene degenerates into a Sphacelus, the Part infected muſt be remov'd; but the Method of doing this is to be varied, according as the Part is totally, or only partially affected, and according to the Situation of the Part, which ſometimes does not admit of Amputation, as the Buttocks, Os Sacrum, Os Coccygis, the prominent Spines of the Vertebræ, and Eminences of the Scapulæ.

If, therefore, the Part is not corrupted to the very Bottom, or cannot be extirpated, our Endeavours muſt tend, firſt, To ſtop the Progreſs of the Sphacelus; and, ſecondly, To remove the ſphacelated Portion.

The Progreſs is ſtopt by intercepting the Communication betwixt the live and ſphacelated Part.

In the Part, thus mortified, all the Humours remain at Reſt, in the Veſſels; or, the Veſſels being ruptur'd, the Humours are diſcharg'd, and become ſtagnant: But, ſo long as the Coheſion between the mortified and live Parts remain, the Fluids, convey'd through thoſe Veſſels, which are as yet alive, will ſtop in the Part where the Sphacelus begins; and, conſequently, the Motion will be ſuffocated in the live Parts contiguous to that which is mortified; and thus the Diſorder will be propagated. Nor can this Misfortune be prevented, unleſs the Coheſion between the live and mortified Parts is previouſly deſtroy'd: As ſoon as this happens, whether by the ſpontaneous Workings of Nature, or the Aſſiſtance of Art, the Humours will be diſcharg'd from the ruptur'd Veſſels, the Extremities of the divided Veſſels will be retracted, and an Aperture, dividing the live from the mortified Parts, will be form'd; nor will the Sphacelus, in this Caſe, ſpread any farther, tho' ſeveral Cauſes, favouring its Propagation, ſhould concur.

A Stop is put to the Propagation of this Diſorder, by placing a pretty deep Boundary between the ſound and diſorder'd Part, either by Inciſion, the actual Cautery, or Corroſion.

Art, attempting to imitate Nature, may place a Boundary of this kind, to prevent the Propagation of the Diſorder, and cut off the Communication between the mortify'd and live Parts. But this is never ſo accurately done by Art, as by Nature; which produces a perfect Separation of the mortify'd from the live and ſound Parts, at the ſame time preſerving the latter entire and undeſtroy'd; for, when this Effect is produc'd by the Knife, the actual Cautery, or Corroſives, a Part of the mortify'd Portion is either left, or the live Parts are deſtroy'd together with thoſe which are mortify'd. We have already ſhewn, that the Coheſion between the mortify'd and live Parts, is deſtroy'd only by the Efficacy of the vital Fluid, convey'd to the Circumference of the corrupted Part; which, afterwards, by a gentle Suppuration is every-where ſeparated, and falls off. 'Tis expedient to make this Boundary or Diviſion, whether by the actual Cautery, or the Knife, in the mortify'd Parts, but, at

at the ſame time, as near to thoſe which are alive as poſſible; for ſince, in this Caſe, all the Parts are not ſuppos'd corrupted to the Bottom, or when the Condition of the Part affected is ſuch, that it cannot be entirely remov'd, it would be cruel to deſtroy the live Parts; for hence would be produc'd violent Pains and Inflammations, eſpecially, becauſe the Knife and Cautery muſt penetrate pretty deep in a Sphacelus. 'Tis true, that by this Method a Part of the mortify'd Portion is left adhering to the live Parts; but yet this mortify'd Portion, left without the Diviſion or Boundary, will no longer injure the ſound Parts by its putrid Contagion, and may by antiſeptic Medicines be ſo preſerv'd, as to prevent any Degree of Putrefaction. Whilſt, in the whole Surface of the ſphacelated Part, ſuch a Boundary is artificially made, and the remaining Surface divided by deep Scarifications, the Medicines apply'd will penetrate much deeper, ſo that there will be no Danger of a Putrefaction; and we may ſafely expect the perfect Separation of the mortify'd from the ſound Parts, which Effect is produc'd by Nature alone. Now, ſuch a Boundary, or Diviſion, may be made either by the Knife, the actual Cautery, or thoſe corroſive Liquors, which, in a Moment, deſtroy the Parts they touch. For this Purpoſe, *Belloſte* recommends a rich Solution of Quick-ſilver in Aqua-fortis. But others give the Preference to Butter of Antimony, eſpecially, when, by due Rectification, it is render'd fine and limpid, like Water; for then, by means of this highly acrid Liquor, and the Aſſiſtance of a Pledget, ſuch a Boundary may be made at Pleaſure all round the Circumference of the Sphacelus. This Medicine is highly efficacious in Diſorders of this Nature, becauſe it conſiſts of a moſt concentrated Spirit of Sea-ſalt, united with the reguline Part of Antimony. Now, Spirit of Sea-ſalt is an incomparable Remedy for checking and correcting Putrefaction; for which Reaſon it is of ſo ſingular Service in curing Gangrenes of the Gums, as we have already obſerv'd. But by theſe means a Separation of the mortify'd from the live Parts will not be produc'd, but a Boundary is only plac'd between the ſound Parts and the Sphacelus, which Boundary is itſelf mortify'd, and muſt afterwards be ſeparated; the Communication, however, between the ſound and mortify'd Parts is by this means deſtroy'd. *Celſus*, in the twenty-eighth Chapter of his fifth Book, when treating of the Cure of a Carbuncle, beautifully deſcribes the Force of corroding Medicines in the following Words: "A Cruſt is pro-"duc'd by corroſive Medicines, which being ſeparated every-"where from the live Fleſh, carries along with it whatever "was corrupted." This Author juſtly obſerves, that ſuch a Cruſt is produc'd by Corroſives, but that it is afterwards ſeparated from the live Parts. This Separation does not, therefore, depend on the Force of the Corroſives, which was ſpent before the Separation happens.

The infected Part is ſeparated, if, after the Progreſs of the Diſorder is ſtopt, or whilſt it is a ſtopping, the whole Part is cauterized or cut to the ſound ſubjacent Parts, and then corroded by the Application of a warm acrid Lixivium, till it is conſum'd to the live Parts, till Eſchars are form'd, which are carefully to be ſoften'd and remov'd: But the live Parts muſt, at the ſame time, be avoided with the greateſt Caution.

Since a Sphacelus is ſaid to be preſent, when all the Parts are mortify'd as far as the Bone, all theſe corrupted Parts muſt be remov'd as ſoon as poſſible, leſt they ſuffocate and render putrid the Parts of the Bone, or Perioſteum, which are ſtill alive. But the Parts affected with a Sphacelus are mortify'd, and can be no more influenc'd by Medicines, than a Carcaſe. Hence, they muſt be remov'd, either by Inciſion, the actual Cautery, or ſuch Corroſives, as by their external Heat are capable of acting upon dead Bodies. Mr. *Petit*, in the *Memoires de l'Academie des Sciences*, for the Year 1732. informs us, that the potential Cautery, commonly us'd by Surgeons, apply'd to the Skin of an human Carcaſe for fifteen Hours, and diſſolv'd, as it generally is, by the Air, ſcarcely produc'd any Effect: But when, by the Application of warm Linen Cloths, he carefully fomented the Part of the Carcaſe, to which the Cauſtic was apply'd, he, after fifteen Hours, found that the Skin was render'd ſoft like Pulp; and that the Efficacy of the Medicine had penetrated to the Fat. For removing mortify'd Parts, therefore, we may, with great Succeſs, apply that common potential Cautery of the Surgeons, which is prepar'd of the inſpiſſated Lixivium of Quick-lime, and Pot-aſh, or this Lixivium itſelf may be us'd for the ſame Purpoſe: And if the Heat of the adjacent live Parts is not ſufficient, external Heat may be apply'd. By this means the mortify'd Parts will ſoon be converted into Eſchars, which, being ſoften'd by the Application of ſome emollient Ointment, or of Butter, may be commodiouſly remov'd. Then the ſame Medicine is to be apply'd in the ſame manner, till all the mortify'd Portion is conſum'd as far as the live Parts. But becauſe, in every Sphacelus, there is always a Danger of Putrefaction, we might poſſibly be induc'd to think, that acid Corroſives would be more proper, than a Lixivium prepar'd of Quick-lime and alcaline Salt, which quickly renders the Salts of the human Fluids volatile, alcaline, and putrid. But if we conſider, that a Sphacelus penetrates as far as the Bone; and that Acids, eſpecially of a highly acrid kind, are greatly injurious to the Bones; the Reaſon will be obvious, why in thoſe Caſes we ought to abſtain from the Uſe of Acids. Thus Quacks have a Practice of rendering Teeth white in a Moment, by touching them with Spirit of Vitriol; but a few Weeks after they begin to grow yellow, then black, and at laſt fall off in ſmall Pieces, becauſe their vital Structure is deſtroy'd by the Acid of the Vitriol. Hence, in order to fix the Boundary between the mortify'd and live Parts, we juſtly prefer that highly concentrated Acid of Sea-ſalt, which is found in Butter of Antimony. But, for ſpeedily converting the mortify'd Part into Eſchars, and by that means gradually procuring its Separation, a highly acrid alcaline Lixivium is far more proper and effectual. If, after the ſoft Parts are thus conſum'd, any Fault ſhould appear in the Bone, which may be diſcover'd by the Change of its Colour, then thoſe Medicines are to be apply'd, which are proper, when in Wounds of the Head, the Cranium is affected. See CAPUT.

But ſince all theſe Remedies are highly acrid, and almoſt inſtantaneouſly deſtroy the Parts to which they are apply'd, 'tis obvious, that great Caution is requiſite, leſt the ſound ſhould be deſtroy'd with the mortify'd Parts. And, becauſe, in a legitimate Sphacelus, all the Parts are often mortify'd, except the Bones, and the Perioſteum, which covers them, theſe may be greatly injur'd by an imprudent Application of ſuch Medicines. Hence, the Cure would be render'd highly difficult and tedious, ſince the Separation of the corrupted Parts of the Bone often requires a long time. Beſides, as theſe Medicines penetrate very deep, the adjacent, and, as yet, live Tendons, Nerves, and tendinous Membranes, may be conſiderably injured and irritated by them: A Circumſtance, which may give Birth to a Series of other Misfortunes.

'Tis alſo to be obſerv'd, that the Uſe of theſe Corroſives is by no means requiſite, unleſs when the mortify'd Parts are very thick; for, if they are otherwiſe, the Cure may be ſafely accompliſh'd without them. Thus, when, by long lying in Bed, a Sphacelus is form'd about the Os Coccygis, or the Os Sacrum, the mortify'd Parts generally become black, and parch'd like a Piece of dry Leather. And as, in theſe Parts, the Membrana Adipoſa is very thin, theſe Medicines can hardly be apply'd without Danger of injuring the ſubjacent Bone. When, in Caſes of this Nature, the Parts are frequently fomented with Wine, Vinegar, and Salt, then cover'd with the Emplaſtrum Simplex Plumbatum, and when, the Force of the Diſeaſe being ſubdued, the Patients frequently change their Poſture, and retain their Fæces and Urine, in which theſe Parts were before drench'd, all the mortify'd Parts will be ſpontaneouſly ſeparated, and the Cure happily accompliſh'd. *Van Sweiten* informs us, that he has ſeen ſeveral Inſtances of this kind.

The corroſive Lixivium, recommended by *Boerhaave*, for procuring the Separation of a Sphacelus, is prepar'd thus:

Take of Quick-lime, made of calcin'd Stones, one Part: Cover it carefully up with three Parts of Pot-aſh; and when they are diſſolv'd in a ſubterraneous Place, filtrate and keep the Preparation for Uſe. Quick-lime itſelf, reduc'd to a fine Powder, may alſo be ſprinkled on the Part.

But Separations are moſt advantageouſly made, if the mortify'd Eſchars, ſoften'd by the Application of a putrefying Remedy, ſo as to be diſſolv'd into a ſoft Maſs, recede from the ſound Part, whilſt the live Parts are, in the mean time, cheriſh'd with enlivening Fomentations. See above.

When the Signs of Soundneſs and Life return, the Diſorder is to be treated like an Ulcer, or a Wound.

When the Influx of the vital Humours into the Arteries, and their Efflux thro' the Veins, are deſtroy'd, the Part is then ſaid to be mortify'd. The Signs, therefore, of returning Life, are ſuch Circumſtances as inform us, that the Humours flow into the Arteries, and are return'd by the Veins; that is, that the Circulation is reſtor'd, or at leaſt beginning to be ſo. But this can never happen in Parts corrupted by a legitimate Sphacelus, but only in thoſe which are ſubjacent or contiguous.

If, therefore, either by Scarification or Corroſion, a Part of the mortified and corrupted Portion is remov'd, or divided, as far as the Confines of the live Parts, as ſoon as the Life of theſe begins to prevail, theſe Fiſſures, which before were dry, become moiſt, and the mortified Portion will, in all its Circumference, be ſeparated from the live Parts, as we have before obſerv'd. In this Situation of things, there is no longer any Danger, leſt the Sphacelus ſhould ſpread; but it may be conſider'd as a ſordid Ulcer, which, after cleanſing the corrupted Parts, may, by a benign Suppuration, be brought to the State of a ſimple Wound, and conſequently requires a ſimilar Treatment. But we muſt obſerve, that, after ſuch Parts are ſufficiently

ciently cleans'd, the ſofteſt Balſams are principally beneficial, in order to regenerate and reſtore the loſt Subſtance.

When the Meaſures above-recommended will not produce the deſir'd Effect, we muſt proceed to Amputation. See AMPUTATIO.

The following Medicines are, by *Heiſter*, recommended for the ſeveral Intentions of Cure in a Gangrene.

A FOMENTATION *which digeſts, ſtimulates, and reſiſts Putrefaction.*

Take of Quick-lime Water, one Pint; of camphorated Spirit of Wine, three Ounces; and of the Spirit of Sal Ammoniac, half an Ounce: Mix all together.

Let this Preparation be frequently apply'd warm with proper Compreſſes: The ſame Intention is alſo excellently anſwer'd by a Pint of Quick-lime-water, mix'd with an Ounce of Mercurius Dulcis. *Heiſter* tells us, that, in the Hoſpital of *Amſterdam*, the Surgeons, with great Succeſs, uſe the following Fomentation againſt a Gangrene.

Take of the Spirit of Wine, three Ounces; of the Powders of Aloes, and Myrrh, each half an Ounce; and of *Egyptian* Ointment, three Ounces: Mix all together.

Or,

Spirit of Wine, gently boil'd with Aloes, Myrrh, and Saffron; or camphorated Spirit of Wine mix'd with Venice Treacle; or the Spiritus Theriacalis, or the Spiritus Matricalis, mix'd with about a ſixth Part of Elixir Proprietatis; or, what *Garengeot* ſo much extols, warm Wine, mix'd with ſimple or camphorated Spirit of Wine; or camphorated Spirit of Wine, either by itſelf, or quicken'd with Sal Ammoniac; which he recommends as a highly efficacious Medicine for reviving the gangrenous Parts.

Or,

Take of the Leaves of Scordium, Southernwood, and recent Rue, each two Handfuls; of Chamomile-flowers, one Handful: Boil in a ſufficient Quantity of common Water: Strain off the Liquor, and, to every two Pints of it, add, of the Spiritus Vini Theriacalis, four Ounces; of Venice Soap, two Ounces; and of Sal Gemmæ, half an Ounce.

Theſe Fomentations are to be apply'd frequently every Day, with Linen or Woolen Cloths; applying over them, in order to preſerve the Heat, folded Cloths, and heated Bricks.

A penetrating, reſolvent, and digeſtive Cataplaſm, for reſtoring the Circulation of the Blood in the affected Part, may be prepar'd in the following Manner:

Take of the Herbs Scordium, Mallows, Wormwood, and Feverfew, each two Handfuls; of Mint, and Southernwood, each one Handful.

Boil theſe in a ſufficient Quantity of Oxycrate, in a cloſe Veſſel, to the Conſiſtence of a Cataplaſm; to which add, of Sal Ammoniac, half an Ounce; of the Meal of Linſeed, two Ounces; of the Oil of Rue, or Chamomile, by Infuſion, an Ounce and an half: And, before the Cataplaſm is apply'd, let it always be ſprinkled with camphorated Spirit of Wine, or the Spiritus Vini Theriacalis, in order to render it more efficacious: Or, inſtead of this, the following Cataplaſm, recommended by *Koenerdingius*, may be uſed.

Take of the Crums of Wheaten Bread, one Pound; of the Powders of Wormwood, Scordium, and Rue, each one Handful; of Wine, a Quantity ſufficient to reduce them to the Conſiſtence of a Cataplaſm: After gentle Boiling, add four Ounces of the Spirit of Wine; and apply warm.

A Fomentation for ſtopping the ſpreading of a Gangrene may be prepar'd in the following Manner:

Take of the Decoction of Barley, or Scordium, one Pint; of the Vinegar of Rue, ſix Ounces; of the Spiritus Vini Theriacalis, four Ounces; of Sea-ſalt, one or two Ounces: To be apply'd warm with Compreſſes.

A Cataplaſm for ſoftening the gangrenous Cruſt, and promoting its Separation, may be prepar'd in the following Manner:

Take of the Flowers of Scordium, two Handfuls; and of the Leaves of Mallows, Henbane, and Marſhmallows, each one Handful; and of the Flowers of Lavender, half an Handful: Boil in Vinegar, or Oxycrate, to the Conſiſtence of a Cataplaſm: To which add, of the Meal of Linſeed, three Ounces; of the Oil of Linſeed, one Ounce; and of Sal Ammoniac, two Ounces.

If, in any Stage of the Diſorder, the Uſe of Corroſives ſhould be indicated, the celebrated *Belloſte* orders the following Preparation, as the moſt efficacious of all others.

Take of the Spirit of Nitre, or of Aqua-fortis, two Parts; and of Quick-ſilver, one Part: Mix over a gentle Heat, till the Mercury is diſſolv'd.

With this corroſive Liquor, the mortify'd Part is to be anointed, or a little Lint, or a Linen Cloth ſoak'd in it, is to be apply'd to the corrupted Part; for, by this means, the mortify'd Parts will ſoon be divided from ſuch as ſound and alive. *Heiſter. Chirurg.*

GANGRINOS *(Sal)*, γάγγραινος ἅλας, in *Myrepſus*, *Antidot.* 418. is render'd by *Fuchſius*, *Sal foſſilis*, foſſile Salt; for other *Greek* Authors, he ſays, call the ſame Salt ὀρυκτὸν, *foſſile*; and the *Barbarians*, *Sal Gemmæ*.

GANIMEDES (more properly GANYMEDES), in the myſterious Language of the Chymiſts, is *white Sulphur*; becauſe it is elevated, ſublim'd, and, as is feign'd of *Ganymede*, by the Poets, rapt up into Heaven. *Johnſon.*

GANNANAPERIDE. A Name, in *Ray*, for the QUINQUINA.

GARAB, ALGARAB, are Names, in *Avicenna*, for the ÆGILOPS. *Sennert. Vol.* 2. *p.* 569.

GARAGAY. A Bird of Prey in *America*, of the Bigneſs of a Kite. It ſearches the Banks of Rivers for the Eggs of Crocodiles and Tortoiſes, which it carries away, and eats. It lives ſolitary, and is of no Uſe in Medicine. *Lemery des Drogues.*

GARB. A Name given by the *Moors* to an *Arabian* Species of SALIX, or *Willow*. *Ray.*

GARGALE, *Gargalos*, *Gargaliſmos*, γαργάλη, γάργαλος, γαργαλισμός. Irritation, Stimulation, Titillation. *Erotian. in Hippoc.*

GARGAREON, γαργαρέων. The Uvula. See UVULA.

GARGARISMA, GARGARISMUS, γαργάρισμα, γαργαρισμός, is ſometimes taken, in a large Senſe, for every Collution of the Mouth; and ſo is the ſame with DIACLYSMA, of which before; but, more ſtrictly and properly, it ſignifies a liquid Medicine, appropriated to Affections of the Mouth, Gums, Fauces, Larynx, and ſometimes of the Head, receiv'd into the Mouth, and there us'd by way of Collution, without Deglutition. *Caſtellus.*

Gargarizations, as *Celſus* ſays, are made for the ſake of Alleviation, Repreſſion, or Evacuation: The firſt Intention is anſwer'd by Milk, and Cremor of Ptiſan, or of Bran; Repriments are Water, boil'd with Lentils, Roſes, Bramble, Quinces, or Dates; Evacuants are Muſtard and Pepper. *Celſus*, *L.* 5. *Cap.* 22.

GARGATHUM. A Bed, to which Lunatics and Demoniacs were confin'd. *Caſtellus.*

GARIDELLA. This Plant was ſo nam'd by Dr. *Tournefort*, in Honour of Dr. *Garidel*, who was Profeſſor of Phyſic at *Aix* in *Provence*.

The Characters are;

The Root is annual, the Leaves capillaceous, the Calyx polyphyllous, the Flower roſaceous, with formicated, or arch'd, bifid Petals, diſpos'd in a Circle. The Head conſiſts of many oblong bivalve Capſules, full of Seeds, which are, for the moſt part, round.

Boerhaave mentions but one Species of this Plant; which is,

Garidella; foliis tenuiſſime diviſis. *T. App.* 655. *Nigella, Cretica, folio Fœniculi.* C. B. Pin. 146. GARIDELLA, *with very narrow-divided Leaves. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 283.

At preſent there are no medicinal Virtues attributed to this Plant, that I can find.

GARIP. A Term in *Lagneus*'s *Harmonia Chemica*, quoted from *Haly*, and explain'd by *aliquid aliud*, "ſome other "thing." *Theat. Chym. Vol.* 4. *p.* 730.

GARON, GARUM, γάρον, γάρος. A kind of Pickle, prepar'd of Fiſh, ſeaſon'd or macerated with Salt. The Fiſh moſt in Uſe, for this Purpoſe, was the Scombrus, or Mackrel, as appears from *Martial*, and *Horace*, *Serm. Lib.* 2. *Sat.* 8. *Garo de ſuccis piſcis Iberi*; "Garum of Juices of the *Iberian* [*Spaniſh*] "Fiſh." There were ſeveral Sorts of Garum. *Archigenes, in Galen. de C. M. S. L.* commends γάρον Σπάνιον, "*Spaniſh* Garum." And *Aſclepiades*, in the ſame Book, mentions black Garum, in auricular Compoſitions. This black Garum ſeems to be the ſame with what *Martial* calls *Fæcoſum*, as if made of the Fæces of Fiſh, and with the αἱματῖτον, "ſanguineous," ſo call'd becauſe the Blood of the Fiſhes was an Ingredient in its Compoſition. One way of preparing it is deſcrib'd by *Conſtant. Cæſar*, *Lib.* 20. *de Agricultura. Paulus*, *Lib.* 3. *Cap.* 51. calls it γάρον πρῶτον, "the primary (or choiceſt) "Garum. And it is the ſame as what *Pliny* and *Martial* call *Hiſpanienſe*, *Carthaginienſe*, and *Sociorum. Auſonius*, *Epiſt.* 7. ſays, that Garum was call'd, in *Latin*, *Liquar ſociorum*. When we read in *Galen*, that black Garum was call'd; by the *Romans*, *Oxyporum*, it means no more than that this Sort of Garum was us'd in Medicines and Pickles call'd *Oxypora* (ſee OXYPORON); or ſerv'd to dilute them,

and

and thence took the Appellation of *Oxyporon*. We are inform'd by *Pliny*, *Lib.* 31. *Cap.* 7. that this exquiſite Kind of Liquor, call'd *Garon*, is made of the Inteſtines, and other Offals, of Fiſh, macerated in Salt, ſo as to be the Sanies produc'd from their Putrefaction. It was formerly made of the Fiſh, which the *Greeks* call *Garos*, as he relates. But (as he goes on, in the next Chapter) the moſt eſteem'd, at preſent, is made of the Scombrus: Nor is there hardly any other Liquid, beſides Ointments, that bears a greater Price. He proceeds to inform us of ſeveral other Species of Fiſh, of which it is prepar'd; and ſays, there are infinite Sorts of it among them, one conſecrated by the Religious among the *Jews* to the Service and Promotion of a ſuperſtitious Chaſtity, becauſe it was prepar'd from Fiſhes void of Scales. He ſays further, that theſe Preparations of Garum are not only ſerviceable to the Neceſſities of Life, but have their Uſe in Medicine; for they cure the Scab, or Mange, in Cattle, being infus'd into an Inciſion made in the Skin: And, being ſpread on Linen, and applied, are effectual againſt the Bite of a Dog, and the Draco marinus, and, eſpecially, the Crocodile. It cures alſo, he ſays, recent Ambuſtions, and ſpreading or ſordid Ulcers; and is of extraordinary Efficacy in Pains and Ulcers of the Mouth and Ears.

All Kinds of Garum, which are the Colliquament or Sanies of Fiſh and Fleſh, macerated in Salt, are uſeful, in Clyſters, for the Dyſentery and Sciatica; in the firſt Caſe, for repreſſing and reſtraining Exulcerations of the Inteſtines; and, in the latter, for inciting and ſtimulating the Inteſtines, though free from Exulceration, to diſcharge the peccant Humours which affect the Hip. *Dioſcorides*, *Lib.* 2. *Cap.* 34.

Aetius, *Tetr.* 4. *Serm.* 4. *Cap.* 121. gives the following Deſcription of a Garum, for the Uſe of thoſe who are bound to Abſtinence: Take of Water, thirty-one Sextaries, or Pints; Salt, two Pints; Caricæ, or dry Figs, to the Number of fifty: Prepare, ſtrain, and repoſit them for Uſe. The true way of preparing the Garum, ſo much in Requeſt among the Antients, is unknown to the Moderns.

Garum, as well as Muria, is eſteem'd, by *Oribaſius*, a vehement Drier; and *Aetius*, *Tetr.* 1. *Serm.* 2. *Cap.* 150. tells us, that Garum is of a very hot and dry Quality, and, for that Reaſon, was us'd, by ſome Phyſicians, for putrid Ulcers, and, in Clyſters, for a Dyſentery, and the Sciatica. *Galen*, *de Al. Fac. Lib.* 2. *Cap.* 22. aſcribes to Garum a laxative Quality, if taken before Food.

Garum, among the Moderns, ſignifies the Liquor, or Pickle, in which Fiſh is preſerv'd, more eſpecially the Herring and Anchovy; the medicinal Uſes of which may be found under the Articles HALEC, and APUA.

GARRULUS. A Species of Pye, call'd alſo *Pica marina*, frequent about *Strasburg*. *Garrulus Bohemicus* is the ſame Bird as the AMPELIS; which ſee. *Caſtellus*.

GARYOPHYLLATA. See CARYOPHYLLATA.

GARYOPHYLLI. See CARYOPHYLLI.

GAS is a Term coin'd by *Helmont*, and ſignifies, in general, a Spirit incapable of Coagulation; ſuch as proceeds from fermented Wine. In particular, it has various Significations; thus *Gas vitale* is the Spirit of our Life, the Light and the Balſam which preſerves from Corruption, *Complex. & Miſt. N.* 42. The *Gas pingue Sulphureum* is what is ſuddenly mortal, being lethiferous Exhalations, ariſing principally in Caves and Mines. *Gas Sulphuris*, the Gas or Spirit of Sulphur, is made by burning Sulphur under a glaſs Bell, ſet over a Veſſel of Water, till the Water is ſufficiently impregnated with the Sulphur. The *Gas Sylveſtre* is that inviſible and incoercible Spirit, which ariſes from vegetable Juices under Fermentation. See ALCOHOL, and BUFO. *Helmont* makes ſeveral other Diſtinctions of Gas; as the *Gas Ventoſum*, which is mere Air; the *Gas ſiccum*, which is Sublimate, *de Flatibus*, *N.* 4. the *Gas Salium*, and the *Gas Fructuum*, which are mere elementary Water, *Complex. & Miſt. N.* 37, 38.

GASSELA, *ſeu* GAZELLA, is the *African* wild Goat. See BEZOAR.

GASTER, γαστὴρ, in *Hippocrates*, often ſignifies the whole Abdomen, comprehending the lower Belly and Epigaſtrium, or all that Region of the Body which is circumſcrib'd by the Diaphragm, Hypochondria, and Pubes; it is, alſo, taken for the Ventricle, or Stomach, the Receptacle of Meat and Drink; ſo it ſignifies in 6 *Epid. Sect.* 4. *Aph.* 6. *Hippocrates*, alſo, frequently means by it the Uterus.

GASTERANAX. See BITHNIMALCA.

GASTRICUS SUCCUS, from *Gaſter*, the Stomach, is a thin, pellucid, ſpumous, and ſaltiſh Juice, which continually diſtils from the glandulous Kernels of the Stomach, for the Diſſolution, Mixture, and Dilution of the Food.

GASTRINUM. Pot-aſh. *Rulandus*. *Johnſon*.

GASTROCNEMII. The Name of two Muſcles of the Leg; from γαστὴρ, a Belly, and κνήμη, the Leg.

Theſe are two thick, pretty broad, and oblong Muſcles, ſituated laterally with reſpect to each other, in the ſame Plane, under the Hams, and forming a great Part of what is call'd the Calf of the Leg. That which lies next the Tibia is call'd *Internus*; and that next the Fibula, *Externus*; and becauſe they form, as it were, the Belly of the Leg, they have been term'd, in *Greek*, *Gaſtrocnemii*.

Each Muſcle is fix'd above, by a flat Tendon, to the poſterior Part of the lower Extremity of the Os Femoris, behind the lateral Tuberoſity of each Condyle, adhering cloſely to the poſterior Ligaments of the Joint of the Knee.

From thence they run down, each forming a large and pretty broad fleſhy Body, irregularly oval. The *Externus* covers the *Popliteus*, being larger and broader, ſpreading more laterally, and running lower down than the *Internus*, the fleſhy Body of which begins higher up than the other.

About the Middle of the Leg they end in a ſtrong, broad, common Tendon, which contracts a little in Breadth, as it deſcends, and is inſerted in the poſterior Extremity of the Os Calcis, together with the Tendon of the *Soleus*.

The ſuperior Tendons of theſe Muſcles become gradually cartilaginous in aged Perſons, and, at laſt, oſſify near the Condyles; the bony Portions looking like Seſamoide Bones. It is ſometimes very late before they are harden'd in this manner; and ſometimes one grows hard before the other. *Winſlow*.

GASTROEPIPLOICA, γαστροεπιπλοϊκὰ, from γαστὴρ, the Stomach, and ἐπίπλοον, the Omentum or Cawl. An Epithet for the Veins and Arteries which go to the Stomach and Omentum. *Blancard*.

GASTRORAPHIA, γαστρορραφία, from γαστὴρ, the Belly, or Abdomen, and ῥαφὴ, a Suture. Gaſtroraphe, or the Operation of performing a Suture of the Abdomen. See ABDOMEN and SUTURA.

GASTROTOMIA, γαστροτομία, from γαστὴρ, the Belly, and τέμνω, to cut, is a Cutting of the Abdomen and Uterus, as in the Cæſarean Section. *Blancard*.

GATRINUM. Pot-aſh. *Johnſon*.

GATTARIA. The ſame as CATTARIA, that is, Catmint. *Blancard*.

GAUSOS, γαῦσος, γαυσὸς. Gibbous, bent, incurvated, as *Galen* explains the Word, commenting on that Paſſage of *Hippocrates*, *Lib. de Fract.* προσξυρίναι δὲ χρὴ, &c. "Now "we ought to know, that the Thigh is γαυσὸν" [that is, ſays *Galen*, κυφὸν, gibbous, bent] "more towards the exterior, than the interior Parts."

GAZAR. The Bay-tree. *Johnſon*.

GAZELLA. See BEZOAR.

GE, γῆ. Earth. See TERRA.

GEBRAIL AL CAHHAL, a Phyſician, who, though a Chriſtian, was much in Favour with the Caliph *Al Mamoun*; which he loſt entirely, by ſaying, one Day, to ſome of the Lords of his Court, that he was aſleep.

GECHARSUN. A Frog. *Rulandus*.

GECHYTON, γήχυτον, in *Galen's Exegeſis*, is expounded, the external Part of the Earth, which is ſoft, and not at all ſtony.

GEISON, γεῖσον, γείσου, γείσωμα, properly the Eaves of an Houſe, is put, by Metaphor, for the prominent Part of the Eyebrows. *Gorræus*.

GELASINOS, γελασινὸς, from γέλως, Laughter, is an Epithet of the four middle fore Teeth; ſo call'd becauſe they are ſhewn in Laughing. *Gelaſinus* ſeems alſo to ſignify the Hollow of the Cheek, which appears from that Verſe of *Martial*,

Nec grata eſt Facies, cui Gelaſinus *abeſt.*

"Nor does that Face pleaſe, which wants a *Gelaſinus*;" though ſome underſtand it of the fore Teeth.

GELATINA. A Jelly. Theſe are made of the Juice of ripe Fruit, boil'd with Sugar to a proper Conſiſtence; or of ſtrong Decoctions of Horns, ſoft Bones, or the Extremities of Animals. Jellies of Fruits are cooling, ſaponaceous, and aceſcent; and, therefore, proper in an alcaleſcent State of the Primæ Viæ, and Juices, eſpecially when diſſolv'd in a proper Liquor. On the contrary, Jellies of animal Subſtances are alcaleſcent, and good when an Acidity prevails; but are leſs alcaleſcent when Lemon-juice and Sugar are added to them. Sometimes Jellies have medicinal Drugs added to them, in various Forms, as Powders and Extracts; and this with various Intentions, and then they are call'd Compound Jellies.

Jelly of Bread is made by boiling well-fermented Bread, or Biſcuit, in Water, till it will aſſume the Form of a Jelly, when cold.

The celebrated *Gelatina Avenæ*, Jelly of Oatmeal, is thus prepar'd:

Take of excorticated Oats, a Pound and an half; of Currants, and Shavings of Hartſhorn, each two Ounces; a Leg of Veal, cut, and bruis'd together with the Bones: Let them boil in a cloſe Veſſel, with a gentle Heat, a ſufficient time; then let the Broth be ſtrain'd, which ſoon becomes a thick Jelly, a few Spoonfuls of which ſhould be taken every Morning for a conſiderable time, diſſolv'd in a proper Vehicle.

Boerlr

Boecler recommends this, as admirable in hectic Diſorders, if taken with the Broth of Snails, or Craw-fiſh.

GELATIO. Properly Freezing; but ſometimes us'd to expreſs that Rigidity of the Body, which happens in a Catoche or a Catalepſis.

GELBUM, GELFUM. The Name of a Marchaſite, or rather a Pyrites, found in *Hungary*, and often pregnant with Silver. *Gelbum*, or *Geldum*, is alſo a Name for the Philoſophers Stone, in *Theat. Chym. Vol.* 4. *p.* 727.

GELION. A Leaf. *Rulandus.*

GELOS, γέλως, Laughter, is defin'd a Motion, by the Contraction of the Lips, and a ſonorous and broken Expiration, expreſſive of Mirth. In a preternatural State, Laughter is a Species of Convulſion, or convulſive Spaſm, like that proceeding from the Uſe of the poiſonous Sort of Apium, call'd *Sardon*, growing in *Sardinia* (ſee SARDONIUS), an Abuſe of Saffron, or an Inflammation of the Diaphragm. Laughter is alſo a frequent Symptom in Hyſterics.

GELSEMINUM. A Name in *Ray*, for ſeveral Species of Jaſminum.

GELUTA. The Carline Thiſtle.

GEMELLI.

There are two ſmall flat narrow Muſcles, ſituated almoſt tranſverſly one above the other, between the Tuberoſity of the Iſchium and the great Trochanter, immediately below the Pyriformis, and parted by the Tendon of the Obturator Internus.

The ſuperior and ſmalleſt Gemellus is fix'd to the lower Part of the Spine of the Iſchium, to the ſuperior Part of the ſmall iſchiatic Notch, and to a rough Line which runs croſs the Outſide of the Iſchium, beginning from the Spine, and continued under the Acetabulum, where it is bent downward.

The inferior and largeſt Gemellus is fix'd to the ſuperior and back Part of the Tuberoſity of the Iſchium, and to a rough Impreſſion, which runs croſs the Outſide of the Iſchium, from the lower Extremity of the iſchiatic Notch, and is bent upward toward the other Line, together with which it forms a ſort of irregular Semicircle.

Both theſe Muſcles have likewiſe a ſmall Inſertion in the Inſide of the Iſchium, where, being united together by a particular Membrane, one of them joins the upper Side, and the other the lower Side of the Obturator Internus, a little after it is paſs'd over the Notch: They incloſe it as in a Bag, and continue to be fix'd to it by fleſhy Fibres all the Way to its Extremity.

The ſuperior Muſcle terminates wholly with the Tendon of the Obturator Internus; but the Inferior, being broader, is inſerted likewiſe, by fleſhy Fibres, in the orbicular Ligament, and under the Tendon of the ſame Obturator. *Winſlow.*

GEMONIS, γεμωνὶς, from γέμω, to be full or pregnant. A Stone, the ſame as the Ætites.

GEMURSA. The Name of a Diſeaſe known to the Antients, as *Pliny* ſays, *Lib.* 36. *Cap.* 1. but extinct in his Time; it was an Excreſcence between the Toes.

GENA, γένυς. That Part of the Face between the Noſe and Ears. See CAPUT.

GENEIAS, γενειὰς. The downy Hairs which firſt cover the Cheek; alſo the Name of a Bandage, which comes under the Chin. *Gal. de Faſciis.*

GENEION, γένειον. The ſame as ANTHEREON; which ſee.

GENER. A Name for the Philoſophers Stone. *Theat. Chym. Vol.* 4. *p.* 727.

GENERATIO, Generation.

The Parts of Generation proper to Men may be fitly divided into thoſe which prepare and ſeparate the Seed from the Blood, and thoſe which convey it into the Womb. The firſt is done by three ſorts of Glands, which are the Teſtes, the Veſiculæ Seminales, and the Proſtatæ. The ſecond is the Office of the Penis.

The Teſtes, which prepare the principal Part of the Seed, receive their Blood from two long and ſlender Arteries, ſee *Tab.* XVI. *Fig.* 1. F F, which, at their Riſe from the Sides of the Aorta, a little below the Emulgents, are extremely ſmall, but immediately become larger. As theſe Arteries run between the Duplicature of the Peritonæum, to which they give ſome ſmall Twigs, they paſs out of the Abdomen, at the Holes in the tranſverſe and oblique Muſcles, and march over the Os Pubis, within the Productions of the Peritonæum, to the Teſticles; but, before they arrive, they divide each into two Branches, the largeſt of which are ſpent upon the Teſticles thamſelves, and the two ſmall ones upon the Epididymides. When the Blood has diſcharged itſelf of the Seed into the Teſticles, it returns by the Veins, which, riſing in ſeveral Branches from the Teſtes, tend towards the Abdomen, in the Productions of the Peritonæum, the ſame Way the Arteries come down. In their Progreſs, their Branches frequently inoſculate, and divide again, till they come near the Abdomen, when they all unite into one Trunk; and therefore, becauſe of their Shape, they are call'd Corpora Pyramidalia: In the Abdomen they receive ſome ſmall Twigs from the Peritonæum. The Right ſpermatic Vein opens into the Vena Cava, a little below the Emulgent: But the Left is always inſerted into the Emulgent of the ſame Side, that it may not be obliged to croſs the Aorta, whoſe Pulſe would be ſubject to ſtop the Blood which returns from the Teſticles very ſlowly, by reaſon of the narrow Orifices of the ſpermatic Arteries, and the Largeneſs of the Veins. Theſe Blood-veſſels have been call'd the Vaſa Præparantia.

Having deſcrib'd the Blood-veſſels of the Teſticles, I come now to their Integuments, which are three; one common, and two proper: The common is the Scrotum, which, beſides the Skin, (which is very thin, and full of Blood-veſſels) Scarf-ſkin, and Membrana Adipoſa, in this Place likewiſe very thin, its Veſicles being empty of Fat, is compos'd likewiſe of many fleſhy or muſcular Fibres, by means of which the Scrotum is contracted, which is reckon'd a Sign of Health. This muſcular Lining of the Scrotum is by the *Greeks* call'd DARTOS, which ſee. The Scrotum is divided in the Middle by a thin Membrane, which ſeparates the two Teſticles.

The firſt of the proper Integuments is call'd Tunica Vaginalis, or ἐλυθροειδὴς, being form'd by the Dilatation of the Productions of the external Membrane of the Peritonæum; its internal Superficies is ſmooth, its external rough: It contains the Vaſa Præparantia and Deferentia; it embraces looſely the whole Body of the Teſticle, adhering to one End of the *Epididymis*. Upon the Outſide of this Tunicle runs a Muſcle called Cremaſter, from its Office; it ariſes from the Os Pubis, and, ſpreading its Fibres upon the Elythroides, it ſuſpends the Teſticles, and draws them up in the Act of Generation. See CREMASTER.

The ſecond is that which covers immediately the Teſticles: It is call'd Albuginea, becauſe of its white Colour. It is ſtrong and thick, very ſmooth and equal. The Branches of the Vaſa Præparantia are finely wav'd upon it.

The Subſtance of the Teſticles, (ſee *Tab.* XVI. *Fig.* 1. I I; and *Fig.* 3. 4. and 5.) which formerly was thought to be a ſort of Marrow, is nothing but the Folding of ſeveral ſmall and ſoft Tubes, diſpoſed in ſuch a manner, that if they could be ſeparated from one another, without breaking them, they might be drawn out to a great Length. They run in ſhort Waves from the Tunica Albuginea to the Axis of the Teſticles, being divided from one another by thin membranous Productions from the inner Side of the Albuginea. Theſe Productions unite at the Axis of the Teſticle, and form a Cover to ſome ſmall Tubes, which at one End of the Teſticle pierce the Tunica Albuginea, and unite into one Canal, which, by ſeveral Turnings and Windings upon the upper Part of the Teſticles, forms that Body which we call Epididymis, cover'd with a thin Production of the Albuginea. The ſame Canal continuing, and aſcending from the Extremities of the Epididymides, forms the Vaſa Deferentia, one from each Epididymis, (*Fig.* 3. H) about the Bigneſs of a Gooſe-quill: As they aſcend within the Tunica Vaginalis, they make ſeveral ſhort Turnings and Windings; then they enter by the Holes of the tranſverſe and oblique Muſcles into the Abdomen, and, marching over the Ureters, between the back Side of the Bladder and the Rectum, they grow larger as they approach the Veſiculæ Seminales, (with which they communicate) where they come cloſe to one another; and, growing again ſmaller and ſmaller, they paſs through the Proſtatæ, and open into the Urethra, a little below the Neck of the Bladder, (ſee *Tab.* XVI. *Fig.* 2. 3. 3.) where each Orifice has a ſpongious Border, called Caput Gallinaginis, which hinders the involuntary Running of the Seed; ſee DEFERENTIA VASA. The Teſticles have many Lympheducts, which diſcharge themſelves into the inguinal Glands. Their Nerves come from the Intercoſtal, and twenty-firſt of the Spine.

The ſpermatic Arteries convey the Blood from the Aorta to the Teſticles, which ſeparate that Part of it which is fit for Seed. The Veins carry back to the Cava what Blood remains, after the Secretion of the Seed. The Seed is farther purify'd in the Epididymides, and in Coition is carried by the Vaſa Deferentia into the Urethra. As the narrow Orifices, and great Length, of the Spermatic Arteries, (which give time to the ſlow moving Particles of the viſcous Seed to combine and unite) the Particles which compoſe the Seed, being groſs, all the ſmaller Particles of the Blood muſt enter the Tubes with them; and therefore, that none but the Particles of the Seed might arrive at the *Vas Deferens*, it was neceſſary, that the Tube of the Gland ſhould be long, having many ſmaller Branches, to convey off all the leſſer Particles, which were not to enter into the Compoſition of the Seed. Many of theſe Particles muſt be lymphatic, becauſe of the great Proportion they bear in the Blood; and therefore we find, that the Teſticles, as well as the Liver, have a Multitude of the lymphatic Veſſels. The Reaſon of the Length of the *Vaſa Deferentia* is, that the Impetus of the Seed at the *Caput Gallinaginis* might not be ſufficient to dilate the Orifices of the *Vaſa Deferentia*, but when aſſiſted with the Compreſſion of the ſurrounding Parts in Copulation.

The *Veſiculæ Seminales* (*Tab.* XVI. *Fig.* 2. 4. 4. and *Fig.* 6. F F) are two in Number, one on each Side, ſituated betwixt the Bladder, and the ſtrait Gut, tied to the one and the other by a Membrane of fleſhy Fibres, which in time of Coition, contracts and preſſes the Veſiculæ: They are cover'd with a pretty thin Membrane, upon which creep many Branches of Veins, Arteries, Nerves, and Lymphatics. Their external Surface reſembles rather that of the Brains, than that of the Guts of a little Bird: They are about two Fingers-breadth long, their broadeſt Part is not an Inch, from which they grow narrower, by little and little, to their End, which is next the Proſtatæ. They have two conſiderable Cavities divided into membranous Cells, which open diſtinctly by two Orifices, which are in their ſmall Extremities, into the two *Vaſa Deferentia*, from which they receive the Seed, which is ſeparated in the Teſticles, to be kept till Coition.

The *Proſtatæ*, or *Corpus Glanduloſum*, (*Fig.* 6. G G) is a conglomerate Gland, ſituated at the Neck of the Bladder, covered with a Membrane made of muſcular Fibres, as that of the Veſiculæ, and for the ſame Uſe: It is about the Bigneſs of a Walnut. The Vaſa Deferentia paſs through its Subſtance, which is veſicular and glandulous. The Glands (which like little Grains lie upon the Sides of the Veſicles) ſeparate a clear and mucilaginous Humour, which lies in the Veſicles till Coition, when it is carried into the Beginning of the Urethra, by eleven or twelve excretory Ducts, which open about the Orifices of the Vaſa Deferentia; the Border of their Mouth is all ſpongious, to prevent a continual Running of this Humour, which happens in a Gonorrhœa, when their Orifices are corroded by the morbific Matter.

The other principal Member of the Parts of Generation is the Penis, whoſe Shape and Dimenſions are pretty well known. Its Skin, (*Fig.* 6. M M) which is thin, and without Fat, has a Reduplication (NN), which makes a Hood to the Glans, or End of the Penis, call'd Præputium, or the Foreſkin. The ſmall Ligament, by which it is tied to the under Side of the Glans, is call'd *Frænum*. The Uſe of the Præputium is to keep the Glans ſoft and moiſt, that it may have an exquiſite Senſe.

The Subſtance of the Penis is compos'd of two ſpongious Bodies, call'd *Corpora Cavernoſa*; they ariſe diſtinctly from the lower Part of the Os Pubis. A little from their Root they come cloſe together, being only divided by a Membrane, which at its Beginning is pretty thick, but, as it approaches the End of the Penis, it grows thinner and thinner, where the Corpora Cavernoſa terminate in the Middle of the Glans.

The external Subſtance of theſe ſpongy Bodies is hard, thick, and white. The internal is compos'd of ſmall Fibres and Membranes, which form a ſort of looſe Net-work, upon which the Branches of the Blood-veſſels are curiouſly ſpread. When the Blood is ſtopt in the great Veins of the Penis, it runs through ſeveral ſmall Holes in the Sides of their capillary Branches into the Cavities of the Net-work, by which means the Corpora Cavernoſa become diſtended, or the Penis erected.

Along the under Side of the Corpora Cavernoſa, there runs a Canal, called the Urethra, (*Fig.* 6. I I H) which is about twelve or thirteen Inches long, beginning at the Neck of the Bladder (from which it receives the Urine); it bends to the lower Part of the Os Pubis, and, turning up to the Roots of the Corpora Cavernoſa, is continued to the End of the Penis. The Sides of this Canal are compos'd of two Membranes, and a middle ſpongy Subſtance, like that of the Corpora Cavernoſa, except at the End, which joins the Neck of the Bladder, where the Diſtance between the Membranes is ſmall, and fill'd up with a thin and red glandulous Subſtance, whoſe excretory Ducts, piercing the inner Membrane, pour into the Canal a mucilaginous Liquor. The external Membrane is hard, cloſe, and white; the internal, which lines the Cavity of the Urethra, is thin, ſoft, and of an exquiſite Senſe. The ſpongious Subſtance, which lies between the two Membranes, is about half a Line thick next to the Corpora Cavernoſa, one half Line round the reſt of the Canal. The Extremities of this ſpongy Subſtance are much thicker than in the Middle: That End next the Proſtatæ, becauſe of its Bigneſs, is call'd the Bulb of the Urethra (H), being about half an Inch thick, and divided in the Middle by a thin Partition, as the Corpora Cavernoſa are. The other End forms the Glans or Balanus upon the Extremities of the Corpora Cavernoſa. The Veins in the Urethra have Holes in their Sides, through which the Blood paſſes into the Cavities of its Net-work, in an Erection, as in the Corpora Cavernoſa.

On each Side of the Bulb of the Urethra, there lies a ſmall Gland, whoſe excretory Duct, ſloping forwards, pours into the Urethra a viſcous and tranſparent Liquor, which defends it againſt the Acrimony of the Salts of the Urine: And, on the oppoſite Side of the Urethra, upon its internal Membrane, a little nearer the Glans, there is another ſmall Gland, which has the ſame Office. Theſe Glands were firſt obſerv'd by that diligent Anatomiſt, Mr. *Cowper*. At the other End of the Urethra, round the Crown of the Glans, where it joins the Præputium, is a Row of ſmall Glands, like thoſe of the Cilia, called, by that accurate Anatomiſt, Dr. *Tyſon*, *Glandulæ Odoriferæ*: They ſeparate a Liquor, which lubricates the Glans, that the Præputium may ſlip eaſily upon it.

The Penis has a ſmall Ligament, which ariſes from its Back, a little Diſtance from its Root, which ties it to the upper Part of the Os Pubis, that it may not hang too low: It receives two Branches of Veins and Arteries from the hypogaſtric Veſſels, beſides others from the Pudenda. The two Veins unite near its Roots, and form one Trunk, that runs along the upper Side of the Penis. It has two Nerves from the Os Sacrum, and ſeveral Lymphatics, which empty themſelves into the inguinal Glans.

The Penis has three Pair of Muſcles: The firſt is the *Erectores*, (*Tab.* XVI. Fig. 1. M M) by ſome called *Directores*, and by *Spigelius*, *Collaterales Penis*. They ariſe fleſhy from the external Knob of the *Os Iſchium*, below the Beginnings of the cavernous Bodies of the Penis, in whoſe thick Membrane they are inſerted. When theſe Muſcles act, they pull the Penis towards the *Oſſa Pubis*, whereby its great Vein is compreſt, and the refluent Blood denied its Paſſage under thoſe Bones, by which means the Penis is erected. The ſecond are the ACCELERATORES, which ſee. The third Pair are the *Tranſverſales*; they ariſe from the Iſchium, juſt by the Erectores, and run, obliquely, to the upper Part of the Bulb of the Urethra.

The external Parts of Generation in Women are the *Vulva*, or great Chink, ſituated below the *Os Pubis*, and cover'd with Hair; above this there is a little Swelling, made by ſome Fat, under the Skin, which is call'd *Mons Veneris*. The *Labra*, or Lips, of the great Chink, (*Tab.* XVI. Fig. 7. *i i*) are only the Skin, ſwell'd by ſome Fat underneath: Theſe being a little ſeparated, there appear the Nymphæ, (*f f*) one on each Side of the Chink; they are two ſmall Pieces of Fleſh, reſembling the Membranes that hang under the Throats of Pullets. Their internal Subſtance is ſpongious, and full of Blood-veſſels; therefore they ſwell in the Act of Generation; they receive Veſſels and Nerves as the Clitoris; their Uſe is, to defend the internal Parts from external Injuries; to increaſe Pleaſure; to direct the Courſe of the Urine: They are bigger in married Women than in Maids. In the Angle of the great Chink next the Os Pubis, is the Extremity of the *Clitoris* (*e*), cover'd with a little Hood of the Skin call'd Præputium (*d*); ſee CLITORIS. A little deeper, in the ſame Side of the Vulva, there is a little Hole, which is the Orifice of the Neck of the Bladder (*g*). On the oppoſite Side, next the *Anus*, are the Glandulæ Myrtiformes, ſituated in the Foſſa Magna, or Navicularis; and, in this Angle of the Chink, there is a Ligament, call'd the Fork, which is torn in the firſt Birth.

The Hymen is a circular Folding of the inner Membrane of the Vagina, which being broke in the firſt Embraces, its Fibres contract in three or four Places, and form what they call Glandulæ Myrtiformes.

A little beyond the Clitoris, in the fore Part of the Vulva, above the Neck of the Womb, there is a little Hole, which is the Orifice of the Urethra (*Fig.* 7. *g*). It is naturally ſo large as to receive a Probe as big as a Gooſe-quill. The Length of the Neck of the Bladder is near about two Fingers-breadth: It has a little Muſcle, call'd its Sphincter, which embraces the Urethra, to hinder the involuntary running of the Urine; it joins the fleſhy Fibres, which are at the Orifice of the Vagina.

Between this Muſcle, and the inner Membrane of the Vagina, there are ſeveral little Glands, whoſe excretory Ducts are call'd Lacunæ: They pour a viſcous Liquor into the lower Part of the *Vulva*. Theſe Glands are the Seat of Gonorrhœas in Women, as the Proſtatæ are in Men (according to *Keil*); and have the ſame Uſe that they have. They have been found all ulcerated in Women who have had a Gonorrhœa.

The Vagina, (*Tab.* XVII. *Fig.* 3. *Numb.* 7.) or Neck of the Womb, is a long and round Canal, which reaches from the Pudendum, to the internal Mouth of the Womb. In Maids, 'tis about five Fingers-breadth long, and one and an half wide; but, in Women who have born Children, its Length and Bigneſs cannot be determin'd; becauſe it lengthens in the time a Woman is with Child, and it dilates in the time of Birth. It lies betwixt the Bladder and the Rectum; with which laſt it is wrapt up in the ſame common Membrane from the Peritonæum; for this Reaſon, the Excrements come out ſometimes by the Vulva, when this Inteſtine is wounded.

The Subſtance of the Vagina is compos'd of two Membranes, of which the inner, which lines its Cavity, is nervous, and full of Wrinkles and Sulci, eſpecially in its fore Part. It has three or four ſmall Glands on that Side next the Rectum, which pour into it a viſcous Humour in the Time of Enjoyment.

The Wrinkles of this Membrane are for the Friction of the *Balanus*, to increaſe venereal Pleaſure; to detain the

Seed, that it run not out again; and that it may extend in the Time of Geſtation.

The external Membrane of the Vagina is made of muſcular Fibres, which (as Occaſion requires) dilate and contract, become long and ſhort, for adjuſting its Cavity to the Length and Bigneſs of the Penis. At its lower Part, there is a Muſcle of circular Fibres, like a Sphincter, and under it, on each Side of the Vagina, a Net-like Plexus of Blood-veſſels, which, with the Muſcle, helps to ſtraiten the Mouth of the Vagina, that it may graſp the Penis cloſely.

The Neck of the Womb receives Veins and Arteries from the hypogaſtric and hæmorrhoidal Veſſels. Thoſe from the hypogaſtric are diſpers'd in its upper Part, and thoſe from the hæmorrhoidal in its lower Part. Theſe Veſſels communicate with one another. It has Nerves from the Os Sacrum. Among other Uſes, the Neck of the Matrix ſerves for a Conduit to the Menſtrua, and for a Paſſage to the Fœtus.

The Matrix or Womb (*Tab.* XVII. *Fig.* 3. *Numb.* 1.) is ſituated in the lower Part of the Hypogaſtrium, betwixt the Bladder and the ſtrait Gut; the Os Pubis is a Fence to it before, the Sacrum behind, and the Ilium on each Side; theſe form, as it were, a Baſon for it; but, becauſe it muſt ſwell whilſt Women are with Child, therefore they leave a greater Space in them than Men; it is, for this Reaſon, that Women are bigger in the Haunches than Men.

The Figure of the Womb is like a Pear, from its internal Orifice to its Bottom; 'tis three Fingers long, two broad, and almoſt as much thick. In Maids, its Cavity will contain a large Almond. It changes both Figure and Dimenſions in Women that are with Child; it preſſes the Bowels, and reaches to the Navel, towards their Delivery; whilſt, at other times, it does not paſs the Os Sacrum.

The Womb is cover'd with the Peritonæum. Its Subſtance is compos'd of fleſhy Fibres, which are woven together like a Net, and they draw together, and make ſeveral Bundles, which have ſeveral Directions, for the better contracting the Womb in the Expulſion of the Fœtus. The Spaces between theſe Fibres are fill'd up with thin and ſoft Membranes, which form an infinite Number of Cells, upon which the Blood-veſſels run, turning and winding frequently. Upon theſe Membranes, eſpecially towards the Cavity of the Womb, there are ſeveral Glands, which ſeparate an Humour to lubricate the Cavity of the Womb.

The Bottom of the Womb grows thick, as it dilates, ſo that in the laſt Months of Geſtation, 'tis at leaſt an Inch thick, where the Placenta adheres; becauſe its Roots run into the Subſtance of the Womb.

The Entry into the Cavity, or the Mouth of the Womb, joins the upper End of the Vagina, and makes a little Protuberance, in the Form of Lips, and reſembles the Muzzle of a little Dog; by ſome it is call'd Os Tincæ (*Tab.* XVII. *Fig.* 3. *Numb.* 5.). The Cavity of the Womb, next its internal Orifice, being more contracted than it is near its Bottom, is call'd *Collum minus Uteri*. Its Surface is unequal, and among the Rugæ open ſeveral ſmall Ducts, which diſcharge a glutinous Liquor, to ſeal up the Mouth of the Womb in Geſtation. Theſe Ducts are affected in a *Fluor albus*.

The Veins and Arteries of the Womb are Branches of the hypogaſtric and ſpermatic Veſſels, whoſe larger Ramifications inoſculate with one another; the ſpermatic Artery, with the hypogaſtric, and the Vein with the Vein, as alſo the Branches of one Side of the Womb with thoſe of the other. When the Term of Accretion draws to a Period, and the Blood, which us'd to be ſpent in the Increaſe of the Body, being accumulated, diſtends the Veſſels, it breaks forth once a Month, at thoſe of the Womb; becauſe, of all the Veins of the Body, which ſtand perpendicular to the Horizon, theſe only are without Valves. This Evacuation is call'd the *Menſtrua*, to which Men, for the ſame Reaſon, are ſubject; but in them the redundant Humour paſſes off by Urine, as *Sanctorius* obſerves, and rarely by the hæmorrhoidal Veins.

Its Nerves come from the Intercoſtals, and from thoſe which come from the Os Sacrum. There are, alſo, ſeveral Lymphatics upon its Outſide, which unite, by little and little, into greater Branches, and diſcharge themſelves into the Reſervatory of the Chyle. All the Veſſels of the Womb creep upon it by many Turnings and Windings, that they may not break when it is diſtended.

The Womb is tied by two Sorts of Ligaments; by two broad, call'd *Ligamenta Lata* (*Tab.* XVII. *Fig.* D D); and by two round, call'd *Ligamenta Rotunda* (*Tab.* XVII. *Fig.* 3. *Numb.* 66.). The two broad Ligaments are only a Production or Continuation of the Peritonæum from the Sides of the Womb. For their Largeneſs and Figure, they are commonly compar'd to the Wings of a Bat. The Ovaria are faſten'd to one End of them, and the Tubæ Fallopianæ run along the other.

The two round Ligaments riſe from the fore and lateral Part of the Bottom of the Womb, and paſs, in the Productions of the Peritonæum, through the Rings of the oblique and tranſverſe Muſcles of the Abdomen to the Os Pubis, where they expand like a Gooſe-foot, and are partly inſerted in the Os Pubis, and partly continu'd or join'd to the Muſculus Membranoſus, or Faſcia Lata, on the upper Part of the Inſide of the Thigh; from thence comes the Pain that Women, big with Child, feel in this Place. The Subſtance of theſe Ligaments is hard, but cover'd with a great Number of Blood-veſſels; they are pretty big at the Bottom of the Womb, but they grow ſmaller and flatter as they approach the Os Pubis.

The ſpermatic Veſſels, in Women, are four, as in Men: they differ only in this, that they are ſhorter, and the Artery makes ſeveral Turnings and Windings, as it goes down; that it divides into two Branches, of which the ſmalleſt goes to the Ovarium; the biggeſt divides into three more, of which one is beſtowed upon the Womb, another upon the Vagina, and the third upon the Ligaments of the Womb, and Tubæ Fallopianæ: 'Tis the ſame as to the Vein.

The Ovaria are tied, about two Fingers Diſtance from the Bottom of the Womb, by the Ligamenta Lata. They are fix'd to the Peritonæum at the Ilia, by the ſpermatic Veſſels. They are of an oval Figure, a little flat upon their upper Part, where the ſpermatic Veſſels enter.

The Ovaria, or Teſticles, (*Tab.* XVII. *Fig.* 3. *Num.* 4. 4.) are near half as big as Mens are; their Surface is unequal and wrinkled, in old Women, but ſmooth and equal in Maids; they are cover'd with a proper Membrane, which ſticks cloſe to their Subſtance, and with another common from the Peritonæum, which covers all the ſpermatic Veſſels. Their Subſtance is compos'd of Fibres and Membranes, which have little Spaces, in which there are ſeveral ſmall Veſicles, round, and full of Water, which, being boil'd, hardens like the White of an Egg; they have each of them two proper Membranes, upon which there are ſeveral ſmall Twigs of Veins, Arteries, and Nerves. Theſe Veſicles are called Eggs, and they are of a different Size and Number, in Women of different Ages. We obſerve, in Cows, that ſuch of them as are impregnated, after Copulation, are contain'd in, or cover'd all over with, a yellow Subſtance, which has a ſmall Hole in its Side, through which they are thruſt, when they fall into the Tubæ Fallopianæ: Beſides the ſpermatic Veſſels, the Ovaria have Nerves, from the Intercoſtals and Lymphatics, which diſcharge themſelves into the common Receptacles.

The *Tubæ Fallopianæ* (*Tab.* XVI. *Fig.* 7. E G; *Tab.* XVII. *Fig.* 1. E E; *Fig.* 2. G G; and *Fig.* 3. *Num.* 2. 2.) are ſituated on the Right and Left Side of the Womb; they riſe from its Bottom by a narrow Beginning, and they dilate in form of a Trumpet, to their Extremities, where they are contracted again into a ſmall Orifice, from whoſe Circumference they dilate into a pretty broad Membrane, which looks as if it were torn at its Edges, therefore call'd *Morſus Diaboli* (*Tab.* XVII. *Fig.* 1. F F; and *Fig.* 3. *Num.* 3. 3.). Their Cavity, where they open into the Womb, will ſcarcely admit of a Hog's-briſtle; but, at its wideſt Part, it will take in the End of one's little Finger. Their Subſtance is compos'd of two Membranes, which come from the external and internal Membranes of the Womb. The Tubes are about four or five Fingers-breadth long; they have the ſame Veins, Arteries, Nerves, and Lymphatics, as the Ovaria. Theſe are all the Parts of Generation in Women. See the Explications of *Plate* XVI. and XVII.

So great is the Pleaſure in the Act of Generation, that it alters the Courſe of the Blood, and animal Spirits, which then move all the above-deſcribed Parts, which before lie quiet, and at Reſt. The *Clitoris* is erected, which, by its exquiſite Senſe, affords a great deal of Delight; the Glands about the Neck of the Womb, being preſſed by the Swelling of the neighbouring Parts, pour forth a Liquor to facilitate the Paſſage of the *Penis*, and to increaſe the Pleaſure. The Neck of the Womb contracts, and embraces cloſely, the Penis; the Fibres of the Womb contract, and open its Mouth (which, at other times, is extremely cloſe) for the Reception of the ſpirituous Part of the Seed; and the Branches of the ſpermatic Artery, which run upon the *Ligamenta Lata*, between the *Ovaria* and the *Tubæ Fallopianæ*, being diſtended with Blood, contract and pull the Extremities of the Tubes to the Ovaria, for conveying the Seed to them. The Seed impregnates the Egg, which, from being tranſparent, becomes opake; ſome time after, 'tis cover'd with a thick and yellow Subſtance, which preſſes it on all Sides, and thruſts it out through a little Hole in its Middle; ſo it falls into the Orifice of the Tubes, which dilate ſufficiently for its Paſſage into the Womb.

Some, partly conſidering the Cloſeneſs of the Mouth of the Womb, and partly the Thickneſs of the Membranes of the Ovaria and Ova, judge it impoſſible for the Seed to paſs this Way; therefore they think, that it is taken up by the Veins, which open in the Cavity of the Vagina and Matrix, where, circulating, it ferments with the Maſs of Blood; from thence come all thoſe Symptoms, which appear upon Conception: It enters and impregnates the Egg, by the ſmall Twigs of Arteries which are upon its Membranes. This Fermentation ſwells the Membranes of the Tubæ, opens the Cavity of the

Womb,

Womb, and makes every thing ready for the Reception of the Egg.

The great and many Difficulties which attend the moſt plauſible Account of the firſt Formation of the Parts of an Animal, and Beginning of Motion in its Fluids; and the nice and curious Obſervations of *Redi*, and *Leeuwenhoeck*, and others, have been ſufficient Motives to moſt of the Moderns, to throw off the Notion of equivocal Generation. But though both Reaſon and Experiments convince us, that all the Parts of an Animal did exiſt, and its Fluids were in Motion, before Generation; yet whether the Animalcule was lodg'd in the Seed of the Male or Female Ova, is matter of Controverſy. The Arguments, ſtrongly alleg'd on both Sides, perſuade me of the Truth of what Dr. *Garden* ſays, that the Female Ovum is a proper Nidus for the *Animalcula in ſemine*. It is amazing to ſee the prodigious Number of little Creatures, like ſo many Tadpoles, ſwimming, every Way, in the Male Sperm of all Animals: Nor is it leſs curious to obſerve their languid Motion, in ſuch as are pox'd, and how they recover their former Briſkneſs, as the Diſtemper abates. *Leeuwenhoeck* tells us of one whoſe Wife, for ſome Years, did not conceive, becauſe there were no Animalcula to be found in his Seed, there being no other ſenſible Hindrance on either Side. Theſe Animals are ſo ſmall that 3000000000 of them are not equal to a Grain of Sand, whoſe Diameter is but the hundredth Part of an Inch. Whilſt the Seed thus abounds with Animalcula, there are not the leaſt Rudiments of an Animal to be ſeen in any Part of the Ovaria: Yet theſe, likewiſe, have a principal Part in Generation; for without them there is no Conception; and even Bitches, which have been ſpay'd, forget their uſual Appetites, as if they were the only Spurs to Venery. The yellow Subſtance, which grows in the Ovaria of Cows, upon Conception, is very remarkable; it has a ſmall Dint, and a Cicatrix, in its Middle, as if the Ovum had dropt out there (as *Malpighi* thinks). When the Fœtus is very ſmall, I have obſerv'd it very large; but, as the Fœtus grows bigger and bigger, this dries; and, I think, at laſt, even vaniſhes: Nor is it to be ſeen before Conception, and in one Teſticle only, when there is but one Calf. If all the Animalcula, or a great many of them, did faſten and grow to the Womb, till ſuch time as by their Bigneſs, or want of Nouriſhment, they made one another drop off, (as *Leeuwenhoeck* thinks) Women could not but be ſenſible of their Evacuation; for they muſt be falling off, through the whole Time of their being with Child: But when the Animalcula gets into an Ovum fit to receive it, and this falls through one of the *Tubæ Fallopianæ*, into the Womb, the Humours which diſtil thro' the Veſſels of the Womb, penetrating the Coats of the Egg, ſwell and dilate it, as the Sap of Earth does Seed, thrown into the Ground: Or elſe the Branches of the Veins and Arteries, whereby the Egg was tied in the Ovarium, (which, probably, make the umbilical Veſſels) being broken, faſten with the Veſſels of the Womb; then the Placenta begins to appear like a little Cloud, upon one Side of the external Coat of the Egg; and, at the ſame time, the Spine of the Embryo is grown ſo big, as to be viſible; and, a little after, the Cerebrum and Cerebellum appear like two Bladders; and the Eyes, next, ſtand goggling out of the Head; then the Beating of the Heart, or *Punctum Saliens*, is plainly to be ſeen; and the Extremities diſcover themſelves laſt of all.

Now the Membranes, which involve the Fœtus, are the ſame with the Coats of the Egg: The external is called *Chorion*; it is pretty thick, and a little rough on its Outſide, to which the Placenta adheres: It embraces the *Amnios*, or internal Membrane, which is a fine and delicate Bag, full of a clear Liquor, in the Middle of which the Fœtus ſwims. The Liquor is ſeparated, for the Nouriſhment of the Fœtus, by the Glands of the *Amnion*, from its Blood-veſſels, which are fine Branches of the umbilical Veins and Arteries.

The Arteries riſe from the Extremity of the Aorta, or the Beginning of the Iliacs of the Fœtus; and, paſſing by the Sides of the Bladder to the Navel, through which they paſs, they give ſome Branches to the *Amnion* and *Chorion*, and are afterwards divided into an infinite Number of Branches in the Placenta. The Vein riſes by ſeveral Roots or Branches, which are ſpread through all the Subſtance of the Placenta; it enters the *Chorion* and *Amnion*, to which it gives ſeveral Twigs; and, paſſing in at the Navel, it joins the *Vena Portæ*, in the Subſtance of the Liver.

The umbilical Veſſels, between the Navel and the Placenta, are wrapt up in Productions of the *Chorion* and *Amnion*, which is generally about a Foot and an half long, that the Motion of the Fœtus might not pull the *Placenta* from the Womb. The Uſe of this Navel-ſtring is, to carry the material Blood, by the Veins, to the Fœtus, for its Nouriſhment: That which is unfit for this Uſe, is carried back, by the Arteries, to the *Placenta*, whilſt the Fœtus is ſtill ſupplied with more, by the Vein; ſo that there is a continual Circulation betwixt the Mother and the Fœtus.

Now, the *Placenta* is a thick Cake, which grows upon the Outſide of the *Chorion*, in proportion as the Fœtus grows; it is of a circular Figure; at its biggeſt, it is about two Fingers-breadth thick, and ſix or ſeven in Diameter. The Branches of the umbilical Veſſels are ſpread through all its Subſtance; and, indeed, it ſeems to be nothing elſe but a Texture of the Vein and Arteries, by whoſe Extremities, opening into the Sides of the hypogaſtric Veſſels, the Circulation is perform'd between the Mother and the Fœtus; for that Side of the Placenta, which adheres to the Womb, appears to be nothing but the Extremities of an infinite Number of ſmall Threads, which, in Labour, dropping out of the Pores in the Sides of the hypogaſtric Blood-veſſels, into which they had inſinuated themſelves, is the Occaſion of the Flowing of the Lochia, till the Uterus collapſes, or the Pores, by the natural Elaſticity of the Veſſels, contract by degrees. Sometimes Twins have only one common Placenta, and ſometimes they have each a diſtinct one.

Beſides theſe Membranes which involve the Fœtus, there is another, which lies between the Chorion and the Amnion, on the oppoſite Side to the Placenta, in the Form of a Bag, call'd the ALLANTOIS; which ſee.

The Fœtus is almoſt of an oval Figure, whilſt it lies in the Womb; for its Head hangs down with its Chin upon its Breaſt; its Back is round; with its Arms it embraces its Knees, which are drawn up to its Belly; and its Heels are cloſe to its Buttocks, its Head upwards, and its Face is towards its Mother's Belly. But, about the ninth Month, its Head, which was always ſpecifically lighter than any other Part, becomes ſpecifically heavier, its Bulk bearing a much ſmaller Proportion to its Subſtance, than it did; and, conſequently, it muſt tumble in the Liquor which contains it; ſo its Head falls down, its Feet get up, and its Face turns towards its Mother's Back: But becauſe then it is an irkſome, though favourable Poſture for its Exit, the Motion it makes for its Relief, gives frequent Pains to its Mother, which cauſes a Contraction of the Womb, for the Expulſion of the Fœtus.

I have above given the prevailing Opinion, with reſpect to Generation, as collected by Dr. *James Keil*; but I muſt confeſs, that neither this, nor any Syſtem I have yet met with, gives me the leaſt Satisfaction; but, on the contrary, all of them appear full of Abſurdities, and the Whole of Generation to be involv'd in Difficulties, at preſent in no Degree clear'd up, notwithſtanding all the Pains that have been taken about it. *Leeuwenhoeck*, as obſerv'd above, by the Help of his Glaſſes, diſcover'd Animalcula in the Seed of all Male Animals; whence he, and his Followers, deduc'd a new Syſtem of Generation, as it ſhould ſeem, utterly romantic, and inconſiſtent with the Conduct of Providence, obſervable in all natural Productions. Thus, for Example, if 3000000000 Animalcules ſhould be included in a Quantity of Male Sperm ſufficient for the Production of one Animal only, provided the Animal is produc'd by one of theſe Animalcules, all the reſt are ſuperfluous, and created for no End, but to be immediately deſtroy'd: Beſides, we muſt ſuppoſe, that Providence aims very ill, if oblig'd to load her Engine ſo enormouſly, in order to be able to hit the Mark propos'd. But in all other Inſtances we find, that the Author of Nature perpetually adapts much leſs compounded Means, in order to arrive at the deſtin'd Ends. We have, therefore, great Reaſon to believe, that the Generation of Animals is not the only thing neglected, and accompliſh'd in a Manner extremely unartificial.

With reſpect to theſe Animalcula, I muſt obſerve, that they really exiſt, and are eaſily viſible by the Help of Glaſſes; but never, ſo far as I have been able to obſerve, whilſt the Sperm is freſh, and uncorrupted. But, in a very ſhort time, the Sperm of Animals corrupts, and then the Animalcules appear, and, I believe, not before.

Something analogous to this happens to the Seed of Vegetables. Wheat, for Example, ground down into Meal, whilſt freſh, exhibits no Animalcules; but, when mixt with Water into a Paſte, and corrupted, great Numbers of Animalcules are diſcoverable in it by Glaſſes. Now it ſeems to be equally probable, that the Animalcules obſervable in Wheat, the Seed of a Vegetable, ſhould be the Rudiments of the future Blade of Corn, as that the Animalcule in the corrupted Sperm of an Animal ſhould be neceſſary to the Production of an Animal ſimilar to its Parent.

GENEROSUS. An Epithet in Medicine, ſignifying the ſame as vehement, potent, efficacious. *Caſtellus.*

GENESIS, γένεσις. The ſame as GENERATIO.

GENETHLIACUS, γενθλιακὸς, was formerly a kind of Prophet, as appears from *Galen*, *Com.* 1. *in Lib. de R. V. I. A.* but is now appropriated to modern Aſtrologers, who pretend to caſt Nativities. *Caſtellus.*

GENETTA, call'd alſo the *Spaniſh Cat*, is a Beaſt of a leſs Size than a Fox, and much valued for its Skin. It lives in marſhy and watery Places in *Spain*, and its Fat, which is us'd in Medicine, is a Diſſolvent, and friendly to the Nerves. *Lemery des Drogues.*

GENICULATUS, geniculated, from *Geniculum*, a Joint, or Knot, is ſpoken of ſuch Plants, or their Parts, which are divided by Joints.

GE-

GENICULUM, GENICULUS. See the preceding Word.

GENIOGLOSSI *Muſculi.*

This, with its Partner, lies immediately under the Genio-Hyoidæus. They ariſe fleſhy from the fore Part of the lower Jaw internally; and, enlarging themſelves, are inſerted in the Root of the Tongue.

When theſe act, they pull the Tongue forwards, and thruſt it out of the Mouth.

GENIO-HYOIDÆUS.

This, with its Partner, are ſhort, thick, and fleſhy Muſcles, ariſing from the internal Parts of the lower Jaw-bone, call'd the Chin; and, dilating themſelves, are ſoon leſſen'd again, and inſerted into the ſuperior Part of the fore Bone of the Os Hyoides.

Theſe, acting, pull the Os Hyoides both upwards and forwards, and aſſiſt the Geniogloſſi in thruſting the Tongue out of the Mouth.

GENIPAT. An *Indian* Tree, the ſame with the JANIPABA, which ſee.

GENISTA. See the common *Geniſta* or Broom, under the Article CYTISO-GENISTA; but there are ſeveral other Sorts of Plants which go by the Name of *Geniſta*; as the

Geniſta; juncea, *Boerh. Ind. A.* 2.23. *Tourn. Inſt.* 643. *Geniſta Hiſpanica*, Offic. Ger. 1131. Emac. 1313. Raii Hiſt. 2. 1726. *Spartium arboreſcens ſeminibus Lenti ſimilibus*, C. B. Pin. 396. *Spartium Hiſpanicum frutex vulgare*, Park. Theat. 231. SPANISH BROOM.

It is common in Gardens, and flowers in *June* and *July*; the Parts in Uſe are the Branches, Flowers, and Seeds; and it agrees in Virtues with the common *Geniſta*, only is more efficacious. *Dale.* It is a potent Expeller of pituitous and ſerous Humours, both upwards and downwards; for which Reaſon it is effectual in Dropſies, the Sciatica, and Arthritis; provokes Urine, and breaks the Stone in the Kidneys. The Oil of the Flowers diſcuſſes Tumors of the Spleen, the Part being anointed with it. The Flowers, alſo, us'd with Honey of Roſes, or an Egg, diſſolve ſtrumous Swellings. *Raii Hiſt. Plant.*

The Flowers and Seeds, drank to the Weight of 50 Grains in Hydromel, work violently by Vomit, after the manner of Hellebore, but with Safety; the Seeds alſo purge downwards. The Juice of the Branches, firſt macerated in Water, and then bruis'd, is given with Effect in the Sciatica and Quinſey; the Doſe is a Cyathus, faſting. Some macerate the Branches in Brine, or Sea-water, and adminiſter the ſame in Clyſters for the Sciatica; it extracts bloody and ſtrigmentitious Abraſions. *Dioſcorides, Lib.* 4. *Cap.* 158.

Geniſta; hortenſis; major Luſitanica. *Vir. Luſit.*

Geniſta; radiata; ſive ſtellaris. *J. B.* 399.

Geniſta; ramoſa; foliis hyperici. *C. B. P.* 395.

Geniſta; tinctoria; Germanica. *C. B. Pin.* 395. *Tourn. Inſt.* 643. *Boerh. Ind. A.* 2. 25. *Geniſtella, Geniſta tinctoria.* Offic. *Geniſtella tinctoria.* Ger. 1136. Emac. 1136. Raii Hiſt. 2. 1725. Synop. 3. 474. *Geniſta tinctoria vulgaris.* Park. Theat. 228. *Tinctorius flos.* J. B. 1. 391. GREEN WEED, DYERS WEED.

It is too frequent in Paſture-grounds, and flowers in *June* and *July*. The Herb is in Uſe, and has an aſtringent Virtue aſcrib'd to it by *Monti. Dale.* As it agrees in Temperament, and outward Appearance, with the common Geniſta, it may very well be ſuppos'd to have the ſame Virtues. *Raii Hiſt. Plant.*

Geniſta; tinctoria; Germanica; foliis anguſtioribus. *C. B. P.* 395.

Geniſta-ſpartium; majus; brevioribus aculeis, *Tourn. Inſt.* 445. *Boerh. Ind. A.* 2. 24. *Nepa*, Offic. *Geniſta aculeata minor ſive Nepa Theophraſti*, Ger. 1140. Emac. 1321. *Geniſta ſpinoſa minor*, Park. Theat. 1003. Raii Synop. 3. 479. *Geniſta ſpinoſa major brevibus aculeis*, C. B. Pin. 394. Raii Hiſt. 2. 1719. THE LESSER FURZ.

It flowers in Autumn, and the whole Plant is us'd, which agrees in Virtues with the common Broom. *Dale.*

Geniſta-ſpartium; majus; longioribus aculeis, *Tourn. Inſt.* 645. *Boerh. Ind. A.* 2. 24. *Scorpius*, Offic. *Geniſta ſpinoſa major*, Ger. 1138. (*quoad deſcript.*) *Geniſta ſpinoſa vulgaris*, Ger. Emac. 1319. Raii Hiſt. 2. 1729. Synop. 3. 475. *Geniſta ſpinoſa major longioribus aculeis*, C. B. Pin. 394. *Geniſta ſpinoſa major vulgaris ſeu Scorpius Theophraſti, quam Gaza Nepam tranſtulit*, Park. Theat. 1003. *Geniſtellæ ſpinoſæ affinis, Nepa quibuſdam*, J. B. 1. 400. FURZ, or GORS.

This Plant flowers in the Spring, and is every Part of it us'd in Medicine, for the ſame Purpoſes as the common Broom. *Dale.*

3. Geniſta-ſpartium; Africanum; folio baccis breviore; flore luteolo.

4. Geniſta-ſpartium; minus Anglicum. *T.* 645.

5. Geniſta-ſpartium; ſpinoſum; majus; tertium hirſutum. *C. B. P.* 394.

6. Geniſta-ſpartium; montis ventoſi. *T.* 645.

GENISTELLA.

The Characters are,

The Parts of the Leaves grow one within another by Articulation.

Boerhaave mentions but one Species of this Plant; which is, Geniſtella; herbacea; ſive Chamæſpartium. *J. B.* 1. 393.

There are no medicinal Virtues attributed to this Plant, that I know of.

GENITURA, γονὴ, γόνος, Semen, or Seed. Some, from *Ariſtotle, de Gen. Animal. Lib.* 1. *Cap.* 18. diſtinguiſh between γονὴ (*Gone*), and σπέρμα (*Sperma*), making the firſt the Principle and Cauſe of Generation in perfect Animals; the other to ſerve the ſame Purpoſe in imperfect Animals and Plants. There are ſome other Diſtinctions made between them; but, however, it is certain, that they are us'd promiſcuouſly, and in particular by *Hippocrates*, *Lib. de Genitura*, as well as *Galen, de Sem.* Γόνος, in *Hippocrates de Humid. Uſu*, ſignifies the *Pudendum virile.*

GENIUS, δαίμων, a Genius. *Galen*, in his Book *de Hippocr. & Plat. Decret.* aſſerts, that God has given to every Perſon a Genius, which reſides in the uppermoſt Part of the Body, and exalts us from Earth to the Knowledge of celeſtial things.

GENOS, GENUS, γένος. To omit other Senſes of the Word, as not ſo pertinent to our Purpoſe, in Botany, is a Claſs or Order of Plants, agreeing in ſome common Character, or Structure of Part, diſtinguiſhing them from all others. *Triſmegiſtus* makes three *Genera generaliſſima*, or higheſt and moſt univerſal Orders of Subſtances, which are Minerals, Vegetables, and Animals. *Theat. Chym. Vol.* 1.

GENSING. See GINGSZENG.

GENTIANA.

The Characters are;

The Leaves are conjugated, or grow in Pairs: The Calyx is monophyllous, membranaceous, and form'd like a Sheath: The Flower is ſhap'd like a Cup, and is divided into four, five, or, perhaps, ſeven or eight Segments. The Fruit is unicapſular, oval, acuminated, bivalve, and running out into two Parts like Horns: The Seeds are flat, orbicular, and border'd with a Rim.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Gentiana; major; lutea, *C. B. Pin.* 187. *Tourn. Inſt.* 80. *Boerh. Ind. A.* 204. *Park. Parad.* 350. *Gentiana*, Offic. *Gentiana major*, Ger. 351. Emac. 432. Raii Hiſt. 1. 716. *Gentiana vulgaris major Ellebori albi folio*, J. B. 3. 520. GENTIAN.

The Root of the great Gentian is large, thick, and woody, pretty much divided, of a yellow-brown Colour, and a very bitter Taſte; no Part of the Plant beſides is us'd in Medicine, and the Root, *Schroder* tells us, ſhould be taken up in *Auguſt* and *September*. It is extremely bitter, but leaves rather an agreeable than nauſeous Guſt behind. It deſervedly ſtands at the Head of the Stomachic Claſs, as it wonderfully warms the Stomach, and excites the Appetite; and alſo, as it enables it the better to digeſt what it receives. The Subtilty of its Parts makes it alſo paſs for a Diſcutient and Aperient, in many Compoſitions of thoſe Intentions; and likewiſe for an Alexipharmic, and a great Antidote againſt many kinds of Poiſons, as it wonderfully promotes ſenſible and inſenſible Perſpiration. For killing and expelling Worms, it is the beſt in Eſteem: And in Surgery, it not only goes for a Diſcutient, in their Fomentations, but is alſo us'd, in fine Powder, to Iſſues, to promote their running; and as a Tent, both to enlarge and cleanſe ſome fiſtulous Apertures. Some Authors extol this beyond all Credibility, for its alexipharmic Qualities, and rank it almoſt with the *Peruvian* Bark, in Intermittents. And for this Reaſon undoubtedly we meet with it in the *Theriaca Andromachi*, and in ſome other Shop Compoſitions of the ſame Intention, although it now ceaſes to be preſcrib'd for ſuch Purpoſes in extemporaneous Practice. That it very much aſſiſts in ſome Compoſitions for removing Agues, and ſome Kinds of Intermittents, I have found by Experience, in many Inſtances; but it is not to be depended upon alone; and, by its great Subtilty and Heat, if Caution be not us'd, it will inflame in many Caſes, rather than abate the Symptoms. With this only, and the outer Rind of Orange-peels, may be made a very good Bitter, in any proper Menſtruum.

Officinal Preparations are, a compound Water, ſee AQUA; and an Extract, made according to the Rules laid down under the Article EXTRACTUM.

The medicinal Virtue of Gentian was ſaid to be firſt taken notice of by *Gentius* a King of the *Illyrians*. *Pliny, Lib.* 25. *Cap.* 7.

The *Decoctum amarum ſimplex*, in which Gentian is the principal Ingredient, is thus prepar'd:

Take of the Roots of Gentian and Galangal, each one Dram; of the Tops of *Roman* Wormwood, two Drams; of

of the yellow kind of dry'd *Seville* Oranges, and of the leſſer Cardamom-ſeeds, each one Dram: Infuſe all in a Pint of boiling Water, and, when the Liquor is cold, ſtrain it off.

The *Decoctum amarum ſalutiferum* is prepar'd in the following Manner:

Take of the Tops of the leſſer Centaury, and of Chamomile-flowers, each one Pugil; of Gentian-root, half a Scruple; of Rhubarb, one Dram; of Senna-leaves, ſufficiently cleans'd, and of the Seeds of Carduus Benedictus, each one Dram; of the leſſer Cardamoms, half a Dram: Infuſe in five Ounces of boiling Water, and ſtrain off the Liquor. *Pharmacop. Londin.*

2. Gentiana; Aſclepiadis folio, *C. B. P.* 187. *J. B.* 3. 723. *Raii Hiſt.* 1. 717. GENTIAN WITH SWALLOW-WORT-LEAVES.

It grows plentifully in *Stiria*, *Hungary*, and *Lower Auſtria*, at the Foot of Mountains, and on ſhady Hills, but never on the open Tops.

The Peaſants of *Sclavonia* ſay, they drink the Decoction of the Root, with good Succeſs, for the Stone: And *Aretius* and *J. Simlerus* inform us, that the Farmers make uſe of it to cure the Udders of their Cows, when bit by the Shrew-mouſe, or other poiſonous Animals, *Raii H. P.*

3. Gentiana; cruciata, *Offic. C. B. P.* 188. *Raii Hiſt.* 1. 717. *Tourn. Inſt.* 81. *Boerh. Ind. A.* 205. *Gentiana minor cruciata*, Park. Parad. 350. Ger. 351. Emac. 433. *Gentiana minor ſeu vulgi cruciati*, J. B. 3. 522. CROSSWORT GENTIAN.

It grows in all Parts of *Hungary*, both on the open and graſſy Hills and Mountains, and in the dry and green Meadows.

The Roots of this Species are extol'd by the Moderns againſt the Peſtilence, and the Bites of venomous Creatures. *Matthiolus* affirms, that the Root bruiſed, and apply'd to the Belly by way of Cataplaſm, is an experienced Remedy againſt the Worms of the Inteſtines; and that the Plant newly digged up, and bruis'd in the ſame manner, or dry'd and pulveriz'd, is effectual in curing ſtrumous Ulcers. *Raii H. P.*

4. Gentiana; Alpina; flore magno, *J. B.* 3. 523. *Tourn. Inſt.* 80. *Boerh. Ind. A.* 205. *Gentianella verna*, Offic. *Gentianella verna major*, Ger. Emac. 436. Raii Hiſt. 1. 718. *Gentianella major*, Park. Theat. 403. *Gentianella Alpina latifolia, magno flore*, C. B. P. 187. GENTIANEL.

The whole Plant, ſays *J. Bauhine*, is of a very bitter Taſte, and therefore is good for hyſteric Diſorders, the Jaundice, and Obſtructions. *Raii Hiſt. Plant.*

5. Gentiana; Alpina; pumila; verna; major, *T.* 80.

6. Gentiana; anguſtifolia; autumnalis, major. *Tourn. Inſt.* 81. *Boerh. Ind. A.* 205. *Pneumonanthe*, Offic. Ger. 355. Emac. 438. *Gentianella autumnalis Pneumonanthe dicta*, Park. Parad. 352. *Gentiana paluſtris anguſtifolia*, C. B. P. 188. Raii Hiſt. 1. 719. *Gentianæ Species, Calathiana quibuſdam radice perpetua, ſive paluſtris*, J. B. 3. 524. MARSH GENTIAN.

It is found on boggy Heaths, and flowers in Autumn. The Herb is accounted, by the Moderns, of great Virtue againſt the Peſtilence, and the Poiſon of venomous Animals; and ſome no leſs commend it in hepatic and pulmonic Affections: In ſhort, it agrees in Virtues with the common Gentian, only is much weaker. *Dale.*

7. Gentiana; paluſtris; latifolia; flore punctato, *C. B. P.* 188. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 204.

Beſides the foregoing Species of *Gentiana*, *Dale* mentions the following:

Gentianella autumnalis, Offic. *Gentianella fugax minor*, Ger. Emac. 437. *Gentianella autumnalis Centaureæ minoris foliis.* Park. Theat. 406. *Gentiana pratenſis, flore lanuginoſo*, C. B. Pin. 188. Raii Synop. 3. 275. Tourn. Inſt. 81. *Gentianæ Species quibuſdam, an Cordo Pneumonanthe, aut Gentiana fugax altera Cluſii?* J. B. 3. 526. BASTARD GENTIAN.

It grows on chalky Hills, and in dry Paſtures, and flowers in *September*. It is ſuppoſed to have the ſame Virtues with the greater Gentian.

This Gentian is a moſt excellent Stomachic, and one of the moſt grateful of bitter Herbs, far ſurpaſſing, in that reſpect, the leſſer Centaury, inſtead of which it begins to be frequently us'd by the Phyſicians and Apothecaries of *London*. *Dale.*

GENTIANELLA. See the preceding Word.

GENTIAPOLIS, Γεντιανόπολις, a Term in *Myrepſus*, *Antid.* 447. follow'd by an ἄλσος, "that is," and a void Space left for a Word to explain it, which none as yet, ſays *Fuchſius*, has been able to ſupply.

GENTILITIUS. An Epithet of Diſeaſes propagated from Parents to their Children, meaning the ſame as *Hereditarius*, hereditary.

GENU, γόνυ, the Knee. See CAUS.

GENUGRA. A barbarous Term in *Paracelſus*, for *Genagra*, the Gout in the Knee. *Coſtellus.*

GENYS, γένυς. See GENA.

GEODES *Lapis*, λίθος γεώδης, a Stone ſo call'd from γῆ, "the Earth," which it contains. It is of an aſtringent and drying Quality, deterges ſuch Things as darken the Sight, and mitigates Inflammations of the Breaſt and Teſtes, being rub'd on the affected Parts with Water. *Dioſcorides, Lib.* 5. *Cap.* 169.

GEOPILYSIA, γεωπιλύσια, according to *Rulandus*, is the Name which the Antients very properly gave to a Separation by Dilution; but it will be very hard to find a ſufficient Authority for his Aſſertion. *Coſtellus.*

GERÆTEROS, γεραίτερος, in *Hippocrates*, ſignifies Middle-aged, or one between thirty Years and Old-age. *Galen's Comment.*

GERANDRYON, γεράνδρεον. A Name for any old Tree; for the *Greeks* uſe the Word δρῦς, to ſignify all Kinds of Wood. *Gorræus.*

GERANIS, γερανὶς, the Name of a Bandage for a Diſlocation of the Shoulder, or a Fracture of the Clavicle, or Collar-bone, invented by *Hippocrates*; or, as others ſay, by *Perigenes. Galen, Lib. de Faſc. Æginet. Lib.* 6. *Cap.* 99.

GERANIUM, γεράνιον.

The Characters are;

The Leaves are, for the moſt part, conjugated, the Calyx pentaphylloidal, and expanded in form of a Star. The Flower here, in *Europe*, is pentapetalous, and roſaceous; but in *Africa* ſometimes tetrapetalous, and in a manner galeated and labiated, and furniſh'd with ten Stamina, which cloſely ſurround the Baſe of the Ovary. The Fruit is pentangious, or quinquevaſcular, beaked, containing, at the Baſe, five Capſules, including each a tailed Seed, and producing a long ſlender Tube; which five Tubes, uniting in cloſe Coalition, repreſent, with the Ovary, the Head of a Stork, or Crane.

Boerhaave mentions ſixty-eight Species of this Plant; none of which have any Medicinal Virtues attributed to them, except the following: The firſt of *Boerhaave's* is, the

Geranium; Africanum; arboreſcens; ibiſci folio rotundo; Carlinæ odore, *H. L.* 274.

This Plant has an emollient Virtue like the *Acetoſa*: As it is eſculent, its tuberous Roots are eaten in *Africa*, as we eat Turneps. An Infuſion, or Decoction, of the Herb, or its Juice, are effectual in reſolving the coagulated Blood in Wounds; it has ſomething of Aſtringency, and is recommended by the Antients for the Cure of foul Ulcers; they uſed it alſo in Ulcers of the Pudenda. A Bath prepared of the Decoction of this Herb has a good Effect in Fevers; and a Decoction of the Seeds is in Uſe for the healing of Wounds, and as a Demulcent of Aſperities in the Body; it is highly comforting and refreſhing to the Breaſts labouring under a Cancer, being reckon'd among thoſe Plants which preſerve from Corruption: The Leaves, boiled in Wine, diſcuſs an Inflammation, and are commended for an Eryſipelas. The Juice of the Root cures Diſeaſes in the Ears, and is good in a Fomentation for Pains of the Joints; for which Purpoſe it is uſed by ſome Surgeons, as alſo for Fiſſures in the Breaſts, and Diſcuſſion of the Milk.

Boerhaave mentions ſeveral other Species of the *African Geranium*; all which, he ſays, are poſſeſs'd of an emollient Quality.

The twenty-ſeventh of *Boerhaave's* is, the

Geranium; Batrachioides; Gratia Dei Germanorum, *C. B. Pin.* 318. *Tourn. Inſt.* 266. *Boerh. Ind. A.* 264. *Geranium Batrachioides*, Offic. Ger. 797. Emac. 942. Raii Hiſt. 2. 1061. Synop. 3. 360. J. B. 3. 475. *Geranium Batrachioides flore cæruleo*, Park. Parad. 228. CROWFOOT CRANE'S-BILL.

It grows in low Meadows and Paſtures, and flowers in *June* and *July*. The Powder of the Herb, ſprinkled on a Wound, dries it, and not only puts an immediate Stop to the Hæmorrhage, but cures it in a ſpeedy and ſurpriſing manner. *Dale.*

All the Species which go by the Name of *Batrachioides*, and eſpecially this twenty-ſeventh, have a very aromatic Smell, whence they are excellent Aperitives. This Species, in particular, is very ſucceſsfully uſed by Surgeons in the Cure of a Scirrhus, Abſceſſes, and Cancers. It is alſo commended for its Efficacy againſt the Stone, and as a Lenitive; and is highly extol'd by the antienit Surgeons againſt cancerous Tumors.

The other Species of *Batrachioides* are, the 28th, 29th, 30th, and 31ſt of *Boerhaave*.

28. Geranium; batrachioides; Gratia Dei Germanorum, flore albo.

29. Geranium; batrachioides; Gratia Dei Germanorum, flore variegato, C. B. P. 318.

30. Geranium; batrachioides; odoratum, C. B. P. 318.

31. Geranium; batrachioides; folio Aconiti, C. B. P. 317.

The thirty-ſecond of *Boerhaave's* is, the

Geranium; ſanguineum; maximo flore, *C. B. Pin.* 318. *Tourn. Inſt.* 267. *Boerh. Ind. A.* 263. *Geranium ſanguinarium*, Offic. Ger. 799. Emac. 945. *Geranium ſanguineum ſive Hæmatodes, craſſa radice*, J. B. 3. 478. *Cardiaca Hæmatodes*, Park. Parad. 229. Raii Hiſt. 2. 1061. Synop. 3. 360. BLOODY CRANE'S-BILL.

The Leaves of this Plant are ſtyptic, and taſte a little ſaltiſh; they give as deep a Tincture of red to the blue Paper, as Alum: Thus it is probable they are vulnerary no otherwiſe than by their aluminous Salt, which is united with a great deal of Sulphur and Earth: That does not hinder this Plant from having ſomething urinous in it; for, by the chymical Analyſis, is obtain'd from it, beſides ſeveral acid and oily Liquors, a little concreted volatile Salt.

The Roots and Leaves of this Species of Geranium are us'd in Ptiſans and Broths, which are vulnerary, and good to ſtop either external or internal Defluxions. *Martyn's Tournefort.*

It grows on Heaths, and among Buſhes, eſpecially in hilly Places, and flowers in *July*. It ſtops an Hæmorrhage in a ſurpriſing manner, in any Part of the Body, what Way ſoever almoſt it be us'd. *Dale.*

The thirty-ninth Species, in *Boerhaave*, of this Plant, is the

Geranium; tuberoſum; majus. *C. B. P.* 318. *Boerh. Ind. A.* 265. *Tourn. Inſt.* 267. *Geranium tuberoſum.* Offic. Ger. 795. Emac. 940. Raii Hiſt. 2. 1060. J. B. 3. 474. *Geranium tuberoſum, vel bulboſum.* Park. Parad. 228. KNOTTED ROOTED CRANE'S-BILL.

It is cultivated in the Gardens of the Curious, and flowers in *June* and *July*. *Dioſcorides* tells us, that the Root, drank in Wine, diſcuſſes Inflammations of the Uterus. *Dale.*

The forty-firſt of *Boerhaave* is the

Geranium; folio Malvæ rotundo; majus. *Boerh. Ind. A.* 265. *Geranium Columbinum, Pes Columbinus.* Offic. *Geranium Columbinum.* Ger. 793. Emac. 938. Raii Hiſt. 2. 1059. Synop. 3. 359. *Geranium Columbinum vulgare.* Park. Theat. 706. *Geranium folio Malvæ rotundo.* C. B. P. 318. Tourn. Inſt. 268. *Geranium folio rotundo, multum ſerrato, ſive Columbinum.* J. B. 3. 473. DOVE'S-FOOT.

The Root of this Species of Geranium is ſmall and rediſh, growing deep in the Earth, but not much branch'd. The Leaves generally lie ſpread on the Ground in a round Form, growing on long, rediſh, hairy Foot-ſtalks; they are ſmall and round, cut into about ſeven ſoft and hairy Segments. The Stalks are ſlender and jointed, hairy likewiſe, and beſet with ſmaller and more divided Leaves; they are about a Span high, having on them ſeveral ſmall, purple, five-leav'd Flowers, growing together, each of which is follow'd by a long Head, which reſembles the Head and Bill of a Crane, or Stork; when ripe, ſplitting into five Seeds. It grows every-where on Banks and Hedge-ſides, and flowers great Part of the Summer. The Leaves are us'd.

Dove's-foot is reckon'd among the Number of vulnerary Plants, being uſeful in inward Wounds, Bruiſes, and Hæmorrhages, and all Fluxes in general. It is mightily commended for the Cure of Ruptures in Children, given in Powder. It likewiſe helps the Stone, and provokes Urine. *Miller's Bot. Off.*

This Plant has an herby, ſaltiſh, glutinous, ſtyptic Taſte. It gives ſuch a red Colour to the blue Paper as the *Geranium ſanguineum; maximo flore*, or *Bloody Crane's-bill*, in all Appearance, by an aluminous Salt, which is diſſolv'd in a more glutinous Phlegm.

The Juice of this Species, boil'd with Sugar, is good for the Dyſentery; its Extract has the ſame Virtue; and its Leaves are us'd in Potions, Decoctions, Plaiſters, Oils, and Ointments for Wounds and Contuſions.

The fifty-eighth Species of this Plant, in *Boerhaave*, is the

Geranium; Cicutæ folio; Moſchatum. *C. B. P.* 319. *Tourn. Inſt.* 268. *Boerh. Ind. A.* 266. *Geranium Moſchatum.* Offic. Ger. 796. Emac. 941. Park. Theat. 709. Raii Hiſt. 2. 1057. Synop. 358. *Geranium Moſchatum folio ad Myrrhidem accedente majus.* J. B. 3. 479. MUSKED CRANE'S-BILL. *Dale.*

This Species of Geranium has its Leaves ſpread on the Ground in a round Compaſs, like the preceding; but they are much longer and larger, being pinnated with long roundiſh Pinnæ deeply ſerrated about the Edges, and pretty hairy, having a ſweet Scent ſomewhat reſembling Muſk, whence it has its Name. The Stalks grow taller than the preceding, beſet with the like, but ſmaller Leaves. The Flowers are ſmall and purple, growing on longer Foot-ſtalks, many together, in a kind of Umbel; after which come beak'd Heads of Seed like the former, but much longer, parting aſunder at the End, into five Seeds, each curling itſelf in a ſpiral Manner. It is found wild in divers Places of *England*, and is alſo frequently planted in Gardens, flowering great Part of the Summer.

This is alſo accounted a vulnerary Plant, as well as the former; and is ſometimes, though not ſo often, us'd in Wound-drinks. *Miller's Bot. Off.*

The ſixtieth Species of Geranium, in *Boerhaave*, is the

Geranium; Robertianum, *Ger.* 794. *Emac.* 939. *Raii Hiſt.* 2. 1058. *Synop.* 3. 358. *C. B. P.* 312. *Tourn. Inſt.* 268. *Boerh. Ind. A.* 366. *Geranium Robertianum, Gratia Dei*, Offic. *Geranium Robertianum vulgare*, Park. Theat. 710. *Geranium Robertianum murale*, J. B. 3. 480. HERB ROBERT.

This Species of Crane's-bill grows taller than either of the former, with ſeveral hairy rediſh Stalks, full of Joints, having at each two Leaves ſet oppoſite, which are much cut in and divided, reſembling Chervil-leaves, and are beſet with ſmall ſhort Hairs. The Flowers come forth at the Joints, two together upon one long Foot-ſtalk, which are larger than the Flower of either of the two former, conſiſting of five Leaves, and are ſucceeded by Heads, reſembling the Head and Beak of a Crane, as in the two preceding. The Root is of a rediſh-yellow Colour, ſlender, and creeping in the Earth. It grows in Hedges, and ſhady Banks, flowering in the Summer Months. The whole Plant has a ſtrong unſavoury Smell.

This is much of the Nature of Dove's-foot, being drying and binding, and uſeful in Wounds and Bruiſes, as well as in Fluxes; and is more particularly commended for the King's-evil, and all ſcrophulous Swellings; and has done great Service in nephritic Caſes. *Miller's Bot. Off.*

It is ſtyptic, ſaltiſh, and a little ſouriſh; and ſmells of Bitumen, and gives a pretty deep Tincture of red to the blue Paper. In all Appearance it contains a Salt reſembling Alum, mix'd with a little fetid Oil, and a very ſmall Quantity of Sal Ammoniac; for by the chymical Analyſis it yields a great deal of Acid, a little Salt, no volatile concrete Salt, but a little urinous Spirit. This Geranium is very aſtringent, and vulnerary. An Infuſion of its Leaves, in Wine, ſtops all Sorts of Hæmorrhages. *Martyn's Tournefort.*

It is of extraordinary Efficacy in cancerous Breaſts; and an old and ſkilful Surgeon aſſur'd me, that he never found more Succeſs, in theſe Caſes, from any Herb than from Geranium and Phellandrium. The Leaves, boil'd in Water, and made into a Cataplaſm, and ſome Vinegar added thereto, have an anodyne Virtue. *Boerhaave.*

GERARAT. A Name in *Avicenna* for ſome poiſonous Animalcula, ſuch as Scorpions, with gibbous Bodies, and ſharp Tails. *Caſtellus.*

GERARDI HERBA. See ANGELICA.

GERAS, γῆρας, in *Hippocrates*, means extreme Old-age, in which State Perſons are call'd by the *Greeks, Gerontes*, γέροντες, according to *Galen, Com. in Aph.* 31. *Lib.* 3. and by *Hippocrates, Presbytæ*, πρεσβύται, in the ſame Aphoriſm; γῆρας ἐκ νόσου, "Old-age from a Diſeaſe," is a ſort of Conſumption, or maraſmodic Fever. *Galen de Præſag. ex Pulſ.*

GERMEN. The ſame as BLASTEMA; which ſee.

GERMINATIO, Germination, Budding, in the Senſe of the Spagirifts, is a kind of particular Tranſmutation of Metals, eſpecially Silver, when, by the Mediation of Aqua-fortis, Mercury, and a ſmall Quantity of Silver, ſet over a moderate Fire of Charcoal, you ſee an Appearance of Silver Ramifications, or Branches, germinating or ſprouting forth in the Glaſs. *Caſtellus.*

GEROCOMIA, γηροκομία, from γήρων, an aged Perſon, and κομέω, to be concern'd about, is that Part of Medicine which preſcribes a Regimen to Old-age. *Blancard.*

GEROCOMICE, γηροκομικὴ, is the ſame with GEROCOMIA.

GERONTOPOGON. A Name, in *Boerhaave*, for the *Tragopogon purpureo-cæruleum Porri folio, quod Artifi vulgo.*

GERSA. Ceruſs. *Rulandus.*

GERULA, in *Paracelſus, de Puſtul. Gallic.* is a monſtrous Plant, or a Degeneration of a tranſplanted Parſnip. *Caſtellus.*

GERYON. A Name attributed to Mercury, or Quick-ſilver, by *Libavius, Ars Chym.*

GESNERA. An *American* Plant, ſo named by Father *Plumier*, in Honour of *Conrad Geſner*, a very learned Botaniſt, and Natural Hiſtorian.

It has an anomalous perſonated Flower, conſiſting of one Leaf, from whoſe Cup ariſes the Pointal, fix'd like a Nail in the hinder Part of the Flower, which afterwards becomes a membranaceous Fruit, divided into two Cells, which are fill'd with ſmall Seeds. *Miller* deſcribes three Species of this Plant.

GESOR. Galbanum. *Rulandus.*

GESTATIO, Geſtation, a Species of Gymnaſtics; for which ſee ÆGRA. *Geſtatio* is alſo us'd to expreſs the Pregnancy of a Woman, or the Time ſhe carries a Child in her Womb, till the Birth. *Caſtellus.*

GESTICULATIO, Geſticulation, is a Species of Gymnaſtics, conſiſting in a ſpontaneous Agitation of the Parts, and throwing the Body into different Poſtures, much like Actors on the Stage. Geſticulation, ſays *Oribaſius*, is a middle kind of Exerciſe, between Dancing and Mock-fighting, but more like the latter, and is uſeful for the ſame Intentions [ſee UMBRATILIS PUGNA]; but it is more adapted to Children, Women, and aged Perſons, and thoſe of weak and thin Bodies. *Oribaſ. Med. Col. Lib.* 6. *Cap.* 30.

GEUM. See SAXIFRAGA.

GEUMA, γεῦμα, from γεύω, to taſte, in *Hippocrates*, ſignifies all kinds of Food.

GHAHALA. A Name for the *Colocaſia*; *quod Arum Zeylanicum*; *minus*; *Colocaſiæ foliis*; *pediculis punicantibus.*

GHAN-

GHANDIROBA, *vel* NHANDIROBA *Braſilienſibus*, Maregr.

An hederaceous ſcandent Plant, growing in *Braſil*; it bears a Fruit of the Size of a large Apple, which contains, under ſeveral Shells and Membranes, an oily yelloviſh Kernel, of which the Inhabitants prepare an Oil, which is us'd in their Lamps, and burns very clear, and is very laſting. It cannot be eaten with Food, becauſe it is bitter, as is the whole Fruit. *Raii Hiſt. Plant.*

GHITTA *Jemou*. A Name for the GUTTA GAMBA. *Caſtellus.*

GIALAPPA, GIALAPIUM, JALAPPA. Names for the JALAPIUM; which ſee.

GIBAR. Metallic Medicines. *Rulandus. Johnſon.*

GIBBEROSITAS, GIBBOSITAS. The ſame as CYPHOSIS; which ſee.

GIBUM. Cheeſe. *Rulandus. Johnſon.*

GIFFÆ. Tumors behind the Ears. *Caſtellus.*

GIGARTON. The Stone, or Kernel, of a Grape. Grape-ſtones, *Ægineta* ſays, are drying and refrigerating. The Stones of Raiſins afford an acid Spirit, an empyreumatic Oil, and, as ſome pretend, a volatile Salt. *Caſtellus.*

GIGARUS. A Name for the *Dracontium*, in *Marcellus Empiricus*, *C.* 10.

GIGERIÆ. The Entrails, Viſcera, and Extremities of Poultry. *Heſychius.*

GILARUM. A Name for the *Serpyllum*, in *Marcellus Empiricus*, *C.* 11.

GILLA *Vitrioli*. See VITRIOLUM.

GINGIBER. The ſame as ZINZIBER, which ſee.

GINGIBRACHIUM, and GINGIPEDIUM. Names for the Scurvy, ſo call'd; becauſe the Gums, Arms, and Legs, are affected by this Diſtemper.

GINGIDIUM *alterum*. A Name for the *Viſnaga*.

Gingidium Dioſcoridis. A Name for the *Caucalis*; *arvenſis*; *echinata*; *magno flore*.

Gingidium folio Chærophylli. A Name for the *Daucus*; *maritimus*; *lucidus*.

Gingidium folio Pæniculi. A Name for the *Thapſia*; *Orientalis*; *Anethi folio*; *ſemine elegantèr crenato*.

Gingidium primum. A Name for the *Tordylium*; *minus*; *limbo granulato*; *Syriacum*.

GINGIVÆ. The Gums. See DENS, EPULIS, and PERULIS.

When Infants, whoſe Teeth are juſt about to break out, are afflicted with intenſe Heat, Crying, and Watching, or with Convulſions and Epilepſies, we muſt forthwith examine, whether there is not, on the Gum, a Tumor, which indicates a riſing Tooth: If there ſhould, the means of Relief are, firſt, to be ſought from proper Remedies; and, if theſe ſhould prove ineffectual, manual Operation muſt be us'd; for a tranſverſe Inciſion is cautiouſly to be made, with a Knife, in the tumid Gum, as far as the riſing Tooth. By this means the violent Diſtention of the Gums being remov'd, the above-mention'd Symptoms, for the moſt part, immediately diſappear; eſpecially if the wounded Gum is diligently anointed with Syrup of Violets, or Honey of Roſes. *Sydenham*, a juſtly celebrated Practitioner, affirms, that difficult Dentition, which is always accompanied with Inflammation, cannot be more expeditiouſly cur'd than by Veneſection. *Veſalius*, in the eleventh Chapter of his firſt Book *de human. Corp. Fabric.* informs us, that in Adults, whoſe *Dentes Sapientiæ* generally appear after the twentieth Year of their Age, with intenſe Pain, this Pain may be ſucceſsfully remov'd by frequent Scarification of the tumid Gum, or by making an Inciſion into it. The Authority of *Veſalius*, in this Caſe, is ſo much the better, becauſe, when he was twenty-ſix Years of Age, he us'd this Method himſelf. And *Paré*, in the ſixty-ſeventh Chapter of his twenty-third Book, obſerves, that through a Neglect of theſe Precautions the Duke of *Nevers*'s Son died, when eight Months old. *Heiſt. Chirurg.*

GINGIPEDIUM. See GINGIBRACHIUM.

GINGLYMUS, γίγγλυμος, ſignifies a Hinge; and hence, in Anatomy, a Species of Articulation reſembling a Hinge. See ARTICULATIO.

GINSZENG, & NINZIN, Offic. *Ninzin*, *Ginſen*, Mont. Exot. 7. *Ninzin ſeu Zingin & Ginſeng Radix genuina Indiæ Orientalis*, Pluk. Phytog. Tab. 101. Num. 7. *Ginſeng & Genſing quibuſdam*, Raii Hiſt. 2. p. 1338. *Radix Ninzin*, Piſ. Mant. Arom. 194. *Ginſeng vel Ninzen, Niſi, Rad. Chinenſis*, Cod. Med. 55. *Radix Ginſeng Chinenſibus, Niſi Japonenſibus*, Ogilb. Chin. 1. 212. *Radix Ginſeng*, Ejuſd. 2. 679. *Siſarum montanum Coreænſe, radice non tuberoſa*, Kempf. Amœn. Exot. 818. *Aureliana Canadenſis Iroquais Garensogen, Sinenſibus Ginſeng*, R. P. Lafiteau.

Father *Jartoux*, a Jeſuit Miſſionary, in *China*, gives the following Deſcription of Gingſeng.

The Ginſeng has a white Root, ſomewhat knotty, about thrice the Thickneſs of the Stem, and which goes tapering to the End: At a few Inches from the Head, it frequently parts into two Branches, which gives it ſome Reſemblance of a Man, whoſe Thighs the Branches repreſent; and it is hence it takes the Denomination *Ginſeng*.

From the Root riſes a perfectly ſmooth, and tolerably round Stem; its Colour is a pretty deep Red, except towards the Foot, where, by the Neighbourhood of the Earth, it is turned ſomewhat whiter: At the Top of the Stem is a ſort of Joint, or Knot, formed by the ſhooting out of four Branches, which ſpread as from a Centre: The under Side of each Branch is green, mix'd with white; and the upper Part, much like the Stalk, of a deep Red: The two Colours gradually decreaſe, and at length unite on the Sides.

Each Branch has five Leaves, equally divided from each other, both with reſpect to themſelves, and to the Horizon; and with the Leaves make a circular Figure, nearly parallel to the Surface of the Ground.

The Fibres of the Leaves are very diſtinguiſhable, and on the upper Side are beſet with ſmall whitiſh Hairs: The Membrane, or Pellicle, between the Fibres, riſes a little in the Middle, above the Level of the Fibres.

The Colour of the Leaf is a dark Green, above; and a ſhineing, whitiſh Green, underneath; and all the Leaves are finely jagged, or indented.

On the Edges, from the Centre of the Branches, ariſes a ſecond Stalk, very ſtrait, ſmooth, and whitiſh, from Bottom to Top, bearing a Bunch of round Fruit, of a beautiful red Colour. This Bunch, in the Plant viewed by our Miſſionary, was compoſed of twenty-four Berries.

The red Skin, which covers the Berry, is very thin and ſmooth, and contains within it a white Pulp: As theſe Berries were double, (for they are ſometimes ſingle) each had two rough Stones, of the Size and Figure of our Lentils. The Pedicles, whereon the Berries were ſupported, all aroſe from the ſame Centre; and, ſpreading exactly like the Radii of a Sphere, made the Bunch of Berries of a circular Form. The Fruit is not good to eat, and the Stone includes a Kernel: It has alſo a ſmall Beard at the Top, diametrically oppoſite to the Pedicle.

The Plant dies away every Year, the Number of its Years may be known by the Number of Stalks it has ſhot forth, of which there always remain ſome Marks.

As to the Flower, *F. Jartoux* owns he had never ſeen it; and therefore could not deſcribe it: Some have aſſured him, that it is white, and very ſmall; others, that there is no Flower at all, and that nobody had ever ſeen it. He rather inclines to think it ſo ſmall as to have eſcaped Notice; and what confirms him in the Opinion, is, that thoſe who ſeek the Ginſeng, having nothing in View but its Root, overlook and deſpiſe the reſt as uſeleſs.

As they have ſowed the Seed in vain, without any Plant ever ariſing therefrom, it is probable that might give occaſion to the Fable, which is current among the *Tartars*: They ſay, that a Bird eats it, as ſoon as in the Earth; and, not being able to digeſt it, it putrefies in its Stomach, and afterwards ſprings up in the Place where it was caſt, by the Bird, with its Dung. The Miſſionary rather believes, that the Stone remains a long time in the Ground, before it takes Root; which appears the more probable, as there are ſome Roots no longer or bigger than one's little Finger, which yet have ſhot forth, at leaſt, ten Stalks.

The moſt eminent Phyſicians in *China* have wrote whole Volumes upon the Virtues and Qualities of this Plant; and make it an Ingredient in almoſt all Remedies, which they give to their chief Nobility; for it is of too high a Price for the common People. They affirm, that it is a ſovereign Remedy for all Weakneſſes, occaſion'd by exceſſive Fatigues, either of Mind or Body; that it diſſolves pituitous Humours; that it cures Weakneſs of the Lungs, and the Pleuriſy; that it ſtops Vomitings; that it ſtrengthens the Stomach, and helps the Appetite; that it diſperſes Fumes, or Vapours; that it fortifies the Breaſt, and is a Remedy for ſhort and weak Breathing; that it ſtrengthens the vital Spirits, and increaſes Lymph in the Blood; in ſhort, that it is good againſt Dizzineſs of the Head, and Dimneſs of Sight; and that it prolongs Life, in Old-age. Nobody can imagine, that the *Chineſe* and *Tartars* would ſet ſo high a Value upon this Root, if it did not conſtantly produce a good Effect. Thoſe who are in Health often make uſe of it, to render themſelves more vigorous and ſtrong; and I am perſuaded, that it would prove an excellent Medicine in the Hands of any *European*, who underſtands Pharmacy, if he had but a ſufficient Quantity of it, to make ſuch Trials as are neceſſary, to examine the Nature of it chymically, and to apply it in a proper Quantity, according to the Nature of the Diſeaſe, for which it may be beneficial.

It is certain, that it ſubtilizes, increaſes the Motion of, and warms the Blood; that it helps Digeſtion, and invigorates in a very ſenſible manner. After I had deſigned the Root, I obſerv'd the State of my Pulſe, and then took half of the Root, raw as it was, and unprepar'd: In an Hour after, I found my Pulſe much fuller and quicker; I had an Appetite, and found myſelf much more vigorous, and could bear Labour much better and eaſier than before: Four days after, finding myſelf ſo fatigued

fatigued and weary, that I could ſcarce ſit on Horſeback, a Mandarin, who was in Company with us, perceiving it, gave me one of theſe Roots: I took half of it immediately, and an Hour afterwards I was not the leaſt ſenſible of any Wearineſs. I have often made uſe of it ſince, and always with the ſame Succeſs. I have alſo obſerv'd, that the green Leaves, and eſpecially the fibrous Part of them, chew'd, would produce nearly the ſame Effect. The *Tartars* often bring us the Leaves of Ginſeng inſtead of Tea; and I always find myſelf ſo well afterwards, that I ſhall readily prefer them before the beſt Tea. Their Decoction is of a grateful Colour; and, when one has taken it twice or thrice, its Taſte and Smell become very pleaſant.

As for the Root of this Plant, it is neceſſary to boil it a little more than Tea, to allow time for extracting its Virtue; as is practiſed by the *Chineſe*, when they give it to ſick Perſons, on which occaſion they ſeldom uſe more than the fifth Part of an Ounce of the dry'd Root. But, as for thoſe who are in Health, and take it only for Prevention, or ſome ſlight Indiſpoſition, I would adviſe them not to make leſs than ten Doſes of an Ounce, and not to take of it every Day. It is prepar'd in this manner: The Root is to be cut into thin Slices, and put into an earthen Pot, well glaz'd, and fill'd with about a quarter of a Pint of Water, *Paris* Meaſure: The Pot muſt be well cover'd, and ſet to boil over a gentle Fire; and, when the Water is conſum'd to the Quantity of a Cup-full, a little Sugar is to be mix'd with it, and it is to be drank immediately. After this, as much more Water is to be put into the Pot, upon the Remainder, and to be boil'd as before, to extract all the Juice, and what remains of the ſpirituous Part of the Root. Theſe two Doſes are to be taken, one in the Morning, and the other at Night.

As to the Places where this Root grows, it is between the thirty-ninth and forty-ſeventh Degree of Northern Latitude, and between the tenth and twentieth Degree of Eaſtern Longitude, reckoning from the Meridian of *Peking*. There is there a long Tract of Mountains, which the thick Foreſts, that cover and encompaſs them, render almoſt unpaſſable. It is upon the Declivities of theſe Mountains, and in theſe thick Foreſts, upon the Banks of Torrents, or about the Roots of Trees, and amidſt a thouſand other different Sorts of Plants, that the *Ginſeng* is to be found. It is not to be met with in Plains, Valleys, Marſhes, the Bottoms of Rivulets, or in Places too much expos'd and open. If the Foreſt takes Fire, and be conſum'd, this Plant does not appear till two or three Years after. It, alſo, lies hid from the Sun, as much as poſſible; which ſhews that Heat is an Enemy to it: All which makes me believe, that, if it is to be found in any other Country in the World, it may be particularly in *Canada*, where the Foreſts and Mountains, according to the Relation of thoſe that have lived there, very much reſemble theſe here.

Father *Laſitau*, a Miſſionary Jeſuit, and a Lover of Botany, was moved at the Reading of a Letter, wrote by Father *Jartoux*, from *China*, concerning the *Ginſeng*, to ſearch for that Plant in the Foreſts of *Canada*; and, after much Pains, believ'd he had found it, becauſe it was exactly like what Father *Jartoux* had deſcrib'd. The *Iroqueſe*, in that Country, who are very curious in Plants without being Botaniſts, and know very well how to uſe them without regular Preſcriptions, call this Plant *Garent-oguan*, which nearly ſignifies, *Two things ſeparated like two Thighs.*

The Academy being appriſed of this Diſcovery of Father *Laſitau*, ſome Botaniſts ſtill wanted clearer Information, to ſatisfy themſelves, that this Plant of *Canada*, was the ſame as what grew in *Tartary*; and they even doubted, whether that of Father *Jartoux* was the true *Ginſeng*, becauſe *M. Kæmpfer*, in a Book printed 1712, had given a Cut of the *Ginſeng*, very different from that of Father *Jartoux*. Father *Laſitau* happening to return to *Paris*, publiſh'd a ſmall Treatiſe on the Subject, which was diſtributed to the Academy, and ſeems entirely to diſſipate all Doubts. It contains a Deſcription of the *Ginſeng* of *Canada*, or the *Garent-oguan*, more circumſtantial than that of Father *Jartoux*. Its Virtues, as far as they could be try'd by Father *Jartoux*, for the preſent, are the ſame as M. *Bourdelin*, and common Opinion, aſcribe to the *Ginſeng*. M. *Vaillant* has reduc'd that Plant under a new Genus, which he calls *Araliaſtrum*. Before it was known to be the *Ginſeng*, or any thing heard of its Virtues, M. *Sarraſin*, a Phyſician, and very good Botaniſt, at his firſt Arrival in *Canada*, had obſerv'd this, among other Plants, peculiar to that Country, and gave it the Name of *Aralia humilis Fructu majore*. The *Engliſh* alſo obſerv'd it in their Colony of *Maryland*, and it is from their Accounts, that M. *Ray*, in his *General Hiſtory of Plants*, has given it us under the Name of *Plantula Marilandica Foliis in ſummo Caulículo ternis, quorum unumquodque bifariam dividitur, circa Margines ſerratis*, "The *Maryland* "Plant, with three quinquefid ſerrated Leaves, at the Top of "the Stalk." A Deſcription which, however ſhort, is ſufficient to make us know it.

We are here then, you ſee, enrich'd with the Diſcovery of a very valuable Plant, for which, as well as for that of the *Quinquina*, we are oblig'd to the Miſſionary Fathers, the Jeſuits. The Misfortune is, that this Plant, though growing in the Foreſts of *Canada*, where you need only take the Pains to gather it, will, in all Probability, be always ſcarce and dear. It has a perennial Root, and an annual Stalk; the Root produces, yearly, but a ſingle Stalk, which periſhes every Year; and by certain Nodes, form'd every Year in the Root, every one of which is the Mark of a Stalk, which has proceeded from it, Father *Laſitau* judges, that the Plant, or, more properly, its Root, may live a hundred Years. The Plant grows only in Foreſts, and not ſuch neither as are over-run with Briars, or Copſes, but only in the Shade of tall Trees; ſo that when theſe Places are clear'd, it appears no more there; and, in ſhort, it ſows itſelf with Difficulty; for, in the moſt advantageous Situations, we diſcover no more than ſeven or eight Stalks, one after another. M. *de Juſſieu* ſow'd ſome freſh and likely Seeds, which he had receiv'd from Father *Laſitau*, in the Royal Garden, but they did not ſucceed.

We have, however, ſome Reaſon to comfort ourſelves for the Scarceneſs of the *Ginſeng*, if, as M. *Reneaume* aſſures us, the *Hepatica nobilis Tragi*, a common Plant in Medicine, but leſs eſteem'd than it deſerves, be endu'd with its principal Virtues. *Hiſtoire de l'Acad. Royale*, 1718.

Whatever Virtues the *Ginſeng* may poſſeſs, when recent, I am afraid it loſes ſo much before it comes to us, that we cannot be proper Judges of its Efficacy. It is certain, that it is ſoon eaten by Worms, and becomes carious; an Inſtance of which I have ſeen, in a large Parcel, that was purchas'd by one concern'd in Medicine: When he perceiv'd the Worm began to ſeize it, he prudently made a Tincture of all he had left; and he aſſures me, from his own Experience, that he has great Reaſon to believe, that the Virtues attributed to the *Ginſeng*, by the *Chineſe* and *Tartars*, are not without Foundation.

GISCARA. A Name for the *Palma, Coccifera, minor Braſilienſis.*

GIR. Quick-lime. *Rulandus.*

GIRGIES. White Stones, found in Rivers. *Rulandus.*

GIRMER. Tartar. *Rulandus.*

GISISIM. Gum. *Rulandus.*

GIT, or GITH. A Name for the *Nigella*; *Flore minore, candido.* Fennel-flower. See NIGELLA.

GITHAGO. A Name for the *Lychnis*; *Segetum*; *major.*

GIUHNAXOCHITL. A Name for the *Tagetes*; *maximus*; *rectus*; *flore maximo, multiplicato.*

GLABELLA. The *Latin* Name for the Space between the Eye-brows, ſo called from its Smoothneſs, as being void of Hair. The *Greek* Term for it, in *Ruffus Epheſius*, is μεσόφρυον, or *Meſophryon.*

GLACIES MARIÆ. The ſame as the SPECULARIS LAPIS; which ſee.

GLADIOLUS.

The Characters are;

The Root is carious, tuberous, and double, one Part reſting on another; the Leaves are like thoſe of the Iris. The Calyx conſiſts of two vaginal or ſheath-like Leaves ſupporting the Ovary, and the Tube of the Flower ſeated thereon. The Flower is monopetalous, and, like a Lily, Funnel-ſhap'd below, but expanded above, and divided into ſix large Segments, of which the three uppermoſt are larger, wider, and more erect; the three lowermoſt longer, narrower, and in a manner pendulous, ſo as to make the Flower appear almoſt bilabiated. The Flower is ſeated on the Apex of the Ovary, and is furniſh'd with three Stamina, which ariſe from the Inſide of its Tube. The Ovary becomes an oblong, tricapſular Fruit, which is full of roundiſh Seeds, involv'd in a Calyptra, or Cover; and has a Tube, which ariſes from the Centre of its Apex; and is furniſh'd with three hollow *Cymbi*, or little Cups, for its Apiculæ. *Boerhaave, Index alter, Part* 2. *p.* 126.

Boerhaave mentions ſix Species of this Plant; which are,

1. Gladiolus; utrimque floridus, *C. B. P.* 41.

2. Gladiolus; carnei coloris, *Swert.* 42.

3. Gladiolus; maximus, Indicus, *C. B. P.* 41.

4. Gladiolus; floribus uno verſu diſpoſitis; major, floris colore purpureo-rubente, *C. B. P.* 41. *Tourn. Inſt.* 365. *Boerh. Ind. A.* 2. 127. *Gladiolus*, Offic. *Gladiolus Narbonenſis*, Park. Parad. 189. *Gladiolus Italicus*, Ger. 95. Emac. 104. *Gladiolus ſive Xiphion*, J. B. 2. 701. Raii Hiſt. 2. 1168. *Victorialis rotunda*, Offic. CORN-FLAG.

It is cultivated in our Gardens, and flowers in *June*. The Root, which is the Part in Uſe, is of a drawing, diſcuſſing, and drying Quality; it is commended as an Alexipharmac, and againſt the Peſtilence; and is accounted, by the Ignorant and ſuperſtitious Vulgar, a Charm againſt Witchcraft, and a Spell to render the Body invulnerable. *Dale.*

5. Gladiolus; Africanus; folio graminéo; floribus carneis maculam rhomboïdeam purpuream inſcriptis, uno verſu poſitis.

6. Gladiolus; utrinque floridus, floribus albis. H. R. Monſp.

Gladiolus luteus. See ACORUS ADULTERINUS.

GLADIUS. The Sword-fiſh. *Pliny.*

GLAMA, GLAME, γλάμα, γλάμη. The Sordes of the Eye in a Lippitude; γλαμυροὶ ὀφθαλμοὶ, in *Hippocrates*, *Lib.* 2. *de Morb. Mul.* are ſordid and humid Eyes. *Caſtellus.*

GLANDES TERRÆ. See LATHYRUS; arvenſis; repens; tuberoſus.

GLANDIUM. The ſame as THYMUS; which ſee. *Caſtellus.*

GLANDOSUM *Corpus.* So *Veſalius* calls the PROSTATÆ.

GLANDULA. A Gland. See CONGLOBATA, and CONGLOMERATA.

The Antients thought, that the Glands were Ciſterns, which contained certain Liquors, by which the Blood being fermented, throws off the Humours we find in the excretory Ducts. But as theſe Ferments muſt mix with the Blood, ſo they muſt be exhauſted and carry'd of by the Blood into the Veins. And becauſe all the Liquors in the Body are ſeparated from the Blood, there muſt, therefore, be another Ferment to ſeparate more: But this ſecond Ferment is liable to the ſame Fate as the firſt; and, therefore, there muſt be an infinite Series of Ferments in the Body, which is abſurd. If it ſhould be ſaid, that the Ferments are not carry'd off with the Blood, they muſt be ſtopt by the Structure of the Glands: But then we have a Secretion without a Ferment; which is the Opinion of moſt of the Moderns: Some of which think, that the Glands are Tubes, whoſe Orifices, differing in Figure, admit only Bodies of ſimilar Figures to paſs through them. But this Opinion is demonſtrably falſe; for, beſide that Liquors are ſuſceptible of all Figures, and that Bodies of any Figure, and a leſſer Diameter than that of the Gland, will paſs through; and that even a Body of a ſimilar Figure, and equal Diameter with that of the Orifice of the Gland, may be preſented innumerable ways, and not be able to paſs through, whilſt there is only one way it can paſs; I ſay, beſides all theſe, it is eaſy to demonſtrate, that all the Veſſels in the Body are either conical or cylindrical, and conſequently there is no Difference in the Figure of their Orifices: For the Preſſure of a Fluid being always perpendicular upon the Sides of the Veſſel that contains it, and equal at equal Heights of the Fluid, if the Sides are ſoft and yielding, they muſt be equally diſtended; that is to ſay, a Section perpendicular to the Axis of the Veſſel muſt be a Circle, and, conſequently, the Veſſel be either cylindrical, or conical. This is agreeable to the Obſervations and Speculations of the niceſt Anatomiſts, who tell us, that a Gland is nothing but a Convolution of ſmall Arteries, whoſe laſt Branches are cylindrical, or, which is the ſame thing, part of an infinitely long Cone. A Gland, therefore, being nothing elſe but a Branch of an Artery, whoſe fartheſt Extremity becomes the excretory Duct of the Gland, let us conſider how ſuch a Structure can ſeparate from the Blood only ſome Parts of it, and how different Glands may ſeparate different Parts of the Blood. Firſt, then, if ſuch a Fluid is to be drawn off, as conſiſts of the ſmalleſt Particles of the Blood, let that Orifice of the Gland, which is inſerted into the Artery, of which it is a Branch, be ſo ſmall as to admit only the ſmalleſt Particles of the Blood; then theſe, and theſe only, will enter this Gland; and the Fluid which paſſes out at the other Extremity of the Tube, or the excretory Duct, muſt be ſuch as is required. If the Particles of the Blood, which are of the next Size or Magnitude, are required to be ſeparated, let the Orifice of the Gland be ſo big as to receive theſe ſecond Particles, but ſmall enough to exclude all bigger Particles, then theſe ſecond Particles, together with the firſt, or ſmalleſt, will enter the Gland; but becauſe the Liquor to be ſecerned is to conſiſt only of the ſecond Sort of Particles, that is, the ſecond Sort of Particles only are to flow out at the Extremity of the Tube, which is the excretory Duct, therefore we are to ſuppoſe, that this Gland (which is only a Branch of the Artery, and differs in nothing from a common Artery, but in the Narrowneſs of its Chanel) has Branches which are big enough to receive the ſmalleſt Particles only, and carry them off into the Veins: So that, as both Sorts of Particles move together along the Gland, the ſmalleſt Particles will paſs off through its Branches, and a Fluid, conſiſting principally of the ſecond Sort of Particles, will arrive at the excretory Duct. Thus the Number of Branches may be ſo great as to draw off moſt of the ſmalleſt Particles, before the ſecond Sort of Particles arrive at the excretory Duct; ſo the Liquor to be ſecerned may conſiſt of both theſe Sorts of Particles, mixt together, in any Proportion, according to the Number of Branches. If a Fluid, conſiſting of a third Sort of Particles, larger than either of the former, is to be ſecerned, the Orifice of the Gland muſt be juſt big enough to admit of ſuch Particles, and none bigger; and the Branches of the Gland muſt be ſmall enough to exclude the biggeſt Particles, and big enough to receive the leſſer; and, according as the Number of Branches is either greater or ſmaller, the Fluid, which runs out at the excretory Duct, will conſiſt either of the largeſt Particles, or of all together mixt in any Proportion. Thus we ſee, how a Liquor, thicker than the Blood, may be ſtrained off from the Blood, if the Orifice of the Gland be ſo big as to admit Particles of all Sizes, and the Branches ſo numerous as to draw off the thinner Part, before the thicker arrives at the excretory Duct.

After this manner, the ſeveral Humours of the Body may be ſeparated by the Glands from the Blood, which muſt either be compoſed of ſo many Humours as are ſeparated from it, or elſe it muſt contain a few Principles, which, mixt all together, form the Blood, and, which variouſly combined, form the different Humours which are drained from it, as a few Rays of Light of different Refrangibilities, mixt all together, produce a white Colour; but, variouſly combined, exhibit all imaginable Variety of Colours.

It is not at all probable, that the Blood, in which we diſcern but two diſtinct Parts, ſhould be compoſed of near thirty ſimple Humours; for ſo many do the Glands ſecern from it: Nor is it agreeable to that Simplicity which Nature conſtantly affects in all her Operations. The Principles of all natural Bodies are ſaid, by Philoſophers, not to exceed the Number Five; and how prodigious is the Variety that reſults from their different Mixtures, and Modifications! If we ſuppoſe, alſo, but five Principles, or different Particles, in the Blood, their Combinations alone, without different Modifications and Proportions, will yield near as many different Humours as are ſeparated by the Blood. Nor is this purely a Suppoſition, but it is matter of Fact, that Urine, Sweat, Tears, Spittle, and Milk, are compound Liquors, and that in each of them there are Parts common to all of them. And if the Compoſition of ſome of the other Humours of the Body is not ſo apparent, it does no more follow from thence, that they are not compounded, than it does, that the Blood is not, becauſe we do not perceive in it the ſeveral Humours, which by the Glands are ſeparated from it. Being, therefore, the ſeveral Humours are formed by the various Combinations of a few Particles which compoſe the Blood, and that each Humour is ſecern'd by Glands, plac'd in ſome one Part of the Body, as the Gall, which is ſeparated no-where but in the Liver, and the Urine in the Kidneys, the Particles of the Blood muſt fall into ſuch Combinations as are fit to form Gall at the Liver, Urine at the Kidneys, and ſo of the others; otherwiſe the Glands could never ſeparate from the Blood ſuch Humours. And being all the Humours are compos'd of a few different Particles, the greater will be the Number of Particles combined to form Bile; and the greater Quantities of Bile will be ſecerned, the fewer there are of all other Combinations at the Liver. Such Combinations, therefore, as are fit to form the Humours proper to paſs thro' the Glands, where theſe Combinations are form'd, being there only requiſite, will be there moſt numerous; and all others, being leſs requiſite, or uſeleſs, will be there leſs numerous: And, therefore, where-ever the Particles of the Blood are moſt diſſolved, there will be plac'd ſuch Glands as ſeparate Humours which conſiſt of the moſt ſimple Combinations, or of Particles which the moſt eaſily combine; and, at the greateſt Diſtance from theſe, will be ſituated the Glands which ſecern Humours conſiſting of the moſt compound Combinations, or of Particles which do the moſt ſlowly unite; and between theſe will be all other Glands, nearer to either Extreme, as they ſeparate Humours more or leſs combined, or compounded of Particles, which more quickly, or ſlowly, combine together. By the Thinneſs of the Liquor in the Pericardium, and of the Urine which paſſes thro' the Kidneys, the Particles of the Blood ſeem to be moſt diſſolved at and about the Heart. Here we not only find the Effects of this Diſſolution in the Secretions, but likewiſe the Cauſe of it, the Force of the Air in Reſpiration breaking the Globules of the Blood, which Force is demonſtrable to exceed the Preſſure of an hundred Pounds Weight, upon the Surface of the Lungs. Nor is it evident only from the Cauſe and Effects, that the Blood is here moſt diſſolved, but alſo from the Methods which Nature takes to prevent the Effects of this Diſſolution, in ſome particular Places, at a little Diſtance from the Heart: For the Bile and Seed being thick Humours, compos'd of Particles which combine but ſlowly together, and it being requiſite, that they ſhould be ſecern'd where the Liver and Teſticles are plac'd, Nature has made uſe of particular Contrivances, to give the Particles, which were to form theſe Humours, more time to combine, than they could have had otherwiſe, being ſo near to the Heart. For the Formation of Bile, ſhe has contriv'd the Vena Portæ, and the Spleen: Through the firſt, the Blood moves near two hundred times ſlower, and through the laſt altogether as much, than otherwiſe it had done. And, that the Particles which form the Seed, might have time to combine, the Orifices of the ſpermatic Arteries are contracted; and they likewiſe ariſe from the *Aorta Deſcendens*, a little below the Emulgents, at a great Diſtance from the Teſticles, contrary to the common Courſe of Nature; by which means the Blood is 150 times longer in going to the Teſticles, than otherwiſe it had been. At the greateſt Diſtances from the Heart, the viſcous Liquor of the Joints is ſecerned; and ſome Liquors, whoſe Parts require no Combination, as the Lympha, may be ſecerned any-where. All theſe different Combinations, which form ſo many diſtinct

Fluids, ariſe from an attractive Power in the Parts of Matter; which, tho' it be equally diffus'd thro' the whole Maſs, yet, according to the different Denſities of Particles, and the Figure of their Parts, ſome Sorts of Particles will be ſoon united, whilſt others require a longer time to be join'd together; ſome Particles will cohere more firmly than others, and Particles of one kind will have a greater Tendency to unite with thoſe of another Sort, in a certain Portion of their Surface, than in any other. This attractive Force is different from that by which Sir *Iſaac Newton* explains the Motions of the heavenly Bodies; for the Force of Attraction, by which the Planets obſerve their Motions, decreaſes only in a reciprocal duplicate Proportion of their Diſtances; whereas this other ſeems to decreaſe in a reciprocal Triplicate, or in a greater Portion of the Diſtances of the Parts of Matter from each other. *Keill's Anatomy.*

In giving an Account of the Nature, Properties, and various Uſes of the Glands, we ſhall take notice of the uſeful Diſcoveries of *Sylvius*, *Steno*, *Wharton*, *De Graaf*, *Malpighi*, *Bellini*, *Borelli*, *Peyer*, *Ruyſch*, and *Nuck*, who have been both diligent and accurate in their Reſearches with reſpect to the Glands.

Glands, then, are either ſimple or compound; the latter conſiſt of the former, and are both contain'd in one common Membrane. Thoſe of the ſimple kind convey their proper Humour thro' their own lymphatic Ducts either to the Chyle, or to the venous Blood; or elſe they diſcharge their Contents, either on the external Parts of the Skin, or the Surfaces of the looſe Membranes, which are every-where found in the Body: But the compound Glands, by means of a proper Canal, diſcharge their Humours form'd in every Part, into a larger Canal, and at laſt, by means of this common Emiſſary, into the large Cavities, eſpecially thoſe of the Mouth and Inteſtines, or quite out of the Body, for particular Purpoſes. The ſimple Glands are alſo call'd conglobate, and the compound conglomerate Glands.

The ſimple Glands are form'd of a certain exterior and ſlender Membrane, together with a ſubjacent one, to which the other cloſely adheres: The former, compos'd of circular and elaſtic Fibres, every-where comprehends, braces up, compreſſes and expreſſes the contained Liquor, and conſiſts principally of a Contexture of the ſmall Veſſels, which enter it, and are ſent out from it. The latter, which is thicker and more denſe, conſiſts of Fibres running almoſt in all Directions, and of an intricate and perplex'd Contexture of the ſmall Veſſels: It is ſubſervient almoſt to the ſame Purpoſes with the former. Theſe Membranes receive the Arteries, ſupport their Ramifications in a due and unalterable Order, and accurately convey and diſtribute theſe Ramifications to every the moſt minute Part of the Gland; ſo that an Injection of Wax or Quick-ſilver, by increaſing the Bulk of the ſmall Arteries, and compreſſing the other Veſſels, would almoſt make us think, that the whole Fabric of the Gland was arterial. Theſe Membranes have, alſo, Veins diſpos'd in the ſame Direction with the ſmaller Arteries, and more and larger Nerves than any Part of the Body of an equal Bulk; and theſe Nerves are alſo ſo diſtributed thro' the ſmall Body of the Gland, that they ſeem almoſt to make up the Whole of it. Theſe Membranes, of which the Glands conſiſt, have alſo lymphatic Veſſels, which arrive at, and are ſent out from them.

Their Arteries are conical, inflected, ramous, elaſtic, and gyrated Canals, whoſe Extremities are cylindrical, and no longer ramous, but chang'd into Veins: But, before theſe ſmall Arteries are thus chang'd, they communicate with each other by an infinite Number of Anaſtomoſes, and various Poſitions at an infinite Number of different Angles; ſo that their Extremities vary very greatly in different Glands.

The arterial Blood, therefore, convey'd to the Glands, is mov'd very briſkly; for there is a great Reſiſtance, a Compreſſion, a mutual Preſſure of the Parts upon each other, an oblique Preſſure, a continual Permutation of Contacts; everywhere a multifarious Application to all the moſt minute Points of the Canals, a various Rotation at every Moment, and an oppoſite Preſſure, in every Particle, a Diſtribution of the Humours into the Ramifications, and a Return thereof to the Ramifications, an Attenuation, an Attrition, a Preſervation of Fluidity, Solidity, Secretion, and a due Mixture.

In the mean time the Ramifications ariſing from the Trunk of the Artery are generally narrower than the Trunk at that particular Part whence they ariſe: This happens even in the moſt minute Ramifications, ſo that the ultimate Ramifications are ſmaller than the ſmalleſt Part of the common Trunk, The ultimate Trunks tranſmit the red and thickeſt Part of the Blood, and convey it to the Beginnings of the ſmall Veins. The ſmaller Ramifications receive finer, more fluid, and pellucid Parts, ſmaller than the Diameters of their reſpective Cavities, preſs'd thro' them by an oblique, oppoſite, and ſtrong Force.

But this ſubtile Fluid, deſtitute of the thicker Parts, is no longer Blood, but ſome other Liquor of various Kinds, ſuch as Sweat, perſpirable Matter, or that diſcharg'd by the cutaneous Pores, Tears, pinguious Wax, the Wax of the Ears, Mucus, Saliva, Spit, Mucilage, Lymph, Serum, Bile, Seed, Oil, Milk, and Fat. Hence, the ultimate Ramifications, loſing their former Name of Artery, are denominated from the Nature of the Fluid they contain; and, as they often aſſume all the Properties of an Artery, they will alſo have their ſmaller Ramifications and Veins. Hence there are both Arteries and Veins deſtin'd for the Serum, the Lymph, the aqueous Parts, and the Spirits, as well as for the Blood. Nor is it known where this Progreſſion terminates; but by this means we come to know the Origin, the Progreſs, the End, and the Office, of the lymphatic Veſſels. See ERROR LOCI.

The Ramifications, however, of any ſuch Artery, when no longer ramous, but direct, and collected in the fineſt Membrane of the moſt minute glandular Follicle, opening the Mouths of their Extremities, diſcharge their contain'd Fluids into a common Cavity, form'd by that fine Membrane, where being collected, it in ſome meaſure remains, and is the glandular Lymph there prepar'd and accumulated.

'Tis probable that the Nerves of the Glands, by a ſimilar Apparatus, diſcharge their Spirits into this common Cavity, where they are mixt with the Lymph, and furniſh it with the Qualities it naturally ought to have.

In the mean time the lymphatic Arteries often convey the Lymph receiv'd into their ſmall Veins furniſh'd with Valves, by us call'd vaſcular Lymph, to theſe Glands; and by a different Apparatus convey it into the ſame Follicle, where 'tis mix'd with the glandular Lymph and Spirits, in order to ſupply a moſt ſubtile Part, in the room of that which is loſt.

Then this compound Humour is by the contractile Force of the fibrous Membrane, the Motion of the Artery, and the Preſſure of the Muſcles, carried thro' the egredient lymphatic Veins into other Glands, where 'tis again to undergo the ſame Action, and thence into the Receptacle of the Chyle, the thoracic Duct, or the Blood-veſſels: And ſuch ſeem to be conglobate Glands in all the Parts of the Body.

But in other Glands the Caſe is quite different; ſince this Follicle immediately expels thro' its proper Emiſſary the Liquor it receives, into ſome common Cavity: Thus the ſecreted Mucus is depoſited, collected, and chang'd in the frontal Sinuſes, the Sinuſes of the ſuperior Jaw, the *Cellulæ* of the *Os Sphenoides* under the *Sella Turcica*, the Excavations of the ſpongious Bones of the Noſtrils, the Cavities of the Noſtrils, and the *Lacunæ* of the Tonſils. Of this Kind ſeem to be the mucilaginous Glands of the Mouth, of the back Part of the Tongue, of the exterior and interior Part of the Epiglottis, of the internal Part of the Noſtrils, of the *Meatus auditorius*, of the *Larynx*, of the *Aſpera Arteria*, of the *Bronchia*, of the *Oeſophagus*, of the Stomach, and of the Inteſtines, which Species of Glands may be call'd ſimple excretory Glands.

Again, other Glands, with a ſimilar Apparatus, diſcharge their prepar'd Liquors thro' proper Emiſſaries, ariſing from the common Cavity, without the Skin, as the Glands in the external auditory Paſſage, in the *Pinnæ Naſi*, in the exterior Part of the Noſe, in the Beginning of the internal Part of the Noſtrils, in the Face, in the Neck, in the *Axillæ*, in the *Scapulæ*, in the *Areolæ* of the Nipples and Navel, in the Hips, in the Areola of the *Anus*, in the *Perinæum*, in the *Pubes*, in the *Mons Veneris* in both Sexes, in the *Scrotum*, in the Integuments of the Penis, in the Lips of the Female Pudenda, and in the Knees. The Glands of this kind are now call'd ſebaceous Glands.

Hence the Diſtance of an Artery from the Heart, its Situation with reſpect to the Heart, and the Trunk whence it ariſes, its various Complication, the different Velocity of the Blood moving thro' it, the Proportion of each Ramification to its common Trunk, the different external and internal expreſſing Force, the Continuance of the Fluid in the common Cavity, its Diſtribution thence into Places which again change the Humours by their Structure; and the Exhalation or Separation of the moſt liquid Part of the ſecreted Fluids, are all Circumſtances which concur to make various Liquors ſecreted from the ſame Blood in various Parts, and, when ſecreted, ſurpriſingly chang'd.

In the Structure of the human Body, as diſcover'd by the Evidence of Senſe, theſe Cauſes are found to be various in various Parts of the Body, or they are capable of being deduced from this Structure of the Body, with the greateſt Evidence, by means of infallible mechanical Laws, and by a Knowledge of the Nature of the Humours, which may be eaſily and ſpeedily acquir'd. The innumerable Species, therefore, of Secretions and ſecreted Fluids may be hence underſtood.

Hence 'tis by no means neceſſary to ſuppoſe, that, in order to glandular Secretion, Pores of a determin'd, various, and immutable Size are abſolutely requiſite; eſpecially ſince 'tis repugnant to the Laws of Nature, that there ſhould be ſuch, or that they could act in ſuch a manner, though they really exiſted,

Much leſs is it conſiſtent with the Principles of Phyſic, to account for glandular Secretion by any Ferments, whether they are ſuppos'd thick or fluid, or whether we conceive them to act by Fermentation, Precipitation, Coagulation, Solution, Change, or Aſſimilation; for to theſe neither Cauſe, Origin, Matter, Place, Admixture, Efficacy, Proportion, Duration, Effect, or Termination, can be aſſign'd.

But of theſe ſimple Glands already deſcrib'd, or of others highly ſimilar to them, united by common Veſſels, and wrapt up in a common Membrane, are form'd the compound or conglomerate Glands. Theſe are generally furniſh'd with a common Emiſſary, which receives the Humours from all the Emiſſaries of the other Parts, collects them, and diſcharges them again into ſome other larger Cavity. Of this Kind are, the Glands of the Eye, the Parotids, the Pancreas, and ſome others.

This common Cavity or Receptacle, ending in an Emiſſary frequently, is either firſt chang'd, as it were, into an arterial inflected Veſſel, which induces ſome Change in the Humours they convey, and by an Apparatus like an Artery diſcharges them into an open and patent Receptacle; as in the Teſtes, the *Ductus Highmorianus*, the *Epididymis*, the *Vas Deferens*, and the *Veſiculæ Seminales*; or, ſecondly, it is immediately convey'd into a common Emunctory.

Hence 'tis certain, that, by means of the Glands, there are ſeparated from the arterial Blood Water, Lymph, a fine Serum, and alſo the Salts, Spirits, and highly ſubtile Parts of the Oils, mix'd with theſe; that all theſe, either becoming ſtagnant, are collected, chang'd, and accumulated in certain Places; or forc'd through the ſmall Veſſels into the moſt minute Parts of the Body, for the Purpoſes of Motion and Nutrition, and thence return to the Heart by their proper Veins, or are exhal'd; and that the Part of the Blood, after this, remaining in the Arteries, enters the Veins, which become gradually wider, is mix'd with ſimilar Blood, diluted with Lymph, and returns to the Heart.

For this Reaſon the arterial Blood is, about the Heart, highly diluted, but gradually becomes thicker, and is thickeſt of all, moſt viſcid, and eaſily concreted, in the End of the Artery, that is, the Beginning of the Vein; for which Reaſon it requires a Veſſel incapable of Obſtruction, and an Admixture of ſome diluting Liquor, that is, of Lymph, which has aſſum'd its due Quality by having perform'd its ſeveral Offices, and is returning to the Heart. It, alſo, requires an Admixture of Spirits. But theſe Circumſtances muſt happen to it, before it can be again convey'd into the pulmonary Arteries; otherwiſe the Blood would only be fit for performing one Courſe of Circulation.

Hence we know the particular Parts, the Diſorders of which moſt eminently endanger Health, and the Continuation of Life. Hence, alſo, we know, how much the large Veſſels, the thick Humours, the ſmall Veſſels, and the ſubtile Humours, contribute to the Strength, Stability, and Flexibility of the Body. Hence, farther, we underſtand, why the Veins becoming gradually larger, lax, fit for the Concourſe and Dilution of the Humours, ſhould perform their reſpective Offices, before a freſh Return of the Blood to the Heart can be produced.

But ſome Glands ſeem to be of another Structure; ſince, in them, the Artery, conveying the Humours, diſcharges the thicker Blood into its correſponding Vein, by means of Anaſtomoſes running between the Artery and the Vein; but, after this, the Artery going on ſingle, and being contorted, diſcharges from its Extremity, into the common Receptacle, its proper Liquor, prepar'd in it, but different from the Blood, tho' ſecreted from it. *Boerhaave's Inſtit.*

GLANDULOSOCARNEUS, glanduloſo-carneous, an Epithet, given by M. *Ruyſch*, to ſome Excreſcences, which he obſerv'd in the Bladder. *Caſtellus.*

GLANDULOSUM *Corpus.* The *Proſtatæ*, ſo called.

GLANIS. The Name of a Fiſh, which lives both in freſh and ſalt Waters. It is ſuppos'd to be like the *Silurus*, or Shore-fiſh. *Caſtellus.*

GLANS, βάλανος. See BALANOS. *Glans unguentaria.* See BALANUS MYREPSICA.

Glans is alſo taken for ſtrumous or ſcrophulous Tumors. *Caſtellus. Glandes Quercinæ.* See QUERCUS.

Glans is, in Anatomy, the Nut of the *Penis*. See GENERATIO.

Glans, alſo, ſignifies a Suppoſitory, or Peſſary.

GLASSA. A ſort of dry Verniſh. *Rulandus. Johnſon.*

GLASTAVIDA *Cretenſium.* A Species of BLATTARIA; which ſee.

GLASTEA *Bilis.* A ſort of Bile, the ſame as the ἰσάδης, which ſee under BILIS.

GLASTUM. A Name for the *Iſatis*; *ſativa*; *ſive latifolia.*

GLAUCEDO. The ſame as GLAUCOMA. See CATARACTA.

GLAUCIUM.

The Characters are;

The End of the Pedicle is expanded into an orbicular Placentula, terminated by a hollow ſpherical Subſtance, to which it grows. The Calyx conſiſts of two Leaves, and is caducous: The Flower is tetrapetalous, expanding in form of a Roſe, or Poppy, and furniſh'd with very numerous Stamina, which, for the moſt part, fall off, after the Opening of the Flower. The Ovary ariſes from the Bottom of the Placentula, with a hairy bifid Apex; and ripens into a long, ſmooth, bivalve Pod, the Valves adhering to the intermediate Partition, in ſuch a manner as to leave the whole Capacity unicapſular, and full of roundiſh Seeds.

Boerhaave mentions four Species of this Plant; which are,

1. Glaucium; flore luteo. *Tourn. Inſt.* 254. *Boerh. Ind. A.* 305. *Papaver Corniculatum.* Offic. *Papaver corniculatum luteum.* J. B. 3. 398. Park. Theat. 261. Raii Hiſt. 1. 857. Synop. 3. 309. *Papaver corniculatum luteum, magnitudine Dioſcoridi, & Theophraſti, ſylveſtre, Ceratitis, Plinio.* C. B. P. 171. YELLOW-HORNED POPPY.

Dioſcorides ſays, this Plant is diuretic; and *Galen* looks upon it to be vulnerary and deterſive; but he conſiders not, that it muſt be uſed only to eat away the proud Fleſh of Ulcers. Nevertheleſs, in *Portugal*, they give the Infuſion of half a Handful of it, in White-wine, to thoſe who are ſubject to the Stone. In *Provence* they uſe the ſame Leaves, bruiſed, for Ulcers, and, above all, for the Wounds of Horſes. *Martyn's Tournefort.*

2. Glaucium; hirſutum; flore phœniceo. *T.* 254.

3. Glaucium; glabrum; flore phœniceo. *T.* 254.

4. Glaucium; flore violaceo. *T.* 254. *Boerh. Ind. alt. Plant. vol.* 1. *p.* 305.

The *Argemone Mexicana*; of *Boerhaave*, is the *Glaucium.* Offic. *Papaver Spinoſum.* C. B. P. 171. J. B. 3. 397. Ger. Emac. 401. Raii Hiſt. 1. 856. *Papaver ſpinoſum Americanum.* Park. Theat. 366. PURGING THISTLE.

It is cultivated in the Gardens of the Botaniſts, and flowers in *July* and *Auguſt*. The Juice, which bears the Name of *Glaucium*, is the Part uſed; and, being, as *Dioſcorides* ſays, of a refrigerating Quality, is effectual in recent ophthalmic Diſorders.

From what Plant this Juice, or *Glaucium*, of *Dioſcorides*, is expreſs'd, remains a Controverſy among Botaniſts. I, ſays *Dale*, with *C. Bauhine*, have ſuppos'd it to be produc'd from the Plant before-mention'd, being induced thereto by the Deſcription; which Deſcription he gives of it as follows: "*Glaucium* is the Juice of an Herb, which grows near *Hierapolis*, "a City of *Syria*; its Leaves nearly reſemble thoſe of the "horned Poppy, only fatter, and ſpreading upon the Ground, "of a ſtrong Smell, and a bitter Taſte; the whole Plant is "full of a Saffron-colour'd Juice. The Natives of the Country "put the Leaves into an earthen Pot, which they place in their "Ovens, when half cold, and keep it there till the Leaves "become flaccid; then take it out, and, bruiſing the Leaves, "expreſs the Juice."

GLAUCOMA, or GLAUCOSIS. A Diſorder of the Eye. See CATARACTA.

GLAUCOS, γλαυκὸς. A Colour compos'd of a White and Green. Sky-colour'd.

GLAURA, in *Paracelſus*, is immature Amber, call'd alſo, *Nympha.*

GLAUX. Offic. *Glaux Dioſcoridis.* Ger. 1061. Emac. 1242. *Glaux Hiſpanica.* J. B. 2. 341. *Glaux Hiſpanica Cluſii.* Park. Theat. 1095. Raii Hiſt. 1. 940. *Ciceri ſylveſtri minori affinis, ſi non idem.* C. B. P. 347. THE MILKWORT OF DIOSCORIDES.

It grows in hilly and chalky Fields, and the Herb is in Uſe, which, boil'd in Barley-water, is effectual, as *Dioſcorides* ſays, for renewing Milk in Womens Breaſts, where it is loſt.

There is a Diſpute, among the Botaniſts, about the *Glaux* of *Dioſcorides*. *Anguillarus*, *Parkinſon*, and *Alpinus*, will have it to be the *Lotus*; *Geſner*, the *Onobrychis*; *Turner*, the *Glaux vulgaris* (Liquorice-vetch); *Dodonæus*, *Cordus*, and *C. Bauhine*, a Species of a certain ſmall marine Plant; *Lobel*, *Gerard*, and *Cluſius*, the Plant here exhibited, and deſcrib'd by *Dioſcorides*, as follows: "The *Glaux* has Leaves like thoſe of the "*Cytiſus*, or Lentil, green on the upper Side, and whitiſh "underneath. The Root ſends forth five or ſix ſlender Stalks, "a Span high; the Flowers are of a purple Colour, and reſemble thoſe of the *Leucoium*, (Stock-gilliflower) only "ſmaller." *Dale.*

The *Aſtragalus* γλυκύφυλλος of *Boerhaave* is the *Glaux vulgaris.* Offic. *Glaux vulgaris leguminoſa ſeu Glycyrrhiza ſylveſtris.* Park. Theat. 1098. Raii Hiſt. 1. 935. *Glycyrrhiza ſylveſtris floribus luteo-palleſcentibus.* C. B. P. 352. *Aſtragalus luteus perennis procumbens vulgaris ſeu ſylveſtris.* Raii Synop. 3. 326. Tourn. Inſt. 416. *Fœnum Græcum ſylveſtre, ſeu Glycyrrhiza ſylveſtris quibuſdam.* J. B. 2. 330. *Hedyſarum Glycyrrhizatum.* Ger. 1056. *Quoad deſcript.* Emac. 1233. LIQUORICE-VETCH.

It grows in Buſhes and Thickets, and on the Borders of Fields, and flowers in *July*: The Herb and Seed are in Uſe, which

which agree in Virtues with the Milkwort of *Dioſcorides*. The Herb, as *Buxbeaums* writes, is deceitfully ſold, in the Shops, for *Galega*. *Dale*.

Under the Article ASTRAGALUS I have, by Miſtake, apply'd the Account which *Tournefort* gives of this Plant to the *Aſtragalus*, Offic. Which is, that the Root is ſweetiſh, aſtringent, and gives a deep Tincture of Red to the blue Paper; the Leaves give it hardly any; they are bitter, and ſmell like Elder; which ſhews, that the fetid Oil is found in greater Quantity in the Leaves, and that it involves the acrid Salt and Earth: This Plant is not in Uſe; nevertheleſs, a Night's Infuſion of it, in Wine, is given, with Succeſs, for the Retention of Urine, and for the Gravel, by ſome Herbariſts, at *Paris*. *Martyn's Tournefort*.

GLAUX. The Owl. See NOCTUA.

GLECHON. γλήχων, or γλῆχος. Peny-royal. See PULEGIUM. HIPPOCRATES.

GLECHONITES, γληχονίτης. An Epithet for Wine, impregnated with Peny-royal. *Dioſcorides*, *L.* 6. *C.* 5. *C.* 67.

GLENE. γλήνη. This properly ſignifies the Cavity of the Eye, and the Pupil: But it is uſed to expreſs any ſlight Depreſſure, or Cavity of a Bone, which receives another Bone, in Articulation. *Cotyle* is, alſo, ſuch a Cavity, or Depreſſure, but much more deep.

GLENOIDES. An Epithet for two Cavities, or ſmall Depreſſures, in the inferior Part of the firſt Vertebra of the Neck.

GLEUCINUM (*Oleum*), γλεύκινον (ἔλαιον), or Gleucine-oil. Simple Gleucinum is prepar'd of Oleum Omphacinum, Juncus, Calamus, *Celtic* Nard, Spatha, Aſpalathus, Melilot, Coſtus, and Muſt, put together into a Veſſel, which is to be ſurrounded with the Huſks of Grapes, after preſſing out the Wine. This Mixture is to be ſtir'd twice a Day, for thirty Days; then the Oil is to be preſs'd out, and reſerv'd for Uſe.

It is warming, emollient, and relaxing; and, therefore, good in Rigidities, and Diſorders of the nervous Parts, and Affections of the Uterus. *Dioſcorides* prefers this before all ſorts of Acopa, *Lib.* 1. *Cap.* 67.

Aetius, *Tetrab.* 3. *Serm.* 4. *Cap.* 44. gives the Deſcription of a much more compounded Gleucinum.

GLEUCOS, γλεῦκος, Muſt. The unfermented Juice of the Grape. *Vander Linden* ſays, it ſometimes imports ſweet, generous, and ſtrong Wine.

GLEUXIS, γλεύξις. Wine which has a large Quantity of Sapa, or Defrutum, mix'd with it.

GLIS. Offic. Geſn. de Quad. Digit. 550. Aldrov. de Quad. Digit. 409. *Glis Geſneri & aliorum*. Raii Synop. A. 229. THE REL, or RELL-MOUSE.

The Fleſh, if eaten, is ſaid to cure the Bulimia; if the Soles of the Feet are anointed with the Fat, it is ſaid to procure Sleep; the Excrements, drank in any convenient Vehicle, have the Reputation of diſſolving the Stone; and, mix'd with Vinegar and May-dew, to cure an *Alopecia*, the Part affected being anointed therewith; the Aſhes clear the Sight. *Dale*.

GLISCHROCHOLOS, γλισχρόχολος. An Epithet for Excrements which are viſcid, and, at the ſame time, bilious.

GLISCHROS, γλισχρός. Viſcid, or glutinous; in *Latin lentus*. In the ſeventh Book of *Hippocrates's Epidemics*, πυρετοὶ γλίσχροι, are ſlow Fevers, the ſame as *lentæ Febres*.

GLISOMARGO. White Chalk. *Rulandus*.

GLOBULARIA.

The Characters are;

The Floſcules are unilabiated, multifid, connected each to its proper Calyculus, and collected very many together into one globous flowery Head, ſurrounded with one common Calyx. The Calyculus, or little Flower-cup, of the Floſcule becomes a Capſule, which contains the Seed, and is affix'd to the common Placenta.

Boerhaave mentions but one Species of this Plant; which is,

Globularia; vulgaris. *Tourn. Inſt.* 467. *Boerh. Ind. A.* 131. *Globularia*. Offic. *Globularia Monſpelienſium Bellis cærulea*. Park. Theat. 529. *Bellis cærulea Monſpeliaca*. Ger. 512. Emac. 637. Raii Hiſt. 1. 381. *Bellis cærulea caule folioſo*. C. B. P. 262. *Aphyllanthes Anguillara, ſive Globularia Bellidi ſimilis*. J. B. 3. 13. FRENCH DAISY.

It is to be found in the Gardens of the Curious, and flowers in Summer. The Plant is a Vulnerary. *Dale*.

GLOEOS, γλοιός. The ſtrigmentitious Serges ſcrap'd from the Skin, after Exerciſe, or in the Baths. See STRIGMENTA. Hence γλοιώδης, ſtrigmentitious.

GLOSSA, or GLOTTA, γλῶσσα, or γλῶττα. The Tongue. See LINGUA.

GLOSSOCATOCOS, γλωσσοκάτοκος. A chirurgical Inſtrument, for depreſſing the Tongue. *Paulus Ægineta*, *L.* 6. *Cap.* 30.

GLOSSOCOMON, γλωσσόκομον, or GLOSSOCOMION, γλωσσοκόμιον, in Surgery, is the Name of an Inſtrument, or Sort of Caſe, contriv'd for containing a fractur'd Leg, or Femur. It is not at preſent in Uſe. *Gorræus* gives a Figure of it, from *Oribaſius*, *de Machinamentis*, *Cap.* 7.

GLOSTOPETRÆ. The petrified Teeth of the Serpent, or of the Canis Carcharias, white Shark. See CANIS CARCHARIAS.

GLOTTA. See GLOSSA.

GLOTTIS, γλωττίς. The Chink in the Larynx, through which the Air paſſes into the Aſpera Arteria.

GLUMA. The Huſk or Chaff of Corn.

GLUTÆUS. The Name of three Muſcles, which form the Buttocks, call'd *Glutæus maximus*, *Glutæus medius*, and *Glutæus minimus*.

GLUTÆUS MAXIMUS,

So call'd from its being the largeſt Muſcle of thoſe which compoſe the Buttocks. It has a large ſemicircular Beginning; forwards, merely tendinous, from near two thirds of the external Part of the Spine of the Os Ilium; backwards its Origination is thick and fleſhy, from the poſterior Part of its Spine, and hindermoſt Part of the Os Sacrum, laterally, and whole Os Coccygis, as alſo from a broad Ligament that is extended between the two laſt-nam'd Bones, and Tubercle of the Os Iſchium; its fleſhy Fibres deſcending diſgregately, in an almoſt ſemicircular manner, become tendinous as they approach the great Trochanter, where it is united with its firſt deſcrib'd tendinous Beginning, deſcending over the external Part of the great Trochanter, after being join'd with the Tendon of the Membranoſus, proceeds to cover and ſtrictly embrace all the external Muſcles of the Tibia, like the external Tendon of the Biceps thoſe of the Cubit. But the other Part of it, proceeding from the fleſhy Body of this Muſcle, is largely inſerted into the Linea Aſpera, on the back Part of the Os Femoris, near four Fingers-breadth below the great Trochanter.

The firſt-deſcrib'd tendinous Beginning of this Muſcle doth not only ſerve to ſupport its fleſhy Body, but its Fibres, interſecting thoſe of the Membranoſus, as they cover all the Muſcles of the Tibia, do more adequately include them, whereby they are corroborated in their Action. When this Muſcle acts, it pulls the Thigh directly upwards.

GLUTÆUS MEDIUS.

This lies principally under the tendinous Beginning of the former Muſcle; and, ariſing fleſhy from almoſt the whole external Part of the Spine of the Os Ilium, in its Deſcent becomes thicker and fleſhy, and is inſerted, by a ſhort ſtrong Tendon, to the ſuperior and external Part of the great Trochanter, in a ſemicircular manner.

If the differing Series of Fibres in this Muſcle are rightly conſider'd, their Poſition will manifeſt they are not ſo uſeful in extending the Thigh, as Authors would perſuade us, but rather employ'd in turning it inwards. This will plainly appear, if, in the time of Diſſection, you give the Thigh that Motion; you then may obſerve the fore Part of this Muſcle notably relax'd. And in living Perſons, when the Thigh is turn'd inwards, you may ſee it tumefied; or if, in performing that Action with your own Thigh, you lay your Thumb on this Muſcle, you may feel it contract or move under the Skin. Beſides its being partly uſeful in extending the Thigh, with the former Muſcle, it is alſo employ'd in divaricating the Legs, it co-operating with the Muſculus Membranoſus in that Action.

GLUTÆUS MINIMUS

Lies totally under the former Muſcle, it being ſo much leſs than the former, as the former is the precedent; it ariſeth ſemicircular, broad, and fleſhy, from the Dorſum Ilii; from hence its fleſhy Fibres deſcend to their partly tendinous and partly fleſhy Inſertion, like the former, at the ſuperior Part of the Root of the great Trochanter.

The Fibres of this, running parallel with thoſe of the former, aſſiſt it in all its Actions. They alſo aſſiſt in rendering the Articulation of the Thigh-bone, with the Coxa, more ſtable in ſtanding erect. *Cowper's Myotomia Reformata*.

GLUTEN. Glue. *Dioſcorides*, *Lib.* 3. *Cap.* 101. gives the following Account of Glue, and its Virtues.

Glue, which ſome call *Xylocolla*, or *Taurocolla*, is beſt made at *Rhodes*, of Bulls Hides, and is white and pellucid; the black Sort is not ſo good.

Diſſolv'd in Vinegar, it cleanſes the Skin from the Lichen and Lepra; infus'd in warm Water, and the Parts anointed therewith, it prevents Ambuſtions from riſing into Veſicles; and, diluted with Honey and Vinegar, it proves a good Vulnerary.

GLUTIA. The Nates; two ſmall Protuberances of the Brain. See CAPUT.

GLUTINATIO. The ſame as AGGLUTINATIO.

GLUTOS, γλουτός. A Buttock.

GLUT-

GLUTTUPATENS. An Epithet for the Stomach, in *Q. Serenus Samonicus.*

GLYCYRRHIZA.

The Characters are;

The Pod is ſhort, unicapſular, and full of kidney-ſhap'd Seeds; the Leaves grow by Pairs to a Rib, which ends in an odd Leaf.

Boerhaave mentions three Species of this Plant; which are,

1. Glycyrrhiza; ſiliquoſa; vel Germanica. *C. B. P.* 352. *Tourn. Inſt.* 389. *Boerh. Ind. A.* 2. 47. *Glycyrrhiza, Liquiritia.* Offic. *Glycyrrhiza vulgaris.* Ger. Emac. 1302. Raii Hiſt. 1. 910. Synop. 3. 324. *Glycyrrhiza radice repente, vulgaris Germanica.* J. B. 2. 328. *Glycyrrhiza ſiliquoſa vulgaris.* Park. Theat. 1098. LIQUORICE.

Liquorice has very long Roots, of a brown Colour without, and of a greeniſh-yellow within, tough and pliable, and with few Knots or Joints. They are full of a very ſweet Juice. In the Spring it ſends forth long ſtriated Stalks, three or four Foot high, beſet alternately with pretty large wing'd Leaves, made of eight or ten double Pinnæ, with an odd one at the End; they are of an oval Form, and feel clammy to the Touch. From the Boſom of the Leaves, towards the Tops of the Branches, after the Root has been ſome time in the Ground, ſpring long ſlender Spikes of ſmall, blue, papilionaceous Flowers, and after them ſmall erect Pods, holding the Seed. It is frequently planted in Gardens and Fields, and flowers in *Auguſt.*

The Roots of Liquorice, which are the only Part us'd, are a good Pectoral, and of great Uſe in Diſtempers of the Lungs, as Coughs, Shortneſs of Breathing, mitigating the acrimonious Particles which cauſe Soreneſs of the Aſpera Arteria, and Hoarſeneſs, as well as the Heart-burn. They are likewiſe good in nephritic Affections, as Stone, Gravel, Stoppage and Heat of Urine, and Ulcers in the Kidneys.

There are two kinds of the inſpiſſated Juice ſold in Shops; one made in *England*, and prepar'd of the Decoction of the Roots mix'd with the Pulp of Prunes, and made up into Balls; the other is imported from *Spain*, being made near *Tortoſa* in *Catalonia*, and brought to us in beautiful ſhining brittle Lumps, wrapt in Bay-leaves. The Way of preparing it is as follows:

The Liquorice is firſt dry'd, and cut in ſmall Pieces, then boil'd in Water. This Decoction, being firſt filtred, is evaporated to the Conſiſtence of an Extract, which is what we call an inſpiſſated Juice.

It is a good Emollient and Healer, proper for Coughs, and for promoting Expectoration, becauſe the viſcid Parts, which it contains, ſheath and blunt the acrid Salts. It ought to be given in ſmall Quantities, and often repeated, being otherwiſe diſagreeable to the Taſte. *Dale. Geoffroy.*

Liquorice, with us, is principally cultivated at *Pomfret*, in *Yorkſhire*; and *Worksop*, in *Nottinghamſhire*: The *Engliſh* Liquorice is prefer'd to what is imported. The Leaves and Stalk periſh every Winter, and are renew'd in the Spring. *Tragus* prefers the Root, and its Juice, before Sugar itſelf: Every one, ſays he, knows, that bitter Things and Sugar excite Thirſt, which this ſweet Root and its Juice extinguiſh. The Bark, ſays *Dodonæus*, has ſomething of Bitterneſs, and is of an hotter Quality than the other Parts, and, therefore, ought to be ſcrap'd off. But *C. Hoffman* ſays, we are not to regard this; for the Bitterneſs is ſomething more internal, being increas'd by long Boiling, as it is in other ſweet things, and gives it an abſterſive Quality. Liquorice, boil'd in Water with a little Cinnamon, ſerves ſome for their ordinary Drink; and, after Fermentation, inebriates no leſs than Beer. *Raii Hiſt. Plant.*

2. Glycyrrhiza; capite echinato. *C. B. P.* 352. *Tourn. Inſt.* 389. *Boerh. Ind. A.* 2. 47. *Radix dulcis.* Offic. *Glycyrrhiza echinata.* Park. Theat. 1099. Raii Hiſt. 1. 914. *Glycyrrhiza echinata Dioſcoridis.* Ger. 1119. Emac. 1302. *Glycyrrhiza echinata Dioſcoridis non repens.* J. B. 3. 327. ROUGH-HEADED LIQUORICE.

It is planted in Gardens; the Root is us'd, and agrees in Virtue with the common Liquorice. The Powder of the Root, as we are told by *Dioſcorides*, is very proper to be ſprinkled on a Pterygium. *Dale.*

3. Glycyrrhiza; Orientalis; ſiliquis hirſutiſſimis. *T. C.* 26. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 47.

GLYCYS, γλυκύς. When us'd relative to Taſtes, it ſignifies *ſweet*; when apply'd to the Humours, it imports *mild.*

GLYCYSIDE, γλυκυσίδη. Peony. A Plant much recommended by *Hippocrates* and *Dioſcorides*, in the Diſorders peculiar to Women. See PÆONIA.

GLYXIS. See GLEUXIS.

GNAPHALIUM.

The Characters are;

It has downy Leaves, and the Appearance of the Filago; the Calyx is hemiſpherical and ſquamous; the Floſcules are tubulous, quinquefid, and interſpers'd with ſmall Leaves; the Seeds are ſecur'd within a ſolid Calyptra, or Covering.

Boerhaave mentions but one Species of this Plant; which is the

Gnaphalium; maritimum. *C. B. P.* 263. *Raii Hiſt.* 1. 294. *Synop.* 3. 18. *Tourn. Inſt.* 461. *Boerh. Ind. A.* 119. *Gnaphalium maritimum multis.* J. B. 3. 157. *Gnaphalium marinum.* Ger. 516. Emac. 640. *Gnaphalium marinum, ſeu Cotonaria.* Park. Theat. 687. *Polium Gnaphalodes.* Alp. Exot. 146. Tourn. Voy. 1. 21. SEA CUDWEED, or COTTON-WEED.

Lemery ſays, that this Plant is deterſive, deſiccative, and very reſtringent.

GNAPHALIUM is alſo a Name for the FILAGO; which ſee. As alſo for ſeveral Species of *Helichryſum.* And a Name alſo for the GNAPHALODES; which ſee.

GNAPHALODES.

The Flowers conſiſt of Florets; in ſome Plants they are apetalous, Male, and repreſenting a Diſcus. The Ovary is conſtituted of Embryos growing in a Circle, ſupported by the Florets, and ripening into a creſted Fruit, full of oblong Seed.

Boerhaave mentions but one Species of this Plant, which is the

Gnaphaloides; Luſitanica. *T.* 439.

There are no medicinal Virtues attributed to this Plant, that I know of.

GNATHOS, γνάθος. Sometimes it ſignifies the entire Cheek; ſometimes only the lower Part, betwixt the Angles of the Mouth and Ear, which the *Latins* call *Bucca*; but it is alſo us'd to expreſs the Jaws, or Jaw-bones.

GNESIUS, γνήσιος. Legitimate, or genuine. It is frequently an Epithet, in *Hippocrates*, for Diſtempers; and is alſo applied to Sweats.

GNIDIA GRANA. See CNIDIA.

GOACONEZ. The Name of a very large Tree in *America*, which affords a ſort of Balſam. It is call'd *Balſamum purius*, Monard. *Balſamum album*, Park. *Americanum*, C. B. *Raii Hiſt. Plant.*

GOAN. The Name of a Tree which grows in *Perſia*, near *Ormuz*, of the Aſhes whereof they make a ſort of Tutty, or rather Antiſpodon. See ANTISPODA.

GOBIUS. The Gudgeon.

There are two ſorts of Gudgeons, as the Sea and Freſh-water Gudgeon. The firſt is ſubdivided into two other, of which the one is white, and the other black; they have both of them a good Taſte, though the white has the Preference. Both the Sea and River-gudgeon ought to be well fed; and thoſe that have been bred in clear and running Water are the beſt.

The Gudgeon yields pretty good Nouriſhment, produces good Juice, is eaſy of Digeſtion, and provokes Urine. Several Authors affirm, that People recovering from Sickneſs may eat it.

It produces no ill Effects, unleſs us'd immoderately.

It contains much Oil, and volatile Salt.

It agrees, at all times, with any Age and Conſtitution.

A Gudgeon is ſoft, and not compact in its Parts, and hath but few viſcous and groſs Humours; and, therefore, is eaſily digeſted, and of a pleaſant Taſte. *Lemery on Foods.*

The Sea-gudgeon is thus diſtinguiſh'd;

Gobius niger. Offic. Rondel. de Piſc. 1. 200. Jonſ. de Piſc. 35. Geſn. de Aquat. 395. Aldrov. de Piſc. 97. *Gobius niger Rondeletii.* Raii Ichth. 106. Ejuſd. Synop. Piſc. 76. *Gobius marinus.* Charlt. de Piſc. 15. *Gobius marinus niger.* Bellon. de Aquat. 233. *Gobius, vel Gobius niger.* Sconef. Ichth. THE SEA-GUDGEON, or ROCK-FISH.

It is taken among the Rocks by the Sea-ſhore. Broil'd, and eaten without Salt, it cures the Dyſentery, Lientery, and Teneſmus. *Sim. Sethi.*

A freſh Gudgeon, put into an Hog's Ventricle, or Maw, and the Aperture ſew'd up; if the ſame be afterwards boil'd in twelve Pints of Water, till they are reduced to two, and the Liquor ſtrain'd off, and ſuffer'd to cool in the open Air, when drank, it purges by Stool, without Perturbation. The Fiſh, applied in a Cataplaſm, is good againſt the Bites of Dogs and Serpents. *Dioſcorides, Lib.* 2. *Cap.* 32.

GOMPHIASIS, γομφίασις. A Word us'd by *Dioſcorides, Lib.* 2. *Cap.* 63. which his Interpreters explain, Pains of the interior Teeth. *Caſtellus* thinks it means, Vacillation of the Teeth.

GOMPHIOI, γόμφιοι. The Dentes Molares.

GOMPHOSIS, γόμφωσις, or Gomphoma, from γόμφος, a Nail. A Species of Articulation peculiar to the Teeth. See ARTICULATIO.

GONAGRA, from γονὺ, the Knee, and ἄγρα, a Prey. The Gout in the Knee.

GONANDINA *Braſilienſibus*, Marcgr. The Name of a tall Tree, which grows in *Braſil. Raii Hiſt. Plant.*

GONE, γονή. The Seed; but it alſo ſignifies, in *Hippocrates*, the genital Organs, particularly of Women; or the Uterus.

GONGRONA, γογγώνη, from γόγγος, a round Tubercle in the Trunk of a Tree. Any round and hard Tumor of the nervous Parts; but, particularly, a BRONCHOCELE; which ſee.

GONGYLIS. The Root of a Turnep.

GONGYLION. A Pill.

GONIMOS, γόνιμος. An Epithet for Days, frequently us'd by *Hippocrates*, importing their being odd, or uneven, and critical. It alſo imports prolific, vital, and genuine.

GONIOSIS, γωνίωσις, from γωνία, an Angle, is a Species of Pulſe, not improperly, as *Galen* ſays, ſo called by *Archigenes*, which ſtrikes not with the whole Circle of the Artery, but only with an Angle of it, or when the elevated Artery is not felt like the curve Line of a Circle, but like the Vertex of a Triangle. The Cauſe hereof is to be aſcribed to the Imbecillity of the Faculty, which renders it incapable of duly elevating the Artery.

GONOIDES, γονοειδὴς, from γονὴ, Seed, and εἶδος, Form; reſembling Seed. *Hippocrates*, in many Places, uſes this as an Epithet for the Excrements of the Belly, and for the Contents of the Urine, when there is ſomething in them which reſembles the ſeminal Matter.

GONORRHŒA, from γόνος, Seed, and ῥέω, to flow; an involuntary Efflux of the ſeminal Juice. Authors take notice of three Species of Gonorrhœas. The firſt is a ſimple Gonorrhœa, or perpetual Efflux of the ſeminal Juices, without any Virulence. The ſecond is a virulent, or Venereal Gonorrhœa, ſo call'd, tho' improperly, from its Similitude to the preceding. The third is an involuntary Efflux of a viſcid, white, or whitiſh Fluid, from the Urethra, in conſequence of a Venereal Gonorrhœa ill cur'd, or too frequently repeated.

The firſt Species, or a ſimple Gonorrhœa, is thus deſcrib'd by *Aretæus*:

The Gonorrhœa is not a deadly Diſtemper, but noiſome, and even indecent to be mention'd; for if the Diſtemperature and Relaxation affect the Humours, and the Parts of Generation, there is a perpetual Efflux of the ſeminal Juice through the refrigerated Places, which is not to be reſtrained even in Sleep; but, whether the Patient be ſleeping or waking, the Flux is continual, and at the ſame time inſenſible. Women, alſo, labour under the ſame Diſorder, but with ſome Senſe of Pleaſure, whereas Men have none at all. The Matter of the Flux is an humid, thin, cold, colourleſs Subſtance, which is void of Fecundity; for how is it poſſible, that Nature thus refrigerated ſhould emit a prolific Juice? Young Men affected with this Diſorder muſt of neceſſity become old in Habit of Body, ſlow, languid, ſpiritleſs, dull, ſilent, feeble, wrinkled, unactive, pale, white, effeminate, of a weak Appetite, cold, with a Heavineſs of the Limbs, and a Numbneſs of the Legs, weak, lazy, and indiſpos'd for all manner of Action. In many Subjects this Diſorder is the Forerunner of the Palſy; for how is it poſſible for the Nerves not to ſuffer under a Decay of their Forces, when Nature, as the generating Principle of Life, is infrigidated? ſince it is the vital Seed which makes us Men, hot, robuſt, hairy, of a ſtrong and deep Voice, bold, and courageous, and fit to contrive or execute any Enterprize. Men are a Proof of this; whereas they who are deſtitute of vital Seed are wrinkled, weak, of a ſhrill Voice, without Hairs, beardleſs, and effeminate; ſuch are Eunuchs. But the Man who is retentive of the ſeminal Juices becomes bold, hardy, and ſtrong, like the Beaſts of the Foreſt; witneſs the *Athletæ*, who lead a chaſte Life. And they who by Nature were ſtronger than others, have, by Intemperance render'd themſelves much weaker than thoſe who were naturally weak; and thoſe who were much weaker by Nature, have by their Temperance become ſuperior in Strength to thoſe who were ſtronger; for nothing renders an Animal robuſt, but the ſeminal Juice, which is therefore of great Efficacy and Importance towards Health, Strength, and Magnanimity, as well as Procreation. A *Satyriaſis* uſually degenerates into a *Gonorrhœa*. *Aretæus de Cauſ. & Sign. Chron. Morb. Lib.* 2. *Cap.* 5.

A Gonorrhœa would furniſh Materials for an entire Volume; but, that I may be as ſhort, and, at the ſame time, as inſtructive as poſſible, I ſhall give the Sentiments of ſome of the moſt celebrated Authors among the Moderns upon this Subject.

Among the Diſorders ariſing from a Want of a due Tone in the ſolid Parts, we may juſtly reckon a Gonorrhœa, which is an involuntary Diſcharge of the Seed, and of a Matter reſembling it, from the Genitals, produc'd by a preternatural Relaxation of the Veſſels containing the Seed, and of the Parts adjacent to them.

A Gonorrhœa is different from a Venereal Pollution, in which latter, ſometimes at ſhorter, and ſometimes at longer Intervals, a conſiderable Quantity, one or two Drams for Inſtance, either of pure ſeminal Juice, or of this together with a chylous Serum, are diſcharg'd in the Night-time, in conſequence of Venereal Dreams, with a Senſation of Enjoyment. In the Day-time the ſame Accident happens upon viewing beautiful Women, or after Riding, in conſequence of a Relaxation; and at the ſame time a gentle Irritation of the *Veſiculæ Seminales*, or *Proſtatæ*.

A Gonorrhœa is either of a mild and benign, or of a malignant kind. The latter conſiſts in a Diſcharge of Matter of various Colours, accompanied with Heat and Exulceration; and, in ſcorbutic or cacochymic Patients, as alſo thoſe afflicted with the Stone, this Diſorder is generally attended with a Pain in diſcharging the Urine, which in ſuch Patients is of an acrimonious Quality. But, in a Gonorrhœa of a mild or benign kind, a whitiſh Liquor, all of one Colour, is diſcharg'd without Pain, Heat, or Exulceration; and this Species bears a near Reſemblance to the *Fluor albus* in Women, which is a Diſcharge of a chylous Matter, ſeparated by means of the glandular Subſtance of the Uterus. *Maſſarias*, in his fourth Book, beautifully delivers his Sentiments on this Subject in the following Words: "Thoſe Phyſicians, in my Opinion, err "egregiouſly, who think that their Patients labour under an "Effuſion of Seed, ſince they are rather afflicted with an "Evacuation of ſome other recrementitious Matter; for we "obſerve, that this Diſcharge has with ſome Patients laſted for "ſeveral Years, ſo that if the Matter evacuated was Seed, "theſe Patients muſt neceſſarily be extenuated, and thrown "into a Conſumption, like thoſe who uſe immoderate Ve-"nery; which, in the mean time, we find does not happen."

This Species of Gonorrhœa mention'd by *Maſſarias* is not only protracted for a long time, but there are alſo ſignal Inſtances both of benign and malignant Gonorrhœas continuing for ſeveral Years. Thus *Bartholine*, in *Hiſt.* 36. *Cent.* 2. and in *Anat. Lib.* 1. *Cap.* 23. makes mention of two Men, one of whom had a malignant Gonorrhœa, protracted for ten Years; and the other labour'd under the ſame Diſorder for thirty Years; but it was uncertain whether it was of the benign or malignant kind. The former of theſe Patients was extremely emaciated; but in every other reſpect both of them had all the Symptoms of good Health.

There is alſo a virulent Gonorrhœa, which ariſes from a Venereal Contagion, and affects thoſe who imprudently purſue illicit Venereal Enjoyments. This Species of the Diſorder diſcovers itſelf not only by the Diſcharge of a Matter of different Colours and Conſiſtences, but alſo by an uncommon Loſs of Strength. Unleſs ſpeedy Meaſures of Relief are taken, this Diſorder is attended with large Tumors of the Teſticles and inguinal Glands, as, alſo, with inflammatory Ulcers of the Glans and Prepuce, and a painful Incurvation of the Penis: Urine, alſo, full of Filaments reſembling ſmall Worms, is ſometimes diſcharg'd. When the Diſorder becomes virulent, is of long ſtanding, or has been prepoſterouſly or unſkilfully treated, the Taint is convey'd thro' the lymphatic Veſſels, and affects the fineſt and moſt fluid Part of the Blood. Upon this the Symptoms of a Pox diſcover themſelves, ſuch as lancinating Pains of the Head and Joints, which are moſt intolerable in the Night-time, Ulcers of the Fauces, a Conſumption of the Bones of the Noſe, Puſtules in the Glands reſembling the Nature of a Cancer; Leanneſs of the whole Body, accompanied with Paleneſs of the Countenance, hollow Eyes, and tophaceous Indurations.

Theſe are the general Symptoms which either accompany or ſucceed this Diſorder; but we ſhall proceed to a more accurate Hiſtory of it. Soon after unlucky Embraces, a gentle Diſcharge begins, and becomes worſe on the third, fourth, and ſubſequent Days. The Glans begins to be wet with a kind of thin Seed, is afterwards cover'd with a whitiſh kind of Colluvies, and Stains are found on the Patients Linen. In the Beginning the Matter diſcharg'd is whitiſh; but, if the Evacuation is continued for a conſiderable time, it becomes yellowiſh, and, at laſt, greeniſh. When the Urine is diſcharg'd, a burning and almoſt intolerable Pain is perceiv'd, firſt in the Glans, then about the Root of the Urethra, and, at laſt, thro' the whole Tract thereof; ſometimes a continual Deſire of diſcharging the Urine afflicts the Patient; and ſometimes the Diſcharge of the Urine is much hinder'd, and almoſt ſuppreſs'd, on account of the uneaſy Tenſion of the Penis, which in the Night-time is ſo great as to produce Pain, Hardneſs, and an Incurvation of the Penis; beſides, there is ſo ſtrong a Stimulus to Venery, that the Patient cannot, without the greateſt Difficulty, abſtain from it; and ſordid Ulcers frequently appear on the Glans and Prepuce.

De Graaf, in his Treatiſe *de Virorum Organis Generationi dicatis*, thinks that the Seat of this Diſorder is in the Proſtatæ: And *Veſalius*, in the twenty-firſt Chapter of his fifth Book, informs us, that upon diſſecting a Man who was executed, and before his Death had labour'd under an involuntary Diſcharge of Seed, he found all the Veſſels, and eſpecially thoſe which reach from the Teſticles to the Revolutions of the *Vaſa deferentia*, highly lax and open; and therefore places the Seat of the Diſorder there: But, for Reaſons of ſufficient Importance, I aſſert, that the true Seat of this Diſorder is in the Coat of the Urethra, which, according to the Diſcoveries of *Cowper* and *Littre*, is furniſh'd with a large Number of Glands: It is not, at the ſame time, to be denied, that ſometimes, in virulent Gonorrhœas, the Diſorder ſpreads ſo far as to infect the *Proſtatæ* and *Veſiculæ Seminales*. This is ſufficiently certain from the Diſſections of thoſe, who during their Lives, had for a long time continued under this Diſorder; for in theſe

the *Proſtatæ* have been found callous, ſcirrhous, and ſometimes exulcerated.

In Women affected with this Diſorder, ſmall Ulcers appear in the *Corpus glandulоſum*, or in the Part where the Lacunæ are ſituated, about and at the Termination of the urinary Paſſage. Thus *De Graaff*, in his Treatiſe *de Mulierum Organis Generationi dicatis*, informs us, that, upon diſſecting the Body of a Woman who had labour'd under this Diſorder, he found the *Corpus glandulоſum* or *Proſtatæ* lying about the Urethra affected, whilſt, in the mean time, the Uterus and its Vagina were ſound and unaffected: Hence the Reaſon is obvious, why the Children of Women affected with this Diſorder may be ſecure from it. *Palmarius*, however, is of a different Opinion; and, in the ninth Chapter of his Treatiſe *de Lue Venerea*, ſays, that the Neck of the Bladder is the Seat of this Diſorder, becauſe he met with an Ulcer there, remaining after the Cure of a Gonorrhœa, which, during the Remainder of the Patient's Life, diſcharg'd a purulent Matter, not unlike that which in a long-continued Gonorrhœa is generally diſcharg'd thro' the Urethra from the *Proſtatæ*. 'Tis, beſides, obſervable, that this Diſorder does not rage with ſuch Violence in Women as in Men, ſince the former may live a long time under it, whereas it much ſooner proves fatal to the latter, if not remov'd.

The Cauſe of a virulent Gonorrhœa is a Taint, by impure Coition, convey'd from a Woman infected with a malignant Gonorrhœa, or a Lues Venerea, firſt, to the Genitals of a Man, and afterwards through the Pores, to the Lymph, or ſeminal Liquor, the due Craſis and natural Mixture of which it entirely deſtroys, by inducing partly a cauſtic and corroding, and partly a putrid State thereof. Hence ariſe the Pains, the Heats, the Tumors, the Inflammations, and the Exulcerations of the Genitals; for, at firſt, the Glans is only affected, whilſt, in Coition, the Poiſon inſinuates itſelf into the open Pores. Then, unleſs Meaſures of Relief are taken, it ſoon proceeds to the Glands of the Urethra, then to the Proſtatæ, which are porous; and, after that, to the Veſiculæ Seminales. If the infected Lymph is convey'd to the inguinal Glands through theſe lymphatic Veſſels, which *Cowper* diſcover'd to run from the Prepuce to the Groin; then a Venereal Bubo is form'd, which is a kind of hard Tumor, without Pain. But, if the Seat of the Gonorrhœa is deeper, and an Inflammation ariſes about the Beginning of the Urethra, where the Veſiculæ Seminales generally diſcharge the ſeminal Fluid; then theſe Veſſels are ſo compreſs'd by the Tumor, that this Fluid cannot be convey'd to them; and hence ariſe Tumors of the Teſticles.

In accounting for a benign Gonorrhœa, we are to have a due Regard to the ſeminal Juice itſelf, and the Tone of the ſeminal Veſſels, which is generally weak and languid. 'Tis ſufficiently certain, from Experience, that the Redundance of the ſeminal Fluid, ariſing from high Living in an unmarried State, or its Acrimony in cacochymic, ſcorbutic, or arthritic Patients, frequently produce a Gonorrhœa. That a Weakneſs of Tone in the ſeminal Organs may, alſo, produce this Diſorder, is moſt certain; for all the Cauſes which are capable of weakening theſe Veſſels, the moſt conſiderable of which are too great a Profuſion of the ſeminal Fluid, whether by too frequent Embraces, nocturnal Pollution, or the prepoſterous Way of Venery by Manuſtupration, and a preceding virulent Gonorrhœa, diſpoſe to a benign Gonorrhœa, eſpecially in Perſons who are naturally weak, or of a phlegmatic Conſtitution.

Both a virulent and benign Gonorrhœa are more eaſily remov'd, when recent, if treated with proper Remedies; on the contrary, if they have made ſome conſiderable Progreſs, and are attended with violent Symptoms, they are not to be cur'd without Difficulty; and may not only render Men incapable of propagating their Species, but, in Proceſs of Time, bring on a Cachexy, and hectic Conſumptions. With reſpect to the virulent Kind, we are, in a particular manner, to obſerve, that the greater the Infection is, the more violent and obſtinate the Diſorder will prove; though it rarely brings on a Pox, unleſs the Diſcharge is imprudently ſtopt by the prepoſterous Uſe of Sudorifics, and Aſtringents, either internally or externally apply'd; for, immediately upon the imprudent Suppreſſion of the Diſcharge, Buboes, Tumors of the Scrotum and Teſticles, Caruncles of the Urethra, and other terrible Symptoms, appear, together with a confirm'd Pox. The more regularly the Diſcharge is made, the more mild all the Symptoms are. But, it is a bad Sign, when it diſtils in too ſmall a Quantity, and when the Urine diſcharg'd is highly fetid, and the Matter yellow or green. It is a certain Sign, that the Diſorder is mitigated, when the painful Conſtriction of the Penis in Erection, and the Heat of Urine, are remov'd; when the impair'd Strength begins to return, and the Countenance, before pale, aſſumes a more natural and florid Colour: It is a Sign, that the Gonorrhœa is cur'd, if, upon compreſſing the Penis, a Drop or two of a limpid thin Liquor, reſembling the White of an Egg, are diſcharg'd. As a benign Gonorrhœa is generally long protracted, and creates a deal of Trouble to the Phyſician, ſo 'tis ſtill more obſtinate, when it ſucceeds a virulent Gonorrhœa, which it frequently does. But this Diſorder differs according to the various Conſtitutions of Patients: Thus it remains for a longer time with thoſe who are of phlegmatic Conſtitutions; or who, during their Youth, have been ſubject to catarrhal Defluxions, or Fluxes; for, as the Fibres of ſuch Perſons are naturally lax, we may juſtly conclude, that, as the Parts are depriv'd of their due Tone, this Diſorder muſt be far more violent in them, than in others, whoſe Fibres are ſtronger.

As the Cauſes of a benign and virulent Gonorrhœa differ very widely from each other, ſo the Diſorders themſelves call for different Methods of Cure; and are, for that Reaſon, to be conſider'd ſeparately. The Cure, then, of a benign Gonorrhœa is highly difficult, as we have already obſerv'd; nor can we aſſign any other Reaſon for this, than that, in this Diſorder, there is a preternatural Afflux of impure Humours from all the Parts of the Body, to thoſe infected, which are already too much weaken'd, and have their Tone deſtroy'd. Beſides, the Parts ſubſervient to Generation, which are, in this Diſorder, affected, conſiſt almoſt entirely of Nerves, and nervous Coats; and it is not without the greateſt Difficulty, as we learn from Experience, that the Energy of Medicines penetrates to them.

In the Cure of this obſtinate Diſorder, the following Intentions are to be purſued: Firſt, The Redundance of impure Serum, if there is any ſuch in the Body, is, by means of proper Laxatives, to be evacuated, and deriv'd from the Part affected. Then the too much relax'd and flaccid Parts are to be ſtrengthen'd by proper corroborating Medicines, both of the external and internal Kind.

The former of theſe Intentions is anſwer'd by ſuch Laxatives as operate in a double manner, ſuch as the *Pilulæ Balſamicæ*, of *Becher*, and thoſe directed by *Stahl*, which are not only purgative, but alſo highly corroborating. Beſides, I have often found happy Effects produc'd by a laxative Infuſion, prepar'd in the following manner:

Take of *Alexandrian* Rhubarb, one Ounce; of the Roots of Swallow-wort, of Burnet, and the Shavings of Saſſafras, each half an Ounce; of Sena-leaves, of Agaric, reduc'd to Troches, and of the fibrous Part of black Hellebore, each three Drams; of Cardamoms and Cinnamon, each two Drams; of Currants, three Ounces: Mix all together, and infuſe in two Pints of *Rheniſh* Wine, the fourth Part of which is to be taken for a Doſe.

After the Uſe of this Infuſion, for eight Days, every Morning, in order to anſwer the other Intention, we are to uſe the following Powder:

Take of Cuttle-bone, one Ounce; of red Coral, Amber, the Species de Hyacintho, and the Bark of Caſcarilla, each two Drams: Make into a Powder, one Dram of which is to be taken every Morning and Evening, in a Decoction of Barley, prepar'd with ſome Almonds. At the ſame time, I would have the following Epithem externally applied to the Region of the *Pubes* and *Perinæum*, eſpecially during the Night-time.

Take of the Herbs Baum, Mint, and Baſil, of the Leaves of red Roſes, and Balauſtins, each one Handful; of Pomgranate-bark, Cloves, Nutmeg, Cardamoms, and Maſtich, each half an Ounce: Mix together, and put into a ſmall Bag, to be boil'd in red *French* Wine.

Theſe Meaſures are to be ſeconded by an accurate Regimen: The Patient muſt, therefore, carefully abſtain from Aliments prepar'd with Pepper, from Aromatics, ſaline Subſtances, leguminous and inflating Foods; as, alſo, from the immoderate Uſe of Wine and Beer: He ought, farther, to abſtain from frequent Converſation with Women, from Venereal Encounters, and from violent Motion, eſpecially that by riding in a Coach, or on Horſeback. On the contrary, the Aliments moſt proper are Broths prepar'd of Oats, and reduc'd to an Emulſion, with the Yolks of Eggs, Sweet-almonds, and Piſtaches; which are of ſingular Efficacy, in correcting the Acrimony of the ſaline Lymph. 'Tis, alſo, proper to uſe, for common Drink, either ſweet Whey, or a Decoction prepar'd with the Roots of Vipers-graſs, China-root, red Sanders, Shavings of Saſſafras, Liquorice, and Raiſins.

If theſe ſhould prove ineffectual, I, in order to remove inveterate Diſorders of this Kind, generally recommend Baths, compos'd of the nervous Species and Corroboratives; ſuch as Southernwood, Marjoram, Mint, Hyſſop, Origanum, Mother of Thyme, Roſemary, and others of a like Nature. After bathing, let the Patient go to Bed, and promote a gentle Sweat. I have, with good Succeſs, frequently recommended the Springs of *Lauchſtad*, to be us'd for ſome Weeks, by way of Bath, ſince theſe Waters, in conſequence of the highly ſubtile Crocus of *Mars* they contain, are of ſingular Efficacy in corroborating the relax'd Parts.

This Method of Cure is highly effectual in putting a Stop to violent and weakening Pollutions; only the Purgatives muſt be leſs frequently exhibited; for, if there is a Neceſſity for rendering the Body ſoluble, that Intention may be anſwer'd by Preparations of Rhubarb and Raiſins alone. In Caſes of this Nature, beſides the Medicines already mention'd, I would adviſe the following Plaiſter to be applied to the Region of the Loins, or to the *Spina Dorſi*, near that Part.

Take of the *Emplaſtrum de Spermate Ranarum*, (ſee RANA) two Ounces; of the Sugar of Lead, and burnt Alum, each two Drams; of Camphire, and the Oil of Roſewood, each half a Dram: Mix all together, and apply in the uſual manner.

In this obſtinate Diſorder I have, alſo, obſerv'd very happy Effects produc'd by a proper Uſe of cold Baths, provided the Body is prepar'd for them, and if there is neither a Plethora, a Cacochymy, nor a Loſs of Strength, to contraindicate their Uſe: Twice a Day, in the Morning, and at four in the Afternoon, the Patient may ſit, for half an Hour, in pure River-water; or, which is far better, that of *Lauchſtad* Springs: After which he is to go to Bed for a little time, and drink a few Cups of ſome warm Infuſion. The whole Body is not only ſurpriſingly corroborated by this means, but Perſpiration being ſo far promoted, as to riſe to a Sweat, an excellent Derivation of the Humours is made from the Part affected.

The Cure of a virulent Gonorrhœa, if duly ſet about in the Beginning, is not very difficult; but if the Diſorder, after having been prepoſterouſly treated by Aſtringents, a Practice common among Empirics, is committed to the Management of a Phyſician, the Cure is ſo difficult, that he often finds it more difficult to remove ſuch a Gonorrhœa, than an univerſal Lues. But, in my Opinion, the moſt rational Method of curing this Diſorder conſiſts, firſt, in expelling from the Body, as ſoon as poſſible, the Venereal Poiſon receiv'd into the Genitals, and which is partly of an acrid, cauſtic, and partly of a putredinous Nature. Then, when the Parts deſtin'd to the Conſervation and Excretion of the ſeminal Fluid are relax'd, corroded, or exulcerated, by the virulent Matter, they are to be cleans'd, conſolidated, and ſtrengthen'd, that, by this means, too copious an Afflux of Humours to them, for the future, may be prevented.

Since, therefore, the firſt Step to be taken, by the Phyſician, is, with all Expedition, to expel the Venereal Poiſon, in order to prevent its pernicious Effects; I think it highly proper to exhibit Alexipharmics, and uſe a ſudorific Regimen, immediately after ſuſpected or impure Embraces. For this Purpoſe we recommend an Eſſence, prepar'd of equal Portions of the Spirit of Hartſhorn, Spirit of Amber, and the *Eſſentia Bezoardica*; ſixty Drops of this Eſſence may be taken every Morning, in an Infuſion of Scordium, Scabious, and Goats-rue; and the Patient muſt keep his Bed for an Hour after, in order to ſweat. Nor does the following diaphoretic Powder promiſe leſs Succeſs.

Take of bezoardic Powder, two Drams; of bezoardic Mineral, and medicinal Regulus of Antimony, each half a Dram; of Nitre, fifteen Grains; and, of Camphire, four Grains: Make into a Powder, to be divided into four Doſes; one of which is to be taken at Bed-time, for three or four Nights.

Externally, in order to diſcuſs the Poiſon convey'd to the Genitals, I generally adviſe the Uſe of the *Aqua Sclopetaria*, (See AQUA) render'd ſtronger with Eſſence of Amber, and camphorated Spirit of Wine. A Cloth, wet in this Preparation, may be apply'd to the Penis, the Region of the Pubes, and the Peronæum, even during the Diaphoreſis.

But if the Poiſon has penetrated farther, and, by intimately inſinuating itſelf into the Parts, has produc'd a virulent Diſcharge, accompanied with Heat, Pain, and Exulceration; the principal Buſineſs of the Phyſician is, by Remedies calculated both to correct and eliminate the peccant Matter, to free the Body from the impure Sordes. To the Medicines anſwering this Intention, belong Purgatives, the moſt important Ingredient in which is *Mercurius Dulcis*, which is poſſeſs'd of a peculiar and ſpecific Virtue in correcting an ulcerous and cauſtic Acrimony; as alſo in evacuating and reſolving Viſcidities. It is moſt commodiouſly mix'd with an equal Quantity of the Extract of Rhubarb; or, for the Uſe of ſerous Patients, with an equal Quantity of the *Extractum Panchymagogum Crollii*; and reduc'd to the Form of Pills, with Balſam of Capivi, or Peruvian Balſam. Of theſe Pills, let a Scruple, or half a Dram be taken every other Day, till the Heat of Urine is remov'd, and the yelloviſh or greeniſh Matter diſcharg'd aſſumes a better Colour. The ſame Intention is, alſo, excellently anſwer'd by the following Pills:

Take of the pureſt Gum Ammoniac, Sagapenum, Extract of black Hellebore, of the Trochiſci Alhandal, of Mercurius Dulcis, of the Roſin of Guaiacum, and of Balſam of Capivi, each one Dram: Make all into a Maſs, from each Scruple of which make Pills, which may be taken three Days ſucceſſively, either in the Morning, or towards Evening.

Then, for two Days, the Alexipharmics above-mention'd muſt be exhibited, eſpecially in phlegmatic Patients, in the Method already ſpecified. After this, the Pills are to be exhibited, and then Sweat excited for three Days more, and it is expedient to repeat this three times.

After a ſufficient Evacuation of the impure Humours, ſuch Remedies are to be us'd, as by their mild balſamic Virtues dry, conſolidate, and ſtrengthen the too much relax'd ſeminal Veſſels; and by that means check the Diſcharge. Among theſe we may juſtly reckon boil'd Turpentines, Maſtich, Amber, Myrrh, Opobalſamum, Rhubarb, Armenian Bole, Diaphoretic Antimony, Japan Earth, Blood-ſtone, and the *Antimonium Martiale Cachecticum*, which may be reduc'd to Pills, in the moſt commodious manner. But I, with great Succeſs, have preſcrib'd thoſe prepar'd in the following manner:

Take of Venice Turpentine, of Amber, Maſtich, Extract of Rhubarb, and Caſcarilla, each two Drams; of Balſam of Capivi, and Roſin of Guaiacum, each one Dram: Mix all together, and, from each half Dram of the Maſs, form Pills, to be taken during ten or more Days ſucceſſively, towards Night, in a temperating Emulſion; drinking, next Morning, an Infuſion of *Paul*'s Betony, Mint, Baum, Yarrow, and Saracens Conſound; or a Decoction of the Roots of China, Sarſaparilla, Liquorice, Succory, and crude Antimony tied up in a Bag.

For checking the ſeminal Diſcharge, the following Mixture is, alſo, of ſingular Service.

Take of the acrid Tincture of Antimony, of the Eſſence of Guaiacum, of Amber and Aloes-wood, each an Ounce; of the Tincture of Blood-ſtone, or of the chalybeate Liquor, prepar'd from the *Caput Mortuum* of chalybeated Flowers of Sal Ammoniac, one Dram: Mix together, into an Eſſence, which is of a blackiſh Colour, and of which, after ſufficient purging, forty Drops may be taken, twice a Day.

But, unleſs internal Medicines be ſeconded by external Applications, we labour in vain; but theſe vary according to the Nature of the Symptoms: Thus, in order to lay the Pain and Heat of the Genitals, as, alſo, to bring Buboes to Suppuration, the beſt Applications are Cataplaſms, prepar'd of demulcent and emollient Ingredients, ſuch as Roots of white Lily and Marſhmallows; Flowers of Chamomile, Elder, and Mullein; the Seeds of Fenugreek, Cumin, Dill, and Henbane, made into a Cataplaſm, with a Decoction of Oats, or with Milk, and frequently applied warm. In order to cleanſe exulcerated Parts of the Urethra, and corroborate ſuch as are relax'd, nothing is of more Service than Injections, prepar'd of two Drams of Mercurius Dulcis, boil'd for a Quarter of an Hour in half a Pint of a ſtrong Infuſion of ſome vulnerary Plant, made by way of Tea. But if the Corroſion is very violent, Milk, and deſpumated Honey, together with a Decoction of Myrrh, prepar'd with Water, is to be injected, by means of a Syringe.

It is of the higheſt Importance, that the Phyſician ſhould preſcribe a proper and ſtrict Regimen: Above all things, he ought to order his Patients to abſtain from Aliments prepar'd with Aromatics; from ſuch as are of hard Digeſtion, or too nutritive a Quality; from Wine and Ale; from violent Exerciſe; from the Sallies of Paſſion; and from Converſation with Women; otherwiſe this Diſorder will not only be cur'd with Difficulty, but will readily recur. Let the Patient, for Aliments, uſe weak Broth, prepar'd with Endive, Sorrel, Lettuce, and Succory; and, for common Drink, let him uſe a Decoction of Liquorice, with Barley or Whey. Excellent Effects are, alſo, produc'd by Emulſions of ſweet Almonds, the Four greater cold Seeds, and white Poppies, together with a thin Decoction of Hartſhorn, us'd for common Drink; to which may be commodiouſly added, purified Nitre, as, alſo, gently diaphoretic Powders, prepar'd of calcin'd Hartſhorn, diaphoretic Antimony, or Ceruſs of Antimony; for, by theſe means, the Acrimony of the Humours is corrected, and the Heat and Pain of the Genitals effectually allay'd.

In a benign Gonorrhœa, draſtic Purgatives, and Preparations of Mercury, are to be cautiouſly us'd, as well as the ſtrong and diuretic Balſamics; for theſe, by putting the Humours into a violent Commotion, and forcing them to the weaken'd Genitals, increaſe the Diſcharge of the Matter. Theſe are ſtill more to be abſtain'd from by Perſons of ſanguine and choleric Habits, to whom they are, in a particular manner, prejudicial. The ſame is to be affirm'd of Aſtringents, which ought never to be us'd without a previous Correction

rection of the Humours, unleſs we intend to bring on a Gonorrhœa of a bad Kind, eſpecially in thoſe whoſe Juices are highly impure.

Veneſection, Abſtinence, weak and drying Aliments, and Drink, are of ſingular Service in the Beginning of this Diſorder, in phlethoric, fat, and ſpongy Habits, for ſuch as live high; whereas, if, by the Continuation of the Diſorder, the Body is much weaken'd, theſe Meaſures are not at all to be taken; ſince, by exhauſting the Strength ſtill more, they often induce a Cachexy, a Tabes Dorſalis, a hectic Fever, or an ignominious Impotence.

In the Cure of a malignant Gonorrhœa, the Phyſician ought to have a particular Regard to the Conſtitution of the Patient; for it is of the higheſt Importance, whether he is of a choleric, ſanguine, or a phlegmatic Habit; as alſo, whether he is robuſt, or tender: Nor ought he to be leſs cautious in inquiring into the State of his Humours; for, according as the Condition of theſe varies, ſo the Diſorder is attended with different Symptoms. Thus, if the Body is cacochymic, or, in conſequence of a bad Regimen, affected with the Itch, a ſcorbutic purple Fever, or the hypochondriac Diſorder, then the Symptoms are more terrible, and not to be cured without great Difficulty.

When Men of a hot and delicate Conſtitution are ſeiz'd with this Diſorder, they ought, eſpecially in the Beginning of the Diſtemper, to abſtain from hot Subſtances, Purgatives, Sudorifics, Diuretics, Decoctions of the Woods, ſuch as that of Guaiacum, acrid Subſtances, as, alſo, the Eſſences of *Peruvian* Balſam, and Opobalſam; for, by the prepoſterous Uſe of theſe, without a due Preparation of the Body, the peccant Humour is often retain'd, the Diſcharge ſuppreſs'd, and not only Buboes form'd about the Genitals, but alſo ulcerous Puſtules, of a bad Kind, produc'd on the Face.

I remember to have ſeen a recent Gonorrhœa perfectly cur'd, and the Poiſon expel'd, from Patients of a languid Habit, after ſufficient Purging, by Corroboratives, and gently ſpirituous Subſtances. With this Intention, the following Preparation may be frequently exhibited:

Take of Mint, three Handfuls; of *Venice* Turpentine, one Ounce; of *Peruvian* Balſam, half an Ounce: Diſtil with three Pints of *Rheniſh* Wine. The Doſe is from one to two Ounces.

For this the following Formula may very properly be us'd as a ſuccedaneum.

Take of Roſe-water, and rectify'd Spirit of Wine, each half a Pint; of Roſe-water, two Ounces; and of the Balſam of Life, fifty Drops: Mix all together.

So long as the Matter diſcharg'd is fetid and greeniſh, Aſtringents are never to be us'd; for when, by their means, the Diſcharge is too ſoon ſtopt, or when too ſtrong Decoctions of the Woods, together with a ſudorific Regimen, are us'd, the Poiſon paſſes into the ſeminal Fluids and Lymph, and produces the Symptoms peculiar to a confirm'd Pox. But by no Aſtringent are worſe Effects produc'd, than by Sugar of Lead unſeaſonably exhibited internally, as is the Cuſtom with Quacks; for, by means of this Medicine, I ſaw a convulſive Colic, a Loſs of Appetite, and an obſtinate Coſtiveneſs, brought on. Aſtringent Injections ought, in like manner, never to be us'd, till the Impurity of the Matter is corrected.

Among diuretic Medicines, Cantharides, and the Eſſence of them, are, in my Opinion, to be highly condemn'd; ſince they are prejudicial to the urinary Paſſages, and excite violent Inflammations of the Kidneys and Bladder, together with a Diſcharge of bloody Urine, unleſs their Effects are prevented by the Uſe of proper Medicines.

In the Cure of a virulent Gonorrhœa, Veneſection is rarely neceſſary; and, in delicate Conſtitutions, eaſily ſubject to a Suppreſſion of the Diſcharge, it is more prejudicial than beneficial: But, if the Body is full and young, Veneſection may be beneficial, in order to mitigate the Symptoms.

It ſometimes happens, from various Cauſes, that, when the Matter is diſcharg'd in too ſmall a Quantity, Puſtules break out here and there on the Body. In this Caſe, it is highly expedient to moiſten and relax the Parts affected, and, by Purgatives, to derive the Humours downwards. This Intention is alſo promoted by Injections of ſweet Milk, and a Decoction of Oats, mix'd with Oil of ſweet Almonds; by which I have often known the Diſcharge brought on again.

'Tis ſurpriſing, that a Gonorrhœa cannot be remov'd by Salivation; for we know, from Experience, that the worſt Venereal Ulcers have been cur'd by this means, whilſt, at the ſame time, the Gonorrhœa has remain'd; and this terrible Diſcharge, when ill treated, and become inveterate, frequently continues all the Patient's Life; for ſometimes ſcirrhous and fiſtulous Ulcers, not to be remov'd without the greateſt Difficulty, are lodg'd both in the large and ſmall Glands. In Caſes of this Nature, I have found the moſt happy Effects produc'd by the internal Uſe of the *Caroline* Baths, which, though cautiouſly to be us'd in a recent Gonorrhœa, becauſe they relax the weaken'd Parts ſtill more, are yet highly beneficial when the Diſorder is inveterate; ſince they remove the Obſtructions of the Veſſels, and reſolve latent, incarcerated, and hard Tumors. But I would have them exhibited in ſmall Quantities, uſing, at the ſame time, both during and after the Cure, internal Medicines, and Injections of a corroborating and balſamic Nature.

When the Urethra, whoſe middle Coat is highly glandular, is not only exulcerated, but too much relax'd, and, ſomething adheres to the fungous Subſtance of the Penis, from which troubleſome Caruncles afterwards ariſe, I have often, with good Succeſs, order'd Eſſence of Opobalſam, extracted with Spirit of Wine, as alſo the Balſam of Life, diluted with three Parts of the *Aqua Sclopetaria*, to be injected frequently every Day. By ſuch an Injection, a violent Heat is indeed excited, but it ſoon remits. As for Caruncles, which are a Species of Warts, I think they ought to be remov'd by corroſive Powder, or the actual Cautery; the Application of which calls for a ſkilful Hand, leſt the adjacent Parts ſhould be injur'd.

For cleanſing Ulcers of the Glans and Penis, the following Epithem is of ſingular Service:

Take of Quick-lime-water, mix'd with Roſe-water, two Ounces; of the *Aqua Solopetaria*, one Ounce; of the Sugar of Lead, ten Grains; and of white Precipitate of Mercury, eight Grains: Mix all together.

And, when the Intention is to conſolidate, the beſt Medicine is the antimoniated Balſam of Sulphur, or that prepar'd with Oil of Turpentine, and mix'd with a digeſtive Ointment.

Buboes are to be maturated by the emollient Plaiſter of *Agricola* malaxated with Oil of Henbane and Soap. This Intention is, alſo, excellently anſwer'd by *Barbett*'s Plaiſter, prepar'd with Soap, and a ſmall Quantity of the Oil of Henbane.

Tumors of the Scrotum and Teſticles are to be remov'd by warm Fomentations, or the Steams ariſing from Decoctions of emollient Herbs and Flowers, prepar'd with Milk. By this Method, ſeaſonably us'd, the Tumor is ſo ſoften'd, that emollient Plaiſters may be afterwards applied with more Advantage. *Frederic Hoffman.*

Boerhaave thus delivers his Opinion of a virulent *Gonorrhœa:*

A *Gonorrhœa* proceeds from the infecting Matter imbib'd by the dilated Pores of the Glans, in that Inſtant of Time when this Part firſt begins to ſubſide from its turgid State in the Venereal Paroxyſm. In this Caſe, the contagious Poiſon takes its Place in the Cells of the *Corpus Spongioſum* of the Glans; which is wrapt up in its two Membranes, and continu'd all the Way to the Neck of the Bladder. From this Continuation of its Structure it is that the ſlighteſt Contagion is eaſily propagated through all this Tract; and when once the Poiſon has made its Way into the *Membrana Celluloſa*, which is here extremely tender, it immediately produces a ſmall Ulcer, attended with a whitiſh yellowiſh Diſcharge, of the Conſiſtence of new Cream, like it, almoſt void of Tenacity or Ropineſs to the Fingers, and which, when it dries upon the ſtiffen'd Linen, appears of a Colour between green and yellow. This filthy Pus, feeding upon the fine fattiſh Texture of the Part, digs out, by degrees, an ample Cavern, in which it is prepar'd, accumulated, retain'd, and from which it makes a ſlow, drilling, ſpontaneous Exit, or is preſs'd out in conſiderable Quantities. If this Cavity is confin'd within the fungous Texture of the Glans, and, through its Surface, has form'd to itſelf Outlets, a very filthy Pus ouſes out, by which both the Glans and Prepuce are corrupted, and ſometimes conſum'd and mortify'd. This, according to *Boerhaave*, is the firſt Species of a virulent *Gonorrhœa*. It is known by a ſordid Moiſture, of a leſs thick Conſiſtence than what is produc'd in the other Kinds of this Diſeaſe, continually prepar'd within the Structure of the Glans and Prepuce, and, when the Glans is ſqueez'd, ſweating out upon its Surface. After the Contagion is remov'd, this Kind of *Gonorrhœa* is eaſily cur'd. And, in order to the Cure, theſe Parts muſt be bathed often in a Day with a Fomentation, compounded of Honey, Salt, Wine, and Water; or with a Solution of Myrrh in Wine, made by Digeſtion in a proper Heat; or with Vinegar, and a ſmall Quantity of Aloes, much diluted with Water. Above all things, any the leaſt Moiſture, which may lie conceal'd among the Rugæ of the Prepuce, muſt be very carefully wip'd off. After the Part has by theſe means been very accurately depurated, let the naked Glans, with the Prepuce drawn back, be involv'd in an emollient, relaxing, attracting, anodyne, and ſomewhat antiſeptic Cataplaſm. One who is ſkill'd in the *Materia Medica*, can never be at a Loſs for proper Materials. For Inſtance;

Take of the Powder of Marſhmallow-root, and the Meal of Linſeed, each an Ounce; Flowers of Marſhmallows, and Elder, each half an Ounce; Leaves of white Horehound, and Scordium, each a Quarter of an Handful; Sal Ammoniac, a Scruple. Make, according to Art, a ſoft Cataplaſm, adding at laſt a little Linſeed oil.

This Cataplaſm ſpread upon a Cloth, and applied to the Part, is ſufficient for all the aforeſaid Intentions: For, by means of ſuch Applications, the Pores are dilated, whilſt the morbid Matter is puſh'd out and ſeparated by the Force of the vital Power, and its Retreat inwards is prevented. In the mean time, all poſſible Care muſt be taken, that no Cold ever reaches the Part, and that it never becomes dry, leſt the Pores contracting ſhould repel the Flux of Matter. Another very prudent Caution here is, that during the whole Time of the Cure, the Patient ſtrictly abſtains from all Food which partakes of the leaſt oily Quality: He muſt, alſo, avoid every thing, which, by an acrimonious Activity, ſtimulates to Venery; ſuch as Spices, bulbous Roots, Fleſh, Eggs, Fiſh, and fermented Liquors; for there is nothing that more retards the Cure of a *Gonorrhœa*, than the Inflation of the Penis. For ſince during that State its Cells are expanded by the warm Blood flowing in from the Arteries, till they are almoſt in danger of burſting, their Breaches will now be made wider, the contagious Particles will be rouſed, exaſperated, put into Motion, and mix'd with the Maſs of Blood accumulated in the Cells; and, when the Penis collapſes, theſe poiſonous Corpuſcles will be taken into the Circulation along with the returning Blood. Hence I have often, in this Diſeaſe, ſeen the moſt approved Methods of Cure fruſtrated by this Condition of the Penis, which here has too many Cauſes to produce it: And, even from one Venereal Paroxyſm, I have often known this Diſeaſe, after it has been already ſubdued, make a freſh Attack, and require a new Application of all the former Efforts againſt it. Whatever, therefore, the Cook, the Vintner, or the Apothecary, ſupply to the Irritation of Venery; whatever has a Tendency to tickle the prurient Fancy, whether the Company of Women, or lewd Pictures, or wanton Converſation, or laſcivious Reading; all ſuch Provocatives and Allurements muſt here be avoided as certain Death. Water and Whey I would recommend as very proper for Drink; and, for Food, Seeds and Summer-fruits.

If ever hydragogue Purges are of excellent Uſe, it is here. Jalap, Hermodactyls, Scammony, and Sena, are ſingularly good in this Caſe: Theſe, when frequently repeated, melt down the red Blood into Serum, determine the reſolved Fluids downwards, and diſcharge them by the Inteſtines; while, at the ſame time, they act powerfully upon the urinary Paſſages, the Bladder, and Urethra. Hence it is, that theſe Purges are ſo much in Vogue in thoſe Countries of which this Diſeaſe is a Native, as *Africa* and *America*; nor are they held in leſs Eſteem among the greateſt Maſters of the medicinal Art among us.

And now, after all, I cannot eaſily believe, that any other Practice, that has yet been purſued, is at all ſuperior to this here laid down; for there are not many other Methods but what I know, and have try'd, and yet this does not in the leaſt ſuffer by the Compariſon. This Method is not, indeed, quite ſo happily calculated for the Convenience of thoſe who live in Courts, who ſtudy Pomp and Magnificence, or are hurried in public Buſineſs: But the ſafeſt Courſes are often difficult, and attended with Trouble. I know how ſanguine the Mountebanks are in their Promiſes. They pretend to remove this Diſeaſe, tho' the Patient all the time indulges in regal Luxury, tho' he is every Day on Horſeback, or abandons himſelf to all manner of Senſuality. For my part, I have attempted the ſame, but have never had the good Fortune to ſucceed under theſe Circumſtances; and it has many a time moved my Pity, to ſee ſeveral Patients of Diſtinction, who had been manag'd in that manner, liable for ſome Years to the Remains of the long-contracted Diſeaſe.

In the mean time, if the Patient cannot be prevail'd upon to ſubmit to the Trouble of Cataplaſms, Fomentations may be us'd in their ſtead; and, when his Situation is ſuch, that neither of theſe can be conveniently apply'd, emollient Plaiſters, as the *Emplaſtrum de Mucilaginibus*, or *de Meliloto*, may be ſubſtituted in their Place. But the Preference here always belongs to Cataplaſms and Fomentations.

It makes another kind of *Gonorrhœa*, when the Venereal Poiſon, after having inſinuated itſelf thro' the Pores of the Glans, has penetrated into that cellular Subſtance, which is apply'd round the upper Part of the Urethra, ſo as to form a ſmall Ulcer there; which, thro' Paſſages that it has eat into the Cavity of the Urethra, pours its Pus into that Canal, out of whoſe Canal it is perpetually trickling, but in greateſt Plenty when the Penis is preſs'd at this Part, and the Preſſure continued forward from its Root. What is here moſt remarkable is, that if, after the Patient awakes in a Morning, and before he has emptied his Bladder, a Preſſure begun an Inch behind the Apex of the Penis be continu'd forwards, a conſiderable Quantity of Pus may be diſcharg'd; which Method of Compreſſion, and Manner of Diſcharge, conſider'd, it appears that this Pus did not come immediately from the Canal of the Urethra, but that it had been firſt ſqueez'd out of its fungous Subſtance into its Cavity: And in this Species of *Gonorrhœa*, if you begin from the Neck of the Bladder, and preſs all the Way to the Glans, you will not be able to ſqueeze out the leaſt Drop of that kind of Matter from beyond this Part. This, therefore, is the only affected Part, and hither muſt all your Efforts be directed. This is the Shape in which the *Gonorrhœa* moſt commonly appears at firſt; and this Species of Diſeaſe occurs every Day. For the moſt part it produces a vaſt Quantity of Venereal Pus, continues a long time in People of lax Habits; and yet, if the purulent Matter has a free Exit, it ſeldom occaſions a Pox; ſo far from that, it rather prevents it: But it is principally attended with this Misfortune, that when it has continued a long time in the ſinuous Meanders of the cellular Membrane, it is ſubject to produce tedious Gleets, which all the Art of the World cannot, without extreme Difficulty, dry up.

The Cure of this *Gonorrhœa* is the ſame with that of the firſt kind; only I would adviſe beſides, that the Penis and Scrotum be, three or four times a Day, for half an Hour together, bathed in the ſame Liquors that I have already recommended for Fomentations. In the mean time, as the affected Cells can ſcarcely be reach'd by Injections, theſe are of little Service here, except at the firſt Appearance of the Diſeaſe, or when the internal fungous Subſtance has ſcarcely ſuffered any Injury.

I reckon it the third kind of *Gonorrhœa*, when the contagious Particles have enter'd and taken Poſſeſſion of the *Glandulæ Cowperianæ Urethræ*, ſo that the Pus diſcharges itſelf by their excretory Ducts into the Urinary Duct. Here the Diſeaſe works out vaſt, hollow, fiſtulous Sinuſes, which flow with large Quantities of Matter, and are very difficult to deterge, and conſequently to heal. If the Diſcharge of this Ichor ſo produc'd is by any means obſtructed, it ſometimes forms very malignant Ulcers about the Sides of the Urethra, where theſe Glands, according to the Deſcription of their noble Diſcoverer, are ſituated. Hence proceed very obſtinate Ulcers, which give a great deal of Trouble to both the Phyſician and Patient, and frequently continue for ſome Years. What renders the Cure ſo inſuperably difficult in this Caſe is, that when once the contagious Matter has made its Way into the Folliculi of thoſe Glands, it can ſcarce be expel'd, but there it lies in ſpite of all that can be done to diſcharge it: By Stagnation it becomes every Day more and more virulent, and ſpreads the Infection thro' the neighbouring Parts; inſomuch that ſometimes the ſubcutaneous pinguedinous Cells towards the Root of the Penis are affected by it; and what miſerable Effects this may, and in fact ſometimes does produce, any knowing Practitioner can tell. This *Gonorrhœa* requires the very ſame Treatment with the two former: But here the leaſt Time muſt not be loſt. The affected Parts muſt be kept in a conſtant State of Laxity by the moſt emollient Applications, and the contagious Matter muſt, with all poſſible Expedition, be drawn out; for the Succeſs of your Practice here entirely depends upon the total Diſcharge of the infectious Matter, together with the Pus which it has introduc'd; and, if this Taſk is not perform'd, a *Pox* is greatly to be apprehended. Wherefore, if this Diſeaſe continues but for a little time, we muſt have recourſe to all the Severities of a Salivation: For, tho' Salivating does not at all cure either of the two former kinds of *Gonorrhœa*, this Species of the Diſeaſe, as it has its Seat in a more ſolid glandulous Part, in which the Action of the Heart and Arteries is briſker, is much more ſuſceptible of the Power of Mercury.

Beſides theſe, there is a fourth *Gonorrhœa*, which differs from the reſt: For, after the virulent Matter has, by the Paſſages already deſcrib'd, reach'd the Proſtatæ, it waſtes their Subſtance, and melts it down into a very plentiful Maſs of virulent Pus. This Diſeaſe ſometimes takes its Riſe from other Gonorrhœas long-continued, but principally from often repeated ones. It diſcovers itſelf by Tumors upon the Perinæum; ſometimes too the Parts all around the Region of the Proſtatæ are moſt miſerably ulcerated, by which means the neighbouring Parts are deſtroy'd, and become a very ſhocking Spectacle.

But one of the moſt common Symptoms of this Diſeaſe is, that frequently thoſe miſerable Patients, all at once, and without any manifeſt Cauſe, are ſeiz'd with a Suppreſſion of Urine; whence they are tortur'd with a great many painful and fruitleſs Attempts to make Water; while, at the ſame time there is no Admiſſion of the Catheter to relieve them that Way: At laſt, after a long Torment, ſome Quantity of Pus on a ſudden makes its Way out of the Orifice of the Urethra, a little after which the Urine is diſcharg'd without Difficulty, till the ſame Miſchief returns again. I have ſometimes ſeen

this Diſeaſe, and you cannot but be ſenſible what a hard Matter it is to accompliſh a Cure. Here Salivation takes place, and here all the Remedies recommended againſt the aforenam'd kinds of Gonorrhœa muſt be very diligently apply'd.

The laſt and moſt abominable Species of this Diſeaſe happens, when, from the already-mention'd Affection of the Proſtatæ, the Emiſſaries of the Veſiculæ Seminales, deſcrib'd by the famous *Morgagni*, gaping with open Mouths among the Ducts of the Proſtatæ, are eroded. Whence the Venereal Poiſon, admitted by theſe Emiſſaries into the ſeminal Reſervoirs, corrupts their Veſſels, and contain'd Liquids, with its Virulence, occaſions a very copious Diſcharge of moſt filthy Matter, and ulcerates thoſe ſinuous Parts intorted into a great many winding Labyrinths. Hence what enormous Miſchiefs enſue! I have ſeen that whole cellular Apparatus, which inveſts, and ſeparates from one another, the Veſiculæ Seminales, the Bladder of Urine, the Rectum, and Perinæum, ulcerated, putreſy'd, and corroded into fiſtulous Caverns, reaching as far as the Scrotum, the Anus, and Perinæum; ſo that theſe Parts were entirely deſtroy'd by the mining Corruption, whilſt, in the mean time, there was no Benefit receiv'd from the Uſe of Baths, Fomentations, or Injections; nor from the Application of Plaiſters, Ointments, or Cataplaſms; nor from making Inciſions into the Sinuſes, or dilating their Orifices. In ſpite of all theſe Means, I have known the Diſeaſe proceed till the very Urine was diſcharg'd by thoſe Ulcers. And if theſe topical Remedies did no Service, the moſt abſtemious Life, the Uſe of Decoctions of the Woods, the Sweating-box, and the beſt-manag'd Salivations, did as little.

Aſtruc adapts the Cure of a Gonorrhœa to the different Stages of the Diſeaſe.

Thus, in a Beginning of a Gonorrhœa, he adviſes Bleeding to be repeated more or leſs, according to the Violence of the inflammatory Symptoms; and, where theſe are very ſevere, he thinks Bleeding is to be as plentifully uſed as in a Peripneumony, or Dyſentery.

He preſcribes, for the Patient's ordinary Drink, Ptiſan made of emollient and refrigerating Herbs, together with Cryſtal Mineral, or Sal Prunellæ; and, if the Belly is not open enough, he adviſes a Glyſter of the ſame Ptiſan to be adminiſter'd every Day, either alone, or with a little Vinegar, Sal Prunellæ, or Pulp of Caſſia.

Where the Inflammation is not mitigated by the Uſe of the Ptiſan, he adviſes the Patient, Morning and Evening, to take a large Draught of Emulſion of the Seeds of Melon, Agnus Caſtus, Hemp, white Poppy, or Linſeed, prepar'd with the Decoction of the Flowers of Water-lily, adding to it, after ſtraining, a ſufficient Quantity of the Syrup of Water-lily.

Where the Symptoms are very violent, he recommends an Opiate, diſſolv'd in both Doſes of the Emulſion, but eſpecially that taken in the Evening.

Where the Dyſury, and inflammatory Symptoms, are very ſevere, he recommends Fomentations of Milk for the genital Parts, emollient Cataplaſms to be apply'd to the Perinæum, and emollient, cooling, and Saturnine Injections.

He recommends the Uſe of Camphire, and Sugar of Lead, internally, as prodigious Anodynes and Coolers; each to be given from the Quantity of ſix Grains, to half a Scruple; but he gives a juſt Caution to uſe them ſparingly, eſpecially the Sugar of Lead. This, however, in my Opinion, ought never to be us'd at all internally.

In the mean time, he adviſes a thin moiſtening Diet of young animal Food; Abſtinence from ſpirituous Liquors, from all Sauces with Salt and Spices, from Venery, and violent Exerciſe.

In the ſecond Period, when the Inflammation, and painful Symptoms, begin to remit, and the Matter flows more freely, he lays down the following Intentions: (1.) To diſcharge as much of the contagious Particles, by the purulent Running, as poſſible. (2.) To drive out the reſt by Purging. And, (3.) If any Remains of them are left, to diſcharge and correct them by means of Mercury.

In the firſt Place, therefore, he gives a gentle lenitive Purge of Caſſia, or the like, leſt a ſtrong one ſhould excite the Inflammation afreſh. But afterwards, if there be Occaſion, he allows a briſker one of Diagrydium, or Mercurius Dulcis.

He diſapproves of the common Method of Purging, and giving Preparations of Mercury alternately. For, he ſays, theſe ſharp Preparations not only injure the Stomach, and weaken the Patient; but, by increaſing the Acrimony of the Blood, render the Ulcers more malignant and obſtinate: And he tells us, that he has frequently ſeen a remitting Dyſury, and yielding Gonorrhœa, return upon their Uſe, and a yellow or green Diſcharge reappear.

Inſtead of theſe, he adviſes rubbing the Perinæum, Genitals, Hips, and Groins in Men, the Perinæum, Hips, Groins, and Labia Pudendorum in Women, once in three or four Days, with a ſmall Quantity of mercurial Ointment, not above one or two Drams at a time, leſt a Salivation ſhould be brought on; and, if any Symptoms preſage that, it muſt be prevented by gentle Purges.

By theſe means, he ſays, the Particles of Mercury, without any Injury to the Stomach, being apply'd immediately to the affected Parts, eaſily penetrate into them, reach the Particles of the Venereal Poiſon, and deſtroy them.

Theſe Ointments are to be thus us'd, till the Diſcharge is deſtroy'd, and the Cure of the Gonorrhœa completed.

In the mean time, proper Remedies for reſolving the Remains of the Inflammation, deterging the Ulcers, and correcting the Acrimony of the Blood, muſt not be omitted.

But if the Inflammation returns, or the virulent Diſcharge is ſuppreſſed, which frequently happens from Irregularities in the Non-naturals; ſuch as Intemperance in Eating and Drinking, Venery, or too much Exerciſe; this Method, he ſays, muſt be laid aſide, as not only uſeleſs, but noxious; and the Method of Cure, laid down for the firſt Stage, muſt be call'd in.

In the third Period, when the Inflammation, and painful Symptoms, are gone, and the Diſcharge is abated, and become thicker, milder, and whiter, his Intentions are to deterge and conſolidate the internal Ulcers, and to temperate and correct the Acrimony, which the Blood, and ſeminal Fluid, have contracted from the Venereal Taint, by the means of ſweetening and diluting Medicines.

For theſe Intentions, he recommends Balſams, Milk, the acidulous, vitriolic, mineral Waters; and, if the Gonorrhœa does not yield to theſe, the internal Uſe of Aſtringents. And after the Heat is gone, and the Diſcharge is become thin, whitiſh, ropy, and inconſiderable as to Quantity, he ſays, you may ſafely have recourſe to Injections of the detergent Vulneraries, as Decoctions of Bugle, Sanicle, Horehound, Guaiacum, Lady's-mantle, and the like, with Honey of Roſes; or of hot ſulphureous Waters, diluted with a Decoction of Barley. As for aſtringent Injections, he ſays, they are never ſafe.

He cautions againſt ſome common Faults in the Method of managing this Diſeaſe: As, 1. Againſt the exhibiting ſtrong Cathartics. 2. Adminiſtring Decoctions of Guaiacum, without Diſtinction, to all Patients; though, at the ſame time, he allows, that theſe Decoctions are ſucceſsful enough in drying up Ulcers in corpulent pituitous Habits. 3. The immoderate Uſe of internal Mercurials, eſpecially where the Blood is affected with an acrid Dyſcraſy. 4. The prepoſterous Uſe of ſtyptic Injections, which frequently occaſions a genuine Lues, or a morbid Conſtriction of the Urethra; and hence a violent Strangury.

He enumerates the different empirical Methods, as he calls them, of curing this Diſeaſe, and condemns every one of them. Among the reſt, he takes notice of the internal Uſe of the Sugar of Lead, which, he ſays, may be given with Succeſs in the Gleet, which ſometimes remains after the Cure of a virulent Gonorrhœa. But, at the ſame time, he gives a Caution, never to adminiſter it in a larger Doſe than four or ſix Grains; and if it occaſions any Heart-burnings, Pain at the upper Orifice of the Stomach, or Nauſea, to lay it aſide immediately. It is, however, more ſafe not to give it at all.

He alſo examines the different boaſted Methods of preventing Infection; but juſtly concludes, that there is not one of them to be depended upon, not even the faſhionable, modern Practice, which he charges upon the *Engliſh*, tho' the *French* are in the Mode too.

He treats of two other Kinds of Gonorrhœa, which, he ſays, leſs frequently occur; and firſt, of the virulent dry Gonorrhœa, or, more properly, the dry Venereal Dyſury, by which he means a Dyſury with a Senſe of a burning Acrimony, without any Diſcharge from the Urethra, or, at leaſt, with very little.

This Dyſury, he ſays, is ſometimes attended with a Strangury, Heat, Redneſs, and Swelling of the Perinæum, and often of the whole Penis; ſometimes with a ſlight Strangury, without any ſenſible Swelling, or Redneſs, in the Perinæum, or Penis.

Hence, ſays he, this Gonorrhœa ought to be diſtinguiſh'd into two Kinds; in one of which the Proſtatæ, or Veſiculæ Seminales, are inflam'd; and this either precedes a ſevere virulent Gonorrhœa, or follows a ſuppreſs'd one. The other is produc'd by an eryſipelatous Inflammation of the Urethra, which may be a Prelude to a virulent Gonorrhœa, but, for the moſt part, is neither the Forerunner nor Attendant of any other Diſeaſe.

As to the Prognoſtics, he ſays, 1. That a dry Gonorrhœa is always worſe than a running one, both becauſe the Poiſon is retain'd, and becauſe it erodes and injures the affected Parts more.

2. The firſt of theſe two Kinds of Gonorrhœa, if the Inflammation is not ſpeedily reſolv'd, is very ſubject to degenerate into an Abſceſs of the Perinæum.

3. The ſecond Species, if it is not ſoon reſolv'd, ends in a Sphacelus of the Part.

For the Cure, he adviſes the antiphlogiſtic Method, and recommends

commends Bleeding once every fourth Hour at firſt, emollient Fomentations, Injections, and the Uſe of emollient Diuretics: By which Method, duly obſerved, he ſays, within three, four, or, at moſt, ſix Days, you will be able to procure a virulent Flux, or the Inflammation will be gradually reſolved without any. Above all, he adviſes, in theſe two kinds of Gonorrhœa, that, as ſoon as the Remiſſion of the Symptoms makes it ſafe, Mercurial Ointments be cautiouſly apply'd for a long time to the Perinæum; becauſe, as the Poiſon, in theſe Caſes, is not diſcharg'd by any Running, there is the greater need of Specifics to correct it.

Women, he ſays, are alſo ſubject to the virulent dry Gonorrhœa; and the Parts affected in them are the Proſtatæ, and *Cowper's* Glands, or the Vagina. The Cure is eaſily deduc'd from the Method of curing the ſame Symptom in the other Sex.

What he calls the ſpurious Gonorrhœa, is a Diſcharge of lymphatic, ſubviſcid, purulent Matter, from the Crown of the Glans, which, at the ſame time, is affected with a Pain and Inflammation, together with a ſlight Eroſion. This Species, he ſays, is frequent in Men; and he is of Opinion, that Women are not exempted. In Men, he ſays, its Seat is the ſebaceous Glands, upon the Corona; in Women, thoſe upon the entire external Surface of the Pudenda.

The prediſpoſing Cauſes, as he alleges, of this Symptom, are, the Laxity of theſe Glands, and the too great Length of the Prepuce.

In his Prognoſtics, he ſays, this Species of Gonorrhœa is, for the moſt part, without Danger, provided proper Remedies be us'd; but, if it is neglected, theſe ſuperficial Eroſions of the ſebaceous Glands are very ſubject to degenerate into cancerous Ulcers, and theſe, where they become callous, to occaſion a Phymoſis, Paraphymoſis, and Cryſtallines.

The Cure, he ſays, is perform'd by Bleeding, the Uſe of detergent and emollient Applications; and, after the Inflammation is abated, by the Antivenereals, propos'd in the Cure of a common Running; and, at laſt, where the Diſcharge is mild, and yet does not ſtop, he adviſes to foment with the Decoction of Guaiacum, red Wine, in which Iron has been quench'd, or a weak Solution of Sugar of Lead in Plantain-water.

He gives the Hiſtory of the Caſe of a young Man, who contracted a violent Ophthalmia, with a lachrymal Flux, by waſhing his Eyes, every Morning, with his own Urine, while he labour'd under a virulent Gonorrhœa: Both which Diſeaſes yielded to the ſame Method of Cure with the Gonorrhœa.

With reſpect to thoſe Diſeaſes which ſucceed a Gonorrhœa, the firſt he treats of, is the Swelling of the Teſtes; with which Symptom a Gonorrhœa is frequently complicated.

It proceeds, he ſays, from two Cauſes: 1. A ſuppreſs'd Gonorrhœa. 2. From the Venereal Poiſon in the Blood, by which the Seed is inſpiſſated and accumulated in the Meanders of the Teſtes.

From the firſt Cauſe it is more inflammatory, and, conſequently, more capable of being reſolv'd, eſpecially if the Gonorrhœa can again be ſet a flowing; though it frequently ſuppurates, and degenerates into a fiſtulous Ulcer.

What remains unreſolv'd of the ſecond kind, he ſays, is ſubject to harden into a Scirrhus, which frequently produces an Hydrocele, Pneumatocele, or Sarcocele; and often degenerates into a Cancer.

In the Cure, he recommends frequent Bleeding, and the antiphlogiſtic Regimen. All internal ſtrong and purging Remedies as well as external Aſtringents and Repellents, are to be avoided; and Anodynes only are to be us'd, under the Form of Lotions, Fomentations, and Cataplaſms. Conducive to this Purpoſe are a Decoction of the Root of Althea, and Lindſeed; or Milk, ſomewhat warm, with which the Scrotum may now-and-then be fomented; or an anodyne Cataplaſm of the Roots of Lilies, with Leaves of Henbane, Mallow, and Branc-urſine, boil'd to a Mucilage, and mix'd with the Flower of Lindſeed, and Oil of Earth-worms, or of Lilies. After the Inflammation and Fever are abated, he adviſes a gentle Purge, after that, the Application of mild Reſolvents, and the internal Uſe of antivenereal Remedies.

The Hardneſs which frequently remains, eſpecially in the Angles of the Epididymides, muſt be diſcus'd by the Application of the ſuccinated Balſam of Sulphur, Oil of Rue, Mercurial Plaiſters, or Ointments. He ſays, that ſuch Applications as merely relax, the Mucilage-plaiſter, and the Plaiſter of Sperma Ceti, for Example, often do Wonders here.

While theſe Medicines are applied, he recommends a ſuſpenſory Bandage.

Where the Inflammation proceeds to a Suppuration, he ſays, as ſoon as it appears that there is Pus form'd, it muſt be diſcharg'd with a Lancet, leſt it ſhould deſtroy the ſoft Texture of the Teſticle.

In caſe of a fiſtulous Ulcer remaining from the Suppuration, or a Scirrhus, he adviſes the Uſe of Mercurial Ointments. See HERNIA.

2. The next Symptom is a Venereal Abſceſs of the Perinæum.

This proceeds, he ſays, from a Suppuration of the Veſiculæ ſeminales, Proſtatæ, but moſt frequently of *Cowper's* Glands. It is owing to Neglect, or bad Management, both in the Method of Cure, and the Regimen; eſpecially in ſuch Patients whoſe Blood is of an acrid Diſpoſition, or where theſe Parts have been tainted with repeated Gonorrhœas.

As for the Prognoſtic, theſe Abſceſſes are always dangerous, more or leſs; but moſt ſo, where they have dug out Sinuſes into the Urethra and Anus; in which Caſe, for the moſt part, nothing but a palliative Cure ought to be attempted, becauſe of the Danger and Inconveniencies which attend the Uſe of the Knife here.

The Indications of Cure are the common ones in caſe of Abſceſſes.

3. He farther conſiders mild continual Gleets, and involuntary Emiſſions of the ſeminal Fluid.

He tells us, they are of two kinds, either a perpetual, but ſlow, Running, from the too great Wideneſs of the Emiſſaries; or a more plentiful Diſcharge, which only happens when the Imagination is affected with lewd Ideas, or the Patient juſt upon the Point of Venereal Enjoyment: This kind, he ſays, is owing to the Laxity of theſe Emiſſaries; and that, of theſe two, the laſt it moſt eaſily cur'd.

As the perpetual Gleet is, in his Opinion, ſometimes encourag'd by a ſlight Inflammation of the Proſtatæ and Veſiculæ ſeminales, whence their Nerves become more ſenſible, he recommends Bleeding once or twice at firſt; by which means, he ſays, he has more than once ſeen a recent Gleet cur'd.

In like manner, as this Symptom is, for the moſt part, increas'd by the Acrimony of the ſeminal Juices, contracted from the Venereal Poiſon, or the Uſe of acrid Medicines, he adviſes Sweeteners, and a Milk-diet.

The Cure is to be carried on by Vulneraries, Balſamics, and Styptics, externally and internally.

In the mean time, he recommends a thin, moiſtening, and refrigerating Diet; forbids the Uſe of Wine, Venery, violent Exerciſes, and particularly Riding; at leaſt, he would have the Patient to be very moderate in theſe Articles. He adviſes him not to retain his Water long; and, if his Belly is not ſufficiently open, he recommends frequent Clyſters.

Women, he tells us, are ſubject to the ſame Diſeaſe, and to be cur'd the ſame way.

4. The next Symptom, which ſucceeds a Gonorrhœa, is an obſtinate Strangury.

This Symptom, he ſays, by Drinking, Venery, Exerciſe, Riding, Walking, an acrimonious Diet, or violent Paſſions, is ſometimes aggravated into an Iſchury.

The Cauſes of this Strangury are, 1. Callous Ulcers of the Urethra. 2. Hard Cicatrices there. 3. Caruncles. 4. The Caput Gallinaginis becomes ſcirrhous or verrucoſe. 5. The Proſtatæ, or Veſiculæ ſeminales, become hard, callous, or ſcirrhous. 6. Or ſpungy and fungous. From all which Cauſes the Cavity of the Urethra, he ſays, is leſſen'd; and a Strangury, of courſe, produced, from the violent Impulſe of the Urine upon the Obſtructions in the Urethra; and the more ſo, if theſe Obſtacles are any way inflam'd or ulcerated.

This Symptom, for obvious Reaſons, is, he ſays, rarely met with in Women; though, he tells us, he has ſometimes ſeen a Strangury in that Sex, from a Compreſſion of the Urethra, by means of a Calloſity and Tumor of the ſurrounding Glands; and once from a Diſcharge of acrid Pus from the ſuppurated Glands into the Urethra.

The different Cauſes of this Symptom are to be diſtinguiſh'd, but, he owns, with no great Certainty, by the Matter which is diſcharg'd after the Urine, as whether it be Pus or Mucus; and by the Catheter, by which, from the Quality of the Matter that appears upon it, one may judge of the State of the Parts, but eſpecially of the Number and Size of the Obſtacles.

As for the Prognoſtic, our Author ſays, this Symptom is always difficult of Cure, becauſe of the Nature of the Obſtacles, and always preſages Danger from an Iſchury.

He begins with the Cure of the Iſchury, which is to be attempted by bleeding once every four Hours, and the antiphlogiſtic Regimen, and the Application of Emollients to the Perinæum; and, where the Caſe is very urgent, by the cautious Introduction of the Catheter, which muſt remain in the Paſſage, till the Inflammation of the Urethra is either reſolv'd or ſuppurated.

Where the Catheter cannot be introduced, and a Gangrene is threaten'd, he adviſes cutting upon the Extremity of the Catheter, after it is thruſt in, as far as it will go, introducing, by the Wound, a ſtraight Catheter into the Bladder.

But, if neither of theſe Methods ſucceed, he adviſes to thruſt the Trocar, by a Wound of the Perinæum, into the Bladder, according to the Direction of the Urethra.

In the Cure of the Strangury, he, for very good Reaſons, rejects the now obſolete Uſe of Catheretics; as alſo the Pra-

ctice of laying open the Urethra, for the ſake of deſtroying the Obſtacles by proper Applications.

In the next Place, he takes notice of the Method, by introducing Tents into the Urethra, which he approves much of, and, to the Honour of this Method, ſays, that it effectually mitigates, by a ſafe and eaſy, though ſlow Way, the moſt obſtinate Stranguries; but he finds Fault with it upon account of the troubleſome Apparatus; and, for this Reaſon, beſides, that as theſe Tents only fill and dilate one Part of the Urethra, the other Parts muſt ſuffer a greater Coarctation.

For theſe Reaſons, he prefers to this Method the Introduction of leaden Rods, anointed with Oil of ſweet Almonds, or freſh Butter, every Day, through the Urethra, into the Bladder, to remain in the Paſſage for three or four Hours every time, beginning with a very ſmall one; and, as ſoon as that can be introduc'd and taken out again without Pain, changing it for one of a Size larger; proceeding thus till the Obſtructions are all depreſs'd, and the Strangury remov'd.

But, as theſe Obſtacles are very ſubject to ariſe again, he ſays, this Operation ought to be perform'd after the Symptom diſappears, two or three times a Week, and afterwards three or four times a Month. But, after all, he ſays, this Symptom is rather to be palliated, than perfectly cur'd.

In the mean time, that this Method may be us'd with the greater Safety and Succeſs, he gives the following Cautions:

That the Venereal Poiſon be ſubdu'd by antivenereal Specifics, before this Method be attempted; that you chuſe, if poſſible, the Spring or Autumn for it, becauſe the Parts are then the moſt yielding; that you firſt correct the Acrimony of the Juices by bleeding, purging, and refrigerating Decoctions, and the Uſe of Whey; that the Patient, all the time of the Cure, abſtain from Wine, Venery, and Exerciſe, and uſe a refrigerating low Diet, and apply emollient Fomentations to the Perinæum; that the leaden Rods be choſen, ſuch as have not the leaſt Crack upon them, leſt, breaking, they ſhould occaſion a Neceſſity of laying open the Urethra; that they be introduc'd very cautiouſly and deliberately, becauſe, ſays he, it is found by Experience, that if they ſtrike rudely upon the Obſtacles, the Patient is preſently ſeiz'd with a ſudden Horripilation, and a violent ephemerous Fever; if this happens, that a Vein be immediately open'd; that, if there is a violent Dyſury, or ſharp Pain, that Symptom be reliev'd by anodyne, or even narcotic, Injections; that, if there are any Ulcers, they be deterg'd and heal'd by proper Injections; and, in the laſt Place, that the Remains of the Diſeaſe be carried off by the Uſe of Aſſes or Cows Milk, or the mineral Waters; and, where there is any Diſcharge of Mucus or Sanies, that it be dry'd up by proper Injections. *Aſtruc de Morbis Venereis.*

With reſpect to Caruncles, which are exceſſively troubleſome, and difficult of Cure, *Heiſter* aſſigns the following Cauſes, and propoſes the ſubſequent Methods of Treatment.

Men who have been affected with a Gonorrhœa, or an Ulceration of the Urethra, ſometimes find an uncommon Difficulty in making Water, ſo that they cannot void it without Straining, and violent Pains, and then only in a Stream no larger than a Thread; and, ſometimes, the Paſſage is even totally obſtructed. This was attributed to a Caruncle in the Urethra, till, very lately, *Brunner*, Phyſician to the Elector *Palatine*, and *Dionis*, in his Surgery, rejecting this Opinion, aſcrib'd it rather to a Cicatrix remaining after the Cure of an Ulcer, which proceeded from a Gonorrhœa; and this is confirm'd by many Inſtances of dead Bodies which have been opened. But *Arnaud* and *Petit* impute it to a Tumor form'd in the ſpongy or cavernous Body of the Urethra itſelf, (as happens to the Membranes of the Noſe in a Coryza) which ſtops that Paſſage. However, ſome oppoſe the Experience of one Party to that of the other, and contend for the former Opinion. Laſtly, *Benevoli*, a Surgeon of *Florence*, diſſents from both: He declares, in a Treatiſe on that Subject, that he always found the Part of the Urethra or Proſtatæ, which Anatomiſts call *Caput Gallinaginis*, tumefied and ulcerated, but could never yet find the Urine obſtructed by a Caruncle in the Cavity of the Urethra, and that the Obſtruction was always proportionable to the Quantity of Pus lodg'd in the Caput Gallinaginis. This Diſorder, he ſays, generally ariſes from a virulent Gonorrhœa; and that in the Beginning, as well as at the latter End, there is a conſtant Diſcharge of purulent Matter and Fibres with the Urine. For my own Part, I muſt acknowledge, there may be Truth in each of theſe Opinions, as the ſame Diſorder may ſpring from different Cauſes. But the true Cauſe is immaterial, ſince the Method of Cure is the ſame. The Surgeon may ſoon determine, whether it ariſes from a Caruncle, by the Patient's own Account. For, in that Caſe, the Obſtruction is not ſo ſudden, but the Paſſage decreaſes gradually, till it is totally cloſed up, and there is a continual Endeavour to diſcharge the Urine from the perpetual Irritation of the foreign Body in the Urethra; the Urine, alſo, carries off with it purulent Matter, or Fibres, and Membranes. Sometimes it is attended with a ſlight Fever. The Seat of this Diſorder may be diſcover'd by paſſing a Catheter, leaden Probe, or Wax-candle, into the Urethra; for wherever the Inſtrument meets with any extraordinary Reſiſtance, there we ſuppoſe it lies. Laſtly, as this Diſeaſe is very painful, and ſometimes mortal, it will be proper to direct Methods for the Cure of it.

If the Caruncle is recent, without any great Stricture in the Urethra, the following Method will perfect a Cure. The Patient ſhould be ſeated on a Couch or Bed, and, while the Surgeon holds the Penis in his Left Hand, he muſt, with his Right, introduce a leaden Probe, or Wax-candle, about a Foot long, and the Thickneſs of a large Catheter, dipt in Oil, into the Urethra, as far as, or, indeed, ſomewhat beyond, the Obſtacle: This muſt be ſecur'd with a proper Bandage, and left there for ſome Days, till the Urethra appears to be pervious, or the Progreſs of the Diſorder check'd. When the Patient would make Water, the Probe or Candle muſt be extracted, and then inſerted again, till the Cure is completed. But if it is ſo inveterate as not to yield to the preceding Method, it will be proper to dreſs the End of the Probe or Candle with white Vitriol, burnt Alum, red Precipitate, Unguentum Fuſcum, or Ægyptiacum, or any other gently corroding Medicine. This ſhould be repeated once or twice, till there is a free Paſſage open'd for the Urine: We have many Inſtances of Cures perform'd in this manner. But *Brunner* and *Benevoli*, who deny that this Diſeaſe proceeds from a Caruncle, condemn this Practice, becauſe by it the Urethra is corroded and ulcerated; and I join with them, where there is no Caruncle, and prefer a Continuation of the former gentle Method. The Patient ſhould always diſcharge his Urine, before the Inſertion of the leaden Probe, or Wax-candle, that it may remain the longer without Extraction, and more effectually compreſs or dilate the Parts. This is to be continued till the Paſſage is entirely open'd; and, when the Diſeaſe has been of long ſtanding, even after an abſolute Cure, it may be neceſſary to keep a Tent conſtantly, for a few Weeks, in the Urethra, or, at leaſt, to introduce one at Intervals, that the Parts may continue pervious. *Benevoli* adviſes to involve the End of the Probe in the Emplaſtrum Diapalmæ, that the Part affected may be more ſecurely heal'd. Mean time Injections of Lime, or Plantain-water, with a little Sugar of Lead, or the *Lapis Medicamentoſus* of *Crollius*, are to be thrown up the Urethra.

When the Paſſage of the Urethra is entirely obſtructed without an Inflammation, the Catheter will give Relief. If this Inſtrument cannot be paſſed gently, it muſt be ſtrongly, but cautiouſly, preſs'd and twiſted, to break the Caruncle or Cicatrix, and dilate the Parts. After the Urine is diſcharg'd, a leaden Probe, or Wax-candle, dipt in Oil of Eggs, or of ſweet Almonds, may be paſſed into the Urethra, to keep it open. But if, on account of an Inflammation, the Catheter cannot be introduc'd, and the Patient's Life is in Danger, recourſe muſt be had to the following Remedy: The Bladder is to be open'd by the Trocar, either in the Perinæum, or above the Os Pubis, which we ſhall explain at large under the Article ISCHURIA. When the Bladder is thus open'd, and the Urine diſcharg'd through the Pipe left in it, the Surgeon proceeds to the Cure, by Methods already propoſed. When the natural Paſſage is free, the Tube may be extracted, and the Wound heal'd.

If there is a violent Inflammation of the Urethra, neither the Catheter, Probe, nor Wax-candle, ſhould be introduc'd, as they would increaſe it; but the Patient ſhould be bled plentifully, and order'd diſcutient Medicines internally and externally; and, in particular, the Parts affected ſhould be treated externally with diſcutient Fomentations and Cataplaſms; and, when the Inflammation abates, the Surgeon may dilate the Paſſage, by introducing the Catheter, Probe, or Candle, and retaining them in the Paſſage for ſeveral Days. When the Inflammation is ſlight, the Urine may be drawn off by the Catheter.

Great Care muſt be taken not to thruſt the Wax-candle into the Bladder; for a broken Piece, remaining there, may lay a Foundation for a future Stone. When the Difficulty of diſcharging the Urine proceeds from a Diſorder in the Bladder itſelf, as an Excreſcence, Abſceſs, or Ulcer, or an Induration of its Neck, or the Proſtatæ, it is very ſeldom curable: For the Probe, Candle, and all corroſive Medicines, are not only uſeleſs, but pernicious. On the contrary, when the Urine is obſtructed by a Tumor, Ulcer, or Cicatrix, in the Urethra, the Probe or Candle, dipt in Oil, is the propereſt Remedy: The Cicatrix, indeed, is the moſt difficult to remove; though *Benevoli* aſſures us, from his own Experience, that it is to be done by this Method; and, as we are at preſent unacquainted with a better, we muſt purſue it. *Heiſter Chirurg.*

Thus have I given an Account of the Methods propos'd by the moſt rational and celebrated Authors for the Cure of a Gonorrhœa. But, with reſpect to a benign Gonorrhœa, I muſt remark, that the moſt formidable and frequent Species of this is, when the retaining Veſſels of the Organs of Gene-

ration are ſo extremely relax'd, as to permit the ſeminal Juices to paſs off, upon the ſlighteſt Stimulus, as a luſcious Idea, or Converſation with a Woman; though this is frequently attended with a continual Weeping or Gleet. When this is the Caſe, an ignominious Impotence, as to Venereal Enjoyments, is induc'd, which ſcarcely ever admits of a perfect Cure.

There is, perhaps, no Sin, productive of ſo many hideous Conſequences, as that which is the general Cauſe of the Imbecillity here mention'd. Providence has implanted in human Nature, what is by ſome call'd the Paſſion of Love; and, by others, the Appetite of Luſt, for very wiſe Purpoſes; but has given us Reaſon to reſtrain this neceſſary Inclination, and keep it within due Limits. Every Day, however, furniſhes us with Caſes, which evince, that Reaſon is not always a Balance againſt the Appetites; for Boys, regardleſs, or, perhaps, ignorant of the Conſequences, too frequently indulge themſelves in a prepoſterous Method of Venery; and it is to be ſuſpected, that many more advanc'd in Age, who are long immur'd in Colleges and Cloiſters, and at laſt elope from their Cells, utterly deſtitute of Science, and equally unacquainted with the World and Books, are not leſs guilty of this enormous Vice. Theſe, by a moſt deteſtable kind of Magic, conjure up, at Pleaſure, an ideal *Venus*, and thus never want an Opportunity of enjoying an imaginary Miſtreſs. The frequent Repetition of theſe execrable Pleaſures weakens the Tone of the retaining ſeminal Organs, and induces the worſt Species of a Gonorrhœa, attended with an utter Impotence, as to real Enjoyments. If ſuch are, afterwards, ſo wicked as to marry, for ſo I muſt call it, the Conſequences of their preceding illicit Practices, are extended to Families, and the Public, for Reaſons too obvious to require farther Explanation.

Cold Embrocations of the genital Parts, and thoſe adjacent, with old Verjuice diluted with Water, have been much recommended; and wrapping up the Parts perpetually in Cloths impregnated with the ſame, are ſaid to do great Service, and may poſſibly have good Effects; but I have known more Relief from a long-continued Uſe of the cold chalybeate Waters drank at the Fountain-head, together with a due Courſe of ſtrengthening and aſtringent Remedies, both externally and internally apply'd, than from any other Method.

GONOS, γόνος. The ſame as Gone; which ſee.

GONYALGIA, γονυαλγία, from γόνυ, the Knee, and ἄλγος, Pain; is the ſame as Gonagra.

GOR, according to *Scaliger Exercit.* is a Tree growing by the River *Niger*, and bearing a Fruit like the Cheſtnut, but bitter. *Jo. Leo* tells us, that theſe Trees are of an extraordinary Tallneſs, and grow at a great Diſtance from the Sea, on the Continent. *Ray H. P.*

GORAS. The Name of the Perſon, who, as we are inform'd by *Oribaſius*, *Med. Col. Lib.* 1. *Cap.* 40. introduc'd a Fleſh-diet among the Athletæ, who before dieted themſelves on *Caricæ*.

GORGONEI FONTES. Fountains of a petrefying Quality. *Libavius*, *Art. Chym.*

GORGONIAS. A Name given to Coral; becauſe on its Change of Place from Water to Air it immediately hardens into a ſtony Subſtance. The Reaſon of the two laſt Names is taken from the well-known Story of the *Gorgon*.

GOSSAMPINUS, *Plin. Arbor lanigera G. Piſon.* A Tree in the *Eaſt Indies*, producing a ſort of Wool or Cotton, which is too ſhort to be ſpun or carded, but only ſerves to ſtuff Beds, for which Uſe it is very proper, being very fine, ſoft, and light. In medicinal Uſe it is good to recal Heat and Spirits into the Parts to which it is apply'd, and is proper for the Palſy, and to heat the Stomach, being apply'd thereto. The Tree takes its Name from *Goſſipium*, Cotton, and *Pinus*, a Pine-tree, becauſe it has ſome Reſemblance of a Pine, and bears a ſort of Cotton.

GOSSIPIUM, Cotton. See Xylon.

GOSSUM. The ſame as Botium, or Bronchocele.

GOTNEMSEGIAR. A Name for the Xylon arboreum. *Boerhaave*, *Ind. alt. Plant.*

GOTTE. The ſame as Gutta Gamba.

GOUDBOOM. A Name for the *Conocarpodendron*; *folio craſſo, nervoſo, lanuginoſo, ſupra crenato, ibique limbo rubro*; *flore aureo*; *Cono facile deciduo.*

GRACILIS. The Name of a Muſcle of the Leg, which, *Douglas* ſays, ariſes by a thin and broad Tendon from the Os Pubis, near its Commiſſure: It ſoon grows fleſhy, and, deſcending by the Inſide of the Thigh, is inſerted tendinous into the Inſide of the Tibia near the Sartorius. Its Uſe is to bend the Thigh and Leg inwards.

But *Winſlow* deſcribes two Muſcles under this Name; the one is the *Gracilis anterior*, otherwiſe called *Rectus anterior*; and the other is the *Gracilis internus*, otherwiſe call'd *Rectus internus*.

Gracilis anterior, sive Rectus anterior.

This Muſcle is as long as the Os Femoris, and lies directly along the fore Side of the Thigh, from whence it has the Name of Rectus anterior. The greateſt Part of it is fleſhy, and the Middle is broader than the two Extremities. It is called *Gracilis*, from its Thinneſs or Flatneſs.

It terminates above, by a pretty ſtrong Tendon, which is divided into two Branches; one ſhort and ſtrait, the other long and bent. The ſhort Branch, running up in a ſtrait Line, is inſerted in the anterior inferior Spine of the Os Ilium. The long Branch is inflected backward over the Supercilium of the Acetabulum, and runs in the Direction thereof from the Spine toward the great iſchiatic Sinus. It is ſtrong and flat, adhering very cloſely to the Bone, and cover'd by the orbicular Ligament and the Glutæus Minimus; and therefore they who follow the common Method in Diſſecting, often cut it off, and obſerve only the ſmall Branch of the Tendon.

From thence the Muſcle runs down wholly fleſhy, and partly penniform, ſome of its Fibres meeting above, and ſeparating below. It is narrow at the upper Extremity, and grows gradually broader toward the Middle. Afterwards it contracts again in the ſame manner, and at the lower Extremity of the Os Femoris ends in a flat broad Tendon.

Through its whole Courſe it lies between the two Vaſti, and covers the Cruræus; and its inferior Tendon is inſerted in the upper Edge of the Patella, from whence it ſends down a ſmall Plane of tendinous Fibres, which adhere very cloſely to the convex Side of that Bone, and, having reached the great Ligament, ſeem to be loſt therein.

This Muſcle, by its Inſertion in the Patella, is a Congener to the *Vaſtus Internus*, *Externus*, and *Cruræus*; and ſerves to extend the Leg. By its Inſertion in the Os Ilium, it bends the Thigh, and aſſiſts the Pſoas, Iliacus, and Pectineus, whether the Leg be extended or bent. It likewiſe moves the Pelvis forward on the Os Femoris, and hinders it from falling back when we ſit.

Being partly penniform, and partly ſimple, it is capable of ſuſtaining great Efforts, and of producing large Motions; and its Line of Direction, which is raiſed to a conſiderable Diſtance from the Centre of Motion of the Hip and Knee, increaſes theſe Advantages. The particular Diſpoſition and Largeneſs of its ſecond ſuperior Tendon anſwer principally to all the Degrees of Flexion.

The other Tendon, commonly deſcrib'd, would not alone have been ſufficient for that Purpoſe; but its Obliquity is convenient for the Extenſion of the Leg, when the Thigh is extended, or but little bent: But, when the Thigh is very much bent, this Obliquity would remove the ſmall Tendon to too great a Diſtance from the Bone, and thereby expoſe it to be torn off, in the ſame manner as we tear off the Branch of a Tree, by ſeparating it from the Trunk. The Obliquity here mention'd is with reſpect to the Os Femoris, this ſuperior Tendon lying out of the Direction of that Bone.

Gracilis Interior, sive Rectus Interior.

This is a long thin Muſcle, lying in a ſtrait Line on the Inſide of the Thigh, between the Os Pubis and the Knee; and from this Situation and Structure its Names are taken.

It is fixed in the Edge of the inferior Branch of the Os Pubis near the Symphyſis, by a broad and very ſhort Tendon, on one Side of the Inſertion of the Triceps ſecundus, but a little lower down.

From thence the fleſhy Fibres, contracting a little in Breadth, run down to the internal Condyle of the Os Femoris, where they terminate in a thin Tendon, which afterwards degenerates into a kind of Aponeuroſis, and is inſerted in the fore Part of the Inſide of the Head of the Tibia.

This Tendon is inſerted immediately below the Sartorius, by which it is partly covered, and above the Semi-tendinoſus, which it partly covers, mixing ſome Fibres with it. Before it ends, it makes the ſame oblique Turn, and is braced down in the ſame manner as the Tendon of the Sartorius, and it ſends the ſame kind of Aponeuroſis obliquely downward, on the Inſide of the Tibia.

This Muſcle bends the Leg much in the ſame manner with the Sartorius, which it aſſiſts in this Function, but not in that of turning the Leg; and it is more proper to continue the Flexion, than to begin it, it being principally when the Thigh is turned by the Sartorius, that the Gracilis contributes to this Action.

It may likewiſe aſſiſt the Triceps in the Adduction of the Thigh, which it performs with much more Facility than it begins the Flexion of the Leg without the Rotation of the Thigh. This Facility in all Situations of the Thigh is procured by the Diſtance of the ſuperior Inſertion of this Muſcle from the Joint of the Hip; but it cannot with the ſame Eaſe bend the Leg, when the Thigh is not turned; for this Reaſon: While the Thigh is only extended, the Line of Direction of this whole Muſcle is nearly in the ſame Plane with the Axis of Motion of the Knee, and therefore the Diſtance of its ſuperior Inſertion gives it no Advantage. But, when the Thigh is turned round by the Sartorius, the Plane of its Direction changes and croſſes the Axis of the Ginglymus of the Knee,

and

and then the lateral Diſtance of its ſuperior Inſertion facilitates its Action on the Leg. *Winſlow's Anatomy.*

GRACULUS. Offic. Bellon. des Oyſe, 283. Charlt. Exer. 75. *Coracias.* Mer. Pin. 172. *Coracias, ſeu Pyrrhocorax.* Will. Ornith. 86. Raii Ornith. 126. Ejuſd. Synop. A. 40. Geſn. de Avib. 473. Aldrov. Ornith. 1. 769. Jonſ. de Avib. 26. THE CORNISH CHOUGH.

This Bird is found in *Cornwall*, and many other Places. Apply'd externally, it is ſaid to reſolve Tumors, and to be good againſt ſcrophulous Swellings. *Dale.*

GRÆA, γραῖα. In *Moſchion*, either imports an old Woman; or the wrinkled Pellicle which concretes upon Milk, and ſome other Liquors, as they cool after boiling; or the wrinkled Skin about the Navel, which is a Sign of old Age.

GRAMEN, Graſs. Botaniſts mention a great many Species of Graſs. *Tournefort* takes notice of eighty-ſix, and other Authors of a great many more; for which the Curious may conſult *Sceuchzer's Agroſtographia, Tiguri*, 1719. 4to.

I ſhall only ſpecify in this Place thoſe Species of Graſſes, which are principally us'd in Medicine.

GRAMEN ARUNDINACEUM. Offic. *Gramen dumetorum panicula acetoſa, ſemine pappoſo.* Raii Hiſt. 2. 1287. *Gramen arundinaceum panicula ſpadicea molli majus.* C. B. P. 7. Theat. 95. Med. 101. COCK-FOOT GRASS.

It grows in Fields, Vineyards, and in ſandy Places. The Root is uſed, and its Virtues are the ſame with thoſe of the AGROSTIS. *Dale.*

GRAMEN LEUCANTHEMUM. See ALSINE.

GRAMEN MANNÆ. Offic. *Gramen mannæ eſculentum*, Ger. 25. Emac. 27. *Gramen dactylon eſculentum.* C. B. P. 8. Theat. 118. *Iſchæmon ſativum, ſive Gramen Mannæ eſculentum.* Park. Theat. 1178. *Gramen Genus Dens Caninus tertius, ſive Gramen primum, vel Galli Crus.* J. B. 2. 444. MANNA-GRASS, RUSSIA-SEED.

It grows in *Germany* and *Poland.* The only Parts in Uſe are its Seeds, which are ſmall, oblong, pellucid, white, of a faint Taſte; and, when decorticated, not unlike Rice. Theſe Seeds are poſſeſs'd of the ſame Qualities with Rice, are moderately aſtringent, reſolve hard Tumors of the Breaſts, and, when uſed as Aliments, are moderately nutritive. *Matthiolus.* They are, alſo, ſaid to be highly efficacious in the Cure of the Rickets in Children.

But of what Plant theſe are the Seeds, is a Point not agreed upon by the Literati of the preſent Age, ſome imagining, that theſe Seeds are the granulated Pitch of a certain Palm, which is pretty much of the ſame Nature with Sago; whilſt others maintain, that they are the Seeds of the Manna-graſs, with whom I agree, and have therefore call'd them ſo. In this Opinion I was lately very much confirm'd by that ingenious Botaniſt *Johannes Philippus Breynius*, when in *England. Dale's Pharmacologia.*

GRAMEN PARNASSI. See PARNASSIA PALUSTRIS ET VULGARIS.

GRAMIA. The Sordes of the Eyes.

GRAMINULÆ are young Frogs, not yet furniſh'd with Feet; Tadpoles.

GRAMMA, γράμμα. A Scruple, with reſpect to Weights, thus called, becauſe it is the twenty-fourth Part of an Ounce, as a Letter bears the ſame Proportion to the Alphabet.

GRAMME, γραμμή. The *Iris* of the Eye.

GRANA. The ſame as MIGRANA.

GRANA *Cnidia.* See CNIDIA.

GRANA *Paradiſi.* See CARDAMOMUM MAXIMUM.

GRANA *Tiglia.* See LIGNUM MOLUCCENSE.

GRANA *Tinctorum.* See CHERMES.

GRANADILLA. The *Paſſion Flower.*

The Characters are;

The Calyx is, firſt, triphyllous; from whence proceeds a ſhort Pedicle, and from that a quinquefoliated Calyx, which cloſely embraces the Flower; and afterwards expands in form of a Star. The Flower is roſaceous, pentapetalous, and expanded like a Star; within the Petals are many party-colour'd Filaments, diſpos'd in a Circle, and after them minute Leaves, in an erect Poſition. Within theſe ariſes the Axis, or Pointal, ſurrounded, at firſt, by five expanded Stamina, which grow to it, are diſpoſed circularly, and furniſh'd with appendent, verſatile Teſticuli; next to theſe is ſeated the Ovary, of an oval Form; on whoſe Apex grow three Tubes, with ſcabrous obtuſe Apices, and inclining towards the ſubjacent Teſticuli. The Fruit is oval, or globous, carnous, unicapſular, and full of Seeds, which are affix'd to Ribs, as to Placentæ, and involv'd in a Calyptra.

Boerhaave mentions ten Species of this Plant, which are,

1. Granadilla; pentaphyllos; flore cæruleo, magno.

2. Granadilla; pentaphyllos; latioribus foliis; flore cæruleo, magno.

3. Granadilla Hiſpanis; Flos Paſſionis Italis.

4. Granadilla; folio tricuſpide; flore parvo, flaveſcente. *T.* 240.

5. Granadilla; flore albo; fructu reticulato.

6. Granadilla; folio tricuſpide; flore magno, flaveſcente. *T.* 240.

7. Granadilla; pentaphyllos; anguſtifolia; flore albo. *Prægn.*

8. Granadilla; triphyllos; flore roſeo. *Prægn.*

9. Granadilla; folio tricuſpidi, obtuſo, & oculato. *Feuillée. Tom.* 2. 718.

10. Granadilla; quæ Clematitis; Indica, latifolia; flore clavato; fructu maliformi. *T.* 82. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 81.

The firſt and ſecond Species are of a very ſweet and vinous Flavour; and all the Species are refrigerating.

The *Hiſtoria Plantarum*, attributed to *Boerhaave*, informs us, that all theſe Plants are refrigerating.

Miller takes notice of ſeventeen Species.

GRANAGRANUM. An obſcure Term in *Paracelſus's* Treatiſe *de Caduco Matricis*, the Meaning of which is not underſtood.

GRANAL. *Lemery* informs us, that this is a ſort of evergreen Plant, which grows in *America*, from the Cielings of Rooms, ſometimes not far from the Fire. The Juice is eſteem'd poiſonous; and the Plant is of no Uſe in Medicine.

GRANATRISTUM, in *Paracelſus*, is a Carbuncle.

GRANATUM. The Pomegranate. See PUNICA.

GRANATUS. Offic. Worm. 104. Schw. 380. Charlt. Foſſ. 37. Boet. 152. Schrod. 328. De Laet. 17. Mont. Exot. 14. THE GRANATE.

This is a pellucid Gem, of a yellowiſh red Colour, almoſt like that of native Cinnabar. It is ſaid, if prepar'd and taken internally, to be drying and ſtrengthening; to cure Palpitations of the Heart; and to reſiſt Melancholy and Poiſon; and to ſtop Hæmorrhages. It is, alſo, believ'd, by ſome, to have the ſame Effects, if ſuſpended about the Neck. *Schroder. Dale.*

GRANDA. A Name for the Philoſophers Stone.

GRANDEBALÆ. The Hairs which grow under the Arm-pits.

GRANDINOSUM OS. A Name for the *Os Cuboides.*

GRANDO. See CHALAZA.

GRANULATIO. A Granulation, that is, a Reduction of Metals into ſmall Grains.

GRANUM. A Grain. With reſpect to Weight, it is the twentieth Part of a Scruple.

GRAPHIOIDES. γραφιοειδής. A Name for the Styliform Proceſs. See CAPUT.

GRAPHISCUS. γραφίσκος. The Name of an Inſtrument, invented by the celebrated *Diocles*, for extracting Darts. It is deſcrib'd by *Celſus*, *L.* 7. *C.* 1.

GRASSA. Borax.

GRATIA DEI. A Name for the *Geranium*; *Batrachioides.*

GRATIOLA. A Name for the *Digitalis*; *minima*; *Gratiola dicta.*

GRAVATIVUS. An Epithet for a ſort of Pain attended with a Senſation of Weight. See DOLOR.

GRAVEDO imports a Pain in the Head, with a Senſation of Heavineſs; and is, alſo, the ſame as CATARRHUS, or CORYZA.

GRAUS, γραῦς. The ſame as GRÆA; which ſee.

GRAVUS. A Marble, or Porphyry, us'd in Pharmaceutical Operations.

GRESSURA. The Part interpos'd betwixt the *Pudenda* and *Anus.*

GRIGALLUS. The Buſtard. *Lemery* ſays there are two Species, one call'd the *Grigallus major*, which is very large; the other the *Grigallus minor*, which is ſomething larger than a Partridge. Theſe Birds are eſteem'd aperient, and good for the Nephritic Colic. The Brain is eſteem'd good to increaſe the ſeminal Juices.

As the Buſtard lives entirely on Vegetables and Water, and its habitual Exerciſe is not very great, the Salts ſhould not ſeem to be very highly exalted.

GRIPHOMENOS, γριφόμενος, from γρίφος, or γρίπος, a Net. Implicated. In the firſt Book of the Prorrhetics of *Hippocrates*, Text 100. γριφόμενα, is an Epithet for ἀλγήματα, Pains; where it ſeems to import no more than Pains removing from the Loins, and ſeizing upon, or being fix'd on, the *Hypochondria.*

GROS-

GROSSULARIA. The Gooſeberry Buſh. This is a Plant too well known to want a Deſcription. *Boerhaave* enumerates ſeven Species, and *Miller* nine.

Groſſularia; ſpinoſa ſativa. *C. B. P.* 455. *Tourn. Inſt.* 639. *Boerh. Ind. A.* 2. 153. *Groſſularia, Uva criſpa*, Offic. Raii Hiſt. 2. 1484. *Groſſularia.* Park. Theat. 1560. *Uva criſpa.* Ger. 1143. Emac. 1324. *Uva criſpa, ſive Groſſularia.* J. B. 1. 47. Parkinſ. Parad. 560. THE GOOSEBERRY BUSH.

This Buſh is cultivated in Gardens, flowers in *April*, and yields ripe Fruit in *July*. No Parts of it are in Uſe, except the Fruit, which, when unripe, as alſo that of the *Egyptian* Thorn, is ſaid to be effectual againſt the prepoſterous Appetite of pregnant Women, to excite the Appetite, and to ſtop Fluxes. Theſe Berries, when boil'd in Liquors, are advantageouſly exhibited in feveriſh Indiſpoſitions: And, when ripe, they are innocent and friendly to the Stomach. *Dale's Pharmacologia.*

They are not good for melancholy Perſons; they ſometimes incommode the Stomach, prick and contract it a little too much, eſpecially when they are green.

They have a great deal of Oil, eſſential Salt, and Phlegm, in them; they are very good in hot Weather for young bilious and ſanguine Perſons.

Gooſeberries, in the Beginning, are green, and of an acid Taſte, becauſe the acid Salt, contain'd therein in a large Proportion, is not yet encumbred with Sulphurs, and thus it can operate upon the Nerves of the Tongue very powerfully; inſomuch that this Salt, being at that time united with nothing elſe but ſome Proportion of Earth, excites an aſtringent and ſtyptic Senſation; whereas afterwards the little Oil contain'd in the Gooſeberries, which before was kept back by paſſive Principles, gets looſe, riſes, and, by the Help of Fermentation, unites itſelf with the Salts, and diveſts them partly of their Strength; then it is that Gooſeberries are ripe, when they have a ſweet Smell, and yellowiſh Colour: From whence we may conclude, that the riper Gooſeberries are, they are ſo much the leſs aſtringent; and ſo, when you have a mind to have Gooſeberries preſerved, the green are to be prefer'd before thoſe that are ripe.

The ſaid eſſential Salt, wherewith Gooſeberries abound, is the Cauſe of the principal Effects wrought by them. In ſhort, they would not create an Appetite, were it not that this Salt lightly pricks the little Fibres of the Stomach; they would not cool, and be good for People ſick of Fevers, and be endu'd with the little Virtues, but becauſe this Salt, by imparting a little more Conſiſtence to the Humours, ſtops their violent and impetuous Motion. *Lemery on Foods.*

GROSSUS. An unripe Fig.

GRUMA. The Tartar of Wine. *Rulandus.*

GRUMUS. A Grume, or concreted Clot of Blood, Milk, or any other Subſtance.

GRUS. Offic. Schrod. 5. 319. Will. Ornith. 199. Raii Ornith. 274. Ejuſd. Synop. Avium 95. Geſn. de Avib. 494. Aldrov. Ornith. 3. 324. Jonſ. de Avib. 114. Charlt. Exer. 114. Mer. Pin. 185. Bellon. des Oyſe 188. THE CRANE.

The Whole of this Bird, its Fat, its Gall, its Head, its Eyes, its Stomach, and the Marrow of its Legs, are us'd. The Bird itſelf, becauſe nervous, is ſaid to be highly beneficial to the nervous and membranous Parts; hence the Uſe of it is recommended in Colic Pains. Its Fat, if dropt into the Ears, leſſens Deafneſs, ſoftens Hardneſs, and obſtinate Tumors of the Spleen; it quickly relieves a Stiffneſs of the Neck, and is ſaid to be of the ſame Nature with the Fat of a Gooſe. The Gall is beneficial to the Eyes. The Head, Eyes, and Stomach, when reduc'd to a Powder, are ſprinkled upon Fiſtulas, Cancers, and varicoſe Ulcers. An ophthalmic Ointment is prepar'd of the Marrow of the Legs. *Schrod.*

GRUTUM. A ſort of groſs Oatmeal. *Lemery des Drogues.*

GRYALI *Collyrium.* An exterſory *Collyrium*, deſcrib'd by *Aetius, Tetrabib.* 2. *Serm.* 1. *C.* 110.

GRYGALLUS. See GRIGALLUS.

GRYLLUS. Offic. Mer. Pin. 200. *Gryllus domeſticus*, Schrod. 5. 342. Raii Inſect. 63. Aldrov. de Inſect. 442. Charlt. Exer. 44. Jonſ. Inſect. 65. THE CRICKET.

This is an Inſect with Wings, of a ruſty Colour, an Inhabitant of the Fire, and highly officious with its ſqueaking Notes. The Aſhes of it exhibited, are ſaid to be diuretic; the expreſs'd Juice, dropt into the Eyes, is a Remedy for Weakneſs of the Sight, and alleviates Diſorders of the Tonſils, if rub'd on them. *Schrod. Dale.*

GRYPA. The Name of an Ointment, deſcrib'd by *Nicolaus Myrepſus, Sect.* 3. *Cap.* 43.

GRYPALOPEX, γρυπαλώπηξ. This Word occurs in *Hippocrates Epidem. L.* 6. *Sect.* 8. *Aphoriſm*, 52. and ſeems to be the additional Name of a Man.

GRYPHIUS PES. The Name of an Inſtrument mention'd by *Paré*, in his Surgery, *Lib.* 24. *Cap.* 35. for extracting a Mole out of the Uterus.

GRYPHUS. A Name for the Philoſophers Stone.

GRYPOSIS, γρύπωσις. An Incurvation of the Nails. *Cœlius Aurelianus.*

GUABAM. The Name of a ſweet and cooling Fruit, which grows in the *Weſt Indies*. It is about two Palms long, has a cineritious Rind, and a white Pulp, intermix'd with ſome hard Nuclei. *Raii Hiſt. Plant.*

GUACATANA, *Scrophularia Indica.* Park. *Folio affinis Guacatane.* C. B. The Name of a Plant, which grows in *New Spain.*

It is effectual in the Hæmorrhoids. The Method of uſing it is, firſt, to boil the Plant in Wine, or, if the Diſorder be attended with Heat, in Water, and waſh the Parts therewith; then gently to dry them, and afterwards to ſprinkle them with the Powder of the ſame Plant. It alſo mitigates Pains proceeding from Cold, and Flatulences, in any Part of the Body, the Place affected being firſt anointed with Roſin; then ſprinkled with a very fine Powder of this Plant, and a Linen Cloth applied upon the ſame. *Raii Hiſt. Plant.*

GUAJABO. See GUAJAVA.

GUAIABARA. The Name of a Tree that grows in *Hiſpaniola*, which the *Spaniards* call *Uvero.* The Leaves are very large, and are us'd, by the Inhabitants, inſtead of Paper.

GUAJACANA.

The Characters are;

The Leaves grow alternately, and are caducous; the Calyx is quadrifid, the Flowers monopetalous, Bell-ſhap'd, tubulous in the lower Part, with the upper generally expanded into five Lobes or Segments. The Ovary is ſeated in the Centre of the Calyx, and becomes a flat, ſoft, roundiſh, multicapſular Fruit, ſupported by an expanded tetaphyllous Calyx, and containing ſeveral hard Seeds, diſpoſed in a circular Order.

Boerhaave mentions three Species of this Plant; which are,

1. Guajacana. *J. B.* 1. 238. *H. Eyſt. Vern. o. Arb. & Fruct. F.* 13. *Fig.* 1. *Lotus Africana, latifolia.* C. B. P. 447. *Dioſpyros, ſive Faba Græca latifolia Pſeudolotus Matthioli.* Lugd. 349. *Guajacum Patavinum.* Park. Theat. 1522.

2. Guajacana; anguſtiore folio. *T.* 600. *Lotus, Africana, anguſtifolia, ſeu Fœmina.* C. B. P. 447. *Dioſpyros, ſive Faba Græca, anguſtifolia, ſeu Lotus Africana.* Lugd. 349. *Guajacum Patavinum, anguſtioribus foliis.* Park. Th. 1523.

3. Guajacana? Piſhamin Virginianum. *Park. Th.* 1523.

The Leaves and Fruit are aſtringent, and therefore good in Hæmorrhages and Diarrhœas. *Hiſt. Plant. aſcript. Boerh. p.* 657.

GUAIACUM. Offic. Ger. Emac. 1611. Raii Hiſt. 2. 1685. *Guajacum, ſive Lignum ſanctum*, Park. Theat. 1586. *Guaiacum magna matrice.* C. B. Pin. 448. *Fructus Guaiaci putatus & folia.* J. B. 1. 499. GUAIACUM, or POCK-WOOD.

This is a large Tree, having a hard, brittle, browniſh Bark, not very thick, covering over a firm, ſolid, ponderous Wood, appearing very reſinous, of a blackiſh yellow Colour in the Middle, of a hot and ſomewhat aromatic Taſte; the ſmaller Branches have their Bark of a whitiſh Aſh-colour, full of ſhort pinnated Leaves, each conſiſting uſually of four oval ſhining firm Pinnæ, having never an odd one at the End. The Flowers grow ſeveral together in ſmall Umbels, each of ſix little yellow Leaves full of Stamina, having the Embryo of the Fruit in the Middle, which, when ſmall, is in Shape like the Seed-veſſel of Shepherd's-purſe, or an Heart with a ſharp Point at the End. This Tree grows in *Jamaica*, and other Parts of the *Weſt Indies*. *Miller's Bot. Off.*

Ulric Hutten, who, in the Year 1519. wrote a Treatiſe of the Method of curing the Lues Venerea, by the Uſe of Guaiacum, tells us, that the Remedy was known in *Europe* two Years before; but, if we may believe *Braſſavolus*, it was not brought into theſe Parts before the Year 1525. And the Occaſion of its Introduction, as he informs us, was as follows: "There was, he ſays, one *Gonſalvo*, a *Spaniard*, who was "terribly afflicted with the Venereal Diſeaſe; and, having "tried all manner of Remedies, to no Purpoſe, being mov'd "with the Fame of this celebrated Medicine, took a Voyage, "in Company with others, to the newly diſcover'd Countries, "and was there perfectly cur'd; after which he return'd to "*Portugal*, profeſs'd Medicine, and cur'd all thoſe who were "infected with the before-mention'd Diſtemper, by the Uſe "of the ſame Remedy with which he was cur'd by an *Indian* "Phyſician." But *Hutten*, in the before-mention'd Treatiſe, ſays, "That a certain *Spaniſh* Nobleman, who was Receiver-"general of *Hiſpaniola*, and miſerably afflicted with this "Lues, being ſhew'd this Remedy by the Natives, firſt brought "it in Uſe in *Spain*, tho' very dubious whether it would have "the ſame Effects in a foreign Country as in its native Soil." But, by whom, or by what means ſoever Guaiacum came firſt to be known, it is unanimouſly agreed, by all the Authors of that Age, that we are obliged for this Remedy to the *Weſt Indies*, where the Diſtemper was firſt contracted.

There are two Species of Indian Wood adapted to the Cure of the Lues Venerea; one of them ſolid, denſe, reſinous, blackiſh,

blackiſh, conſiſting of variouſly complicated Fibres, of an acrimonious, bitteriſh, and aromatic Taſte, and of a fragrant Smell; this the *Americans* call *Hiacan*, or *Huiacan*; whence comes the *European* Name *Guaiacum*: The other, in Denſeneſs, Complication of Fibres, Taſte, and Smell, is very much like the other, but of a more whitiſh, or rather a more yellowiſh Colour; this the Natives call *Hoaxecan*, and the *Europeans Lignum Sanctum*, for its extraordinary Virtue. The Bark of both of them is ligneous, thin, hard, conſiſting of a Multitude of parallel and cloſely compacted Laminæ; on the Outſide, of an Aſh-colour, inclining to red, of an acrimonious and bitteriſh Taſte, and almoſt void of Smell.

The Trees, producing theſe Woods, differ not only in Age, as was the Opinion formerly, and many ſtill imagine, but alſo in Kind or Species, as has been demonſtrated particularly by *Plukenet* in his *Phytographia*. Both Sorts are now common in the *Leeward* Iſlands, and all that Part of *America* which lies under the Torrid Zone.

The antient Way of making a Decoction of *Guaiacum* moſt in Uſe was, to take a Pound, or twelve Ounces, of the thin Chips or Raſpings of the Wood, and infuſe it in eight, ten, or twelve Pints of Water, for the Space of four-and-twenty Hours, in a new earthen Pot. Then the Veſſel being well ſtopt, they boil'd it *in Diplomate*, (that is, by ſetting the Pot in a Furnace full of Water) to the Conſumption of a fourth or third Part, or even of half, as they would have the Decoction of more or leſs Strength, or as they thought moſt agreeable to the Strength and Temperament of the Patient, or the Violence of the Diſeaſe; this done, they ſtrain'd the Decoction, and, letting it cool, bottled it up for Uſe. To the Wood leſt in the Pot, they pour'd the ſame Number of Pints of Water as before; and then boil'd it over a gentle Fire, to the Conſumption of a fourth Part; then ſtrain'd it, and ſet aſide this ſecondary Decoction, or *Bochetum*, in Glaſs Bottles, as they did the firſt: This latter ſerv'd for ordinary Drink, as the firſt did for Medicine.

Whether the Wood of Guaiacum without the Bark, or the Bark without the Wood, or both together; or whether Guaiacum alone, or in Conjunction with other Woods, Roots, or Plants, of the ſame Nature, are to be uſed; or whether the Decoction is to be made in Wine or Water, or in a Decoction or diſtil'd Waters of ſome Plants of much the ſame Kind, has been matter of Diſpute among the Phyſicians in former Times, and manag'd with much Heat; but it is impoſſible to fix any certain Rules for ſo doubtful and precarious a Subject, where there is ſuch a Variety in the Temperament, Age and Condition of the Patient, as well as in the Nature, Degree, and Complication of the Diſeaſe; for which Reaſon, the whole Affair is to be entruſted to the Management and Skill of the Phyſician, who is the beſt Judge of what is moſt ſuitable to the Exigences of every particular Caſe, and on emergent Occaſions.

The Decoctions being got ready, the Patient, being firſt prepar'd by ſome gentle Cathartic, and a ſparing Diet of ſome Days, was cloſely confin'd to his Chamber, which had a good Degree of Warmth, either by Art or Nature, and was well fenc'd and ſecur'd againſt the Air and Cold. The Patient, being confin'd to his Bed, took every Morning, very early, a Glaſs, which held eight or ten Ounces of the firſt Decoction warm; then, well covering himſelf up with the Bed-clothes, he compos'd himſelf to ſweat for two or three Hours. After this, the Sweat being abſterg'd, and the Body dry'd, four Hours at leaſt after the Decoction, the Patient had two or three Ounces of Biſcuit, with a few Raiſins, Almonds, or Piſtachios, offer'd him to eat, and he was to drink plentifully of the ſecondary Decoction. Four Hours afterwards he took another Glaſs of eight or ten Ounces more of the primary or firſt Decoction; then ſweated three Hours, as before; and, after wiping his Body, was allow'd to eat two or three Ounces of Biſcuit, with ſome Raiſins, Almonds, or Piſtachios, and to take off ſome Cupfuls of the ſecondary Decoction, as before. But, if the Patient was thin, attenuated, or of a tender and weakly Conſtitution, and unlikely to ſupport ſo ſevere an Abſtinence, a ſomewhat larger Quantity of Biſcuit and Raiſins, or a Marchpane, or even ſome Chicken-broth, was indulg'd him; and, after ſome Days, perhaps, he had a Quarter, or Half, of a ſmall Chicken, roaſted, or boil'd in pure Water, without Salt, allow'd him. In this Method did they perſiſt for fifteen Days; in which Space of Time, if the Belly was coſtive, an emollient Clyſter was adminiſter'd every ſecond or third Day: After the firſt fifteen Days, the Patient was purg'd with ſome gentle Cathartic, as the Pulp of Caſſia, Manna, Tamarinds, or the like; and, on ſuch Occaſions, he drank nothing but the ſecondary Decoctions for that Day. When this was over, he enter'd upon the ſame Courſe of Medicine as before, till the thirtieth or fortieth Day, but had a little larger Quantity of Food, by degrees, allow'd him; and, after the five-and-twentieth or thirtieth Day, if his Strength were ſufficient, was permitted, now-and-then, to riſe out of his Bed, and, being well clothed, to take a Turn or two about the Chamber, provided he was free from the leaſt Sweating. Towards the End of the Cure he was again purg'd; and, after that, he had the Liberty of walking out of his Chamber, not, indeed, into the open Air, but into another Room, till he was able to bear the Air. And they were very cautious of making ſudden Innovations, but took a Month longer to bring the Patient, by degrees, to his uſual Way of living; during which, he obſerv'd a Regimen of Diet, abſtain'd from Wine, and us'd the ſecondary Decoction for his ordinary Drink.

By this Method, the ſtrong Decoction of Guaiacum, which is of an acrimonious and aromatic Nature, ſuffering little or no Alteration from the very ſmall Quantity of Food in the Stomach, flow'd in great Abundance into the lacteal Veſſels, exhauſted by Abſtinence, and, pervading all Parts of the Body with a very free Current, diſſolv'd, attenuated, and fuſed, the Globules of Blood and Lymph, which were harden'd and inſpiſſated by the Virulence of the Contagion; and either alter'd and corrected the obvious contaminated Fluids, or expel'd and eliminated them by Urine or Diaphoreſis: The Viſcera alſo, in all their Parts, and the Veſſels, being macerated in that acrimonious Lixivium for forty Days together, had all their Obſtructions by degrees remov'd, and all Infarctions from adhering Humours inſenſibly deterged; ſo that the Virulence of the Venereal Contagion being ſubdu'd and eliminated, the Patients were reſtor'd to their former Health.

This Method had certainly a good Effect in many Inſtances in *Hiſpaniola* and *Spain*; and we are aſſur'd, by *N. Poll*, Phyſician to the Emperor *Charles* the Fifth, in a ſmall Treatiſe of his of the Cure of the *Lues Venerea* by *Guaiacum*, "that "the Uſe of this Decoction, near about one and the "ſame time, cured three thouſand Perſons, whoſe Caſes "were look'd upon as deſperate, and who were ſo perfectly "reſtor'd, that they ſeem'd to themſelves to have receiv'd a "new Birth." And I am perſuaded, that the Fame of this Medicine was not a little promoted by the above-quoted *Hutten*, who confeſſes himſelf to have been miſerably affected with this Diſeaſe for nine Years together, attended with moſt ſevere Pains, with a Multitude of Exoſtoſes, an ulcerous Caries of the Bones, an extreme Emaciation, and a dangerous Maraſmus: He had eleven times, he ſays, undergone a Mercurial Courſe to no Purpoſe; but that after a Multiplicity of tormenting Pains, Anxieties, and Dangers, ſcarce poſſible to be conceiv'd, he was at laſt, by the ſole Uſe of the Decoction of Guaiacum, for thirty Days together, reſtor'd to ſound and perfect Health.

But in nothing is the World more commonly miſtaken, than in paſſing a Judgment on Novelties. Thus, at firſt, the Decoction of *Guaiacum* was believ'd to be a ſure, ſafe, and harmleſs Medicine for the *Lues Venerea*, which might be us'd promiſcuouſly without Danger, and therefore it was try'd upon all indiſcriminately. But, in a ſhort time, it was found, by ſad Experience, that Multitudes, who were of an infirm Conſtitution, or of an acrimonious, bilious, and hot Temperament, or were naturally lean and dry, or were before affected with a preternatural Heat, or other Diſorders of the Lungs, Liver, Kidneys, or, laſtly, ſuch as were any way inclin'd to a Conſumption, often had the Misfortune, under ſuch a Courſe as before deſcrib'd, through too much Abſtinence, the exceſſive Acrimony of the Decoction, and the immoderate Sweats, to be exhauſted and extenuated to ſuch a Degree, as to fall into an incurable Phthiſis. "I have obſerv'd," ſays *Pet. And. Matthiolus*, in a Treatiſe of his *de Morbo Gallico*, printed in the Year 1533. "that Perſons of a dry Habit, labouring "under the *Lues Venerea*, have, by drinking this Wood, "fallen into an hectic Fever, and thence into a Con-"ſumption."

In order to prevent ſuch Miſtakes, and for avoiding all Dangers, it was thought adviſeable to mitigate the Severity of this Method. The Patient was therefore allow'd a fuller Diet, the Decoction was made weaker, and the Time for Sweating was ſhorten'd. But what were the Conſequences of this Alteration? To avoid one Error, the Practice ran into the other Extreme; by which means the Virtue of the Remedy was ſo weaken'd and depreſs'd, that it was no more found to be effectual for the Cure of the Diſeaſe; ſo that the ſame *Matthiolus*, in the forementioned Treatiſe, complains, "that this "Wood had not the ſame ſalutary Effects as heretofore, and "that moſt of thoſe who uſed the Decoction miſs'd of their "Cure, by the Fault of thoſe who adminiſter'd the ſame," who imprudently freed their Patients from the ſevere Reſtraint of a ſtrict Diet. And thus *Guaiacum*, which was at firſt received with ſo much Applauſe, had now begun, in the Time of *Matthiolus*, to loſe its Reputation.

Boerhaave has endeavour'd to revive the Uſe of *Guaiacum* in the Cure of Venereal Diſorders, in his Preface to the Collection of Authors on the Lues Venerea; where he gives it this great Encomium, That it will perform a Cure, where a Salivation has fail'd; whereas, if Guaiacum fails, it is in vain to try a Salivation.

Beſides the Uſes of *Guaiacum* in Venereal Caſes, it is ſaid, in general, to be hot and drying, and, therefore, a great Promoter of inſenſible Perſpiration, rather than Sweat. Upon this account it is reckon'd a wonderful Sweetener and Cleanſer of the Blood, and therefore much preſcribed in cutaneous Foulneſſes of all Kinds. By the ſame hot, penetrating Quality, it alſo is eſteem'd good in the Gout, by diſſipating, and inſenſibly waſting, the Humours thrown upon the Joints; as alſo in Dropſies and Catarrhs, by drying up and waſting the ſuperfluous Humidities. Continual Experience, beyond Contradiction, demonſtrates its Uſefulneſs, in all Depravations of the Conſtitution, which ariſe from too much Humidity.

Analysis of Guaiacum.

Fill a clean glaſs Retort, almoſt up to its Neck, with the ſmall Raſpings of the beſt, green, cloſe, ponderous, and freſh Guaiacum, with Care to prevent any of it from falling thro' the Neck into the Receiver. Set the Retort in a Sand-furnace; apply a very large Receiver, and lute the Juncture cloſe, with a Luting of Linſeed-meal. Diſtil, firſt, with a Degree of Heat not exceeding that of boiling Water; and continue this carefully, ſo long as any Moiſture will be thereby driven from the Wood. A liquid, tart, and ſharply odorous Water will thus come over, which is to be poured out, and kept apart. The Receiver being now, again, luted on, increaſe the Fire, by ſlow Degrees; and, again, a conſiderably limpid, but ſomewhat more acid, unctuous, and rediſh Liquor will come over, which muſt carefully be urged with the ſame Degree of Heat, ſo long as it riſes. This, alſo, may be kept ſeparate, as being conſiderably ſtrong, odorous, and ſmelling almoſt perfectly like red Herrings. The Fire, being now raiſed and kept up, drives over a red, unctuous, and highly acid Liquor, together with a red Oil floating in a conſiderable Quantity therein: At length increaſe the Fire to the utmoſt, that the Bottom of the Iron Pot may begin to be red-hot; there will now aſcend a Smoke, and a thick, black, viſcid Oil, which ſinks to the Bottom of the former Liquor. And if this Fire be continued as ſtrong as the Glaſs will endure, without melting, the ſame Fume will conſtantly continue to riſe, how long ſoever the Fire be kept up. In the laſt Place, apply live Coals upon the Sand, all round and above the Retort, which is called a Fire of Suppreſſion; and keep this up, alſo, for ſome time, till no more Oil comes over. Now ſuffer all to cool ſpontaneouſly, and, by this laſt Extremity of the Fire, a little very thick, black, and ponderous Oil, like Pitch, will be driven over.

Make a little Filtre of Cap-paper, put it into a glaſs Funnel, and pour therein the Water which firſt came over, without any Oil, that the Strainer, being thus well moiſten'd, may tranſmit this pure Water of the Guaiacum, which is to be kept ſeparate. This Water will be tartiſh, limpid, and penetrating, but have little of the Smell or Taſte of the Guaiacum; but a ſomewhat burnt Odour, a little reſembling that of ſmok'd Herrings. Then put the ſecond Water into the ſame Filtre, and this will come through a little rediſh, tranſparent, but more acid, and ſmelling ſtronger of ſmok'd Herrings; ſo as to prove ſomewhat empyreumatic, and much ſharper than the former. And, if any Oil was lodg'd in this ſecond Water, it will remain in the Filtre; which, having been moiſten'd by the preceding Liquor, will not permit the Oil to paſs. Into the ſame Filtre pour, likewiſe, the Vinegar, and third Spirit, together with its light Oil; the Vinegar will immediately paſs through red, pellucid, ſharp, acid, and empyreumatical, but leave its Oil behind, floating upon the Liquor, in the Filtre: For which Purpoſe the Filtre muſt always be kept filling up with more of the oily Liquor, to prevent the Oil from ever touching the lower Part of the Paper; for thus nothing of the Oil will come through with the acid Liquor. When, now, nearly all the Liquor is come through, immediately remove the Funnel, with the Filtre, to another Glaſs, before the Oil begins to ſink through the Paper; which would happen when the Paper begins to grow dry. At this time, therefore, the light and thin Oil may be poured out of the Filtre, into a Veſſel apart.

Pour the Oil, which came over laſt, along with its highly acid, fetid, and unctuous Liquor, into the ſame Filtre, whilſt it remains ſtill wet with the former Liquor, there will now come through a red, acid, tranſparent Fluid; and a groſs, black, pitchy, ponderous Oil remains in the Paper: This, alſo, is to be poured out, and kept ſeparate.

If theſe acid Liquors be preſerved in clean Glaſſes, they depoſit, at the Sides and Bottom thereof, a ſmall oily Cruſt, which gradually increaſes, whereby the Liquor gradually becomes leſs unctuous; whence it appears, that this diſtilled Vinegar is a Compound of Water, Acid, and Oil, and may, therefore, properly be called a volatile, acid, oily, ſaponaceous Salt. If this acid Liquor, when become perfectly limpid, and affording no more viſible Oil, be poured upon clean Chalk, it effervеſces therewith, depoſits its Acid in the Chalk, and becomes a Water, which immediately throws the Oil, before latent in it, to the Surface, in a viſible Form: Or, if the ſame Liquor be again diſtil'd with a gentle Fire in a clean Veſſel, it alſo preſently manifeſts its latent Oil, and ſeparates it from itſelf; and thus becomes a pure and clear acid Liquor.

If the Oils be requir'd in greater Perfection, let a Quantity of them be collected, and diſtil'd by boiling Water; whereby the purer Part will be raiſed, and the groſſer left behind; and, by often repeating this Operation, theſe Oils gradually come nearer to the Perfection of the eſſential Kind, and by loſing their more unactive and terreſtrial Part, become liquid, bright, beautifully red, penetrating, pure, thin, and not fetid. When thus all that is volatile has been drawn over from the Subject, by the violent and long-continued Action of the Fire, extremely black, light, inſipid, and almoſt inodorous, and very brittle Shavings remain in the Retort, being the Coal mention'd by *Helmont*, which can never, by the moſt continued Force of Fire, be calcin'd into white Aſhes, whilſt the Veſſel remains cloſe, but always continues black, and therefore inflammable; becauſe this Blackneſs is the fix'd Oil, tenaciouſly adhering to the Earth, and ſubtly extended upon its Surface; whence the Coal becomes ſubject to take Fire, and burn ſo long as this Oil remains unconſumed: For, if theſe black Raſpings be now put into a large open Pan, and a ſmall live Coal be thrown into the Middle of them, they will immediately burn and flame all over, till the whole Blackneſs be ignited, after which the Subject preſently falls into white Aſhes; ſo that, in a ſhort time, the whole Body of the Shavings may, by means of the ſmalleſt Spark, be perfectly converted into Aſhes: Nor could the Wood itſelf be ſo eaſily, and ſo readily, fired with a ſmall Spark, unleſs, by a like Preparation, it were firſt brought to a Coal, and then broke to Powder. The white Aſhes, thus obtained from *Guaiacum*, are inſipid, inodorous, and almoſt without any Salt; though, if the Wood were recent, they prove conſiderably rich in alcaline Salt.

In making Decoctions of Guaiacum, for medicinal Uſes, it is to be remark'd, that the Raſpings of the freſh and green Wood are much preferable to thoſe of that which is old and dry; and that, the longer it is boil'd, the better.

Tincture of Guaiacum.

Take the Raſpings of freſh, green, and ponderous Guaiacum-wood, or the Bark thereof, in Powder, and put it into a tall chymical Glaſs; pour thereon rectified Spirit of Wine, ſo as to float four Inches above it, without any other Addition: Boil them together, in the manner above-mentioned, for four Hours, often ſhaking the Glaſs; the Liquor will thus become red, which is to be ſtrained, after it is clarified by Reſt, through a linen Strainer, to ſeparate it from any Impurities; then, pouring freſh Spirit upon the Remains, boil them again, and preſerve the ſeveral Tinctures pure. The Liquor, thus obtain'd, will be of a pungent, aromatic, acrid, hot Taſte, and Odour; but if the Alcohol, employ'd, was perfect, the Tincture will always be the better.

If this Tincture, prepar'd with pure Alcohol, be diſtilled in a tall Body, with a gentle Fire, till only one fourth Part be left behind, this will be a very rich Tincture, fully impregnated with the Virtue of the Guaiacum. But if the Spirit employ'd contain'd any Water, the Roſin would begin to fall, if the Tincture was inſpiſſated ſo high: But when pure Alcohol is uſed, the Tincture will eaſily bear to be thickened, and thus increaſe in Virtue, without growing turbid.

This Tincture of Guaiacum being externally applied, is a wonderful Remedy in malignant Venereal Ulcers; whether in the Skin, or Fat, Mouth, Jaws, or Throat.

When this Tincture of Guaiacum, prepar'd with pure Alcohol, and inſpiſſated to an half, is mix'd with four times its Quantity of the Syrup of the Five opening Roots, and taken upon an empty Stomach, in the Morning, lying in Bed, it preſently diſtributes itſelf over the whole Body, which it thus warms, and promotes a copious Sweat; and hence it is commended in the Venereal Diſeaſe, when it has ſeiz'd upon the ſubcutaneous Parts. *Boerhaave's Chymiſtry.*

From the Tincture of *Guaiacum*, its Reſin is prepar'd, by the Proceſs directed under the Article Resina.

Beſides the common Reſin of Guaiacum, extracted by Spirit of Wine, another reſinous Subſtance, conſiderably different from the former, both with reſpect to Taſte and Virtues, may be obtain'd from this Wood, though not by a Maceration with ſpirituous Menſtruums, but by long boiling with common Water; for, when a Decoction of Guaiacum is inſpiſſated over a gentle Fire, there remains, at the Bottom, a kind of reſinous thick Subſtance, which is of a balſamic, grateful Smell, of a ſomewhat acrid Taſte, and which, when reduc'd to a fine Powder, and receiv'd into the Noſtrils, by ſtimulating the glandulous Coats, which cover the Bones of the Noſtrils, ſo powerfully colliquates and evacuates the Phlegm lodg'd there, that, from long Experience, it appears to me preferable to all the other Errhines I know; for, beſides its ſtimulating Quality as an Errhine, it is alſo poſſeſt of a corroborating Virtue, which is highly friendly to the nervous Parts of the Head. *Hoffman. Obſervat. Phyſ. Chym.*

The other Species of *Guaiacum* is the

Lignum Sanctum. Offic. *Guaiacum propæmodum ſine matrice.* C. B. P. 448. Raii Hiſt. 2. 1686. *Guaiaci altera Species Monardi*, Ger. Emac. 1611. *Palum Sanctum Indiæ Occiduæ.* Park. Theat. 1587. HOLY WOOD.

This is a ſolid compact Wood, nearly of the ſame Smell and Taſte as the other, but ſomewhat more white; and its medicinal Virtues are the ſame.

Gum Guaiacum.

This Gum, or rather Reſin, is much of the ſame Virtue as the Wood whence it is drawn, but more efficacious. It is reckoned much to promote inſenſible Perſpiration, and upon that Account is good in ſuch cutaneous Caſes as proceed from Obſtructions of perſpirable Matter in the miliary Glands. It is very warm and deterſive, and therefore good in all Ulcerations and Gleets, both internal and external. In Gonorrhœas it is by ſome almoſt deem'd a Specific. In the Gout, likewiſe, it does frequently good Service, not only by deterging and cleanſing the Joints and mucilaginous Glands from tartarous Matter, but by warming and ſtrengthening the Fibres, enables them to move with that Vigour, as ſhakes off and prevents the Lodgment of ſuch Particles upon them.

The Doſe, according to *Lemery*, is from eight Grains to two Scruples.

GUAJANA-TIMBO. The Name of an *Indian* ſiliquoſe Plant, mention'd by *Piſo*. If impetiginous Eruptions are rub'd with the Juice of the immature Seeds of the Fruit, or Beans, of this Plant, and this is often repeated, it is ſaid to cure ſuch Diſorders.

GUAJAVA. The Guava.

The Characters are;

The Extremity of the Pedicle paſſes into an Ovary, of an oval Figure, crowned, quinquefid, and like a Calyx. The Flower is roſaceous, pentapetalous, growing on the Ovary within the Crown, and furniſhed with numerous Stamina. The Ovary is furniſhed with a long Tube, and becomes a fleſhy Fruit, full of very numerous ſmall Seeds.

Boerhaave mentions three Species of this Plant; which are,

1. Guajava. *Cluſ. Hiſt. App.* 1. *Guajabo Pomifera, Indica.* C. B. P. 437. *Xalxochitl, ſeu Pomum arenoſum.* Hern. 84. *Pela.* H. Mal. 3. 31.

2. Guajava; rubra; acida; fructu rotundiori. *H. L.* 305. *Malakka Pela.* H. Mal. 3. 33.

3. Guajava; ſylveſtris. *Pelou H. Mal.* 3. 35. *Boerh. Ind. alt. Plant.*

The Tree grows to the Height of twenty Feet, or more in the *Weſt Indies*, and has a Trunk as big as a Man's Thigh: In *England* it is preſerv'd in Stoves, and is rarely ſeen above ſix or ſeven Feet high. *Miller's Dict.*

The Fruit reſembles our Pears, with an Umbilicus full of Chaps, and cover'd with a thin whitiſh green Rind. The Pulp is of a pale bloody Colour, in ſome whitiſh, and, when ripe, of a ſweet and grateful Taſte, and a pleaſant Smell. The Fruit has three different Sorts of Taſte, according to its Seaſon. In the time of its Ripening, before it is ſoft and yellow, it is auſtere and aſtringent, and is then good, when boil'd, for the Stomach; when it becomes a little riper, it is of a middle Nature, and in its beſt State; but it is more adviſable for Health to eat it either boil'd or preſerv'd in Sugar, than raw; beſides, it is of a more grateful Taſte and Smell, when thus prepar'd. When it is come to perfect Maturity, and is entirely ſoft and yellow, it has the Taſte and Smell of Raſpberries, looſens the Belly, and is not ſo wholſome to be freely eaten, becauſe it is eaſily corrupted, and breeds Worms. The Root with its aſtringent Bark, boiled in Water, and drank, is an excellent Remedy for the Dyſentery, where Aſtriction and Strengthening are indicated. The Leaves are acid and aſtringent, and proper to be us'd in Bathing. *Fr. Hernandez* adds, that the Leaves us'd in Lotions cure the Itch, and that a Decoction of the Bark is good for ſwell'd Legs, that it cures fiſtulous Ulcers, helps Deafneſs, and removes Pains in the Belly: A Syrup, alſo, made of the Leaves, is very effectual againſt a Flux of the Belly. *Raii Hiſt. Plant.*

The Fruit is refrigerating, and ſomewhat aſtringent: The Roots are aſtringent, and therefore good for the Dyſentery, and to comfort the Stomach: The Leaves are vulnerary, reſolvent, and uſed in Bathing. *Hiſt. Plant. aſcript. Boerh.*

GUAIBI-POCACA-BIBA *Braſilienſis* Piſonis & Marcgrav. *Arbor ſiliqua tortuoſa putreſcente, Fraxinellæ foliis.* It is the Name of an *Indian* Tree, whoſe Root is furniſh'd with a yellowiſh-white Pith, to which ſome medicinal Virtues are attributed. Thus they peel off the external thin Skin, cut the Pith into Slices, and infuſe them in Spring-water, for one Night, in the open Air. This Water, when drank, is ſaid to provoke Urine, to be beneficial in Obſtructions of the Kidneys and Bladder, and to cure a Gonorrhœa without any other Medicine. The freſh Juice of the Bark, dropt into the Eyes, cures the Inflammations thereof.

GUAIUMBI. The Name of a ſmall *Indian* Bird, call'd by the *Portugueſe*, *Pegafrol.* It is ſaid, that this Bird powder'd, and taken in Wine, relieves the *Sciatica.*

GUANABANUS *Oviedi.* A Species of *Indian Anona*, to which no Virtues are attributed, except that the Fruit is ſaid to be cooling.

GUAO. The Name of a *Weſt Indian* Tree, call'd alſo *Thetlatian.* The Juices of this Tree are extremely acrid, inſomuch that it is not ſafe to ſleep under it. The Wood is firm and hard, but ſo poiſonous, that thoſe who work it, contract a Swelling of the Hands and Face, which laſts for ſome Days. *Lemery des Drogues.*

GUAPARAIBA. Piſon. *Mangle Pyri foliis, cum ſiliquis longis, Ficui Indicæ affinis.* J. B. *Paretuvier* Rochefort. THE MANGROVE-TREE.

This is very common in the *Weſt Indies.* The Root, which is ſoft and moiſt, if ſlit and toaſted, and apply'd to the Punctures made by the poiſonous Fiſh, call'd *Niqui*, eaſes the Pain caus'd thereby, and preſerves the Limb affected. This Remedy was diſcover'd by the Fiſhermen. *Raii Hiſt. Plant.*

GUAPEREIBA *Braſilienſibus.* Marcgrav. The Name of a Tree which grows in *Braſil.*

GUARIQUIMYMIA. The Name of a Shrub, which grows in *Braſil*, like Myrtle. The Seed is ſaid to be good againſt Worms in the Inteſtines. *Lemery des Drogues.*

GUARERVA. A ſort of Cucumber, which grows wild in *Braſil. Raii Hiſt Plant.*

GUASSEM. Certain black, and, as it ſhould ſeem, ſcorbutical Spots, mention'd by *Avicenna.*

GUAVIL. A Species of Sea Lizard.

GUAYAVA. See Guajava.

GUAZUMA, *Baſtard Cedar-tree.* *Miller* mentions three Species of this Tree, to which I find no medicinal Virtues attributed.

GUIDONIA. The Name of an exotic Plant.

Boerhaave mentions but one Species of this Plant, which is,

Guidonia; Ulmi foliis; flore roſeo. *Plum. N. G. A.* 4. *Arbuſcula, facie Ulmi, Æthiopica, ramulis alatis, floribus purpuraſcentibus. H. A.* 1. 165. *Boerh. Ind. alt. Plant. Vol.* 2.

There are no medicinal Virtues attributed to this Plant, that I know off, at preſent.

Miller takes notice of five Species.

GUIRAPARIBA *vel Uruparіba Braſilienſibus.* Marcgrav. *Arbor Braſilienſis Folio ramoſo, floribus magnis, pentapetalis flavis.* A Name for two Trees, which grow in *Braſil*; one of which is a ſort of Ebony. *Raii Hiſt. Plant.*

GUITY-IBA, Piſon. & Marcgrav. *Arbor pomifera Braſilienſis, fructu maximo, officulo ligneo.*

The Name of a Tree, which grows in *Braſil*, the Fruit of which is call'd *Guity Coroga*, and contains a Stone as large as a Gooſe's Egg, incloſing a Kernel, which, grated, and given in the Quantity of a Dram, is ſaid to be good in a Dyſentery. And an Infuſion of a double Quantity of this Kernel is reported to be excellent in ſtopping all ſorts of Hæmorrhages. There are two other Trees call'd by this Name. One is the *Guity Toroba*; the other is the *Guity-iba*, the Kernels of which have the ſame Virtues attributed to them.

GULA. The Gullet, or *Oeſophagus.*

GUMA, in Chymiſtry, is Mercury.

GUMMA. A ſort of Venereal Excreſcence on the Periоſteum, of the Conſiſtence of Gum. See Nodus.

GUMMI. Gum. A concreted vegetable Juice, which tranſudes through the Bark of certain Trees, and hardens upon the Surface. The Chymiſts only allow thoſe to be properly Gums, which are diſſolvable in Water; thoſe which are only diſſolvable in Spirit they call Reſins; and thoſe of a middle Nature, Gum-reſins. *Geoffroy* ſays, that Gums are ſomething between Acid and Oil; being an acid Salt ſo fix'd in Earth, as that the greateſt Part of it is changed to an Alcali, the other into Oil; ſo that the Mixture ariſing from thence is an oily Salt, reſembling the ſaponaceous Concretes of the Chymiſts, made of Oil of Olives, and a Lixivium of Tartar, or he mucilaginous Bodies form'd of Spirit of Wine, and the volatile Spirit of Urine. And thus we ſee, that all Seeds which are oily when ripe, are in the Beginning only a Mucilage, or imperfect Oil. *Geoffroy.*

In the antient Writers (κόμμι) *Gummi*, put abſolutely, imports Gum Arabic.

Gummi Ammoniacum	See	Ammoniacum.
Gummi Anime		Anime.
Gummi Arabicum		Acacia.
Gummi Caranna		Caranna.
Gummi Cerasorum		Cerasus rubra.
Gummi Copal		Copal.
Gummi Elemi		Elemi.
Gummi Guaiaci		Guaiacum.
Gummi Hederæ		Hedera arborea.
Gummi Juniperi		Juniperus vulgaris fruticosa.
Gummi Lacca		Jujuba Indica.
Gummi Senegalense		Acacia.
Gummi Tacamahaca		Tacamahaca.
Gummi Tragacantha		Tragacantha.

GUNDELIA. The Name of a Plant, ſo call'd from Dr. *Gundelſheimer*, who found it, in his Travels with the celebrated *Tournefort*.

GURGEATIO. A Name for the SUDOR ANGLICUS.

GURGULIO. The UVULA. It is, alſo, the Name of an Inſect, call'd a Weavil.

GUSTUS. The Taſte of ſapid Subſtances; or the Organ of Taſte. Upon the Tongue, eſpecially towards the Apex and Sides, under the Skin, are obtuſe Papillæ of various Figures. Theſe Papillæ are prominent in the Tongue of a live and faſting Perſon when put out, and applied to any Body to be taſted. In dead Perſons they abſolutely diſappear; but are, in a particular manner, prominent in hungry Perſons. They ariſe from the nervous Body covering the muſcular Fleſh of the Tongue. Whence they paſs through Perforations of the Corpus reticulare, in the ſame manner as in the Skin, and are cover'd with ſmall Vaginæ, form'd by the exterior Membrane of the Tongue. By means of theſe ſmall Vaginæ, they are defended againſt the Roughneſs, the Acrimony, and the Heat of the Aliments. Theſe Vaginæ are, alſo, porous, and prominent, that the Meat and Drink may, by Preſſure, have the greater Influence upon them.

It is obvious, that ſuch a Number of Papillæ may ariſe from the ninth Pair of Nerves, convey'd to the Tongue alone, and diſtributed through it; and that a Ramification of the fifth Pair is ſubſervient to its muſcular Motions, which Office it performs in ſome other Parts of the Body.

Laurentius Bellini has ſhewn, by ingenious and accurate Experiments, that theſe Papillæ form the Organ, to which when ſapid Objects are applied, they excite the Ideas of Taſte; and that the other Parts of the Mouth, Tongue, and Palate, contribute nothing to the Production of this Effect, except, perhaps, thoſe Parts of the internal Cheeks, which lie near the Meeting of the Dentes Molares in both Jaws.

That Subſtance, in Vegetables and Animals, from which a Salt, and an Oil, may be extracted by Art, whether by itſelf, or mix'd with any other Subſtance, is the true Object of Taſte; ſo that Salt, Soap, Oil, and Spirit, muſt, of courſe, be ſo too. The ſame holds true in foſſile Subſtances alſo.

The Ideas of Taſte are, therefore, excited, if the Matter to be taſted, being attenuated, for the moſt part diſſolv'd in the Saliva, warm'd in the Mouth, applied to the Tongue by the Motion of the Mouth, inſinuating itſelf into the Pores of the membranaceous Vaginæ, and penetrating to the Surface of the Papillæ lodg'd there, ſo affects and moves them as to convey this Motion to the common Senſory, and excite in the Mind the different Ideas of ſaline, acid, alcaline, ſweet, vinous, ſpirituous, bitter, aromatic, hot, acrid, auſtere, or any Compoſition and Mixture of theſe.

Hence the Reaſon is ſufficiently obvious, why ſo different Taſtes are excited by one and the ſame Object, according to the Diverſities of Age, Temperament, Diſeaſes, Sex, Cuſtom, and other Subſtances previouſly apply'd to the Organs of Taſte; as alſo why highly ſapid Subſtances are nearly allied to thoſe of the dolorific kind, ſuch as ſaline, aromatic, and ſpirituous Subſtances, when applied to bare Nerves, or an excoriated Tongue; why ſapid Subſtances are ſpeedy Reſtoratives, and why Water, mild Oils, and Earth without any Salt, are inſipid, and without Taſte.

GUTTA. A Drop. But an Apoplexy is ſometimes call'd *Gutta*, from a whimſical Suppoſition, that it was by a Drop of Blood falling from the Brain upon the Heart.

GUTTA GAMBA. See CAMBOGIUM, CARCAPULA, and ESULA INDICA BONTII.

This Gum hath been longer known in Painting than in Medicine, for its yellow Colour. The Violence of its Operation, both by Vomit and Stool, has occaſion'd abundance of Search for ſome proper Corrector; but none has yet been found better than the lixivious Salts, and particularly Salt of Tartar. Monſieur *Boulduc*, who has been induſtrious this way, and communicated his Experiments to the *Academy of Sciences*, upon many of the moſt efficacious medicinal Simples, in the *Memoirs* for 1701. has a Diſſertation upon Gamboge. He ſays, that it ought to be reckon'd amongſt the reſinous Juices, ſince it is inflammable, and will flow in the Fire, and be almoſt entirely diſſolv'd in Spirit of Wine; but, on the contrary, in aqueous Menſtruums, ſpreads itſelf into a milky Subſtance like Scammony, and afterwards precipitates: It ſeems, at firſt, to be inſipid upon the Tongue, but ſoon after becomes ſenſible in the Throat by its Acrimony, and an inſupportable Drought. It is a powerful Hydragogue and Emetic, but ought to be us'd with Caution, and not until it has been corrected. Monſieur *Boulduc* ſays, he endeavour'd to get Flowers from this reſinous Juice, like thoſe from Benjamin, but without Succeſs. He made Trial on it with Spirit of Wine, a Lye of alcaline Salts, and Water: The Spirit of Wine diſſolv'd all, except about a ſixth Part; the Remainder, which the Spirit would not touch, was eaſily diſſolv'd by a Solution of Salt of Tartar. This, ſays he, may be eſteem'd the ſaline Part of Gamboge; and, tho' it had no purgative Virtue, was very diuretic. The Reſin, which was made by the Spirit of Wine, purg'd more violently, and with greater Irritation, than the Gamboge itſelf.

This Gum was entirely diſſolv'd by an equal Quantity of Salt of Tartar, and a ſufficient one of boiling Water, excepting ſome few terreſtrial Parts. The Liquor filtrated, and evaporated by a gentle Fire, gave a ſort of grey Salt, which eaſily flow'd in the Air, if not kept cloſe ſtopt in a Phial. This ſaline Extract purg'd with leſs Irritation, and in a ſmaller Doſe, than the Gum; but caus'd a great Acrimony and Heat in the Throat, inſomuch that it was intolerable, and ought, therefore, to be inveloped in ſome other convenient Subſtance when it is given.

This Gentleman obſerv'd before, that Water would not diſſolve it, but only made it flow into a milky Subſtance of a yellow Colour, which ſoon precipitated, and left the Water clear above it. This Reſidue, dry'd, differ'd in nothing from the Gum, only was more pure. By caſting diſtil'd Vinegar on this milky Subſtance, it became clear; Oil of Vitriol, on the contrary, made it again turbid; and Spirit of Wine gave it a golden Colour. There are many Ways, this Author obſerves, of correcting it, but he thinks that by alcaline Salts the beſt. However, he gives one of his own, which, as it is different from any other hitherto us'd, he alſo continually practis'd it with Succeſs. The Manner is, by tying the Gum in a Rag, and putting it into a hot Loaf, as it comes out of the Oven, where it muſt remain for twenty-four Hours; afterwards it is to be powder'd, and this muſt be repeated four or five times: By this Management, he ſays, he always found it freed from its great Violence, as well purgative as emetic. He farther obſerv'd the Crum of Loaves thus us'd to have both a purgative and emetic Quality.

From this Account, it is not difficult to determine the Qualities of this Drug, wherein its Efficacy conſiſts, and the moſt advantageous Means of managing it in Preſcription; tho' it does not clearly appear what way of Reaſoning directed the Author to the Loaf of Bread, becauſe it has no relation to the Means made uſe of in other Trials; nor is it eaſily to be accounted for, how ſuch a Method made it of a milder Operation. It is a powerful Hydragogue, and therefore good in Dropſies, and all watery Corpulency tending thereunto. But its Roughneſs requires the utmoſt Caution and Skill in its Exhibition. It is a fit Purge only for grown Perſons, and thoſe of a ſtrong Conſtitution. With all the Care poſſible, it will frequently vomit, before it paſſes downward. The moſt convenient Form to give it in, is a Bole, or Pills; for no Menſtruum will equally draw out all its Qualities by Diſſolution. It will not well powder without ſome Portion of a lixivious Salt, or fine Sugar; and ſuch are its beſt Correctors, by dividing its reſinous Parts, and preventing their Adheſion to the Membranes in too forcible a manner. In ſeveral Intentions, which are moſt conveniently anſwer'd by the urinary Diſcharges, that particular Management of Monſieur *Boulduc*'s, which diveſted it of its purgative Parts, and left only the ſaline, which were very diuretic, may be worth putting in Practice.

It purges very well in the Quantity of four Grains; but from ſix to eight Grains, it purges and vomits violently. It is reckon'd particularly ſerviceable in Dropſies, by evacuating the watery Parts of the Fluids; and, as it has no Taſte, a very ſmall Doſe of it, ſuch as a Grain or two, diſſolved and mixed with Sugar, is very fit for Children. It is worthy Obſervation, that tho' this Gum is ſo very purgative, yet the Fruit of the Tree, to which it belongs, is perfectly harmleſs, and is eaten in the Country like Oranges.

Lemery ſays, the Doſe is to twelve Grains; and *Quincy* informs us, that a Scruple is the extreme Doſe, in the moſt robuſt Conſtitutions.

There are many Opinions concerning the Generation of this Gum: Some will have it to be natural, others factitious; ſome refer it to the *Eſula*; *Bontius*, to an *Indian* Plant, near akin to to the *Eſula*; others, to the Flowers of the *Indian Ricinus*, and its Colour to the CURCUMA; and ſome again endeavour to derive it from the *Tithymalus* and *Scammony*.

We take it to be the concreted Juice of the Trees abovemention'd. But, as *De Syen*, *in Annot. ad Hort. Malab. Tom.* 1. obſerves, this Gum *Gutta* here deſcrib'd, muſt not be confounded with the common Gum, which *Bontius*, *in Hiſt. Nat. & Med. Ind. Orient.* affirms to be collected from the Plant akin to the *Indian Eſula*, and call'd, by the *Indians*, *Lonan Cambodia*, becauſe it is plentifully produc'd in *Cambodia*, a Country bordering upon *Indoſtan*. *Dale*.

GUTTA ROSACEA. A red or pimpled Face.

I am inclin'd to believe, that thoſe who have attributed this Diſorder to ſome Intemperature of the Liver, are not much miſtaken, becauſe we frequently obſerve in Practice, that the Diſappearance of fiery Pimples in the Face is ſucceeded by Indurations of the Liver, and from thence Dropſies; and, on the contrary, that Diſorders of the Liver are reliev'd by copious

pious Eruptions of these fiery Pustules of the Face. And this should caution Practitioners against applying Topics, without the utmost Care, to these Eruptions.

It is called *Gutta Rosea*, or *Rosacea*, from the little red Drops, as it were, or fiery Tubercles, dispersed up and down the Face and Nose: By some *Rubedo Maculosa*, or rather, *Ruber cum Maculis*; by which the Parts of the Face are sometimes so overgrown, as to render the whole Countenance horribly frightful.

Nicolaus Florentinus constitutes three Degrees hereof; such as, 1. *Rubedo simplex, seu Facies rubra*; 2. *Rubedo pustulosa*; and, 3. *Ulcerosa*; and deduceth the Cause from a hot, but viscous and thick Blood, generated by some Intemperies or Vice of the Liver, which, being brought by the Capillary Arteries to the Surface of the Skin of the Face, is there diffus'd, as happens in Blushing; but, by reason of its Lentor, or Clamminess, not being return'd, as it ought, presently by the Veins, stops therein, and causes Redness, which neither yet being capable of being discuss'd, by reason of the Density of the Cuticle, raises the same up into Pustules, and at length ulcerates, having vitiated the Frame of the cutaneous Glandules by its long Stagnation.

The diagnostic Signs are evident to the Eye, better than by Description.

The prognostic doubtful as to Cure, tho' not as to Danger otherwise.

If the Disease be recent, mild, and in a good Habit of Body, the Cure is hopeful: If of long standing, inveterate, or malignant, scarce attainable, or at best, palliative.

It is certain, be the Case as it will, it does not always owe its Original to hard Drinking; since it is sometimes observ'd to attend the most Temperate and Abstemious. However, for the most part, the constant Tipplers of strong Beers, Wines, and Waters, but especially the two first, are usually the most obnoxious to this Malady. For the Removal whereof, the Intemperature of the Liver, and other Viscera, is to be corrected, and all other Obstructions remov'd, whilst, at the same time, the Humours are diverted from the Parts affected, by Bleeding, Blistering, Cupping, Issues, with lenient Purgatives frequently repeated. The Diet must be moistening and cooling, taken from Foods easily digested, avoiding Wine, unless well diluted, and strong Drinks, all Things spiced, potted, powder'd, season'd, or salted: The Drink may be an Emulsion of the cold Seeds, Milk and Water, clarify'd Whey. Lettuce, Purslane, Sorrel, and Spinage, are here frequently directed with their Meats; and, indeed, the whole Physical Regimen strikes in with that for the Erysipelas, Itch, and Scurvy.

In the Use, however, of this cooling and contemperating Method, great Prudence is requir'd: For if you take a Person off at once from his strong Liquors, and allow him nothing but Whey, or Milk and Water, you may likely remove his red Face, and Life soon after, by hastening a sudden Decay of Heat, palling his Appetite, and bringing on a Leucophlegmatia, or Dropsy. *Mayern* allows Wine diluted, and even Wine by itself, if moderately taken, on account of its Heat and Tenuity being better fitted to digest and and attenuate the gross and viscid Humours, and promote the Perspiration of the same through the Skin, than Water, which is often found injurious and pernicious to such Patients, by its Coldness fixing the already impacted Humour upon the Part.

As for what concerns Topics, much Caution, likewise, is to be used: For, according to *Sennertus*, if there be only Redness without Pustules, and the Disease recent, Refrigerants and Repellents take place: But, if Pustules attend, Discutients must be mix'd; and if those Pustules seem hard, and the Disease of long Standing, there may be Reason for Emollients to ripen and digest the tough and viscid Matter, and after, to let the same out upon Occasion, before we use deiccative, or drying and repelling Medicines; which, if at this time apply'd, would only increase the Induration of the Tubercles, fix the Humours more deeply in the Skin, and render the Disease still farther obstinate.

If the Disease be stubborn, and the Tubercles grown hard, we are to begin with Emollients, both Fotus and Ointment; such are the Decoction of Mallows, Vervain, Solomon's Seal, and Linseed: Also, a Cerate of Sperma Ceti, or *Bates*'s white Cerate.

Those which suppurate, and rise with Heads, must be empty'd of their Matter, and the Remains of the Humour disposed for Breathing out with the same Medicines mix'd with Discutients, as the Flowers of Elder, Rosemary, and Broom: In the Use of these latter, however, let the Artist have his Eye to the Part, and see, that by their warmer or more tenuious Particles, the Fluxion be not increased.

Sir *Theodore Mayern*, in his Regimen for my Lord *Maxwell*, subject to these exanthematous Pustules, attended with a red Nose, after taking notice, that it was hereditary to the Family, the Brothers and Sisters being subject thereto, lays the Fault principally on the Liver, which, he says, was very hot, his Blood vaporose, impure, abounding with adust earthy Fæces, attended with a bilious Temperament.

In order, therefore, to the Removal of the Disease, he says, the over-hot Blood must be attemper'd, and the Intemperature of the Bowels, especially, corrected, that a more laudable Blood may be generated; for which Purpose, and to alter, as it were, the whole Substance of that Bowel tainted, as well as to preserve the native Salt and Balsam pure and uncorrupted, he lays a mighty Stress upon Antimony, and its Preparations, as the Spirit, Salt, fix'd Substance, as the diaphoretic or the fix'd Flowers of Antimony, (of which Mind was *Sylvius*, and several others, who direct the diaphoretic Antimony, not only inwardly, but use the same in Ointments, and account it one of the best Cosmetics in the Case before us) which have the first Place in depurating the Blood, and correcting its Dyscrasies. Next to this he subjoins Mercurials to purge with, which are proper to convey away the salt and tartarous Humours out of the same, separating also the viscous, impure, and feculent, and carrying them off by Stool; although they do not (continues he) so powerfully operate by the Emunctories of the Skin.

The Simples he lays down to alter and edulcorate are these, Dodder, Fumitory, Adders-tongue, Hops, the cordial and refrigerating Flowers, and Veronica rubra.

Also the Tincture of Tartar, Oil of Sulphur and Vitriol, Broths of the hepatic Plants with Cream of Tartar, and Sal Prunellæ, than which nothing is more powerful to refrigerate, and hinder the Afflux of Humours, and take off their Heat and Ebullition; and these are to be continued for a Week or ten Days.

For the same Purpose he directs, also, an hepatic and splenetic Apozem for three Doses, being render'd purgative with Sena, Cassia, Manna, Rhubarb, solutive Syrup of Roses, and Fumitory, betwixt whiles; purging, moreover, with a Scruple of Calomel, made up with some purging Electuary.

Every Spring he orders a Vein to be open'd in the Right Arm; in Autumn, in the Left.

For twenty Days together he gives Whey, clarified with Fumitory, Succory, and the Juice of Apples; also Tinctures and Julaps of the like Nature, edulcorated with Syrups made from the Juices of the said Plants; and, sometimes, a small Ale, with the more temperate Antiscorbutics infus'd; and, through the whole Course, a most exact Regimen of the Non-naturals.

When the Body is costive, a Clyster must be injected, which if frequently repeated, an exellent Revulsion is thereby made of the Humours to the lower Parts.

As to the Surgery, he prescribes Cupping-glasses, set frequently to the Nape of the Neck, between the Shoulders, with Scarifications; Leeches, behind the Ears, and on the Inside of the Nostrils; also the Veins under the Tongue to be open'd.

Hence we may see what Care or Caution is necessary to be us'd, to provide against the Disease, whilst forming, by rectifying and altering the whole Temperament, and striking at the Source, or Root, before we take notice of that already form'd, or which is already thrown out by Translation to the Surface.

For whoever goes about, by cooling, or repelling, or, indeed, any other local Applications only, to cure this Infirmity, is in great Likelihood, by striking in, or otherwise retarding, those impure Feculences, which are here thrown forth as by some proper Emunctory, to kindle in the Blood some dangerous feverish Ebullition; or, by the same Humours now detain'd, or pent in, to suffocate the vital Flame at the Focus, or Fountain-head, whilst we are endeavouring to put out that in the Face.

The Topics order'd for this Nobleman, were, first, a Sweat for the Parts affected, holding his Head, cover'd about, and receiving the warm Steam of a Decoction of Bran, Soapwort, Melilot, Nettles, Chamomile, Ground-ivy, and the greater Celandine, in Milk and Water, to be us'd for an Hour in the Evening, taking none, or a very little light Supper before upon those Nights, and to avoid the cold Air above all things, at such times.

This was repeated once a Week; whilst, in the mean time, the Pustules were dress'd with an Ointment of Cerus, and white Diachylon, adding a little white Precipitate, or Calomel, for the more stubborn and obstinate, whilst the lesser and milder are touch'd with a Nodulus, wherein were inclos'd Salt of Lead, Camphire, burnt Alum, Borax, and Sal Prunellæ, made wet in Water of Frog-spawn, and Water-lily. Or,

With Water of Frog-spawn, and Phlegm of Alum, let a Mucilage be extracted from the Seeds of Flea-bane, and Quinces; and, by an Addition of the preceding Spices, form a Liniment, to be applied to the Pustules.

Or,

With strong Vinegar extract the Mucilage, and, adding Flowers of Sulphur, form a small Poultice, to be applied

all Night; and in the Morning let the Face be wash'd with Myrrh-water. When the Disorder is highly obstinate, says the Author, Mercurials are beneficial; but they are cautiously and rarely to be used, lest they should injure the Teeth, or procure a fetid Breath. *Nodali*, also, consisting of *Mercurius Dulcis*, and Lead, are to be express'd upon the Pustules.

But I have frequently done good Service with some of the less pompous, and more easily prepar'd Remedies; as the Salt of Tartar, Salt-petre, and Salt of Lead, mix'd up with some Pomatum, or dissolv'd in a suitable Menstruum, adding sometimes a little White-wine, and Juice of Lemons; the White of an Egg, shak'd up with a little Powder of Alum, or beat up well with a few Grains of Sublimate and Camphire; also, Oil of Myrrh per Deliquium, prepar'd by boiling an Egg hard, taking out the Yolk, and filling up its Place with Myrrh; then binding the divided Sides together, and setting it in a moist Cellar, that the Liquor may drop forth, which is an excellent Cosmetic: For this Purpose, also, is the *Unguentum Faciale* of *Bate*. *Turner de Morbis Cutaneis.*

Many other Topics might be here specify'd, but I look upon them all to be more or less dangerous; and that, for this Reason, it is better to abstain from them. The Cure is more safely perform'd by a proper Course of Mercurial Deobstruents, which must be succeeded by a due Use of alterative Mineral Waters; such as those of *Scarborough*, *Holt*, or *Rhode*. Or, perhaps, a long-continued and copious internal Use of the saponaceous and resolvent Juices of Summer Fruits, perfectly ripe, will be more effectual than either.

GUTTA SERENA. See AMAUROSIS.

GUTTALIS. The same as ARYTÆNOIDES.

GUTTETA. *Castellus* informs us, that *Goutte*, in *French*, among other Significations, imports Convulsions. Hence a particular Powder, calculated against Convulsions, and nervous Disorders, is call'd *Pulvis ad Guttetam*. It is thus prepar'd:

Take of white Dittany, Misleto of the Oak, Contrayerva, Virginian Snake-root, and Male Peony-root, of the Male Peony-seeds, of burnt Hartshorn, and Elks-hoof, each two Drams; of wild Valerian-root, one Ounce; of red Coral, and human Scull, of each three Drams; of Iacynth-stone, one Dram; of Occidental Bezoar, one Dram and an half; of the Oriental, one Scruple: Mix them into a Powder; to which may be added, at Pleasure, of Musk, five Grains; and, of the Leaves of beaten Gold, N° 30.

This was first prescribed by *Riverius*. It is given to both Children, and grown Persons, from ten Grains to half a Dram for Children, and to one Dram to grown Persons.

GUTTUR. The LARYNX, or ASPERA ARTERIA.

GUTTURIFORMIS *Cartilago*. The Arytænoide Cartilage.

GUTTUS. A barbarous Name for a Vessel contriv'd to hold Oil in such a manner, as to let it drop upon a Person. It was used for this Purpose after Bathing.

GUVAVIRAP *Brasilienſium*. De Laet. The Name of a very tall and large Tree, which bears a Fruit like Gooseberries. *Raii Hist. Plant.*

GUYTIS. See GUITY.

GYION, γύϊον. It imports the whole Body; and, in the plural Number, the larger Limbs.

GYMNASION, γυμνάσιον, from γυμνὸς, naked. Exercise; or the Place where Exercises were perform'd.

GYMNASTICA. Gymnastics. That Part of Medicine which teaches the Method of preserving and restoring Health by Exercises. See FIBRA. The different Species of Exercises are specify'd under the Articles of their Names.

GYMNOCRITHON. A Name for the *Triticum*, *Spica Hordei*, *Londinenſibus*.

GYMNOSPERMOS. See ANGIOSPERMOS.

GYNÆCIA, γυναικεία, from γυνὴ, a Woman. It signifies the *Menstrua*, and sometimes the *Lochia*.

GYNÆCIUM, γυναικεῖον, from γυνὴ, a Woman. An Apartment for Women, now usually call'd a Seraglio. But *Gynæceum*, also, signifies Antimony, probably from the Use Women made of it, in tinging the Cilia; a Custom which prevails much in the East at this Day.

GYNÆCOMASTON, γυναικομαστὸν. An enormous Increase of the Breasts in Women. *Galen.*

GYNÆCOMASTOS, γυναικόμαστος. A Man whose Breasts are large and turgid, like those of Women, is thus called. There are some few Instances where the Breasts of Men grow to an enormous Bulk, and even afford a Fluid not unlike Milk; and Persons thus affected are said to be utterly impotent.

Paulus Ægineta, *L. 6. C. 46.* says, that the Breasts of Men, as well as those of Women, swell at the time of Puberty, but generally subside again. Sometimes, however, after they have begun to swell, they increase in Bulk, being more and more elevated, and Fat growing underneath. Since a Man, therefore, in such a Case, incurs the Scandal of Effeminacy, it is natural to require the Help of the Surgeon.

In the Operation, he says, we first make an Incision, in the Fashion of a Crescent, in the lower Part of the Breast; then separating the Skin, we take away the Fat, and unite the Lips of the Wound with a Suture. If the Breast, by reason of its Bulk, hangs downwards, as in Women, it will be proper to make two such Incisions, meeting one another at the Extremities, so as that the less may be comprehended within the greater; after which we separate the intermediate Skin, and, taking away the Fat, secure the Wound with a Suture, as before. If the Operation happens to be imperfect, and, by Mistake, we cut away less than is requir'd, we renew the same, and take away what remains redundant; then sew up the Place, and apply such Medicines as are appropriated to Wounds. Thus *Ægineta*.

GYNÆCOMYSTAX, γυναικομύσταξ, from γυνὴ, a Woman, and μύσταξ, a Beard. The Hairs on the Female Pudenda.

GYNANTHROPOS. A Species of *Hermaphrodite*, which partakes more of the Female than Male; whereas that Sort which partakes most of the Male is call'd *Androgynus*.

GYPS, γὺψ, in Zoology, is the Vultur.

GYPSUM. See ALABASTRUM.

GYRIS, γύεις, fine Meal. It agrees with *Amylum* in Virtues, but is somewhat hotter. *Paulus Ægineta*, *L. 7. C. 3.*

GYROFALCO, in Zoology, is the Girfalcon.

H.

H, In the Chymical Alphabet, ſignifies the pure Sun, or Gold.

HABASCUM. The Name of a Root, which grows in *Virginia*, and ſerves the Inhabitants for Food. It is of the Figure and Size of a Parſnip, and is eſteem'd aperitive. *Lemery des Drogues.*

HABENA. The Name of a Bandage, contriv'd to keep the Lips of Wounds together, and ſupply the Place of a Suture.

HABITUDO. Habitude. The ſame as CATASTASIS.

HABITUS. Habit. It imports the ſettled and permanent Conſtitution or Habitude of the Body, or of any thing elſe; or the Structure or Compoſition of a Body, or the Parts thereof: Thus a Body is ſaid to be of a denſe, thin, ſolid, compact, or lax Habit. It, alſo, imports a fix'd and ſettled Cuſtom or Habitude of doing any thing. See HEXIS.

HACUB, *ſive ſilybum quibuſdam.* J. B. An exotic kind of *Carduus*, much reſembling the Carline Thiſtle, only larger. The *Indians*, as *Lemery* informs us, eat the young Shoots, or *Aſparagi*. An Infuſion of the Root provokes Vomiting, and produces a Nauſea, and Inappetency.

HADID. Iron. *Rulandus.*

HÆCCEITAS. A Name for the *Quinta Eſſentia*, of the Chymiſts.

HÆMA, αἷμα. Blood. See SANGUIS.

HÆMAGOGOS, from αἷμα, Blood, and ἄγω, to bring away. The Name of an Antidote in *Nicolaus Myrepſus*, *Sect.* 1. *Cap.* 26. It is principally intended for provoking the menſtrual and hæmorrhoidal Fluxes, and conſiſts of aromatic and fetid Simples, with black Hellebore, ſome other Simples, and Honey.

HÆMALOPS, αἱμάλωψ, from αἷμα, Blood, and ὤψ, the Countenance, properly ſignifies the livid Marks of Sugillations in the Face and Eyes; but thus *Hippocrates* calls the black, thick, and feculent Blood, which overſpreads the Chorion in the Formation of the Fœtus, and is rejected by the Fœtus, as of no Uſe, and diſcharged into the Space between the Uterus and Chorion, the thinner and purer Part of it only being attracted for Aliment. *Galen*, *Lib. adverſus Lycum*, explaining the following Paſſage of *Hippocrates*, (περὶ φυσ. παιδίν) ᾗ ἀμφὶ τὸν ὑμένα ἔξωθεν αἱμάλωπες, "round the Outſide of the Membrane were "grumous Collections of Blood," ſays that ſome ſoft and unſhaped Fleſh, reſembling a Clot of Blood, receives the firſt Form of a Fœtus, which has on it ſomething like *Hæmalopes*, (as *Hippocrates* call'd it) which it received from the Subſtances of the Seed, being white in itſelf. *Hæmalops*, αἱμάλωψ, in *Erotian*, is expounded a bloody kind of Circle or Suffuſion of Blood, proceeding generally from a Blow, round the Cornea Tunica. *Hæmalops* is alſo a Species of Sugillation, and ſignifies a Suffuſion of a bloody Aſpect from Blows, not only in the Eyes, but in any Part of the Body. Αἱμάλωπος πῆξις ἡ ἐρυγώδης, *in Coac.* is "A Spitting of concreted, but not feculent Blood."

HÆMANTHUS, from αἷμα, Blood; and ἄνθος, a Flower. The Blood-flower, or *African* Tulip.

Boerhaave mentions three Species of this Plant; which are,

1. Hæmanthus; Africanus. *H. L. H. A.* 2. 127.
2. Hæmanthus; Africanus; bulbo alio, ſquamoſo.
3. *An* Hæmanthus; bulbo oblongo, ſquamoſo, ex binis, ſemper complicatis, quaſi foliis conſtans? *Ind. alt. Plant. Vol.* 2. *p.* 149.

No medicinal Virtues are attributed to any of theſe.

HÆMATIA, or HÆMATION, αἱματιὰ, or αἱμάτιον. An Epithet of a ſort of *Garum*, made of the Inteſtines of Fiſh, macerated in Salt.

HÆMATITES. Offic. Calc. Muſ. 269. Worm. 64. Dougl. Ind. 42. Aldrov. Muſ. Metall. 646. Boet. 386. De Laet. 122. Charlt. Foſſ. 27. *Hæmatites verus*, Schw. 30. *Lapis Hæmatites.* Matth. 1381. BLOOD-STONE.

Lapis Hæmatites, λίθος αἱματίτης, of the *Greeks*, *Sedenegi* and *Sadanegi* of the *Arabians*, is a ferrugineous, hard, glebous, ponderous, metallic Subſtance; of a dark-red or yellowiſh Colour, and ſometimes blackiſh, or of the Colour of Iron; and of an earthy aſtringent Taſte. Being broken, it ſhews fine, long, ſharp Fibres, like thoſe of Wood. It was called *Hæmatites*, in *Greek*, from its Colour; or, becauſe it is endued with the Virtue of ſtopping Blood.

Pliny diſtinguiſhes five Kinds of Blood-ſtone, according to the Countries where they are found, and their differing Colour and Hardneſs. Others divide them according to their different outward Appearance. Some Stones have an uneven and angular Surface, as thoſe that come from *Spain*; ſome are cluſtered on the Surface, like Bunches of Grapes, from whence they are termed *Hæmatites Botryodes*, as we ſee in thoſe brought from the *Hercynian* Foreſt in *Germany*. Others are formed in various Convolutions, like Inteſtines, or the outer Surface of the Brain; and theſe Surfaces are very well delineated by *Aldrovandus* and *Imperati*.

In Iron Mines, the Blood-ſtone is often found, in a diſtinct Ore; but where-ever it is found, or where-ever it grows, there are always red Stones, and red Earth, near it. It is likewiſe found ſometimes in the ſame Places with the Loadſtone, and indeed there is a great Affinity between theſe two, as being both reckoned Iron Ores. The Blood-ſtone is dug up in many Places of *Germany*, in *Italy*, and *Spain*, and this laſt is reckoned the beſt. That Blood-ſtone is to be made Choice of, which is hardeſt and ſmootheſt, without any Mixture of Filth or Veins; and this Stone is carefully to be diſtinguiſhed from another, ſomething like it in Colour, but ſofter, which Painters and Joiners make uſe of, called by Miſtake in ſome Books *Hæmatites*, but its true Name is *Rubrica Fabrilis*, or Ruddle.

Blood-ſtone is a kind of Iron Ore, from which Iron may be extracted; and, in the Valley of *Joachim* in *Bohemia*, the Mines of theſe Stones are ſo rich, that it is thought worth while to extract the Iron from them, which is alſo excellent in its Kind, as *Agricola* relates. This Stone is diſſolved by Acids, in the ſame manner as Iron, and, with the Vitriolic Acid, is turned into green Vitriol.

Both *Dioſcorides* and *Galen* uſed Blood-ſtone in Roughneſſes or Cicatrices of the Eye-lids; and for this Purpoſe they firſt rubbed it upon a Whetſtone, with Water, a Decoction of Fenugreek-ſeeds, or the White of an Egg; and they commend it, when diluted in Milk, in Suffuſions of the Eyes. In all Ages it has been uſed in a fine Powder, from one to four Scruples, in any proper Vehicle, for all kinds of Hæmorrhages, in ſpitting Blood, and in Ulcers of the Lungs, which it dries and heals. In the Fluor Albus, Cachexia, and Suppreſſion of the Menſes, it is found to be as effectual as the *Crocus Martis aperiens.*

The Chymical Preparations of the Blood-ſtone are not altogether to be deſpiſed; ſuch as its ammoniacal Flowers, urinous Spirit, aperient Tincture, ſtyptic Liquor, acid Spirit, and Crocus; all which are thus prepared.

Take of the fineſt Powder of Blood-ſtone, two Pounds; powdered Sal Ammoniac, a Pound: Mix them well, and put them in an Earthen Cucurbit, with a Glaſs Alembic, and proper Receiver fitted to it. Then ſublime them in an open Fire, gradually increaſed. The firſt Subſtance that riſes is an Ammoniacal Spirit, tinctured with ſomething of a yellowiſh Caſt; afterwards come citrine Flowers, and then Flowers of a ſaffron Colour. The Maſs which remains in the Cucurbit, being put into a Retort, and diſtil'd with a great Degree of Fire, will yield an acid Spirit, not unlike that of Sea-ſalt. If the Reſiduum be expoſed to the open Fire, it will diſſolve into a Gold-colour'd ſtyptic Liquor, of great Uſe. But, if the Reſiduum be calcin'd in a ſtrong reverberatory Heat, it will turn to a Crocus, of the ſame Virtues with *Crocus Martis aſtringens.*

From the above-mention'd Saffron-colour'd Flowers, a Tincture may be extracted with Spirit of Wine, which ſome Chymical Phyſicians prefer to the Tincture of Gold, and therefore term it the Elixir of the Tree of Life. The Ammoniacal volatile Spirit has the ſame Virtues with the volatile Spirit of Sal Ammoniac, and is even more proper to reſolve Obſtructions, becauſe of the martial Parts contain'd in it. Both the Flowers contain the volatile fine martial Parts of the Blood-ſtone, raiſed by the Sal Ammoniac; and, as the Saffron-colour'd Flowers contain more ſuch Parts than the Citrine, they are moſt eſteem'd: They ſmell ſomething like Saffron, and are therefore, by *Paracelſus*, termed *Aroph*, which is the ſame with *Aroma Philoſophorum.* They open Obſtructions, attenuate groſs viſcid Humours, and very often carry them off by Stool or Urine. The Doſe is from three Grains to a Scruple; which if it exceeds, they ſometimes cauſe Vomiting. They are order'd with very great Succeſs in a Suppreſſion of the Menſes, Cachexia, Obſtructions in the Viſcera, ſtubborn Fevers, and Quarten Agues. They are by ſome preferred to the *Flores Martiales*, becauſe in this Ore the metallic Parts are of a more rare Texture, and the ſeveral Principles cohere leſs than in Iron itſelf; and, conſequently, they are more eaſily diſſolved by the Sal Ammoniac. Theſe may be order'd in this manner.

Take of the Flowers of the Blood-ſtone, twelve Grains; Saffron and Myrrh, of each five Grains; Extract of Wormwood, a ſufficient Quantity for a Bolus; to be taken in a Suppreſſion of the Menſes.

Take

Take Arum-root, and white Agaric, of each an Ounce; Gum Ammoniac, half an Ounce; Flowers of Blood-ſtone, a Dram; Extract of Aloes, of Cinnamon, and of Saffron, of each two Drams; Syrup of Fumitory, a ſufficient Quantity to make an Opiate, of which any Quantity between a Scruple and a Dram is to be taken in Obſtructions of the Viſcera, Jaundice, Scirrhus, Dropſy, and cachectic Affections.

Take Peruvian Bark, an Ounce; Flowers of Blood-ſtone, a Dram; Syrup of Wormwood, a ſufficient Quantity to make a ſoft Opiate; two Drams of which are to be taken every four Hours, in Quartan Agues, and in all ſtubborn intermitting Fevers.

Inſtead of the Flowers, the Tincture may be uſed, which has the ſame Virtues, and may likewiſe be uſed with more Safety in Hæmorrhages, from ten to thirty Drops, in any proper Vehicle. The ſtyptic Liquor obrain'd by diſſolving the Caput Mortuum, or Reſiduum, after Diſtillation in the Air, is of very great Efficacy in ſtopping all kinds of Hæmorrhages, either externally applied, or taken inwardly, in the Quantity of between five, and twenty Drops. It alſo cures the Fluor Albus, Gleets, and Looſeneſſes, whether with or without bloody Stools, where the Patient's Body has been duly prepar'd. Laſtly, whatever Efficacy is in the *Crocus Martis aſtringens*, may be found in the Caput Mortuum of the Blood-ſtone.

The Blood-ſtone is an Ingredient in the dyſenteric Powder of *Charas*, in the Powder againſt Hæmorrhages and Hernias, and in the ſtyptic Plaiſter of that Author.

HÆMATITINOS, αἱματίτινος. An Epithet of a *Collyrium*, in *Galen*, prepar'd of the *Lapis Hæmatites*. *Paracelſus* calls a ſort of Tartar, which is eaſily reſolved, *Tartarus Hæmatitinos*.

HÆMATOCELE, αἱματοκήλη. A Species of Hernia, cauſed by extravaſated Blood. *Ingraſſias Comment. in Avicenna. de Tumor.*

HÆMATOCHYSIS, from αἷμα, Blood, and χέω, to pour out. A Term uſed by *Willis*, importing an Hæmorrhage.

HÆMATOPHLOEBOESTASIS, αἱματοφλοιβοίστασις, from αἷμα, Blood, φλὲψ, a Vein, and στάσις, a Station, is a Suppreſſion of the impetuous Current and Intumeſcence of the Blood in the Veins: But ſome, as *Galen* ſays in his *Exegeſis*, underſtand by the Word, the Veins full and tumeſcent with Blood.

HÆMATOSIS, αἱμάτωσις. Sanguification.

HÆMOCERCHNUS, αἱμόκερχνος. Blood brought up from the Fauces, with a Noiſe or Rattling, or bloody Excretions diſcharged in a dry Form; for κέρχνος either imports a *ſhrill Noiſe*, or Rattling; or, as among the *Athenians*, it ſignified, *dry*.

HÆMODENUM. A Name for the *Geniſta Tinctoria Germanica*.

HÆMODIA, αἱμωδία. A Stupor of the Teeth, cauſed by acid and auſtere Subſtances touching them.

HÆMOPHOBOS, αἱμοφόβος, from αἷμα, Blood, and φόβος, Fear. A Perſon who is afraid of Bleeding is thus call'd; but ſometimes it is applied to a Phyſician, who is too timorous of directing Phlebotomy.

HÆMOPTYICUS, αἱμοπτυϊκός. A Perſon who diſcharges Blood from the Mouth is thus call'd.

HÆMOPTYSIS, αἱμόπτυσις, from αἷμα, Blood, and πτύω, to ſpit. A Spitting of Blood. See PHTHISIS, and SPUTUM.

HÆMORRHAGIA. An Hæmorrhage, or Eruption of Blood; from αἷμα, Blood, and ῥῆγνυμι, or ῥήσσω, to break forth.

The ſpontaneous Evacuations of Blood, produced by Nature, are generally made from thoſe Places which are of a lax and tender Texture, have highly minute and ſlender Veſſels every-where diſperſed thro' them, and are not every-where braced up by firm Membranes. Of this Kind the moſt conſiderable are the interior Part of the Noſtrils, the Bronchia of the Lungs, the Fleſh of the Gums, the Stomach, the Inteſtinum Ileum, the Extremity of the Inteſtinum Rectum, and the Uterus and Vagina, from the too much diſtended Arteries of which Parts the Blood is frequently diſcharg'd with an uncommon Impetus. But there are ſome extraordinary Caſes, in which the Blood diſcharges itſelf from unuſual Parts, in which the Veſſels lie ſomewhat more deep. Thus *Salmuthus*, in *Cent.* 3. *Obſ.* 36. and *Henricus ab Heer*, in *Obſ.* 36. inform us, that they ſaw Blood ſpontaneouſly diſcharged from a Patient's little Finger. *Bartholine in Obſervat. Anatom. Cent.* 1. *Hiſt.* 3. tells us, that he ſaw the menſtruous Blood diſcharged from the Hand and the Knee. *Panarolus* alſo, in *Pentec.* 4. *Obſ.* 15. and *Amatus Luſitanus*, *in Cent.* 2. *Obſerv.* 24. and *Cent.* 7. *Curat.* 48. inform us, that they knew the menſtruous Blood violently diſcharged from the Breaſts. *Stalpart. Vander Wiel*, in *Cent.* 1. *Obſ.* 80. furniſhes us with various Inſtances of a menſtrual Diſcharge from the Penis, in Men.

Such Eruptions of Blood are moſt familiar to thoſe, whoſe Bodies are of a ſoft and ſpongious Make, of a delicate Texture; and whoſe Veſſels, being turgid with Blood and Serum, render them, what the Antients called, Perſons of a ſanguineous Conſtitution; for theſe are generally ſubject to Hæmorrhages, almoſt thro' the whole Courſe of their Lives: Whereas thoſe who are of a choleric Temperament, have large Veſſels, a firm Habit of Body, and thro' whoſe Veſſels the Blood circulates briskly, are in their Youth principally obnoxious to an *Hæmoptyſis*, or Spitting of Blood. Perſons, on the contrary, of ſanguineo-melancholic Habits, are generally moſt ſubject to the Hæmorrhoids; whereas Women of a ſanguineo-phlegmatic Temperament are moſt commonly affected with bloody Vomitings.

It is alſo to be obſerv'd, that different Species of Hæmorrhages happen at different Periods of Life, as *Hippocrates* long ago juſtly obſerv'd, in the 27th, 29th, and 30th Aphoriſms, of his 3d Section. Thus Children, and young Perſons, are moſt ſubject to Hæmorrhages of the Noſe. In Perſons ſomewhat farther advanced, the Blood attempts its Diſcharge, thro' the Veſſels of the Lungs: Hence an Hæmoptyſis, and a Phthiſis ariſing from it, are moſt familiar to Perſons of this Age. But in Adults, and ſuch as have arrived to the Years of Maturity, the Blood generally diſcharges itſelf from the hæmorrhoidal Veins; whereas, in decrepit Old-age, it is generally evacuated by the urinary Paſſages.

'Tis alſo obſervable, that in the Spring and Autumn, eſpecially about the Æquinoxes, the redundant Blood is more copiouſly diſcharged than at other Seaſons, eſpecially from the Noſtrils, and in Men, otherwiſe ſubject to the Hæmorrhoids, from the Veins of the Anus. Sanguineous Apoplexies, which ariſe from Eruptions of Blood in the medullary Subſtance of the Brain, are, alſo, more frequent at theſe Seaſons than at others, eſpecially in the Spring: Whereas it is obſervable, that bloody Vomitings, and Diſcharges of bloody Urine, rage more univerſally in the Autumn than in the Spring. Beſides, about theſe Seaſons, the ſpontaneous Evacuations of Blood generally appear, and return periodically.

We, alſo, obſerve, that almoſt all thoſe, who, in their tender Years, are ſubject to copious and frequent Hæmorrhages from the Noſe, are naturally of weak Conſtitutions, have delicate and eaſily ruffled Minds, are, thro' almoſt the whole Courſe of their Lives, ſubject to various Diſorders, Spaſms, and Pains, and rarely live to a great Age; for in their Youth they are inclin'd to a Phthiſis. When they are arriv'd at the Years of Maturity, they eaſily fall into flatulent, ſpaſmodic, and hypochondriac Diſorders: And, when they have the good Fortune to be ſtill farther advanc'd in Years, they are highly ſubject to nephritic and arthritic Complaints.

The Diſpoſition to Hæmorrhages is for the moſt part hereditary, and convey'd from Parents to their Children; but it is moſt ſpeedily put in Action, and exerts itſelf, by means of ſuch external Cauſes, as render the Circulation of the Blood too brisk, or increaſe the inteſtine Commotion of its Parts. The moſt conſiderable of theſe Cauſes are, all Exerciſes of the Body and Mind more intenſe than uſual: Aliments, or Medicines, taken internally, which are either too hot, acrid, or ſpirituous; as alſo the prepoſterous and unſeaſonable Uſe of Baths, Sudorifics, and Purgatives.

As Eruptions of Blood, when ariſing from a Repletion of the Veſſels, and a Redundance of Blood, are highly ſalutary and beneficial to the Conſtitution, ſo they are full of Danger, when excited by a malignant acrid Matter; as in malignant and exanthematous Fevers. And when they ariſe from an Obſtruction, Induration, or Corruption of the Viſcera, eſpecially of the Liver, Spleen, or Lungs, they generally prove mortal, becauſe they readily terminate in a Cachexy, a Dropſy, the Morbus Niger of *Hippocrates*, or an Hectic, which proves fatal.

Thoſe ſeem to be in a great Miſtake, who think that a Redundance of a laudable, fibrous, and purple-colour'd Blood, of a due Conſiſtence, is the principal, immediate, and material Cauſe of Hæmorrhages; for thoſe who abound in a thick and denſe Blood, ſuch as Perſons of brawny and robuſt Bodies, who uſe ſevere Exerciſe, and coarſe Aliments, are rarely ſubject to Hæmorrhages. But Perſons who have too great a Quantity of Serum contain'd in their Veſſels, ſuch as thoſe of ſerous Conſtitutions, thoſe who are of a ſoft Texture of Body, and addicted to Idleneſs, who uſe Veneſection too copiouſly, who have an obſtructed Perſpiration, or who eat more than they can digeſt and diſcharge, are moſt ſubject to Hæmorrhages, and the Diſorders ariſing from them. That the exceſſive, and almoſt incredible, Quantity of Blood, ſometimes diſcharged from the Noſe and the Uterus, is rather the Effect of a ſerous than of a ſanguineous Plethora, is ſufficiently obvious from this, that the red Portion is very ſmall, in Compariſon of the ſerous; as is obvious from opening a Vein in violent Hæmorrhages, and collecting the Blood diſcharged from it.

It is obſervable, that ſome particular Phenomena previouſly appear in the Part where the Blood has a more than uſual Tendency to make an Eruption. Thus an unuſual Redneſs and Heat of the Face, a Swelling, Diſtention, and ſtrong Pulſation of the Arteries, prognoſticate an Hæmorrhage from the Noſe; whereas a Laſſitude of the whole Body, a Pain of the Back and Loins, a Tenſion about the Hypochondria, a Paleneſs of the Face, a Horripilation of the Skin, and a Conſtriction of the Pores, happen before

before Hæmorrhages from the Uterus. In an *Hæmoptyſis*, or Spitting of Blood, an Anxiety of the Præcordia, a Difficulty of Breathing, an oppreſſive undulatory Pain about the Diaphragm, Flatulences in the Abdomen, and a Refrigeration of the Extremities, are perceived before the Eruption. A Vomiting of Blood is generally preceded by a tenſive and oppreſſive Pain in the Left Hypochondrium. The Eruption of the Hæmorrhoids is, alſo, for the moſt part, preceded by ſome ſpaſmodic Strictures, Flatulences in the Abdomen, a tenſive and oppreſſive Pain in the Os Sacrum, a Languor of the Body, and a Refrigeration of the Extremities.

If the Circumſtances already advanced are conſider'd, and duly compar'd with each other, I think it will be ſufficiently obvious, that Hæmorrhages do not proceed immediately and directly, either from a Redundance of Blood, its turgid Quality, by which it attempts a Diſcharge thro' the Veſſels, the Acrimony of the Serum and Blood producing a Diæreſis, or Rupture, or from its too great Fineneſs, in conſequence of which it ſweats thro' the Veſſels, as the Antients imagin'd; but rather from a certain irregular and unequal Circulation of the Blood, which happens, when the Extremities, and ſuch Parts as are remote from the Heart, are, by an intenſe Stricture and Contraction of the Fibres, ſo braced up, that the Blood cannot return thro' the Veins, but, in conſequence of their increaſed ſyſtaltic Motion, is in larger Quantities transferr'd to other improper Places. Hence thoſe ſmall Arteries, which generally do not admit Blood, ſtrictly ſo call'd, are preternaturally diſtended, and at laſt neceſſarily ruptured.

But the Cauſes of thoſe Hæmorrhages, eſpecially of the violent and ſymptomatic Kind, which either precede or follow other Diſeaſes, eſpecially of the chronical Kind, are to be ſought for in Infarctions, Obſtructions, and Indurations of the Veſſels and Viſcera, which put a Stop to the free Circulation of the Fluids. Thus, in hydraulic Machines, we obſerve, that, when ſome of the Pipes are obſtructed, the Water burſts from the other open ones with greater Celerity, and a more violent Force. The ſame happens in the human Body; for when the Blood cannot paſs ſufficiently freely to the Heart, thro' the obſtructed or ſpaſmodically conſtricted Veins of any Part, the Force impelling it is increaſed, both in the large and ſmall Ramifications of the Arteries, which, being full and turgid with Blood, have their Extremities open'd. This is ſufficiently obvious from the Diſſections of dead Bodies. Thus *Willis* informs us, that, upon the diſſecting the Body of a Perſon who died of an Hæmoptyſis, he ſaw a Tumor on the Left Side of the Lungs: Thus alſo in the *M. N. C. Decad.* 8. *an. b. Obſ.* 217. we are told, that in diſſecting the Body of a Patient, who died of the ſame Diſorder, the Lungs were found totally cover'd with a large Quantity of Clay-like Matter, and the Auricle of the Right Ventricle of the Heart preternaturally large. *Blancard, Anatom. Pract. Obſ.* 46. in a Perſon who died of the ſame Diſorder, found the Spleen tumid, and the Veſſels of the Meſentery and Omentum ſtuffed with Blood. The ſame Author, in *Obſ.* 23. and 32. tells us, that, in a Perſon who died of a Vomiting of Blood, the Liver was found hard and ſcirrhous, and the Spleen tumid, and full of Blood. Hence *Fernelius*, in his *Method. Medendi*, juſtly obſerves, "That Perſons whoſe Viſcera and Liver "are weak and ſcirrhous, are ſubject to frequent Hæmorrhages "of the Noſe, as well as dropſical Patients." *Heurnius*, in his Commentary on the Aphoriſms of *Hippocrates*, confirms this Doctrine, in the following Words: "Thoſe whoſe Face is of a "greeniſh Colour, labour under ſome Diſorder of the Liver; "and, in them, frequent Hæmorrhages from the Noſe are a Sign "of an approaching Dropſy."

Since preternatural Eruptions of Blood generally draw their Origins from ſpaſmodic Conſtrictions of the Parts, and Contractions of the Veins, we hence plainly underſtand, why hypochondriac Patients, in whom the Stomach, and whole nervous Canal of the Inteſtines, are continually afflicted with flatulent Diſtentions, and ſpaſmodic Strictures, by reaſon of the Irregularity of the periſtaltic Motion, are ſo highly ſubject to the Hæmorrhoids; and why, if the Blood is not diſcharged in that manner, their Symptoms are greatly exaſperated.

With reſpect to the Cure of Hæmorrhages in general, I would have it obſerv'd, that their Practice is highly prepoſterous, who, maintaining that a Redundance of red Blood, ſo called by way of Eminence, is univerſally the material, as well as accidental, Cauſe of theſe Diſorders, uſe frequent Veneſections for their Cure, tho' at the ſame time, in the Beginning of the Diſorder, for the ſake of Prevention, eſpecially in ſanguineous Habits, ſeaſonable Veneſection is highly ſalutary and beneficial. But the juſteſt and moſt rational Intentions of Cure conſiſt in deriving the Impetus of the Blood from the Part affected, by proper Remedies; ſuch as Bathing the Fleet, Clyſters, Frictions, and Ligatures of the external Parts, warm Coverings, Fomentations, and Baths. Then the ſpaſmodic Strictures of the nervous Parts are to be relaxed. And laſtly, by gentle Laxatives, moderate Diaphoretics, and Abſtinence from high Feeding, which generates Blood, the Redundance of the ſerous Colluvies is to be remov'd, and its Accumulation for the future prevented. *Frederic Hoffman.*

As Hæmorrhages are of various Kinds, it is convenient to treat of them under different Articles. Thus, under the Article ABORTUS, the Reader will find an Account of the Methods to be purſu'd, in caſe of an Hæmorrhage from a Miſcarriage: And will ſee more upon this Subject, under the Article UTERUS. But I muſt remark, that, under the Article ABORTUS, I have made a Reference to HÆMORRHAGIA, which ſhould have been to UTERUS. For an Hæmorrhage of the Brain, ſee APOPLEXIA. For an Hæmorrhage of the Noſe, ſee NARES. For Hæmorrhages of the *Uterus*, ſee UTERUS. For Hæmorrhages from the Urinary Paſſages, ſee URINA. And for Hæmorrhages, conſider'd as Symptoms of Wounds, ſee VULNUS.

PROGNOSTICS FROM HÆMORRHAGES.

As it was often obſerved, that, in acute and violent Diſtempers, a ſudden and copious Hæmorrhage, either from the Noſe, the Hæmorrhoids, the Anus, or, in Women, the Uterus, was the Means of reſtoring the Patient to Health, ſo Phyſicians, in this reſpect, began to imitate Nature, by taking away large Quantities of Blood in Diſeaſes. So well was *Hippocrates* perſuaded of the Reaſonableneſs of this Practice, that in all acute and violent, or great Diſeaſes, ſuch as Fevers, and Inflammations of the Viſcera, he chiefly recommends Phlebotomy. "In acute "Diſeaſes, he ſays, *Lib. de R. V. I. A.* bleed, if the Diſeaſe "be violent, and the Patient ſtrong, and in the Flower of his "Age." And this Kind of Remedy have Phyſicians been taught to practiſe, not only in Imitation of Nature, but by the Example of ſome Animals, particularly the *Hippopotamus*, or River-horſe, which, as *Pliny* tells us, being grown to an exceſſive Degree of Obeſity, thro' its Gluttony, thruſts its Leg againſt the ſharp Stump of a Reed, and thus, wounding a certain Vein, procures a plentiful Diſcharge of Blood, which effectually removes the Plethora, with which it was before oppreſſed. With much the ſame Intention, Phyſicians attempt to evacuate the Humours, either by Cathartics, Emetics, Sudorifics, or Diuretics.

Since Nature, therefore, often procures a Solution of many Diſeaſes, by copious Diſcharges of Blood, it ſhall be our Buſineſs to treat of thoſe ſpontaneous Evacuations, or Excretions, becauſe they are not all good or ſalutary, but are ſometimes very far from relieving the Patient; as are alſo all other Excretions, whether by Vomit, Stool, Sweat, or Urine; nor do all Abſceſſes free from Diſeaſes, but only ſuch as are properly qualified. We ſhall go on, then, firſt, to ſpeak of ſuch Excretions of Blood as are good, and always portend Recovery to the Patient.

Among ſpontaneous Excretions of Blood, thoſe ſeem to afford the beſt Grounds for Prediction, which in continual, acute, and violent Fevers, are diſcharged from the Noſe, and are called peculiarly by the *Greeks*, αἱμορραγίαι, *Hæmorrhagiæ*. *Galen. in Prorrhet.* ſays, that Deliria and Hæmorrhages are excited by the Recurrence of hot and thin Humours to the Head; and, in his Comment on the Firſt of the *Epidemics*, he ſays, that the Blood, excited by Heat, takes its Courſe upwards, and is carried into the Head; whence neceſſarily follows an Inflation, Anaſtomoſis, and even a Rupture of the Veins, from the Redundance of Spirits: And in the ſame Book he writes, that Eruptions of Blood from the Noſtrils, in burning Fevers, proceed from a Predominance of yellow Bile, which, mixing with the Blood, after rendering it aduſt, ſends up with it an Exceſs of Heat to the Head, which produces a Rupture of the Veins, and an Effuſion of Blood from the Noſtrils.

Hence it appears, that ſuch Hæmorrhages always proceed from Blood heated to an Exceſs, or Bile mix'd with it; and never happen but in Bodies of a hot Temperament, and in hot and acute Diſtempers, ſuch as a *Synochus*, and continual burning Fevers: And this is confirm'd by *Galen*, in the before-quoted Comment, where he ſays, that Eruptions of Blood, in burning Fevers, are cauſed by an Exceſs of Heat, by which the Humours are exalted, and carried to the Head. To the ſame Purpoſe, we are told by *Hippocrates*, 6 *Epid. Sect.* 3. that "Hæmorrhages from "the Noſe happen to thoſe who are of a paliſh black, or of a "yelloviſh red, or of a paliſh yellow Complexion;" becauſe ſuch Perſons are obnoxious to theſe Eruptions from the immoderate Heat of their Humours; for which Reaſon alſo *Hippocrates, ibid.* ſays, that thoſe who begin to uſe "Venery, or "feel Inclinations that way, are ſubject to Hæmorrhages;" he means Boys grown up, and paſſing from a State of Puberty to Manhood, who are ſubject to ſuch Profuſions, both on account of the Redundance and Heat of their Blood.

From ſuch Cauſes, then, are Patients ſubject to Hæmorrhages, which, as was obſerv'd, principally affect thoſe who are of a hot Temperament, and abound with hot Blood; and, beſides, labour under Diſorders proceeding from Humours of the ſame Quality; of which Nature, according to *Galen*, are all continual Fevers, and, among Intermittents, Tertians, and ſometimes Quartans. To theſe we may add, all internal Inflammations of the Part about the Region of the Præcordia, particularly the Liver, Spleen, Diaphragm, and Stomach, and ſometime Pleuriſies and Phrenſies, but very ſeldom, or never, Lethargies or Peripneumonies. In Diſeaſes of this Nature, therefore, are Hæ-

morrhages, or Eruptions of Blood, to be expected. We are now to regard what may be prognoſticated from them.

Hæmorrhages from the Noſtrils, and all the Excretions of Blood, from what Part ſoever, whether by the Uterus in Women, the hæmorrhoidal Veſſels in Men, or ſometimes by the Stomach, (which laſt are ſeldom good, *Hippocrates*, 7 *Aph.* 37. pronouncing "Vomitings of Blood, without a Fever, ſalutary, "but the contrary, if attending a Fever," tho' Vomitings of Blood have been critical in many Diſeaſes) are diſtinguiſh'd into *good*, or what we call *critical*, or *judicial*; ſubdivided into *perfect* and *imperfect*; ſo called, becauſe they perfectly or imperfectly determine the Event of the Diſtemper; and into *bad*, called alſo *ſymptomatical*; but theſe are contain'd under the *imperfect critical*.

Critical Hæmorrhages are always ſalutary, and Prognoſtics of a Recovery, the perfect critical of a ſudden Recovery, the imperfect critical of a Recovery for ſome time delay'd. Critical Hæmorrhages, of the beſt Kind, which prognoſticate certain Recovery to the Patient, are known by the following Signs: Firſt, A critical Hæmorrhage never appears in a crude State of the Diſtemper, but always attended with Signs of Concoction; for which Reaſon a perfect critical Diſcharge happens in the Height of the Diſeaſe, an imperfect one in its Increaſe, where there are ſome, but not all the Signs of Concoction. It is neceſſary, therefore, in order to a ſalutary Hæmorrhage from the Noſe, or any other good Excretion of Blood, that there ſhould be ſome Signs of a Concoction, with which if the Hæmorrhage be attended, it will be of Service to the Patient, as we are aſſured by *Galen*, *Lib.* 3. *de Criſibus*, *Cap.* 7. and *Hippocrates*, *de R. V. I. A.* where he ſays, "that, "if there be a Flux of Blood from the Noſe, there is a Solu-"tion of the Diſeaſe; and the ſame Event attends a critical or-"derly Sweat, or an Evacuation of white thick Urine, with a "light Hypoſtaſis." Some perhaps will object the Caſe of *Meton*, *Epidem. Lib.* 1. *Ægr.* 7. and of him who lay ſick in the Garden of *Dealces*, *Epidem. L.* 3. *Ægr.* 3. and others, to whom there happen'd a truly critical Hæmorrhage, attended with a Crudity of the Excrements. In *Meton's* Caſe, the Urine was black, and had a black Sediment; in the other Patient, thin Urine, with a pretty thick Sediment, ſhew'd the Diſeaſe not only to be in a very crude State, but attended, alſo, with a conſiderable Malignity. For Anſwer to this, it may be ſaid, that ſo great is the Efficacy of a copious Hæmorrhage, towards determining a Diſeaſe, as often to relieve and free the Patient, even in the Beginning of the Diſorder, and before any Signs of Concoction appear. This is the Opinion of *Galen*, concerning the Caſe of *Meton*, when he ſays, "His Criſis and Recovery really "ſeem to be owing ſolely to the Hæmorrhage, tho' the Signs "were not at all ſalutary." An Excretion of Blood, then, tho' very good, and a moſt certain Prognoſtic of Health, when it happens in the Height and Concoction of the Diſtemper, is not to be deſpiſed, tho' happening in the Beginning of the Diſorder, and attended with Signs of Crudity. To this Purpoſe it may be obſerv'd of the moroſe Woman, *Epidem. L.* 3. *Ægr.* 11. that ſhe recover'd after a Flux of the Menſes, when under the Symptom of black Urine; tho' to this Inſtance *Galen* ſays, that the black Colour of the Urine had nothing of Danger in it, becauſe it receiv'd that Colour from the Menſes, which were retained, and of a melancholy Conſiſtence: And *Meton* recover'd, who had a critical Hæmorrhage, under the ſame Symptom of black Urine. Agreeable alſo with this is the Obſervation of *Hippocrates*, 1 *Epid. Stat.* 3. that thoſe under the Fever, on whom the Jaundice appeared on the ſixth Day, were relieved by an Hæmorrhage; and yet, 4 *Aph.* 62. he condemns a Jaundice in Fevers, appearing before the ſeventh Day, as it happen'd to *Hermocrates*, 3 *Epid. Sect.* 1. *Ægr.* 2. And, 1 *Epid. Stat.* 3. he informs us, that *Antiphon*, the Son of *Critobulus*, labouring under a Fever, with thin Urine, had an Eruption of Blood, and afterwards recover'd. From the Premiſes we may infer, that Excretions of Blood have this Prerogative, if I may ſo ſay, above other Evacuations, that they frequently prognoſticate a Recovery, in a crude State of the Diſeaſe, when other Excretions, whether by Stool, Vomiting, or Sweat, which appear at that time, are ſymptomatical. The Reaſon of this I take to be, that the Blood may at any time be commodiouſly evacuated thro' the open Veins, and wants no Preparation for its Diſcharge, as do the other Humours; whether they require to be excreted by Stool, Vomit, or Sweat, on account of their Thickneſs, Viſcidity, or the Straitneſs and Obſtruction of the Veſſels; which is the Reaſon why Phyſicians ought not to uſe purging Medicines in the Beginning of ſuch Diſorders; according to that Direction, 1 *Aph.* 22. "Concocted, not crude, Matters are to "be purged, or ſtirred, nor are they to be meddled with in the "Beginning of Diſorders, unleſs there be an Orgaſmus, and a "Tendency to Excretion." But, in Evacuations by the open Mouths of the Veins, we juſtly wait for no Concoction; and for the ſame Reaſon we bleed in the Beginning of acute Diſtempers; and hence ſpontaneous Hæmorrhages are good and ſalutary. We may add, what is worthy of Obſervation, that copious Eruptions of Blood are of Service, not ſo much on account of evacuating the bad Blood with the reſt, as by an univerſal Refrigeration of the Body, and cauſing a free Perſpiration of the hot Vapours, and a Ventilation of the Humours. We conclude, therefore, that Excretions of Blood are moſt beneficial in the Height of the Diſeaſe, and with manifeſt Signs of Concoction; but that, however, they are not on all Accounts to be dreaded, tho' attended with Signs of Crudity.

The ſecond Condition, or Qualification, of the moſt laudable Hæmorrhage is, That it be free and copious. Of ſuch Diſcharges *Hippocrates* ſpeaks, 2 *Epid. Sect.* 1. where he ſays, "that plen-"tiful Hæmorrhages from the Noſe generally relieved the Pa-"tients." *Galen's* Judgment of the ſame, in the Caſe of *Meton*, you have before. Again, *Hippocrates*, 1 *Epid. Stat.* 3. tells us, "that, in the Caſe of burning Fevers, thoſe who had a good "and plentiful Diſcharge of Blood by the Noſe, generally reco-"ver'd by that means; nor do I know any, he ſays, who, in "this epidemical Conſtitution, died after a juſt Hæmorrhage. "But *Philiſcus*, *Epaminon*, and *Silenus*, from whoſe Noſes fell "a ſmall Quantity of Blood, by Drops, on the fourth and fifth "Day, all died." And afterwards he ſays, "Some there were, "on whom the Jaundice appear'd on the ſixth Day; but they "were relieved by ſome Evacuation, either by Urine, Stool, "or a copious Hæmorrhage from the Noſe. Thus it happen'd "to *Heraclides*, who lay ſick in the Houſe of *Ariſtocydes*, and "had a plentiful Effuſion of Blood from the Noſtrils, and Eva-"cuations by Stool and Urine." Again, a little afterwards, "Multitudes were affected with an Hæmorrhage, eſpecially "young Perſons, and thoſe in the Flower of their Age; but "moſt of thoſe, who had no Hæmorrhage died." In the ſame Book, a little farther, ſpeaking of Women who had a critical Evacuation of Blood, he ſays, "Very many had a Flux of the "Menſes in their Fever, ſome an Hæmorrhage from the Noſe, "eſpecially Virgins, who were never before thus affected. Some "had an Hæmorrhage from the Noſe, with the firſt Eruption "of the Menſes, as it happen'd to a Virgin, the Daughter of "*Dætharſes*, who had the menſtrual Flux for the firſt time, "attended with a copious Profuſion of Blood from the Noſ-"trils." From the Premiſes it is ſufficiently demonſtrated, that copious Hæmorrhages are very ſalutary and critical; which is the Concluſion of *Hippocrates*, 2 *Epid. Sect.* 1. "Copious Hæmor-"rhages from the Noſe, he ſays, procure a Solution in many "Diſorders, as it happen'd in the Caſe of *Heragoras*." And of the Woman he ſpeaks of, 4 *Epid. T.* 27. who on the fifth and ſixth Days had a Flux of Blood from the Noſtrils, and on the ſeventh Day underwent a Criſis.

Tho' it abundantly appears, that one of the principal Characters of a ſalutary Excretion of Blood is, that it be in a large Quantity; yet we are to be careful, that we do not deceive ourſelves with the Copiouſneſs of the Evacuation, and miſtake thoſe for very ſalutary and critical Excretions, which are to be eſteemed otherwiſe, ſince many have died under a large Eruption of Blood. For, under violent Diſtempers, immoderate Evacuations are frequent, while the Diſeaſe is yet in a crude State, as *Galen* obſerves, *Lib. de Præſag. ad Poſthumum*; for which Reaſon the Phyſician is often obliged to ſtop the Eruption, as *Galen* did for a young Man of *Rome*, who had an Effuſion of Blood from the Noſtrils, to the Quantity of four Pounds and an half. It will be neceſſary, therefore, to regard the Signs by which good and bad copious Excretions of Blood are diſtinguiſh'd. Large Evacuations are judged to be good and ſalutary, to omit other Signs, which are common to all good Excretions, when the Patient ſupports them with Eaſe, or finds himſelf the ſtronger and lighter for them; if he be no longer thirſty, whereas he was much afflicted with Thirſt before; if the Fever leaves him, and the Symptoms are remov'd, or diminiſh'd, and his Pulſe beats more equally, ſtrongly, and orderly. "Myſelf, ſays *Proſper Alpinus*, "but laſt Year, underwent a critical Solution of a Quartan, from "a copious Excretion of Blood, to the Quantity at leaſt of ſix "Pounds. Among other Signs conſequent upon ſo large an Eva-"cuation, which was by almoſt all eſteemed immoderate, I found "my Thirſt, which before was continual and violent, quite ex-"tinguiſh'd: And I felt myſelf not at all the weaker, but rather "ſtronger and lighter, which flatter'd me with ſome Hopes of a "Recovery, tho' contrary to the Judgment of all the Phyſicians; "and I perſuaded myſelf, that this Evacuation was critical, and "upon no Account to be dreaded, tho' the Profuſion of Blood "was, for the greateſt Part of it, attended with a Cough, which "aroſe on a ſudden." Such then are the Marks by which we diſtinguiſh a good and critical copious Evacuation, from a bad and ſymptomatic one.

A third Condition, or Character, of a critical and ſalutary Hæmorrhage, is, that it happens on a critical Day: For at ſuch a Seaſon the Appearance of Excretions, whether good or bad, are of greateſt Moment towards predicting the Death or Recovery of the Patient: Hence the Author of the *Coac. Præſag.* juſtly obſerves, *T.* 150. that "acute Diſeaſes are determin'd on a critical Day, "by an Hæmorrhage from the Noſe, and a copious Sweat." And *Text.* 152. he ſays, that "Fevers generally have their Solu-"tion on the ſeventh, ninth, and fourteenth Day, by an Hæmor-"rhage from the Noſe."

A fourth

A fourth Requiſite in laudable Hæmorrhages is, That it be prejudicated on ſome indicatory Day. For Nature uſes on one of the *Dies indicets*, or indicatory Days, to excrete a moderate Quantity of Blood, as an Indication of a future and more ample Profuſion on a critical Day. Thus, in the Caſe of *Meton*, 1 *Epid. Sect.* 3. *Ægr.* 7. on the fourth Day of the Fever he was twice affected with a gentle Bleeding at the Right Noſtril, and the next Day with a copious Effuſion of Blood from the Left Noſtril, which gave a Solution to the Diſeaſe.

We may add, as a fifth Requiſite of the beſt Sort of Hæmorrhage, That it ought to be agreeable to the Nature and Quality of the Diſeaſe, as well as of the Patient, and his preceding Way of Living, with the Conſtitution of the Air and Seaſons. We have already obſerv'd, that Excretions of Blood are very proper in all acute Diſorders, as well in Fevers, and among them the Synochus, and burning Fevers, as in Inflammations of the Liver, Spleen, Diaphragm, and frequently in Pleuriſies and Phrenſies. In ſuch Caſes, therefore, it will be very proper and uſeful to regard and conſider theſe Excretions, which in other Diſeaſes are of leſs Importance. For the ſame Reaſon ſuch Evacuations are beneficial in all Bodies which abound with immoderately hot Blood; and therefore, if the Patient's habitual Way of Living has contributed to the Increaſe of Bile, if it be Summer, or an hot and dry Seaſon, or there be any other Circumſtance which may promote the Generation of bilious Blood, nothing can be of more Service to the Sick, under the before-mention'd Diſorders, than an Hæmorrhage: It is even no ſmall Misfortune to the Patient to have none; as we learn from the Obſervation of *Hippocrates*, before quoted, 1 *Epid. Stat.* 3. where we are told, that the greateſt Part of thoſe young Perſons, who were not favour'd with an Hæmorrhage, died.

In the ſixth Place, The moſt laudable Hæmorrhage muſt be congruous or ſuitable to the Places affected, ſo as either to lie in a direct Line with them, and by that means to divert, and plentifully to evacuate, from the afflicted Part; or oppoſite thereto, in order to make a Revulſion from the ſame. To this Purpoſe we read, 6 *Aph.* 21. that "mad Perſons, at the Appearance "of the Varices, or Hæmorrhoids, are freed from their Mad-"neſs;" and, 4 *Aph.* 25. that "an Excretion of Blood down-"wards by Stool is good, or ſalutary." Here *Galen*, in his Comment, ſays, "The Truth is, there is no better Remedy for "a confirm'd Melancholy, than a Flux of Blood from the Veins, "called the Hæmorrhoids." And, 5 *Aph.* 32. we are told, that Women are cured of a Vomiting of Blood by an Eruption of their Menſes. For this Reaſon it is cuſtomary in the Cure of Madneſs, to apply Leeches to the Hæmorrhoidal Veins, which is practiſed with very good Succeſs, upon thoſe in whom thoſe Veins are full and large, and eſpecially if there has been a Diſcharge this Way before; provided ſtill, that Care be taken to make the Evacuation ſufficiently copious, and not to be contented with drawing off a ſmall Quantity of Blood, as is too generally the Cuſtom, which, for that Reaſon, ſeldom anſwers the Intention.

To divert the Humours from the Part affected, and at the ſame time to evacuate them, the beſt Excretion, whether natural or artificial, is in a direct, or on the ſame Side with the Part affected; which Sort of Evacuation *Galen*, *de Curat. per Sang. Miſſ.* highly commends, and calls it κατ' ἰξιν, "direct," as, when the Liver is affected, to have an Evacuation of Blood on the Right Side; when the Spleen is diſorder'd, on the Left. With this View, we are told by *Hippocrates*, 2 *Epid. Sect.* 3. that "a painful Tenſion of the Sides, and Tenſions of the Hypo-"chondria, with Tumors of the Spleen, and Hæmorrhages "from the Noſtrils, ought to regard one another κατ' ἰξιν, in a "direct Order."

A ſeventh Requiſite of the moſt laudable Hæmorrhage is, That it wholly remove, or, at leaſt, diminiſh the Diſeaſe; and that the Patient be relieved, and the Symptoms quite removed, or greatly mitigated. Of this Nature was the Hæmorrhage obſerv'd by *Hippocrates* in *Heropythus*, and the Virgin of *Lariſſa*. Of *Heropythus*, 3 *Epid. Sect.* 3. *Ægr.* 9. he ſays, "that on the fortieth "Day much Blood came from his Noſtrils, and he recover'd "in ſome meaſure the Uſe of his Reaſon; his Deafneſs was "abated, and his Fever remitted." And of the Virgin of *Lariſſa*, *ibid. Ægr.* 12. he tells us, "that on the ſixth Day ſhe had a "copious Hæmorrhage from the Noſe, was ſeized with a ſhiver-"ing Fit, and, immediately afterwards, with a copious hot "Sweat, over every Part, procuring a Criſis, upon which the "Fever left her." The beſt Hæmorrhage is either what gives an entire Solution to the Diſeaſe, and its Symptoms, or, at leaſt, diminiſhes them all. *Galen*, *de Mot. Muſc. L.* 2. *C.* 6. writes, that he ſaw a Man, who had been thirteen Days delirious in a Fever, immediately reſtored to Health, upon a very plentiful Evacuation of Blood from his Noſtrils, and recover the Uſe of his Reaſon on a ſudden. *Hippocrates*, 4 *Aph.* 60. pronounces an Hæmorrhage from the Noſtrils to be good, when it removes a Deafneſs; and the Author of the *Prorrhetica*, *Lib.* 1. *T.* 152. ſays, "They who are affected with Pains of the Head and Neck, "together with a Weakneſs and Trembling of the whole Body, "are relieved by an Hæmorrhage." To this I may add, what is a ſingular Benefit from a critical Excretion of Blood, that the Patients are thereby relieved from a Thirſt, by which they were before extremely afflicted; for in many Caſes the beſt of Blood, when not critically diſcharged, uſually excites a Thirſt by drying; whereas a critical Eruption thereof, by means of refrigerating and moderating the febrile Heat, and ventilating the Body, allays the Thirſt; and perhaps, alſo, the Viſcera are moiſten'd, on account of the Suppreſſion of the Heat, by which their Moiſture was exhauſted; agreeably to which Sentiment, *Hippocrates*, 4 *Aph.* 27. tells us, "that they who, labouring un-"der Fevers, are affected with Hæmorrhages from any Part, if "they feel themſelves thereby refreſh'd, have their Bellies moiſt-"en'd, and excited to Excretion." In ſhort, as we ſaid before, the beſt Hæmorrhages are thoſe, after which the Patients find themſelves ſtronger, and better able to raiſe themſelves, and the Pulſe becomes more regular.

Of bad and deſtructive Hæmorrhages.

Excretions of Blood, which are of a bad Kind, and Prognoſtics of the worſt Event, are known by Signs directly contrary to the foregoing; as,

Firſt, When Hæmorrhages, or other ſanguineous Excretions, are attended with no Signs of Concoction. For, tho' we have ſhewn, that large Hæmorrhages are beſt, and even ſometimes good in a crude State of the Diſorder, yet it is difficult to form a Judgment of them, unleſs they are attended with good Signs; but, when they are attended or ſucceeded by bad Signs, they portend nothing but Deſtruction. If, therefore, an Eruption of Blood be preceded by pernicious Signs in the Excrements, as a Blackneſs of Urine, with a black Sediment, turbid Urine, like that of Horſes, not clear, or thin and aqueous; or fetid, virulent, party-colour'd, and black Vomitings; or black and colliquative Stools; or other pernicious Sympcoms; it portends no Good: Or, if any bad Signs appear together with the Eruption, or ſucceed it, nothing but Deſtruction is to be expected. Of ſuch Signs we read, 1 *Prorrhet.* 126. where it is ſaid, "If there be an Erup-"tion of Blood from the Noſe, attended with ſmall Sweats, and "a Refrigeration of all the Parts, it ſhews a Malignity, and "threatens a bad Event." For, ſince there is a Refrigeration of the Extremities, and alſo of the whole Body, the latter is by far the more dangerous. Again, *ibid.* 127. "An Hæmorrhage ſuc-"ceeded by black Stools is bad: Very red Stools are alſo bad in "ſuch a Caſe, and eſpecially if the Hæmorrhage happens on the "fourth Day." *Galen*, commenting on *Text.* 128. ſays, "that "all Eruptions of Blood, attended with Sweating, are malignant." Again, *ibid.* 129. "A moderate Hæmorrhage with black Stools, "in acute Diſorders, ſucceeded by Deafneſs, is bad: In theſe "Caſes, Blood voided downwards is bad; however, it removes "the Deafneſs." We have obſerv'd, however, ſays *Proſper Alpinus*, in a very robuſt Man of *Bologna*, who laboured under an acute malignant Fever, a continual Hæmorrhage from the Noſe, which held him from the firſt Day to the fourteenth, on which he recover'd; during which he loſt every Day at leaſt a Pound of Blood. When this Hæmorrhage had continued to the ſeventh Day, being under ſome Concern for the Event, we uſed ſome Medicines to ſtop the Blood; after which it flowed no longer from the Noſtrils, but paſſed off in the ſame manner by Stool, accompanied with a copious and bilious Diarrhœa, which continued alſo to a violent Degree, from the firſt Day of the Illneſs to the fourteenth, when both Excretions terminated in a perfect Criſis: Thus did this Man eſcape, merely by his extraordinary Strength of Nature. To this Purpoſe alſo, the Author of the *Prorrhetica* ſays, that "under a Conſtipation of the Belly, where "nothing is excreted but ſmall black Fæces, reſembling the "Dung of Goats, and that by Compulſion, an Hæmorrhage by "the Noſe is a bad Prognoſtic." *Galen*, in his Comment on this Place, ſays, that thoſe who are thus dried and exhauſted by the febrile Heat, are unable to bear Evacuations. Thus, *Coac.* 40. 342. "An Hæmorrhage from the Noſtrils, attended with "cold Sweats, and a general Refrigeration, is bad." And, *ibid.* "Extraordinary Refrigerations, ſucceeding an Hæmorrhage, on "critical Days, are very pernicious." Hence it appears, that Eruptions of Blood, attended with bad Signs, are of dangerous and pernicious Conſequence. Of ſuch Hæmorrhages *Hippocrates* ſpeaks, 3 *Epid. Sect.* 3. "Nor had thoſe who were thus affected, "he ſays, any other Sign of a Criſis; there was no juſt Hæmor-"rhage, nor critical Abſceſs form'd as uſual."

As Eruptions of Blood with bad Signs are pernicious, ſo alſo, in the ſecond Place, are thoſe which neither anſwer the Eſſence of the Diſeaſe, the Nature of the Patient, the Conſtitution of the Air, the Seaſon of the Year, or the Age, preceding Way of Living, and Temperament, of the Sick. Thus, for Inſtance, in cold and pituitous Diſeaſes, an Eruption of Blood can never be otherwiſe than bad.

Thirdly, Hæmorrhages which are not congruous, or rightly ſituated, with reſpect to the Places affected, are pronounced bad. To this Purpoſe, we are told by the Author of the *Prorrhetica*, 125. "That Eruptions of Blood, on the contrary Side, are bad; "as if, for Example, under a Tumor of the Spleen, there "ſhould happen an Hæmorrhage from the Right Noſtril; and

"the

" the Caſe is the ſame, with reſpect to the Hypochondria." For the ſame Reaſon, an Excretion of Blood by Vomiting, in Fevers, is condemn'd by *Hippocrates*, in his *Aphoriſms*; and more eſpecially if the Blood be black, and moſt of all in extenuated Bodies; concerning which latter, 4 *Aph.* 23. he ſays, " In Perſons much extenuated by acute or chronical Diſeaſes, or by " Wounds, an Excretion of black Bile, or a Subſtance like black " Blood, indicates Death on the next Day."

Fourthly, An Excretion of Blood, from which the Patient finds no Relief or Alteration, is to be condemn'd, and moſt of all when the Caſe is alter'd for the worſe, becauſe ſuch an Excretion is to be reckon'd among thoſe undetermining Excretions, which are of a fatal Kind. For, as *Galen* ſays, *Com. in* 1 *Prorrhet.* of critical undetermining Symptoms, ſome are fatal, and others indicate a difficult Criſis; but ſuch as make an Alteration for the worſe are to be reckon'd among the former. We may add, that the Pulſe, by its Weakneſs, Inequality, and remarkable Variation for the worſe, is a ſufficient Demonſtration of the Malignity of ſuch Excretions. We may alſo judge of their Malignity from the Quantity of Blood, as when it flows immoderately, or in too little a Quantity, or not all at once, but by Intervals, as it happens in imperfect Criſes. An immoderate Effuſion is never good, often bad, becauſe it greatly diminiſhes the natural Heat, by which means Nature eaſily ſinks under the Diſeaſe. To this Purpoſe, we are told by the Author of the 1 *Prorrhet.* 133. " That the Belly ſuffers by long Hæmorrhages," becauſe the Part is too much refrigerated; and, *T.* 134. " That " violent Hæmorrhages, in general and critical Refrigerations, " are moſt pernicious;" becauſe, by greatly refrigerating the Body, they add Cold to Cold. Hence a general Refrigeration after a Rigor, when not ſucceeded by a Revocation of the Heat, is condemn'd, *ibid.* 6. And, when the Body is exhauſted by an immoderate Effuſion of Blood, ſometimes the Patient falls into a mortal Delirium, ſometimes into frightful Convulſions, as we may learn from 7 *Aph.* 9. It ſometimes happens in Diſeaſes, not of a violent Kind, that the Patients are refrigerated to ſuch a Degree, as to fall into a Dropſy; for many have been obſerv'd to be hydropical upon that Account. *Galen* expreſſes himſelf to this Purpoſe, *Com. in* 2 *Aph.* 72. where he tells us, " That " an immoderate Efflux of Blood, either from the Uterus, or " the Veins called the Hæmorrhoids, or from an Ulcer, injures " the Patient in all or moſt of the natural Functions; and ſome " are by this means affected to ſuch a Degree as to fall into a " Dropſy."

Of Prognoſtics, in acute Diſtempers, from ſmall and ſuddenly ceaſing Excretions of Blood, and Drops of Blood diſtilling from the Noſe.

Blood effuſed from the Noſtrils, or any other Part, in a ſmall Quantity, is ſometimes good, where it ſhews the Beginning of a Criſis in ſome indicatory Day, as it proved in *Meton*, 1 *Epid. Sect.* 3. *Ægr.* 7. who had a moderate Hæmorrhage from the Noſe on the fourth Day, and on the next had a copious Effuſion of Blood from the ſame Part, attending a Criſis. But the Caſe is not the ſame, when the Diſeaſe is in a perfectly crude State; much leſs, when the Excretion is attended with ſome pernicious Sign; for in ſuch Circumſtances a ſmall Effuſion of Blood diſcharged at once, or at Intervals, is always a bad Sign, and a very ſure Prognoſtic of Deſtruction, where the Diſeaſe appears not in the leaſt concocted by it, nor the Patient at all reliev'd. However, on ſome Occaſions it may be a very good Excretion, as when the Diſeaſe is not perfectly crude, and the other Signs are ſalutary, and if it be renew'd in a very copious meaſure on the next critical Day. But if it ſhould either not happen on an indicatory Day, or not be ſucceeded by a plentiful Eruption, on a judicatory or critical Day, it will be only ſymptomatic, and, if other bad Signs appear, and the Diſeaſe changes afterwards for the worſe, a mortal Prognoſtic. It very rarely happens indeed, as far as we have been able to obſerve, that a ſmall Excretion of Blood is ſalutary, but, on the contrary, is generally very pernicious, as always foreſhewing the Length of the Diſeaſe, and often the Death of the Patient, eſpecially when the Evacuation is not made by a convenient Paſſage, nor the Sick at all relieved by it; as, for Example, if the Liver be inflamed, and the Excretion be made by the Left Noſtril; or the Spleen inflamed, and the Blood comes from the Right Noſtril; or if the Uterus be affected, and the Diſcharge made, not by the Uterus, but by the Noſe, or by Vomiting: And the ſame Judgment is to be formed, when neither the Fever, nor its Symptoms, are at all mitigated by ſuch an Evacuation. Such then are the Indications of a ſmall Excretion of Blood, from which nothing certain can be prognoſticated, without conſidering the other Signs; and, if theſe are bad, the Excretion, you may be ſure, is alſo bad; if the Signs are not bad, the Excretion ſhews a difficult or doubtful Criſis; and with good Signs it portends the long Continuance of the Diſeaſe. We may conclude, therefore, that a ſmall Excretion of Blood, not ſucceeded by one more copious, or an Excretion which ſtops on a ſudden as ſoon as begun, are pernicious to the higheſt Degree, as indicating an extreme Decay of Strength, according to *Galen. Com. in* 1 *Prorrhet.*

We come now to conſider what may be infer'd, or preſag'd, from Excretions of Blood by Drops, ſince ſuch Diſcharges very frequently happen in acute Fevers, eſpecially in thoſe of the inflammatory or burning Kind: Such Excretions, when they ſtop as ſoon as begun, in the Opinion of *Galen*, are worſe then if they had never appear'd. It is to be obſerv'd, that, according to the various Quantities of the flowing Blood, the Eruption thereof is to be eſtimated. One Quantity of Blood is copious, continual, and diſcharges itſelf in a full Stream, and this appears in a perfect Criſis; another Quantity is diſcrete, or conſiſts of diſtinct Portions, which, when continu'd to be evacuated at Intervals, ſometimes foreſhews a future Criſis; and there is a third Quantity, which diſcharges only a few Drops by the Noſe, which Accident is ſometimes occaſion'd by an external Cauſe, as by expoſing the Head to the Rays of the Sun, drinking too freely of pure Wine, and the like. But, when ſuch an Eruption is owing to the Violence of the Fever, it indicates a vain Effort of Nature towards a Criſis, and the Diſappointment to ariſe either from the Malignity of the Diſeaſe, the corrupt State of the Blood, or the Weakneſs of the Brain. This Excretion by Drops, in milder Diſorders, where the other Signs are ſalutary, foreſhews the long Continuance of the Diſeaſe, but in acute Diſtempers are moſt certain Prognoſtics of Death; for it ſhews, as *Galen* ſays, *Com. in Lib. de R. V. I. A.* that Nature made an Attempt to diſcharge the ſuperfluous, or, as he expreſſes it, *Com.* 1. *in Prorrhet.* redundant, Matters, collected in the Brain, but was unable to effect it, either thro' its own Weakneſs, or the Thickneſs of the Blood, or the Denſeneſs of the Parts, or thro' a Concurrence of ſome or all of theſe Cauſes. Hence it appears, that all Diſtillations, or Droppings, of Blood in acute Diſeaſes are very pernicious, and a Sign of Fevers of a bad and malignant Quality, as *Galen* obſerves, *Com. in* 3 *Epid.* It was alſo an Obſervation of *Hippocrates*, 3 *Epid. Sect.* 3. on the epidemic burning Fevers of the peſtilent Conſtitution, that one of their concomitant Symptoms was, a ſmall Excretion of Blood, which fell by Drops from the Noſe; and that it was a pernicious Sign: And this is confirm'd by the ſame Author, 1 *Epid. Stat.* 3. where he informs us, " That when burning Fevers began to " be epidemic, they gave manifeſt Indications to what Sub- " jects they would prove mortal." Then, after enumerating many pernicious Signs, which he had obſerved in the Beginning of thoſe burning Fevers, he adds, " Nor had any of thoſe who " were affected with theſe Symptoms, an Hæmorrhage from the " Noſe, but only an Excretion of a ſmall Quantity of Blood, " which fell by Drops from that Part." All Diſtillations or Droppings of Blood, therefore, in acute Diſeaſes, are juſtly eſteem'd pernicious Signs; in Confirmation of which, we are told by *Hippocrates*, in the ſame Book, " That *Philiſcus*, *Epami-* " *non*, and *Silenus*, who had a ſmall Diſtillation from the Noſe " on the fourth and fifth Day, died." Excretions of Blood by Drops, then, in acute Diſeaſes, are moſt certain Prognoſtics of Death; and moſt of all, when the Blood is thick and black, according to the Author of the *Prorrhetica*, " Excretions of Blood " by Drops from the Noſe, he ſays, are bad; and, if the Blood " be black and ſooty, mortal." And *Galen*, in his Comment, ſays, " That a Diſtillation of black and pure Blood indicates, " not only that the Humours are agitated and carried towards " the Head, but that the Blood is extremely parched by a vio- " lent Heat, which has conſumed all its Humidity, and waſted " its Ichor." And he had ſaid a little before, " That as all " Diſtillations from the Noſe are of a dubious Event, ſo, when " they appear black and thick, they prove extremely pernicious." But, if ſuch Excretions happen on one of the critical Days, they are moſt abſolutely fatal, becauſe on ſuch Days all Signs, whether good or bad, are of greateſt Moment towards a Prognoſtication. Agreeably to this, we are told, 1 *Prorrhet.* 1. " That " Diſtillations from the Noſe are fatal, (in the Caſe before de- " ſcribed) as at other Times, ſo eſpecially on the fourth Day." And *Galen*, on the Place quoted, ſays, " A Diſtillation from " the Noſtrils is always a bad Sign; but, when it happens on " the fourth Day, it indicates the extreme Malignity of the " Diſtemper." For it ſeems as if Nature attempted to expel the redundant Matter collected in the Brain, but was too weak to effect what was intended. Theſe Diſtillations, or Excretions of Blood by Drops, are no leſs fatal and deſtructive, when attended with other bad Signs. Thus, 1 *Prorrhet.* 141. we read that " A " ſmall Diſtillation from the Noſe, attended with a Deafneſs " and Liſtleſſneſs, is of dubious, dangerous Conſequence." Where *Galen*, on the Place, reprehends the Author for ſaying, that ſuch Diſtillations were of a dubious or difficult Nature, ſince they are all of them, as he ſays, mortal. Again, *ibid.* 126. " If there be a Diſtillation of Blood from the Noſe, accom- " panied with a cold Sweat, and a Refrigeration of the Extre- " mities, it is a fatal Sign." We conclude then, that ſuch Diſtillations are always pernicious in the higheſt Degree, when attended with Deafneſs, Liſtleſſneſs, Coma, Watchings, Deliriums, and the like; but eſpecially in Phrenſies: And this is confirm'd in the *Epidemics*, by the Examples of *Philiſcus*, *Silenus*, the Wife of

of *Dromeades*, and the *Parian*, to all whom this Symptom was fatal. *Proſper Alpinus de Præſag. Vit. & Mort.*

Consumptions from Hæmorrhages.

Conſumptions are frequently cauſed by Hæmorrhages, whether it be at the Noſe, or from the Lungs by Coughing, from the Throat by Hawking, from the Stomach by Vomiting, from the Kidneys by the Paſſages of Urine, from the Hæmorrhoids, or Veſſels of the Womb, in the ordinary monthly Purgations, or difficult Labour, or laſtly, from Wounds, where there happens a plentiful and long Flux of Blood, from the Opening of the large Blood-veſſels. For altho' frequent and moderate Bleeding (as every ignorant Fellow and Barber knows) will make one grow fat; foraſmuch as the emptying the Veſſels with a moderate Hand, makes room for a greater Quantity of new Chyle, whereupon the Maſs of Blood growing richer, is render'd more fit for Nouriſhment, and conſequently the Appetite is excited; yet every immoderate and long Bleeding impoveriſhes the Blood, and creates an hectical Heat in the Spirits and ſolid Parts, thereupon deſtroying the Appetite, and bringing the whole Body into a Conſumption and Leanneſs.

In this Caſe the Bleeding muſt be ſtopt as ſoon as may be, and the Return of it is to be prevented, by incraſſating, opiate, and glutinous Medicines. As, for Example: Let ſtrong Ligatures be made upon the Arms and Thighs; if it be neceſſary, and the Strength of the Patient will bear it, let a Vein be open'd with a Lancet, and Blood taken away frequently, but in a ſmall Quantity, to divert the preſent Flux of Blood, and to prevent the Return of it. If the Part where the Blood breaks out will admit of it, let *Galen*'s ſtyptic Plaiſter, the Royal Styptic, cold Oxycrate, Ink, the Aſhes of human Hair, lightly burnt in a Retort, and made into the Form of a Poultice with Vinegar, true Bole, Dragon's Blood, and other Things of that Nature, be in a convenient Manner preſently applied, and often renew'd.

Inwardly let the Patient take, three or four times, twenty or thirty Drops, or more, of the Royal Styptic, in a Draught of Milk-water; alſo five or ſix Spoonfuls of the clarified Juices of Plantain and Nettles: Or let him frequently take the following Linctus out of a Spoon.

Take of the Syrup of Purſlain, three Ounces; true Bole, Dragons Blood, Troches of burnt Ivory, Sealed Earth, of each two Scruples; Japan Earth, a Dram; of Gum Tragacanth, diſſolved in Plantain-water, a ſufficient Quantity: Mix them up into a Linctus.

Or let him take the Quantity of a Nutmeg of the following Electuary.

Take of the Conſerve of red Roſes, an Ounce; Troches of Amber, three Drams; true Bole, Dragon's Blood, of each half a Dram; Syrup of Myrtles, a ſufficient Quantity; mix them up into an Electuary.

Let him alſo take every Night, five or ſix Spoonfuls of the following Julap, ſhaking the Bottle.

Take of Plantain-water, ſix Ounces; ſmall Cinnamon-water, three Ounces; diſtilled Vinegar, half an Ounce; true Bole, Dragon's Blood, of each half a Dram; *London* Laudanum, three Grains; Syrup of Myrtle, an Ounce and an half: Mingle them, and make a Julap.

The Flux of Blood being thus ſufficiently ſtopt, and cured, we are to uſe our moſt diligent Endeavours, that the Blood may be quicken'd, repleniſh'd with ſuch new Chyle as abounds with ſweet and nutritious Juice, and that the feveriſh Heat (if there be any) may be extinguiſh'd, to prevent a Conſumption. And therefore the Patient is to be nouriſh'd with the frequent taking of Jelly-broths, poached Eggs, and Variety of Food that affords good Juices, and is both eaſy to be digeſted, and moſt grateful to the Stomach. Nevertheleſs he is to abſtain from Wine, and from Things that are ſalt, or have Spice in them, leſt they increaſe the Heat of the Blood, which was before too hot, from the Defect of its nutritious Juice. And becauſe this Sort of Patients, as all that are upon the Confines of a Conſumption, are ſubject to Anger, to Sadneſs, hypochondriacal Oppreſſions, hyſteric Fits, and to a Want of Appetite, whereupon they can neither take nor digeſt much Food, and, conſequently, are incapable of making up the Loſs of that Blood which has been ſpent; therefore the ſick Perſon ought to be diverted and humour'd by his Friends, and to be ſent, as ſoon as may be, into a free and wholſome Air, which I have, being taught from a great deal of Experience, obſerved to conduce more than any Thing of Medicines, to the comforting and fortifying of the Nerves and Spirits, to the Recovery of an Appetite, and a chearful Mind, and, conſequently, to the preventing of an approaching Conſumption.

But if the Patient ſeems, either thro' his own Neglect, or the ſudden Advances of the Diſtemper, to be affected with a hectical Heat, and ſome Degree of a Conſumption from his Bleeding; then let the Phyſician make it his whole Buſineſs, perfectly to put out this Flame, as ſoon as ever he can, with the Help of the *Peruvian* Bark, given in a large Quantity, the Efficacy of which I have often found to be wonderful in this Caſe: Afterwards, if it be neceſſary, let the Patient be put into a Milk-diet, or upon the Uſe of the chalybeate Waters: But he muſt forbear the Uſe of all purging Medicines. And ſome Benefit may be reaſonably expected from the giving of Crabs-eyes, Coral, Pearl, and other ſuch kind of altering and ſweetening Medicines. *Morton's Phthiſiologia.*

HÆMORRHOIDALE, or HÆMORRHOIDALIS HERBA. A Name by which the *Chelidonium minus* is ſometimes called.

HÆMORRHOIDES, from αἷμα, Blood, and ῥέω, to flow. The Piles; that is, a Diſcharge of Blood from the Hæmorrhoidal Veins about the Anus, and *Inteſtinum Rectum*. See Hæmorrhagia.

Every liberal Diſcharge of Blood from the Veins of the Anus is not to be accounted exceſſive and preternatural; but, in order to form an Eſtimate of this Circumſtance, we are carefully to conſider the Veſſels, the Habit of Body, the Strength, the Age, and the Conſtitution, of the Patient; for it frequently happens, that the Diſcharge of a certain Quantity of Blood proves ſalutary and beneficial to ſome; whereas the Evacuation of an equal Quantity, proves hurtful and injurious to others: Nor is every hæmorrhoidal Diſcharge, tho' larger than uſual, and excited by the increaſed Quantity and Commotion of the Blood, to be eſteem'd a Diſeaſe; but only ſuch a Diſcharge as continues long, impairs the Strength, deſtroys the Appetite, the due Digeſtion of the Aliments, Nutrition, and the other Functions of the Body, and, conſequently, lays a Foundation for violent chronical Diſorders.

Exceſſive hæmorrhoidal Diſcharges are generally preceded, and accompanied, with a heavy and oppreſſive Pain of the Back and Loins; ſometimes a Stupor of the Legs; a Conſtriction of the external Parts, with a ſlight Horripilation, and a Subſiding of the Veſſels; a hard and contracted Pulſe; a Dryneſs of the Mouth and Fauces; a ſmall Diſcharge of Urine, which is frequently pale; a Senſe of Weight in the Anus, extending itſelf to the Perinæum, a Weakneſs of the Stomach, Flatulences in the lower Part of the Abdomen, a frequent Stimulus to diſcharge the Urine, and go to Stool, on which Occaſion, a white and bilious Mucus is ſometimes diſcharg'd. Beſides, Perſons pretty far advanc'd in Years, and ſuch as are weak, are afflicted with a Procidentia Ani.

In the Beginning of theſe exceſſive Diſcharges, the Blood evacuated is generally black, and pretty grumous, and ſometimes eliminated from the varicoſe Veins, in Pieces as large as the Palm of the Hand. After this, a red Blood is diſcharg'd; then a Blood highly ſerous, and ſometimes pituitous, or a Mucus, reſembling the White of an Egg. The Quantity of the Blood diſcharged is ſometimes ſurpriſingly large: Thus *Montanus* knew an Inſtance, in which two Pints were evacuated every Day: And *Panarollus* ſaw an Inſtance, in which one Pint was daily diſcharged. This Evacuation often continues for a conſiderable time, twenty Days, for Inſtance, a Month, and forty-five Days, as is certain from the Obſervations of Authors of undoubted Veracity.

Every Evacuation of Blood from the *Inteſtinum Rectum* is ſupply'd from the hæmorrhoidal Veſſels; but the external hæmorrhoidal Veſſels rarely flow profuſely, but readily degenerate into painful Varices, which, when open'd, diſcharge Blood, though ſeldom in large Quantities. But the internal hæmorrhoidal Veſſels, which are Ramifications of the ſplenic Branch, and are diſtributed to the interior Subſtance of the *Inteſtinum Rectum*, and the *Sphincter Ani*, together with the ſmall Arteries ariſing from the inferior meſeraic Veſſels, not only diſcharge a larger Quantity, but, when ſuppreſs'd, generate thoſe Diſeaſes which ariſe from Diſorders of the Liver, Spleen, Pancreas, Meſentery, and Inteſtines.

This Diſcharge is immediately and directly made from the Ramifications of the Arteries, diſtended by too large a Quantity of Blood, and at laſt ruptur'd. Nor is it to be abſolutely denied, that often a large Quantity of Blood, which is frequently peccant, is diſcharg'd from the hæmorrhoidal Vein; for Valves preventing the Egreſs of the Blood are there wanting; and tho' there were ſuch Valves, yet the varicoſe State of the Veins muſt neceſſarily induce a great Change with reſpect to their Situation.

'Tis univerſally agreed, that this ſalutary Evacuation from the Veins of the Anus is owing to a difficult Circulation of the Blood through the hæmorrhoidal Veins, in conſequence of their perpendicular Situation, and its difficult Return to the *Vena Portæ*, and the Liver; and that the Diſcharge actually happens, when the Extremities of the Veſſels, in the *Inteſtinum Rectum*, are ſo diſtended by the Blood accumulated in them, as at laſt to be ruptur'd. Hence the Phyſician is in no Error, who de-

duces the Cauſe of an exceſſive and prejudicial hæmorrhoidal Diſcharge from an obſtructed Circulation of the Blood through the hæmorrhoidal and meſeraic Veins, as alſo through the Liver itſelf. This is ſufficiently obvious from anatomical Obſervations, by which we are certain, that the Ramification of the hæmorrhoidal Vein, which runs along the Colon to the Anus, has been found thrice as large as in the natural State, in thoſe who have died of exceſſive hæmorrhoidal Diſcharges; for the greater the Afflux of Blood is through the Arteries, and the ſlower its Reflux through the Veins, the more the Fibres are relax'd by the Blood and Serum collected in the Veſſels; which, being diſtended, and their Tone gradually more and more impair'd, lay a Foundation not only for a long Continuance of the Diſorder, but alſo for its returning more readily than it would otherwiſe have done.

Whatever things, therefore, generate a Redundance of Blood, and ſtop its Paſſage through the Ramifications of the *Vena Portæ*, or invite it in too large Quantities to the hæmorrhoidal Veins, diſpoſe to the hæmorrhoidal Diſcharge; which is either moderate or immoderate, according to the Strength or Energy of the Cauſes. Hence it is, that thoſe who are of a lax, ſpongious, and pinguious Habit of Body, furniſhed with a large Number of Veſſels turgid with Blood, who live delicately, and lead a ſedentary Life, without Exerciſe, or who have ſprung from Parents affected with this Diſeaſe, are moſt ſubject to exceſſive hæmorrhoidal Diſcharges. For the ſame Reaſon it happens, that acrid Purgatives, Preparations of Aloes, frequently uſed; the too liberal Uſe of hot and aromatic Aliments, as alſo of ſweet and ſtrong Wines; a Neglect of habitual Veneſection; the Paſſions of the Mind, eſpecially Anger, and long-continued Grief; violent Commotions of the Body, eſpecially by riding, and other things of a like Nature, contribute very much to the Production of this preternatural Diſcharge of Blood from the Veins of the Anus.

Beſides, this Diſorder, when exceſſive, is not free from Danger, ſince by its means the Strength is impair'd, the Body waſted, the Thighs oppreſſed, the Sleep render'd unſound, the Præcordia rack'd with a Senſation of Weight, the Abdomen render'd tumid with Flatulences, and the Pulſe weak and trembling. But when the Diſorder is long continued, the Ancles become tumid, as alſo the Eyes and Face; the Colour of which is livid, or of a leaden Colour: Reſpiration becomes difficult, and at laſt the Diſorder degenerates into a Cachexy, a Dropſy, or a ſlow hectic Fever; ſo that it is obvious, that very violent Diſorders may ariſe from a Defect of Blood; and that the very Treaſure of Life conſiſts in a Stock of Blood, which is neither peccant in Quantity nor Quality.

Exceſſive hæmorrhoidal Diſcharges are more likely to prove fatal, when brought on by a Tumor of the Liver or Spleen, an Inflation of the Hypochondria, accompanied with a coſtive State of the Belly, or a beginning Cachexy and Dropſy; for, in theſe Caſes, the Obſtructions are increas'd and confirm'd, and the peccant Quality of the Blood and Juices augmented: Hence the Diſcharge proves chronical, and, at laſt, terminates in an Atrophy, or a ſlow hectic Fever, accompanied with extreme Loſs of Strength.

'Tis frequently obſerv'd, that exceſſive hæmorrhoidal Diſcharges, alſo, terminate in Dropſies; eſpecially in phlegmatic Patients, and ſuch as are of a lax Habit of Body; but, if this Diſorder ſucceeds a Dropſy ariſing from an Induration of the Liver, 'tis an infallible Sign, that Death will ſoon enſue.

The Cure.

As this Diſorder may proceed from various Cauſes, ſo there muſt be various Intentions of Cure purſued, and different Remedies made Choice of.

It frequently happens, that when, in plethoric Bodies, the hæmorrhoidal Diſcharge, uſual at other times, is, for ſome time, ſtopt, it not only appears again ſuddenly, upon any violent Commotion either of Body or Mind, the liberal Uſe of ſpirituous Liquors, too hot Baths, or upon taking Medicines increaſing the inteſtine Motion of the Blood, but continues long, and is attended with a large and ſtrong Pulſe. When this is the Caſe, the firſt Step to be taken is, to divert the Impetus of the Blood: For this Purpoſe Veneſection in the Arm, or an Immerſion of the Arms in a tepid Mixture of Water and Wine, are of ſingular Service. Then we are to uſe ſuch things as check the exceſſive inteſtine Motion of the ſulphureous Parts of the Blood, eſpecially things of a diluting and refrigerating Nature, ſuch as the drinking cold Water, eſpecially of the chalybeate or temperate mineral Kind; Whey, made with Citron, or Lemon-juice, the Waters of Plantain, Strawberries, Sorrel, and Wood-ſorrel; a Decoction of Hartſhorn mix'd with Citron-juice, Tincture of Roſes prepar'd with Spirit of Vitriol, and Julaps prepar'd of theſe, with Syrup of Roſes. The ſame Intention is, alſo, excellently anſwer'd by Preparations of Nitre, either ſimply purified, or artificially prepar'd of Spirit of Nitre and Salt of Tartar, exhibited in Powder, with abſorbent and corroborative Subſtances, or in common Drink. Thoſe anodyne Subſtances are, alſo, of ſingular Service, which moderate the impetuous Motion of the Solids and Fluids, and, at the ſame time, alleviate Pains and Spaſms. The moſt conſiderable of this Kind are the anodyne mineral Liquor; the *Spiritus Nitri dulcis*, duly prepar'd; the Waters of common Chamomile-flowers, and of the Tops of Yarrow; the Seeds of white Poppies, the Syrups of both Poppies, the Waters and Extracts of Poppies; and, if ſtrong Anodynes are to be uſed, Seeds of white Henbane will anſwer the Intention.

When, together with a Loſs of Strength, and an injur'd State of the nobler Functions, a large hæmorrhoidal Diſcharge continues for a long time, and the Viſcera begin to be tainted, whilſt, at the ſame time, the Blood is rather aqueous and ſerous, than fibrous, and of a due Conſiſtence; thoſe Medicines are highly beneficial, which gradually and mildly carry off, by Stool, the peccant bilious Juices; and, at the ſame time, invite the Humours from the *Inteſtinum Rectum*, to the Coats and Glands of the other Inteſtines. The moſt efficacious of theſe are Preparations of Rhubarb, with Currans and Tamarinds; or, if the Body is bilious, with Cream of Tartar, exhibited in a Potion render'd agreeable by an Eleoſaccharum, prepar'd with the Oil of Citron. Mild Diaphoretics are, alſo, of ſingular Service, by correcting and expelling the acrid Humours, eſpecially when any thing of a ſcorbutic, or purple, or exanthematous Taint is deeeply rooted in the Blood and Serum. Among the Medicines of this Kind are calcin'd Hartſhorn, the foſſile Unicorn, diaphoretic Antimony, Wine-vinegar mix'd with Crabs-eyes, the Waters of Goat's-rue, Elder-flowers, and Carduus Benedictus, Treacle-water, the Mixtura Simplex, and the Diaſcordium of *Fracaſtorius*, which may be reduc'd to the Form of a Potion. My anodyne mineral Liquor, ſays *Hoffman*, mix'd with a fourth Part of the *Liquor Bezoardicus Buſſii*, is of ſingular Service; as alſo an Infuſion of Yarrow, Paul's Betony, Mouſe-ear, and others, drank either in Bed, or a warm Room, with an Intention to ſweat. We muſt not, for this Intention, forget to recommend a ſmall Doſe, half a Grain, for Example, of Camphire, eſpecially when mix'd with nitrous and bezoardic Powders; for by theſe means the acrid and cauſtic Matter, which is frequently the Cauſe of thoſe Spaſms, which render the Circulation of the Blood unequal, and induce large Hæmorrhages, is obtunded and eliminated, whilſt, at the ſame time, the Virtues of the Aſtringents and Anodynes are ſomewhat corrected, leſt they ſhould prove injurious. It was, therefore, no bad Practice of former Phyſicians to mix Camphire with their principal Preparations, for ſtopping Hæmorrhages, though in a very ſmall Doſe, as in the *Species de Hyacintho*, the *Diatrion Santal.* the *Diatrion Abbatis*, the *Trochiſci de Carobe*, the *Sperniola Crolii*, and the celebrated Powder of *Heurnius* for ſtopping Hæmorrhages.

In that more obſtinate and difficultly cur'd Species of the Diſorder, which ariſes from an Obſtruction, an Infarction, or increas'd Bulk, of any of the Viſcera; ſuch as the Liver, Spleen, and, in Women, the Uterus; if there is ſtill any Place for the Means of Relief, ſuch Medicines are to be choſen as reſolve the Obſtructions, without throwing the Humours into too violent a Commotion: Among theſe, the *Pilulæ de Bdellio* of *Meſue* were long ago extol'd, for their Efficacy and Safety, by *Foreſtus*, *Solenander*, and *Riverius*. Excellent Effects are alſo produced by the Pills prepar'd, according to *Beecher*'s Directions, of bitter Extracts, and temperate Gums; only the Extract of Rhubarb is in a pretty large Quantity to be ſubſtituted inſtead of that of the Aloes; and nitrous Powders are to be interpos'd, according as the Condition of the Patient requires them. But nothing is more efficacious in removing Obſtructions, than aqueous and diluting Subſtances. Hence, in Caſes of this Nature, we properly recommend temperate and ſubtile mineral Waters; the beſt of which are thoſe at *Utrecht*, *Wildungen*, and the *Selteran* Springs, drank either with or without Milk. And, certainly, a prudent and moderate Uſe of theſe Waters for ſome Months, in Conjunction with a proper Regimen, and the alternate Uſe of the above-mention'd Pills, as alſo of a Draught prepar'd of the balſamic Elixir, render'd more efficacious by ſome temperate chalybeate Medicine, is, of all others, the moſt effectual Means of Relief. *Montanus* orders Broth, prepar'd of Fowls, to be copiouſly drank three Hours before Dinner; and affirms, that, by this means, he had cur'd many of this Diſorder. But ſuch Broths will be ſtill more efficacious, if they are prepar'd with the Roots of Sorrel, Succory, or Vipers-graſs; or let ſome temperate chalybeate Medicine, ſuch as the *Tinctura Martis*, prepar'd with Juice of Apples, be exhibited with an Extract of Caſcarilla, made with Water, every Morning, drinking copiouſly of the above-mention'd Broth.

Among the principal Cauſes of a too copious hæmorrhoidal Diſcharge, we may juſtly reckon a Want of a due Tone in the *Inteſtinum Rectum*, together with its component Membranes and Veſſels: For this Reaſon ſuch Medicines are, alſo, to be uſed as reſtore the Strength of Parts too much weaken'd and relax'd. For this Purpoſe we may ſafely uſe the *Species de Hyacintho*, and the *Trochiſci de Carabe* of *Meſue*: And, of chalybeate Subſtances, the Blood-ſtone, reduced to a fine Powder, the *Tinctura Martis* of *Zwelfer*, highly ſubtile antimonial Crocus of

Mars,

Mars, exhibited with old Conſerve of Roſes, as alſo the Tincture of chalybeated Flowers of Sal Ammoniac, prepar'd with highly rectify'd Spirit of Wine, and mix'd with an equal Quantity of a bitter Elixir. Among reſinous and balſamic Medicines, the moſt efficacious are, Amber prepar'd or alcalifated, and the Extracts of Caſcarilla, and red Sanders. If the Diſorder admits of a Cure, theſe Medicines, exhibited prudently, in proper Doſes, and in a due Order, afford great Relief.

In order to obtain the deſign'd Effect, external Applications of an aſtringent Nature are alſo to be uſed. If, therefore, the varicoſe Veins of the Anus, without any Evacuation of the Excrements, diſcharge large Quantities of Blood, attended with Syncopes, and a Danger of Death, we may ſafely apply Colcothar of Vitriol, or the *Crepitus Lupi*, eſpecially if milder Applications have been previouſly uſed without Succeſs; ſuch as Decoctions of Balauſtine-flowers, red Roſes, Myrrh, Plantain, Pomgranate-rinds, and Peruvian Bark, prepar'd with Red-wine, and, after the Excrements are diſcharg'd, applied to the Inteſtinum Rectum by means of a Sponge. When the Force of the effluent Blood is check'd, to the Os Sacrum, Perinæum, and Pubes, we muſt frequently apply Epithems prepar'd of Mint, Sumach, the Flowers of red Roſes, and St. John's-wort, the Shavings of red Sanders, Maſtich, Cardamoms, and Peruvian Bark, boil'd in Red-wine. This ſame Decoction, injected into the Anus by means of a Syringe, is of ſingular Service in reſtoring the Tone of the *Inteſtinum Rectum*.

In the Cure of violent hæmorrhoidal Diſcharges, Veneſection is to be premiſed, and the Primæ Viæ cleanſed, either with recent Caſſia, or the beſt Rhubarb, exhibited in a Decoction: Then both internal and external Medicines, of a corroborative and gently aſtringent Nature, may be ſafely uſed; for, in conſequence of the violent Effuſion of Blood, ſo great a Weakneſs is produced, that 'tis rarely ſafe to uſe draſtic Medicines; for, 'tis a general Rule in Medicine, that the weaker Nature is, the more mild and approaching to a dietetic Nature the Medicines ought to be.

Nitrous, acidulated, and refrigerating Medicines, as they may be eaſily born, when there is a violent Heat and Commotion of the Blood, ſo the Uſe of them is leſs ſafe, when the Blood is already much exhauſted, the Strength impair'd, and the Stomach weaken'd, eſpecially in ſymptomatic hæmorrhoidal Diſcharges ariſing from Obſtructions of the Viſcera.

Veneſection is not to be preſcrib'd at random, and without knowing the particular State of the Patient; becauſe the juſt Quantity of the Blood taken away is a Circumſtance of the higheſt Importance; for, in the Beginning of the Diſorder, if the Body is plethoric, and full of Blood, a large Quantity may be taken from a Vein in the Arm, in order to make a Derivation. But when a large Quantity of Blood is ſpontaneouſly diſcharg'd before, the Quantity taken muſt be ſmall, and the Operation repeated prudently, and at proper Intervals.

Hippocrates prudently adviſed, that, in caſe of violent hæmorrhoidal Diſcharges, one Vein ſhould be kept open, if the others were cloſed, for fear of a Dropſy, or a Conſumption, if the Blood ſhould recur to the Lungs or Liver. Though this Maxim is moſt immediately to be underſtood of the external Veins cloſed, either by the actual Cautery, or by the Application of Styptics, yet it may be juſtly applied to the internal Veins, which frequently diſcharge a large Quantity of Blood; and this is ſo much the more neceſſary, becauſe theſe Veins cannot be cloſed, that is, the Hæmorrhage cannot ſo eaſily and ſpeedily be ſtopt, without the Uſe of efficacious internal Medicines, which ought to be cautiouſly and judiciouſly attempted; otherwiſe the Patient will neceſſarily be injur'd, according to the Remark of *Hippocrates*.

From a due Conſideration of theſe Circumſtances, 'tis ſufficiently obvious, that Aſtringents ought not to be uſed without the higheſt Caution: Nor are they beneficial in the Beginning of the Diſorder, much leſs when the Blood and Strength are exhauſted; ſince, in weak and delicate Habits, they rather excite ſpaſmodic Diſorders, Convulſions, Deliquiums, violent Uneaſineſs of the Præcordia, accompanied with Tremors and Palpitations of the Heart. But if ſuch Subſtances, as check the Violence of the Diſorder, are abſolutely neceſſary, 'tis expedient not to obtain this End by large Doſes, leſt they ſhould produce unlucky Effects. Diluting, correcting, and gently laxative Medicines are, alſo, to be uſed; the moſt efficacious of which are Aſſes Milk, and ſweet Whey; but theſe Diluents are moſt effectual, when taken together with Chalybeates in a liquid Form.

When a ſudden Stoppage of the hæmorrhoidal Diſcharge is ſucceeded by an Uneaſineſs of the Præcordia, Inflations, Reſtleſneſs, and Difficulty of Breathing, it is to be recal'd by mild Laxatives, and emollient Clyſters, and Suppoſitories.

Hypnotics, Opiates, and Narcotics, are alſo to be uſed cautiouſly, ſince, when unſeaſonably adminiſter'd, they have a Tendency to induce Madneſs. But if the Uſe of Medicines of this Kind is indicated, the moſt proper are the *Pilulæ Wildeganſii*, which may alſo be exhibited with Succeſs, when an intenſe Pain and Spaſms about the firſt Vertebra of the Loins excite a violent Effuſion of Blood, which is, therefore, to be check'd.

In no Diſeaſe is an accurate and cautious Regimen more neceſſary than in this, ſince, in conſequence of a Neglect in this Particular, the moſt efficacious Remedies will not produce the deſir'd Effect. For this Reaſon the Patient is carefully to abſtain from Summer Fruits, Pulſes, Sallads, Preparations of Milk, Fleſhes which are old, ſalted and indurated in Smoak, Aromatics, Garlick, Onions, ſtrong Wines, and all ſpirituous Liquors. He muſt, alſo, abſtain from Hunting, and all violent Commotions of Body, whether by Riding or Geſtation, eſpecially in rough and uneven Places; and a gentle Exerciſe, rather affecting the ſuperior than the inferior Parts of the Body, is to be uſed, in a pure and ſerene Air. But nothing is more prejudicial to Perſons labouring under this Diſorder than violent Commotions of Mind, eſpecially Anger and Dread; for which Reaſon all Incentives to theſe Paſſions ought to be carefully and induſtriouſly avoided. 'Tis alſo of great Importance, that the Patient ſhould uſe proper Liquors for Drink. I myſelf, ſays *Hoffman*, both with a preſervative and curative Intention, generally preſcribe Water, or Whey, Decoctions of red Sanders, with Maſtich and Cinnamon; as alſo Julaps prepar'd of a Decoction of Hartſhorn, Syrup of Citron-juice, with the Addition of a few Drops of the Oil of Cedar, or a few Ounces of Citron-flower-water.

When the Diſorder is once remov'd, due Pains are to be taken, in order to prevent its Return. This Intention is moſt commodiouſly and effectually anſwer'd by the Regimen already preſcribed; by Veneſection three or four times inſtituted every Year; by cleanſing the Primæ Viæ once a Month; and by the prudent Uſe of Mineral Waters, or only of chalybeated Milk. And, laſtly, all ſuch Aliments and Laxatives, as excite Pain, are carefully to be abſtain'd from, becauſe they excite an Inclination to Stool. *Frederic Hoffman.* See EMMENAGOGA.

CHIRURGICAL TREATMENT OF THE HÆMORRHOIDS.

Though ſome are deſirous of having this Flux moderated or ſtopt, a ſkilful Surgeon will be ſo far from complying, that he will lay before them the many Inconveniences which muſt attend ſuch a Practice. If, however, they perſiſt, or the Flux is exceſſive, then he may, at the ſame time applying other proper Remedies, ſtop up ſome of the Mouths, leaving one or two open, according to the Direction of *Hippocrates*, *Aphor.* 12. *Sect.* 6. He muſt proceed in the following Manner; firſt, bleed plentifully, then give gentle cooling Purges, and, laſtly, a Clyſter, five or ſix Hours before the Operation.

The Patient muſt be laid on his Belly, either upon a Bed, or Table, ſo that his Feet may touch the Ground; or, according to ſome, on the Side of a Bed, as for a Clyſter; then his Legs and Nates muſt be ſo diſtended, by two Aſſiſtants, that the Surgeon may have free Acceſs to, and Inſpection of, the Parts. Next, if there are no Tubercles, he is to tie up the bleeding Veins with a crooked Needle and Thread; if there are, he is to take hold of the Parts preternaturally tumefied with his Forceps, and cut them off, tying them up likewiſe; but he muſt be ſure to leave one Vein, and that the ſmalleſt, ſtill open. Laſtly, if the Profuſion does not ſtop ſpontaneouſly, in a ſhort time, he may apply Styptics, ſcrap'd Lint, and Compreſſes, with the T Bandage. In the ſubſequent Dreſſings he may uſe cicatrizing Medicines; and, if any thing foreign ſtill remains, he muſt remove it by the Sciſſars, or a Cauſtic. When theſe bleeding Tubercles were ſeated very high in the Rectum, the Antients recommended an actual Cautery; but this was ſevere and dangerous: I, therefore, prefer the Speculum Ani, (*Tab.* LV. *Fig.* 15.) which dilates the Parts, in ſuch a manner, that the Tubercles may be tied, or the open Veins ſtopt by Lint, impregnated with Aſtringents: This, with the Application of proper internal Medicines, will reſtrain a profuſe Hæmorrhage in theſe Parts; though it is ſeldom neceſſary to come to the laſt Operation.

Sometimes the Veins, diſpers'd about the Rectum and Anus, are ſo much dilated with Blood, as to be very painful, and raiſe Tubercles as large as Peas, Grapes, or Eggs; ſometimes, too, they extend to a Finger's-length. Theſe we call the Blind Piles, and diſtinguiſh them from other Tubercles of the Anus by their Colour, and Reſiſtance to the Touch; for they appear livid, or black, from the Stagnation of a thick Blood; and, when preſs'd by the Fingers, feel like a Bladder fill'd with Liquor, which Circumſtances are not obſerv'd in the others. See ANUS. Theſe diſtended Veſſels vary; for ſome are ſoft, giving little or no Pain; others hard, very painful, and inflam'd, rendering the Patient unable to ſit, ſtand, or walk, and ſometimes even bring on fainting Fits.

The blind Piles generally occur in Men of a coſtive, plethoric Habit, and ſuch whoſe Conſtitutions incline them to the bleeding Piles; and Women are moſt ſubject to them from a difficult Labour, a Suppreſſion of the Menſes, Geſtation, or a ſanguine Habit. In all theſe, the Veins ſometimes become ſo turgid as to diſcharge their Blood, and from blind become bleeding Piles, with ſo profuſe an Hæmorrhage as to endanger the Patient's Health. The blind Hæmorrhoids are ſometimes attended

tended with ſuch intenſe Pains as to cauſe a Spaſm of the Anus, and a Difficulty of Sitting, even to that Degree as not to admit of the Adminiſtration of a Clyſter. Sometimes they produce troubleſome itching Ulcers, eſpecially if they do not burſt within three or four Days; and very often give Birth to an Abſceſs, or ſtubborn Fiſtula.

When the blind Piles are neither large, nor troubleſome, they may be left to Nature; but when they encompaſs the Anus like a Bunch of Grapes, ſo that the Patient can neither ſit, ride, nor go to Stool without Difficulty; if they do not ſubmit to Spirit of Wine, the moſt ſpeedy Remedy is gradually to remove thoſe which are very full and large, by a Ligature; but, if there is a violent Inflammation, it is proper, firſt, to bleed, and give, internally, temperating and laxative Medicines, preſcribing a regular Diet, while diſcutient and emollient Fomentations are externally applied. The ſame End is anſwer'd by the *Unguentum Nutritum*, *Unguentum Linariæ*, freſh Butter, Oil of ſweet Almonds and the like, applied to the Parts.

But Linen, dipt in warm Spirits of Wine, and emollient Clyſters, are frequently of infinite Service; and, when they are not effectual, Leeches may be applied, to exhauſt the Blood; if they are not at hand, or the Parts inflam'd, the Lancet muſt be us'd; and, after bleeding in proportion to the Patient's Strength, the Dreſſings muſt be made of Lint, with Compreſſes and the T Bandage: Theſe are to be renew'd, till the Diſorder is completely cur'd. Sometimes the Piles are ſo high in the Rectum as to render the Uſe of the Speculum Ani neceſſary (ſee *Tab.* LV. *Fig.* 15.) When the Anus is properly dilated by this Inſtrument, they muſt be ſcarified with a Lancet, or divided with Sciſſars; for thus the inſpiſſated noxious Blood will be diſcharg'd, and the Pains reliev'd. Sometimes theſe Wounds are ſo far from healing, that of blind they become bleeding Piles, and the Patients, eſpecially if they are cauſtic, always, or very often at leaſt, diſcharge Blood with their Excrements, which Flux, though not entirely free from Trouble, ſhould not be ſuppreſs'd, while it is moderate, as it leſſens the Pains, conduces to the Patient's Health, and prevents or removes many Diſtempers, as the hypochondriac Melancholy, Diſorders of the Kidneys and Bladder, Gout, and iſchiadic Pains. For this Reaſon, many Moderns recommend, and excite, this Evacuation. But as this often induces many Inconveniences, and Diſeaſes, I prefer other Methods of Cure.

The beſt Method of preventing theſe Piles, is a regular, temperate Diet, with bleeding twice or thrice in a Year, and oftener, if requir'd; for theſe Evacuations will leſſen the Quantity of Blood, and, conſequently, remove the Cauſe. Internally may be taken ſome temperating Powder, or a Decoction, of Yarrow, drank like Tea; carefully avoiding all heating and aſtringent Medicines, ſuch as Aloes, Myrrh, and Saffron, and all Aliments of the like Quality, Wine, overloading the Stomach, Anger, violent Exerciſe, profuſe Venery, and Riding. If, notwithſtanding this Regimen, the hæmorrhoidal Veins ſhould begin to ſwell, reſolvent and temperating Medicines ſhould be given internally, while, externally, Fomentations and Cataplaſms may be applied; if the Pains are acute, then Recourſe muſt be had to Leeches, or the Lancet, as before directed. *Heiſter. Inſtitut. Chirurg.*

Sulphur, and its Preparations, are much recommended, taken internally, for the Piles; and it is certain, that the Flowers, or Milk of Sulphur, or crude Sulphur powder'd, are very effectual in removing an habitual Coſtiveneſs, which is a frequent Cauſe of hæmorrhoidal Diſcharges; not to mention its alterative Quality.

It has been obſerved by Practitioners, that a Diſcharge of a few Ounces of Blood from the hæmorrhoidal Veſſels affords greater Relief in many Diſorders, both acute and chronical, than any equal, or even a much larger Quantity, taken artificially from any other Part. That the Reaſon of this may be evident, it is neceſſary to remark, in this Place, that all the Veins which convey the Blood from *all the Contents* of the Abdomen, unite near the Liver, and form the Vena Portæ, which is very different from any other Vein; for it performs the Office of an Artery, conveying Blood to the Liver, for the Secretion of the Bile, in the Manner deſcrib'd under the Article HEPAR. The hæmorrhoidal Vein immediately empties itſelf frequently into the Splenic Branch, and ſometimes into the Meſenteric Branch, From this Structure it is obvious, that when any of the Viſcera of the Abdomen labour under a Plethora, or Fullneſs of Blood, or are obſtructed in ſuch a manner as not to be capable of containing the due Proportion of Blood, without Oppreſſion, a Diſcharge of a Portion of Blood from the hæmorrhoidal Veſſels affords immediate Relief to the labouring and oppreſs'd Viſcera, which could be brought about by no other means. Nor is this all the Advantage of ſuch a Flux; for it neither requires a Demonſtration to prove, nor great Abilities to conceive, that when the Viſcera of the Abdomen, on any Account whatever, are render'd incapable of receiving a due Proportion of Blood propel'd from the Heart, through the Arteries, the deſcending Trunk of the great Artery, which conveys Blood to the abdominal Viſcera, muſt neceſſarily receive leſs Blood than in an healthy State; and, in conſequence of this, the aſcending Trunk, which carries Blood to the Head and Brain, muſt receive more; and hence, all thoſe Actions which depend upon an entire State of the Brain, muſt be proportionably diſturb'd. A Diſcharge, therefore, from the hæmorrhoidal Veſſels makes a true Revulſion from the Head. Hence the Reaſons are evident, why an hæmorrhoidal Diſcharge frequently relieves hypochondriac Diſorders, Melancholy, Madneſs, Gout, Aſthma, Diſeaſes of the Kidneys and Bladder, and iſchiadic Pains.

It muſt, however, be remark'd, that Diſcharges of Blood from the hæmorrhoidal Veſſels are not always ſalutary, but ſometimes ſymptomatic, and of very bad Preſage. This happens when very conſiderable Obſtructions are found in the Liver, Spleen, Pancreas, Meſentery, or any Part contain'd in the Abdomen; for on theſe Occaſions the obſtructed Bowel is incapable of receiving the due Proportion of Blood, which, therefore, burſts out from the hæmorrhoidal Veſſels, and prognoſticates the Deſtruction of the Part.

It were to be wiſh'd, that we could, in Practice, regulate the hæmorrhoidal Flux; that is, procure it when we are certain it would be ſalutary; and check it when redundant, or ſymptomatical, without running the Hazard of doing an Injury to the Patient; for then we ſhould be able to afford ſudden Relief, in Caſes where we now find it attended with much Difficulty. Thus in atrabilarious Conſtitutions, in all Diſeaſes attended with a Depravation of the Imagination and Reaſon, in acute Diſorders, verging towards a Delirium, if we could, at pleaſure, excite the hæmorrhoidal Flux, it would contribute greatly to a Cure. It would farther be of Uſe, if we could reſtore this Diſcharge, when a Suppreſſion thereof is attended with bad Conſequences, or when an Eruption of Blood from ſome leſs convenient Part enſues.

The Medicines contributing to excite the hæmorrhoidal Flux are ſpecify'd under the Article EMMENAGOGA. But the principal Methods of procuring this Diſcharge are to apply warm relaxing Topics to the hæmorrhoidal Veſſels, of Water, Oil, Honey, and emollient Ingredients, either by way of Clyſter, Vapour, or Fomentation; and to rub the Parts, after theſe Applications, with rough Cloths, or Fig-leaves.

HÆMORRHOSCOPIA, αἱμορροσκοπία, from αἷμα, Blood, ῥέω, to flow, and σκέπτομαι, to contemplate. An Inſpection and Contemplation of the Blood let out of the Veſſels, in order to form a Judgment from thence, of the State of the Body.

HÆMORRHOUS, αἱμόῤῥοος. The Name of a poiſonous Serpent.

Paulus Ægineta, *L.* 5. *C.* 15. informs us, that the Bite of this Serpent is attended with exceſſive Pains, and Hæmorrhages; if there happens to be a Cicatrix in any Part of the Body, it breaks, and Blood flows from it; concreted Blood is mix'd with the Stools; Blood is cough'd up from the Lungs, and the Patient expires, vomiting of Blood.

As to the Cure, this Author ſays, that moſt of the Antients eſteem'd it irremediable; but if, ſays he, we are deſtitute of any ſpecific Remedy, we may, at leaſt, try common Methods. Thus we may ſcarify, burn, or even cut off the Part which receives the Wound, provided it be one of the Extremities: After theſe, apply acrid Cataplaſms to the Part. All acrid Subſtances are good, taken internally, eſpecially ſalted Aliments; unmix'd Wine, alſo, and Baths, are proper. But all theſe things muſt be immediately call'd in to our Aſſiſtance, and perpetually perſiſted in; for, if the Diſeaſe once appears, all Remedies are in vain. Vine-leaves boil'd, and made into a Cataplaſm with Honey, are, alſo, to be apply'd to the Part; and the Head of the Serpent burnt is to be taken internally; or Garlick, with *Oleum Irinum*; or let the Patient eat Raiſins.

Hippocrates calls thoſe large Veins, which, when open'd, diſcharge Blood copiouſly, *Hæmorrhous*, αἱμόῤῥους φλέβας.

HÆMOSTASIA. An univerſal Stagnation of Blood from a *Plethora*.

HÆMOSTATICA, from αἷμα, Blood, and ἵστημι, to ſtop. Medicines which ſtop Hæmorrhages.

HÆRMIA. A ſort of *Indian* Fruit like Pepper. It is eſteem'd good for diſpelling Flatulences, to fortify the Stomach, and is ſometimes apply'd to the Uvula, when relax'd. *Lemery des Drogues.*

HAGAR, or HAGIAR. The *Arabic* Name for the *Armenian* Stone.

HAGIOSPERMON; that is, the Holy Seed. A Name for the *Semina Santonici*, Worm-ſeed.

HAGIOXYLON; that is, the Holy Wood, *Guaiacum.*

HAL. Salt. *Rulandus.*

HALATION, ἁλάτιον. The Name of a Medicine, conſiſting principally of Salts, mention'd by *Trallian*, *L.* 3. *C.* 6. and of another, deſcrib'd by the ſame Author, *L.* 12. *C.* 7. which is cathartic.

HALCHEMIA. The Art of fuſing Salts. *Libavii Alchym. Pharm.*

HALCYON. See ALCEDO.

HALCYONIUM, *Spuma Maris*, Offic. FROTH or FOAM OF THE SEA. This is an oleous or bituminous Subſtance found floating on the Sea. It is much controverted, whether this

this is the Excrement, Sperm, or Milk, of ſome Sea Animal; or a kind of Zoophyte; or a Juice of ſome Sea Plant; or ſomething of a bituminous Mineral Exſudation from the Bottom of the Sea, converted into Foam by the Agitation of the Waves.

HALEC, Offic. Schrod. 5. 329. Charlt. de Piſc. 4. *Harengus*, Rondel. de Piſc. 1. 222. Schonef. Ichth. 36. Geſn. de Aquat. 402. Jonſ. de Piſc. 2. Raii Ichth. 219. Ejuſd. Synop. Piſc. 103. Mer. Pin. 185. *Harengus Flandricus*, Aldrov. de Piſc. 294. *Harengus Chalcidis Species*, Bellon. de Aquat. 271. THE HERRING.

The Parts of the Herring, uſed in Medicine, are, the Veſicles call'd *Animæ*, and the entire Fiſh. The *Animæ* are ſaid to excite Urine, taken internally. Salted Herrings are ſometimes apply'd to the Soles of the Feet in Fevers, with an Intent to derive the Humours from the Head, and mitigate the febrile Heat.

The Pickle of Herrings is uſed in Clyſters, for Pains in the Hips, and a Dropſy; externally apply'd, it mundifies fetid Ulcers, ſtops the Progreſs of a Gangrene, and diſſipates ſtrumous Swellings. It is, alſo, of Service in a Quinſy, if the Parts affected are anointed with this, and Honey mix'd together.

Freſh Herrings, conſider'd as a Food, are ſaid to be very good Aliment, if uſed moderately; but, taken in Quantities diſproportion'd to the Powers of Digeſtion, they produce a Putrefaction in the Stomach, of the alcaline Kind, and are attended with all the bad Conſequences, mention'd in the Article ALCALI, of highly alcaleſcent Aliment. But pickled Herrings are very bad Aliment, the Fleſh being render'd hard, and ſcarcely digeſtible by the vital Powers. Theſe, however, are leſs injurious, than thoſe which are ſalted and dry'd; theſe laſt being more harden'd, and, conſequently, leſs eaſily digeſted.

HALELÆUM, ἁλέλαιον. A Mixture of Oil and Salt, recommended by *Galen* for lax Tumors of the Joints. *Olaus Borrichius* has given this Name to a certain inflammable, ſaline, and ſulphureous Liquid, diſtil'd from Snow, or Rain-water.

HALIEÆTOS, HALIEÆTUS, Offic. Aldrov. Ornith. 1. 187. Jonſ. de Avib. 3. Caii de Animal. 85. Bellon. des Oyſe. 96. *Halieætus ſive Aquila marina*, Will. Ornith. 29. Raii Ornith. 59. Charlt. Exer. 70. Geſn. de Avib. 177. *Halieætus, ſeu Oſſifraga*. Raii Synop. A. 6. *Halieætus, ſeu Oſprey*, Mer. Pin. 170. *Niſus Veterum*. THE OSPREY.

The Marrow of the Bones is thought to be of Uſe in Fiſhing, in order to allure the Fiſh to any Place. This popular Error proceeds from a fabulous Story, that the Oſprey, as it flies over the Water, lets fall a Drop of Oil, that allures the Fiſh to the Surface, which it then ſeizes. This Marrow of the Oſprey is what is meant by *Oil of Aſpre*. It is of no Uſe in Medicine.

HALICA. See ALICA.

HALICACABUM. See ALKEKENGI.

HALICACABUM PEREGRINUM. A Name for the *Corindum; folio ampliore; Fructu majore*.

HALICES. Pandiculations after Sleep, or upon awaking.

HALIEUTICON. The Name of two Plaiſters mention'd by *Aetius*.

HALIMAR. Copper. *Rulandus*.

HALIMUS, Offic. *Halimus Cluſii*, J. B. 1. 227. *Halimus latifolius*, Ger. Emac. 523. *Halimus latifolius ſive fruticoſus*, C. B. 120. *Halimus latifolius, ſive Portulaca marina incana major*, Park. 724. *Atriplex Halimus dicta latifolia*, Raii Hiſt. 1. 194. *Atriplex latifolia, ſeu Halimus fruticoſus latifolius*, Tourn. Inſt. 505. Boerh. Ind. A. 2. 89. TREE-SEA-PURSLANE.

Dioſcorides ſays, that the Leaves boil'd are uſed as Food. *Aetius* ſays, the Buds are uſed as Pickles. The Root, taken in the Quantity of a Dram, in *Hydromel*, mitigates ſpaſmodic Pains, thoſe attending Ruptures of the capillary Veſſels in the Muſcles, and the Gripes. *Dioſcorides*, L. 1. C. 120.

HALINITRON, ἁλίνιτρον. Nitre.

HALME, ἅλμη. Brine, or Salt-water, made for preſerving Vegetable or Animal Subſtances from Putrefaction.

HALMYRAX. A ſort of Nitre produc'd in the Valleys of *Media*, in very dry Weather, taken notice of by *Pliny*, L. 31. C. 10.

HALMYRIS, ἁλμυρίς. The Name of a Species of a Sea Cabbage.

HALMYRODES, ἁλμυρώδης. Salt, or ſalſuginous. *Hippocrates* uſes this Word as an Epithet for particular Sorts of Fevers, in which, as *Galen* explains it, the external Parts, when touch'd, communicate ſuch an itching Senſation, as is perceiv'd from handling ſalt Subſtances. When apply'd to the Skin, it imports much the ſame; or, perhaps, a certain Roughneſs, as if it was ſalted. It is, alſo, us'd as an Epithet to many Excretions, when ſalt, and acrimonious. *Halmodes*, ἁλμώδης, implies the ſame.

HALO, in Anatomy, is the red Circle, or Areola, round the Nipples, from its Similitude to the Circles form'd round the Sun, or Moon, call'd *Halo*.

HALOSACHNE, ἁλοσάχνη. The Foam of the Sea.

HALS, ἅλς. Salt. See SAL.

HALTERES. Heavy Maſſes of Stones, Lead, or Metal, us'd by the Antients in their Exerciſes. They ſeem to have been of two Sorts: One, which was held in the Hands, and us'd in Leaping, in order to bring the Body forwards, the Hands being projected at the Inſtant the Leap was taken. Others were thrown ſomewhat like the *Diſcus*. Or, as *Galen* ſays, the *Halteres* were laid on the Ground about an Ell diſtant from each other; then the Perſon to be exercis'd plac'd himſelf in the Middle betwixt them, and, ſtooping, took up that on the Right-hand, with his his Left; and that on the Left-hand, with his Right; laying them in their Places again, and repeating this ſeveral times, without moving the Feet. This Exerciſe is recommended for ſeveral Medicinal Purpoſes. But, as it is not at preſent in Uſe, I ſhall refer the Reader to *Hieronymus Mercurialis*'s Treatiſe *de Arte Gymnaſtica*.

HALYPHÆUS. A Name for the *Quercus*; *Calyce echinato*; *Glande majore*, C. B. P. See ÆGILOPS.

HAMALGAMA. The ſame as AMALGAMA; which ſee.

HAMIA. The Name of a Fiſh. See AMIA.

HAMMA, ἅμμα. A Knot made for faſtening Bandages.

HAMMONITRUM. The ſame as AMMONITRUM; which ſee.

HAMULUS. A Hook in Surgery, of which there are many Sorts, contriv'd for various Purpoſes,

HANDAL. See ALHANDAL.

HAPHE, ἁφή. See HAPSIS.

HAPLOTOMIA, in Surgery, is a ſimple Section.

HAPSIS, ἅψις. The Senſe of Feeling. But it ſignifies, alſo, Connection with reſpect to Bandages. And ἅψις φρενῶν, in *Hippocrates*, imports Madneſs, a Delirium, or Loſs of Reaſon.

HAPSUS. A round Wad of Tow, Lint, or Wool.

HARDESIA. See ARDESIA.

HARENCHUS, HARENGUS, or HERENGA. The Herring. See HALEC.

HARMA, or HARMATION, ἅρμα, or ἁρμάτιον. The Name of a *Collyrium*, deſcrib'd by *Paulus Ægineta*, L. 7. C. 16. and by *Scribonius Largus*, N° 18.

HARMALA.

The Characters are;

The Leaves are alternate, the Flowers roſaceous, and pentapetalous: The Ovary in the Bottom of the Calyx becomes a roundiſh, tricapſular Fruit.

Boerhaave mentions but one Species of this Plant; which is,

Harmala, Ger. 1073. Emac. 1255. *Tourn. Inſt.* 257. *Boerh. Ind. A.* 261. *Ruta ſylveſtris, Harmel*, Offic. *Ruta ſylveſtris flore magno, albo*, C. B. P. 336. Raii Hiſt. 1. 878. *Ruta ſylveſtris Syriaca, ſive Harmala*, Park. Theat. 133. *Ruta, quæ dici ſolet Harmala*. J. B. 3. 200. WILD RUE.

This Rue grows a Foot and an half, or two Feet high, having ſmooth Stalks, beſet with longer and narrower Leaves than thoſe of Rue, of but little Scent: The Flowers conſiſt of five white Leaves, larger than thoſe of Rue, whole and flat, with ſeveral yellow Stamina. The Seed-veſſels are longer than thoſe of common Rue, containing ſmall brown Seed; the Root is ſomewhat hard and woody, of a yellow Colour. It grows wild in the Eaſtern Countries, as well as in *Spain*, and flowers in *July* and *Auguſt*. The Herb and Seed are us'd, tho' but rarely.

It is ſaid to partake much of the Nature of Garden-rue, and to be particularly good for Diſeaſes ariſing from Melancholy, and to provoke Urine.

The *Arabian* Writers ſay, that the Seeds are intoxicating, narcotic, and good in Melancholy. *Dale*.

HARMEL. The ſame as HARMALA.

HARMONIA, in Anatomy, is a Species of Articulation. See ARTICULATIO.

HARMOS, ἁρμός. The Fleſh which grows betwixt the Teeth.

HARPAX. A Name for Amber. See AMBRA. It, alſo, ſignifies, a Mixture of Quick-lime and live Sulphur. *Holler, Inſt. Chirurg.*

HARUNDO. See ARUNDO.

HASACIUM. Sal Ammoniacum. *Rulandus*.

HASTA REGIA. A Name for the *Aſphodelus*; *verus*; *luteus*.

HASTELLÆ. Splints us'd in Fractures.

HAUSTUS. A Draught. In Pharmacy it is a liquid Form of a Medicine, containing as much as is to be drank at once.

HAYRI. The *Ebenus Æthiopica*. See EBENUS.

HEBE, ἥβη. The Hairs which grow upon the Pubes; the Part on which they grow; or the Age of Puberty when they appear in either Sex.

HEBENUM. The ſame as EBENUS; which ſee.

HEBISCOS. The ſame as *Ibiſcus*. See ALTHÆA.

HECATOMBE, ἑκατόμβη. The Name of a *Collyrium* in *Paulus Ægineta*, L. 7. C. 16.

HECATONDRACHMA, ἑκατόνδραχμα. The Name of a Plaiſter in *Galen, de Comp. Medic. per Gen.* L. 2. C. 2.

HECTEUS, ἕκτεύς. An Attic Meaſure, equal to one ſixth Part of a *Medimnus*, which contain'd ſeventy-two Sextaries, or Pints. *Feeſius*.

HECTICA, ἑκτική, from ἕξις, Habit. An Epithet for a Species of Fever.

Hectic Fevers are not ſo much as mention'd by the antient *Greek* and *Latin* Phyſicians, as *Hippocrates*, *Aretæus*, and *Cornelius Celſus*: Nor was a ſlow Fever deſcrib'd in any of the Writings of the Antients, till at laſt *Celſus* directed the Cure of it. What were afterwards call'd ſlow or hectic Fevers, were among the firſt Phyſicians ſtyl'd tabid or long-continu'd Fevers,

or Marasmi. Thus *Hippocrates*, in the sixty-fourth Aphorism of his fifth Section, calls slow Fevers by the Epithet of long-continued; and observes, that those affected with them are not violently feverish; whilst he every-where describes an Hectic under the Name of *Phthisis*. At present, by slow and hectic Fevers are meant, those which are chronical, and continually by a preternatural, tho' mild and remitting Heat, consume the Juices, induce a Consumption, and impair the Strength.

These Fevers are various, according to the Violence of the Symptoms, and the Prospect of the Danger; for, strictly speaking, slow Fevers are such as are accompanied with mild Symptoms, a gentle Heat, profuse Sweats during Sleep, a natural Pulse after Sleep, and in the Forenoon, without any considerable Loss of Strength and Appetite, Dryness of the Body, livid Colour of the Urine, or great Danger: Whereas, in an hectic Fever, the Heat is continual, and the Pulse always hard, weak, and quick; tho' after Eating, and towards Evening, the Quickness and Hardness of the Pulse are increas'd, the Skin and Tongue are render'd dry, hard, and parch'd, the Cheeks become red, the whole Body is weak and flaccid, the Sleep is not refreshing, the Urine is red, has a Sediment at the Bottom, and on its Surface a pinguious Pellicle of a browniſh Colour, and the whole Body is emaciated to such a degree, that the Bones protuberate thro' the Skin: Besides, slow and hectic Fevers differ with respect to their Cause, since in the former the Fault is rather in the Fluids, and the beginning bad Disposition of the Solids; whereas, in the latter, the Solids are rather in the Fault, and the Viscera already corrupted. Hence slow Fevers may be carry'd off, and their Causes remov'd, by proper Medicines; but Hectics are either with the greatest Difficulty, or not at all, to be cur'd; for hectic Fevers are rather of the symptomatic kind, and succeed violent Exulcerations, Vomicas, Abscesses, and Corruptions of the Viscera: Hence all those who labour under a Phthisis, an Abscess, a Vomica, or an Exulceration of the Lungs, Mesentery, Kidneys, or Uterus; those who have violent Suppurations in the internal Parts, or in the Muscles of the Abdomen; those who have a Cancer in their Genitals, Breasts, or Uterus; as, also, those who labour under a Cachexy or Dropsy arising from an Induration, Scirrhus, Corruption, or Putrefaction of the Liver, Spleen, Omentum, Pancreas, and Glands of the Mesentery, die of hectic Fevers.

The Cause of the continual Heat in this Fever is a certain putrid and corrupt Humour, which is utterly prejudicial to the due and natural Mixture of the Blood and Humours, which it disturbs, changes, and dissolves, by a preternatural and intestine Motion. This putrid Humour is offensive to the nervous Fluid, and the nervous Parts; and forces these sensible and moving Parts into a violent Contraction, in which the very Essence of the Fever consists. The greater Quantity, therefore, there is of these putrid and corrupted Humours, arising from an incurable Disorder of the Viscera, and the longer they continue in the Body, the Fever, and all its Symptoms, will be so much the more terrible.

Slow or long-continued Fevers, of a mild and gentle Kind, are highly frequent and incident to Persons at every Period of Life, of every Sex, Temperament, and Country. But the Origins and Causes of these Disorders are various: They, however, commonly arise from some preceding Disease, which too much weakens the Body, and impairs the Strength; for it is certain, from Experience, that those who by obstinate intermittent Fevers, or those of the continual Kind, as also by the Small-pox or Measles; large Discharges of Blood from the Uterus, Anus, or Nose; long-continued Fluxes, whether of the simple or dysenteric Kind; as also, too liberal Salivations, a long-continued Gonorrhœa, or Fluor Albus, Grief, Cares, Watchfulness, continual Application to Studies of any kind, Hunger, hard Labour, or an immoderate Use of Venery, have impair'd their Strength, readily fall into those slow and long-continued Fevers. The Reason of this is sufficiently obvious. Bodies of this kind are deprived of a due Quantity of laudable Blood and Juices, as, also, of a due Quantity of the nervous Fluid: For after such Diseases, the Appetite becomes keener; but the spirituous, salival, and bilious Juices, subservient to the Dissolution of the Aliments, recede from their genuine Nature, and are not so efficacious as they ought to be. The peristaltic Motion, also, of the Stomach and Intestines is highly languid. Hence the Solution, Concoction, and Digestion of Aliments, liberally taken, are not perfectly carried on, but the Chyle, as yet thick, crude, and not duly elaborated, is convey'd to the Mass of Blood, and, by its heterogeneous Nature, destroys the due Crasis of the Fluids, and disturbs the equable and natural Motion of the Solids.

Besides, it is found, from Experience, that these consumptive Fevers are particularly subsequent to a Defect, or a preposterous Suppression, of usual and critical Evacuations; for nothing is more frequent than for those, in whom the Evacuations, which terminate acute Diseases and Fevers, especially Sweats, and a free Perspiration, are obstructed, or not duly carried on; those in whom their usual Night-sweats are dried up; who have Fontanels, or old Ulcers, consolidated; who have Catarrhs, and other acrid Defluxions from the Uterus, or other Organs, or Diarrhœas unseasonably stopt, to be afterwards seiz'd with slow Fevers; for thus the vitious, impure, and superfluous Humours, which ought to be discharg'd, remain in the Body, and so corrupt the laudable and nutritious Juices, that the whole Mass is render'd intemperate, and all the Motions and Functions of the Body vitiated.

That the Seat of slow and hectic Fevers is most generally in the Mesentery, is certain, both from Reason and Experience; for *Fernelius*, and, after him, *Sennertus*, long ago observ'd, that the Mesentery was, more frequently than any other Part of the Body, the Seat of a great Number of latent Disorders, slow and erratic Fevers, Diarrhœas, Choleras, Scurvies, melancholic Disorders, Cachexies, Dropsies, and intermittent Fevers of an obstinate and rebellious Kind. The Reason why the Mesentery has this strong Tendency to generate Diseases, is, that the slow and languid Motion of the Fluids through this Part easily lays a Foundation for Stagnations; for the Vena Portæ, destitute of a Pulsation, receives the Blood returning from the Mesentery, discharges the Office of an Artery, and carries it to the Liver: But, as this is slowly done, an Obstruction happens in the meseraic Vessels, in consequence of which Stagnations, Infarctions, and sometimes Extravasations, are produc'd. Then the hæmorrhoidal Vein, by reason of its perpendicular Direction, and its Distance from the Heart, conveys the Blood very slowly back to the Vena Portæ, and occasions very frequent Stagnations, and painful Distentions of the Vessels in the Mesocolon, and large Intestines, especially in the Intestinum Rectum. In the Mesentery itself, in consequence of a Defect of nervous and muscular Coats, the Progress of the Blood is not at all assisted, but the Vessels, cover'd with Fat, and running through the Membrana cellulosa, rather have their Tone destroy'd, are continually relax'd, and easily yield to the Blood accumulated in them. Whilst, also, the chylous Lymph is slowly carried through the innumerable lacteal Ducts, divided into minute and capillary Vessels about the Glands, and receiv'd by the minute Vessels of these Glands, it easily remains in their Cavities; nor, for this Reason, is it to be wonder'd at, if the Glands of the Mesentery are often obstructed, render'd tumid, and degenerate into a scirrhous State.

But though the slow Circulation of the Humours through the Mesentery is of some Use, as it contributes to the Excretion both of the redundant and peccant Juices; of the Blood, for Instance, through the internal hæmorrhoidal Veins, and of the serous, mucid, and fermentable Sordes through the numberless Glands of the Intestines; yet it happens, for this very Reason, that almost all the Faults of the Humours, whether arising from Quantity, Quality, or Motion, have an unlucky Influence on the Mesentery. A Plethora, in particular, is prejudicial to no Part more than to the Mesentery; since, by a preternatural Distention and weakening the Tone and Elasticity of the Vessels, the Humours are too much accumulated; for the greater the Stagnation of the Blood in the Mesentery is, the more its Impurity is increas'd; and the greater the Impurity of the Blood and Lymph is, the more the Functions of the Body are weaken'd, and the Nutrition is diminish'd, the Strength impair'd, the intestine Motion of the Fluids increas'd, the Heart and Arteries stimulated to a brisker Motion; and the Fever, by this means, increas'd.

Hence the Reason is obvious, why, according to *Hippocrates*, in *Lib.* 2. *Prædict. Sect.* 13. a Defect or Suppression of the Menses are succeeded by dangerous and consumptive, that is, hectic Fevers, known by the Names of Chlorosis and Greensickness; as, also, why in Men, according to the same Author, *Aph.* 12. *Sect.* 6. an Obstruction, or preposterous Stoppage, of the hæmorrhoidal Discharge, generates Consumptions, or hectic Fevers; and, farther, why, by stopping salutary Diarrhœas, which frequently prevent or terminate acute Diseases, and appear at certain stated Times of the Year, consumptive and dangerous Fevers are brought on. Nor is the Reason less obvious, why nothing is more dangerous, or subject to produce chronical, slow, and hectic Fevers, than when, in Persons especially of plethoric, cacochymic, or hypochondriac Habits, where the Circulation of the Blood through the Mesentery and adjacent Viscera is already too slow, have an unseasonable Stop put to Fevers by Astringents, or even the celebrated Peruvian Bark; which Fevers, in these Disorders, are capable of consuming the superfluous Juices, removing Obstructions of the Viscera, and promoting a free Circulation of the Blood, by an Oppression of which, the Infarctions of the mesenteric Vessels, the Obstructions, the Stagnations and Impurity of the Humours, are increased, and, consequently, a future Foundation laid for chronical Fevers, and other Disorders.

Nor is the Mesentery only thus disposed to Stagnations and Obstructions, but also to Suppurations and Abscesses, which are generally accompanied with a febrile Intemperature. Many are of Opinion, that Inflammations, without which there can be neither Suppurations nor Abscesses, cannot happen in the Mesentery, because in it neither an acute Pain nor Heat, the perpetual Concomitants of an Inflammation, are observ'd. But the Essence of an Inflammation does not consist in Heat and Pain, but in a certain Stagnation of Blood in improper Vessels;

and the Heat and Pain are rather the Product of this Stagnation, if it happens in a nervous Part of exquiſite Senſation. Stagnations and Extravaſations of the Humours, together with the Suppurations ariſing from them, may very readily happen in the Meſentery, in conſequence of the large Afflux of Humours thereto; ſince the Blood is either ſometimes impetuouſly forc'd through the minute Ramifications of the Arteries into the lateral Tubes, (among which are the adipoſe Veſſels) or thoſe lateral Veſſels are ruptur'd by the Force of the Humours, and diſcharge their Contents. Beſides, Pus is no-where more readily form'd than in Parts every-where cover'd with Fat; becauſe the Fat itſelf is, by the inteſtine and putrid Motion of the extravaſated Humours, eaſily converted to a ſanious colliquated Matter.

Abſceſſes, therefore, in the Meſentery, happen more frequently than is commonly believed, and may be known from a continual hectic Fever, an oppreſſive and fix'd Pain of the Abdomen, and a Diſcharge of a ſanious Matter by Stool, together with a Pain and Heat of the Inteſtines. I have remark'd many Cauſes concurring to a Production of Abſceſſes in the Meſentery. I have frequently obſerv'd, that in plethoric, plethorico-cacochymic, and hypochondriac Patients, from violent Anger immediately before or after Meals, eſpecially if Refrigeration concurs, the Body has been affected with an univerſal Languor, which has been ſucceeded by fatal hectic Fevers: I have ſeen the ſame happen in thoſe who attempt to procure Abortion, by draſtic forcing Medicines: When Phyſicians have treated a Suppreſſion of the Menſes with hot and ſtrong Emmenagogues or Purgatives, as alſo when they have endeavoured, in Oppoſition to Nature, to promote the hæmorrhoidal Diſcharge in Men by Preparations of Aloes. I have farther known ſuch Fevers produc'd by Abſceſſes, in Patients full of Blood and Juices, after violent and unuſual Exerciſe of the Body, and expoſing the Whole of it to the Cold, but eſpecially the Feet, which have a conſiderable Sympathy with the Abdomen.

For by ſuch a violent Motion, whether produced by Paſſions, Medicines, or Exerciſe, the Blood is forcibly propel'd into the minute Veſſels of the Meſentery, ſtagnates there, and paſſes into ſmall Tubes it ought not to enter, where it remains, and is corrupted. Hence ariſes the Suppuration, which, in conſequence of the inteſtine Motion, ſpreads farther, corrodes and conſumes the adjacent Parts, ſo that of a ſmall Abſceſs a large one is form'd, and the Cavities of Apoſtems enlarg'd. Beſides, the ſanious and corrupted Matter, being abſorb'd by the Veins, and mix'd with the Blood, is often convey'd to other Emunctories, ſuch as the Glands of the *Trachea*, and the Kidneys. Hence large Apoſtems of the Meſentery are often accompanied with Diſcharges of purulent Urine, or a Spitting of purulent Matter, whilſt, at the ſame time, both the Lungs and Kidneys are ſound. Sometimes, alſo, the Pus, in conſequence of its Weight, deſcends through the Pores of the Meſentery, enters the Cavities of the contiguous Viſcera, and is diſcharg'd by Stool. Sometimes, alſo, a large Abſceſs ariſes, and after a preceding Horror, or even a Rigor, with a ſucceeding Heat, breaking its Covering, diſcharges its Contents. If this happens in a Place leſs fit for Excretion, violent Gripes, reſembling a Colic, are produc'd; but if it happens in the Cavity of the Abdomen, the Matter diſcharg'd corrodes, and induces a Gangrene on the internal Parts it touches; but, if this ſhould happen in the Cavity of the Inteſtines, a large Quantity of Pus is diſcharg'd by Stool. Inſtances of this Diſcharge of Pus are given by *Horſtius*, *Lib.* 14. *Obſ.* 25. & 26. *Bartholine. Cent.* 2. *Epiſt.* 23. *Cent.* 6. *Epiſt. Cent.* 4. *Hiſt.* as alſo by *Tulpius*, *Lib.* 2. *Obſ.* 36.

But the Fevers, which either accompany or ſucceed large Abſceſſes of the Meſentery, as well as of the other Viſcera, ſuch as the Liver, Pancreas, Kidneys, Bladder, and Uterus, are not mild and gentle, but of the hectic Kind, violent, and, conſuming the Strength and Juices of the Body, prove fatal. The Beginnings, different Stages, and Symptoms of theſe Fevers are juſtly and accurately deſcrib'd by *Hippocrates*, in his Treatiſe *de internis affectionibus*, in the following Words: "A gentle "Rigor begins to ſeize the Patient; the whole Breaſt is pain'd "as far as the Back; ſometimes, alſo, the Patient is afflicted "with an acute Cough, and a Diſcharge of a large Quantity of "a thin and ſaline Saliva. Theſe Symptoms happen in the Be"ginning of the Diſeaſe; but, in the Progreſs of the Diſorder, "the whole Body, except the Legs, is extenuated; for theſe, "and the Feet, become tumid, the Nails are incurvated, but the "Arms become weak and ſlender. The Fauces are cover'd with "a kind of Down, the Patient breathes as if he whiſtled through "a Reed, and is through the Whole of the Diſeaſe afflicted with "a violent Thirſt, and great Weakneſs. When the Patient comes "to be in this Condition, he generally dies in a Year's time: "All poſſible Care and Pains are, however, to be taken, in order "to reſtore and recover him."

There is another ſlow and latent Species of Fever highly familiar to Children. It is accompanied with a remarkable Swelling of the Abdomen, an Extenuation of the ſuperior Parts, a dry Cough, Loſs of Strength, Want of Appetite, and a wandering Heat, which is increas'd after eating, and towards the Evening; the Patient is ſometimes coſtive, and ſometimes preternaturally looſe, diſcharging a large Quantity of white mucous Matter by Stool. This Species of Fever, ſometimes, ariſes from a viſcid and tenacious Chyle obſtructing the villous Coat of the Inteſtines, and the minute Mouths of the Lacteals, by which an Inflation of the Inteſtines, and a chylous Diarrhœa, are brought on. Theſe Fevers, alſo, ſometimes draw their Origins from a too tough and viſcid Lymph, which, obſtructing the Glands of the Meſentery, is there accumulated, and ſurpriſingly diſtends them. The principal Occaſions of theſe Fevers are the Voracity of Children; Aliments which inſpiſſate the Chyle; Want of thin Liquors for drinking; and expoſing their Bodies to Cold. Theſe Fevers, when they happen, continue for a long time, and are, like other Fevers, ariſing from Obſtructions of the Glands, and an exceſſive Expanſion of their nervous Subſtance, attended with much Danger, and prove fatal, unleſs remov'd by proper Medicines, and a due Regimen. And after the Death of Children, who have been cut off by this Species of Diſorder, the Glands of their Meſentery are generally found preternaturally large, their Inteſtines tumid and inflated, and their Lungs corrupted.

That Species of hectic Fever, which is common and fatal to old Perſons, was, by the *Greeks*, called *Maraſmus*. In it the Body is ſlowly waſted, the Appetite is loſt, the Strength gradually conſum'd, the Bones deprived of their Fleſh to ſuch a Degree, that they ſeem only to form a Skeleton, cover'd with a Skin; the Mouth is dry, the Saliva glutinous, the Skin cold, ſtiff, and dry; the internal Parts are hot, the Pulſe hard and frequent, the Sleep ſhort and unrefreſhing, Reſpiration difficult, the Voice hoarſe, the Tongue dry, and ſometimes cover'd with tough and ſaline Phlegm. All theſe Symptoms gradually increaſe, till at laſt, in about half a Year's time, they put an End to the Patients Lives. This Species of Hectic ſeems to be produc'd in the following manner: Old Perſons, in conſequence of their leading a Life free from Exerciſe, having all their Excretions, eſpecially that from the ſubcutaneous Emunctories, languid, their Bellies coſtive, and through Fear, or for ſome other Reaſons, frequently neglecting their uſual Evacuations of Blood, by theſe means acquire a large Quantity of Blood, and impure Humours: Hence the Circulation of the Juices through the Meſentery, the Omentum, the Liver, Spleen, and Inteſtines, is ſlowly carried on, a Circumſtance ſucceeded by Indurations and Corruptions, which lay a Foundation for chronical Fevers of the worſt Kind.

There is ſtill another Species of ſlow Fever, little adverted to by Authors, and which I call the Stomachic, or Inteſtinal Fever. This Diſorder ariſes from an Eroſion of the Coats of the Stomach and Inteſtines; induced either by an acrid, bilious, and pungent Humour, generated in the Body itſelf, or by taking acrid Subſtances, poſſeſs'd of a corroſive Quality; for 'tis certain, from Experience, that a Cholera, violent Anger, and Dyſenteries, have been ſucceeded by chronical and fatal Fevers. Every one knows, that Poiſon, taken internally, corrodes the Stomach and Inteſtines. *Bartholine*, in *Cent.* 6. *Hiſt.* 21. gives us a Caſe where the Stomach was exulcerated, and a violent Pain produced after eating, by means of a ſtrong Purgative. The ſame Effect is produced by Emetics, imprudently exhibited; as alſo by the purging bitter Salts, either when exhibited alone, in large Doſes, to Perſons of delicate Senſation, or, as ſome raſhly adviſe, mix'd with mineral Waters. Not only the Cauſe and Seat of theſe Fevers are, with Difficulty, diſcover'd, but, alſo, the Cure is hard to be obtain'd; for, as the Coats of the Inteſtines are, in ſome meaſure, injur'd and corroded, every thing taken, eſpecially if in too large a Quantity, or poſſeſs'd of a ſaline or acrid Quality, produces Spaſms, Eructations, and Gripes. The Patient is ſometimes preternaturally coſtive, at other times his Body is too ſoluble. His Body is conſum'd in the mean time: Sometimes a Horror and Rigor, ſometimes a violent Heat, ſometimes a cold, and ſometimes a warm Sweat, attended with a quick Pulſe, ſeize the Patient; and theſe Symptoms return periodically, and are increas'd at ſtated Hours. If theſe Fevers are not ſeaſonably remov'd by proper Remedies, they prove chronical and mortal.

Theſe ſlow and conſumptive Fevers are among the Number of chronical Diſeaſes, and terminate ſooner or later, according to the Conſtitution of the Patient. A ſlow Fever admits of a Cure, if taken in time; but an Hectic is rarely cur'd, and, when of the confirm'd Kind, never. The Signs of Death in an Hectic are, a quick and weak Pulſe, a great Loſs both of the Appetite and Strength; ſo that the Patient can neither move his Body, nor remain in an erect Poſture, an Hippocratic Countenance, a ſmall Diſcharge of Urine, which is red, or oleaginous, and made without a hiſſing Noiſe, a Falling off of the Hair, a Flux, profuſe Sweats, and Swellings of the Feet; for theſe are Proofs partly of the Conſumption, and partly of the colliquative Diſſolution of the Juices. When Perſons who have died of this Species of Fever, are diſſected, an inſuperable Defect is found in their Viſcera; for ſometimes there are Abſceſſes, with large Cavities, found in the Bowels, the Lungs, the Meſentery, the Liver, or Pancreas. Sometimes, alſo, Abſceſſes, or large ſcirrhous Tumors, or thoſe of the ſteatomatous Kind, are found in the Uterus, the Stomach, the Kidneys, and Membranes of the

the Peritonæum; ſometimes Tumors are found in the Glands of the Meſentery, or Tubercles and Impoſtumations in the Lungs, ſcirrhous Tumors of the Liver, Spleen, or Pancreas, a Sphacelus of the Omentum and Inteſtines, and Extravaſations of putrid Humours in the internal Parts.

The Cure.

Since the Seats and Cauſes of conſumptive Fevers are very various, theſe are firſt to be inveſtigated, and the Methods of Cure adapted to them: When, therefore, in conſequence of a bad Digeſtion, and the crude and viſcid Juices of the *primæ Viæ* form'd by that means, ſuch a Fever ariſes after ſome other Diſeaſe, and diſcovers itſelf by the Languor of the Patient, his internal Heat, and his continual Propenſity to ſweat, eſpecially in the Palms of the Hands, and Soles of the Feet; then the principal Intention of Cure is, to free the *primæ Viæ* from theſe Sordes which excite the Fever: This End, according to the Circumſtances of the Patient, may be obtain'd by a gentle Emetic; ſuch as the Root of Ipacacuanha, exhibited either in Powder, or by way of Infuſion: And *Lindanus* informs us, that, in four Days, he cured an Hectic by one Vomit, and the ſubſequent Uſe of *Elixir Proprietatis*: But, if it ſhould be thought more expedient to eliminate the peccant Matter by Stool, and, at the ſame time, to ſtrengthen the Digeſtion; theſe Intentions will be beſt anſwer'd by the neutral or digeſtive Salts, ſuch as the *Terra foliata Tartari*, antimoniated Nitre, *Sal Polychreſtum*, vitriolated Tartar, a Solution of Crabs-eyes, *Sedlitz* Salt, either alone, or mix'd with half the Quantity of Powder of the beſt Rhubarb, exhibited in ſmall Doſes, but frequently, and with a proper Vehicle. The *Pilulæ balſamicæ* of *Becher* are poſſeſſed of the ſame gentle laxative Quality, and may, therefore, be frequently exhibited in ſmall Doſes. When, by this means, the alimentary Duct is cleanſed, Analeptics and Stomachics are to be uſed; as the beſt and moſt efficacious of which, we recommend the Eſſences of Caſcarilla and red Gentian, as, alſo, the ſtomachic Elixir, with Spirit of Salt, or the Spiritus Nitri dulcis, to be taken every Day before Eating; not neglecting, at the ſame time, due Exerciſe, and the Uſe of wholſome Liquors, which are of great Importance in the Cure of Fevers of this kind.

This ſame Method of Cure is highly proper, in the Beginning of thoſe Fevers which ſucceed unſeaſonably ſtopt Intermittents, or Relapſes into them prepoſterouſly check'd: If theſe are ſucceeded by a ſlow Fever, it is moſt expedient to excite the former Fever, eſpecially, if there is a Suſpicion of Infarctions of the Viſcera and Meſentery, as in cachectic and hypochondriac Patients. This was the Method uſed by *Celſus*, who, in the ninth Chapter of his third Book, delivers his Sentiments, in the following Words: "In this Caſe, the principal Care of the Phyſi-"cian ought to be, to change the Diſeaſe; ſince, in all Proba-"bility, this Expedient will contribute to render the Cure more "eaſy. The Patient's Body is, therefore, to be frequently im-"merſed in cold Water, to which a due Quantity of Oil has "been added, ſince, by this means, a Horror is ſometimes ex-"cited, and the Beginning of a new Motion produced: But, "if the Patient has continued long in a cold, torpid, and reſt-"leſs State, it is expedient, even during the Fever, to exhibit "three or four Cyathi of Mulſum, or diluted Wine, with the "Aliments; for, by this means, the Fever is often heighten'd, "and a greater Heat produced; by which the former Sym-"ptoms are removed, the Hopes of Safety obtain'd, and the "Cure promoted. But it is the Duty of every cautious and "skilful Phyſician, ſometimes to renew and increaſe the Diſ-"eaſe, becauſe, by that means, tho' the preſent Diſeaſe is not "cured, yet a future, and a more formidable one may be pre-"vented:" For, as, in intermittent Fevers, a brisk Circulation of Blood is often the beſt means of removing the Cauſe of the Diſorder, ſo it, alſo, removes the Cauſe of a ſlow Fever, which is moſt frequently deeply ſeated in the Interſtices of the ſolid Parts, and, eſpecially, in the meſeraic Glands and Veſſels: Hence, if intermittent Fevers, eſpecially of the quotidian Kind, are ſucceeded by ſlow Fevers, the Intermittent being recalled, which frequently happens, by the free Admiſſion of a cold Northerly Wind, the returning Fever renders the Heat more intenſe, and, by the Aſſiſtance of this, exhibiting, at the ſame time, proper inciding and correcting Remedies, the ſlow Fever is ſucceſsfully removed in due time.

When, in plethorico-cacochymic, cachectic, and ſcorbutic Patients, theſe ſlow Fevers ariſe from an Obſtruction of the menſtrual or hæmorrhoidal Diſcharge; from too great Voracity, a bad Diet, the Abuſe of ſpirituous Liquors, or expoſing the Body to Cold; another Method of Cure is to be taken, and ſuch Medicines are to be uſed, as remove the Obſtructions of the ſanguineous Viſcera, the Liver, Spleen, and Meſentery, the Veſſels, and Glands, and procure a free Circulation of the Blood and Humours thro' the Veſſels of the Abdomen, and, eſpecially, of the Meſentery. For this Purpoſe, nothing is more effectual, than the Uſe of mineral Waters, both of the cold and hot Kind. I have found, from long Experience, that nothing is more efficacious, in the Cure of theſe ſlow Diſorders, than medicinal Springs; and *Thoverus*, in his Obſervations, confirms this Doctrine, by the Succeſs they had on himſelf: Of the hot Kind, the moſt ſalutary are, thoſe of *Embſen* and *Wisbaden*; and, of the cold Kind, the *Selteran*, and thoſe of *Schwalbach*. But theſe muſt be uſed in their proper Orders, at ſeaſonable Times, and in due Quantities, exhibiting, at the ſame time, proper Medicines, to aſſiſt Digeſtion, reſtore a mild and balſamic Quality to the peccant Juices, and promote the Evacuation of the Sordes from the Body. But, where theſe Waters cannot be had, other Medicines are to be uſed, as Succedaneums to them. In their ſtead, I have often uſed, with Succeſs, a Decoction of thin Veal-broth, with the Roots of Succory, Fennel, Aſparagus, Graſs, Dandelion, and Vipers-graſs: Of this, I order the Patient to drink a Pint every Day, for ſome Weeks; taking before it ſome chalybeated Medicine, ſuch as the *Tinctura Martialis*, with the Juice of Apples, Quinces, or Oranges; as, alſo, the *Tinctura Martis* of *Zwelfer*, extracted, with Spirit of Wine, from Vitriol of *Mars*, and the Terra foliata Tartari: The Tincture, alſo, of chalybeated Flowers of Sal Ammoniac, prepared with Bloodſtone, and extracted with pure Spirit of Nitre, which is ſtill better, if impregnated with Orange-peel, is, alſo, of ſingular Efficacy, in Caſes of this Nature: But a proper Regimen, a wholſome Diet, and due Exerciſe, are neceſſary, both during the Uſe of theſe Preparations, and the mineral Waters.

In thoſe ſlow conſumptive Fevers ariſing from a Corroſion of the Stomach and Inteſtines, all acrid, ſaline, acid and ſtimulating Subſtances are as bad as Poiſons. *Rheniſh* Wine, alſo, in conſequence of its Tartneſs, ſweet and fermentable Subſtances, and all Aliments of hard Digeſtion, increaſe them. The Cure of this Species of Fever is highly difficult; nor does it call for any other Medicines, but thoſe of the demulcent and corroborating Kind. I have frequently known good Effects produc'd by a Decoction of Milk, with Saſſafras and Peruvian Bark, or with Chamomile-flowers, and the Tops of Yarrow. A Pint of this Decoction may be exhibited daily. The Roots of Marſhmallows, Broth prepar'd with Milk and Rice, as alſo Gum Tragacanth diſſolv'd in Mint-water, are highly beneficial. Good Effects are, alſo, produc'd by Clyſters of Milk prepar'd with the Yolk of an Egg, and Honey; or other Emollients, with *Fernelius*'s Syrup of Marſhmallows. When the Spaſms of the Abdomen are very violent, they are excellently mitigated, ſays *Hoffman*, by my antiſpaſmodic Pills, prepar'd of the Extracts of Chamomile, Yarrow, Saffron, and Caſtor, together with the Oil of Nutmegs.

In the ſlow and conſumptive Fever, which ariſes in thoſe who have loſt their Strength, and moſt laudable Juices, by long-continued Paſſions, Grief, Care, hard Labour, Watching, Hunger, frequent and unſeaſonable Venery, exceſſive Salivation, the Fluor Albus, a long-continued Gonorrhœa, violent Fluxes, giving too much Suck, or Ulcers which diſcharge a large Quantity of purulent Matter, all Subſtances which throw the Blood into too great Commotions, Purgatives, violent Exerciſe, and too heavy or nutritive Aliments, are highly improper, ſince they rather require Reſt of Body and Mind, and ſuch Medicines and Aliments as are temperate, correct Acrimony, allay Heat, nouriſh gently, and reſtore the impair'd Strength. Among the Medicines of this kind, are Emulſions of ſweet Almonds, Pine-nuts, and the Four greater cold Seeds, prepar'd with a Decoction of Hartſhorn, or Roſe and Cinnamon-water, impregnated with Quinces. Aſſes Milk, or that of Women, or Goats Milk, or Cows Milk boil'd, together with the Juice of River-crabs, the Broth of a young Fowl mixt with Ptiſan, Priſan boil'd with River-crabs, or Wood-tortoiſes bruis'd, according to *Amatus Luſitanus*, *in Cent. 2. Curat.* 53. who cur'd an hectic Patient by the Uſe of Aſſes Milk, and young Fowls fatten'd with Wood-tortoiſes. Some recommend Oyſters, if the Stomach can bear them: And *Lindanus* confirms this, by an Inſtance of a Girl of twenty Years of Age, who, from a Fault of her Lungs, becoming hectic, by a continual and long-continued Uſe of Oyſters was ſo perfectly recover'd, that ſhe liv'd long, and bore eight Children. A ſmall Quantity of Wine ought only to be drank, and that of the Neckarine, or Moſelle kind, mixt with Water. Moderate Exerciſe, alſo, by Geſtation, or ſlow Walking, is only to be us'd.

When Fevers of this kind ariſe from an Abuſe of intoxicating Liquors, ſuch as Wine, Brandy, Aqua-vitæ, burnt Wine, and ſtrong Ales, together with a decaying State of Body, then all heating, ſpirituous, and analeptic Subſtances are to be abſtain'd from, as alſo, Stomachics, ſuch Things as reſolve Phlegm, and the drinking of Malt Liquors; but let the Patient uſe, for Drink, a Decoction of Oats, prepar'd, in *Lower*'s manner, of Oats, Succory-root, the Flowers of wild Poppey, and a little antimoniated Nitre. See Cura Avenacea. Whey, with a little Nitre and Butter-milk, are of ſingular Service, and have much aſcrib'd to them by *Pieus*, *de Febr.* Part 2. and *Barbatus*, *de Sanguine & Sero*. Patients, of this kind, alſo, receive conſiderable Advantage from Ptiſans, prepar'd with Barley and Succory. And *Borelli*, in *Cent.* 4. *Obſervat.* 89. affirms, that many hectic Patients have been reſtor'd by the Uſe of Preparations of Barley alone. Thinner Emulſions may alſo be of conſiderable Service, as alſo gelatinous Subſtances, with an Addition of Citron-juice.

If,

If, as it frequently happens, theſe Fevers ariſe in Women from a ſudden Suppreſſion of the Menſes, by drinking cold Liquors, Refrigeration, or Frights, a Vein in the Ancles is to be quickly open'd; ſome reſolvent Decoction, of Succory-root, the Herb Sow-thiſtle, the Flowers of the leſſer Daiſy, and Elder, is to be exhibited; and the Uſe of the more draſtic Emmenagogues is to be abſtain'd from. But if a ſlow or hectic Fever, ariſing from this Cauſe, ſhould have already afflicted the Body for a long time, with a Conſumption and Heat, Veneſection is ſo far from being adviſeable, that it is juſtly to be condemn'd, becauſe it impairs the Strength too much. When, after Child-birth, the Menſes are totally ſuppreſs'd, and a genuine Hectic form'd, together with an Atrophy, Cough, Diarrhœa, Pain of the Breaſt, univerſal Languor, and a ſlow conſuming Heat, we are not to uſe ſuch Medicines as promote the Menſes, ſince the Symptoms indicate the Uſe of ſuch as are directly the contrary. The ſame holds true, with reſpect to that conſumptive Fever ariſing from a Retention, or Obſtruction, of the hæmorrhoidal Diſcharge; for, in this Caſe, if the Strength and Juices are conſum'd, it is abſolutely imprudent to attempt to recall the Diſcharge by Evacuants, forcing Preparations of Aloes, or Veneſection in the Foot; for by theſe means I have obſerv'd that the Diſcharge of a ſufficiently fluid and red Blood has been procur'd; but, ſoon after the Fever was increas'd, the Strength more impair'd, the Sleep diſturb'd, and the Diſorder made to terminate ſooner in Death, than it would otherwiſe have done.

That Species of Hectic, which is incident to old Perſons, and known by the Name of *Maraſmus*, is more eaſily prevented, than cured. But ſince it is obvious, from accurate Obſervation, that the conſumptive Fevers of old Perſons may ariſe from two Cauſes; that is, from a Plethora, or rather a large Quantity of thick Blood ſtuffing and obſtructing the abdominal Viſcera and Meſentery; or from a Cacochymy, when there is a Redundance of impure and ſaline Serum, in conſequence of its too languid Secretion, eſpecially thro' the Skin; theſe two Cauſes muſt have preſervative Meaſures adapted to their reſpective Natures. Thus, if an old Perſon, addicted to a ſedentary and unactive Life, who ſtill enjoys a good Appetite, ſhould, by omitting his uſual Evacuations of Blood, or by the Stoppage of ſpontaneous Excretions, incur the Hazard of falling into a ſlow continual conſumptive Fever; the Phyſician's firſt Buſineſs is, to diminiſh the Quantity of the Blood, by ſeaſonable Veneſection, then to order the Patient to drink large Quantities of diluting wholſome Liquors, to abſtain from all too nutritive Aliments, and to uſe proper Exerciſe. But if the Juices of old Perſons abound with impure Particles, and ſuch as are oppoſite to their mild and natural Qualities, nothing elſe is to be done, than by the mildeſt Laxatives, ſuch as Preparations of Rhubarb, Manna, and Raiſins, to evacuate the Sordes which foment the Peccancy of the Humours, and again to generate temperate and laudable Juices, by means of Jellies, and Preparations of Milk; and eſpecially by Aſſes-milk, which is highly ſalutary to old Perſons, on account of its demulcent, aperient, and gently evacuating Quality.

That ſlow Fever, which is incident and fatal to Infants and Children, is principally ſubſequent to the Small-pox and Meaſles. In this Species of Fever the Abdomen becomes tumid, and the ſuperior Parts are waſted. Upon diſſecting thoſe who have dy'd of it, the Meſentery is generally full of hard, ſcirrhous, and ſteatomatous Tumors, eſpecially about the Veins which run to the Vena Portæ. The Lungs, are, alſo, found full of Tubercles and Impoſtumations. In this Diſorder, Prevention, if poſſible, is more eligible than any Attempts for a Cure, which are generally unſucceſsful, and in vain. But that Conſumption which ariſes in Children from too great Voracity, and expoſing their Bodies to Cold, admits of a Cure. And, in this Caſe, I know of no more effectual Means of Relief, than the external Uſe of temperate Baths of ſweet Water, continued for ſome time. And, internally, in order to remove the Obſtructions of the Glands, the meſeraic and lacteal Veins, we recommend ſmall, but frequent Doſes of the ſaline, aperitive Liquor prepar'd of Salt of Tartar, Nitre, and the *Arcanum Duplicatum*, mix'd in equal Quantities, adding half the Quantity of Sal Ammoniac to be drank, diſſolv'd in a due Quantity of Ale.

But, in every Hectic, the principal Intention of Cure is, to reſtore that laudable Moiſture which the continual Heat carries off not only from the Blood, but alſo from the ſolid Tubes, and, together with it, at laſt, the Fat and Fleſh. This End is moſt effectually anſwer'd by Aliments of a medicinal Quality, the moſt efficacious of which is Milk: For, according to *Hippocrates*, in the ſixty-fourth Aphoriſm of his fifth Section, "Milk is highly proper for conſumptive Perſons, when not very feveriſh: It is "alſo good for Perſons labouring under long and lingering "Agues; as alſo for thoſe who are much waſted, without any "apparent Reaſon." But the Milk which moſt ſpeedily reſtores the conſum'd Moiſture, and extinguiſhes the Heat, is Womens Milk ſuck'd immediately from the Breaſt, and not vitiated by the Air; by which *Foreſtus*, in the tenth Obſervation of his fifth Book, informs us, he knew a Hectic perfectly cur'd. Aſſes-milk is leſs nouriſhing, but it is more cooling, allays Heat, abſterges, and is aperient. *Ballonius*, in *Lib.* 1. in his Advice to an illuſtrious Prince, who was much diſpos'd to a Conſumption, highly extols the Virtues of this Milk. *Cardan* tells us, "That it is not to "be doubted, but the Safety of conſumptive Perſons depends "on the Uſe of Aſſes-milk." And *Aretæus*, in his ſecond Book *de Cur. Acut.* directs the Cure of a Conſumption, in the following Words: "When any one falls into a Conſumption, it is not "expedient to triſle away Time, in recommending Reſt, and a "ſlender Diet; but the Patient muſt uſe Exerciſe, Frictions, "Geſtations, and Baths, in order to preſerve his Life, and reſtore his Vigour. Milk, eſpecially that of a Woman lately "deliver'd, is alſo to be uſed; for ſuch Patients require Aliments "of a like Nature with new-born Children: If a ſufficient Quan"tity of Womens Milk cannot be had, that of a new-milch'd "Aſs, which is thin and fluid, is to be ſubſtituted." The Milk of Goats or Cows is more nutritive, but is heavier, and contains more of a cheeſy Subſtance; for which Reaſon it is to be corrected, leſt it ſhould prove injurious to the Stomach.

I cannot forbear approving, as the beſt of all others, that Method of uſing Milk, recommended by *Hippocrates*, in his Treatiſe *de internis Affectionibus*, in the following Words: "Aſſes-milk "boil'd, in order to purify it, is to be exhibited; the Patient, is, "alſo, to drink unboil'd Cows-milk, mixed with a third Part of "Hydromel, and a due Quantity of Origanum, for forty-five "Days." This ſagacious Author every-where judiciouſly recommends boiled Aſſes-milk, as a gentle Purgative; becauſe it contains a ſweet kind of Salt, reſembling Sugar, which is gently abſtergent and laxative, and, which is more concentrated by the Diſſipation of the Moiſture by Boiling. *Hippocrates*, no doubt, recommended the Addition of the Origanum, with a View to ſtrengthen the Stomach, and corroborate the weaken'd nervous Syſtem. If Aſſes-milk cannot be had, I generally order, for two or three Mornings, a Pint of Milk from Cows fed with proper Herbs; with an Ounce of Manna, or Sugar of Roſes, or Conſerve of Roſes, diſſolved in it. After this, I order a Pint of the Milk to be drank every Morning, only with the Addition of an Ounce of Sugar, and half a Dram of Nitre, according to the Circumſtances of the Patient; eſpecially, when there is a Suſpicion of ſome Fault in the Meſentery, or of an internal Exulceration of the Viſcera, I order, to mix with the Milk, an half, or a third Part, either of pure Water, or, which is better, of *Selteran* mineral Water: When the *Selteran* Water cannot be had, I order an Infuſion to be prepar'd of common Water, with Paul's-betony, Sow-thiſtle, Lungwort, Liverwort, Tree Lungwort, Colts-foot, Ground-ivy, Spleenwort, Maidenhair, Flowers of St. John's-wort, and Roſes: This Infuſion is to be drank warm, with an equal Quantity of Goats or Cows-milk, with an Addition of Sugar; and, in order to render it more abſtergent, of a few Drops of Oil of Tartar per Deliquium. This Method is to be perſiſted in for ſix Weeks at leaſt, abſtaining, in the mean time, from every thing which may either coagulate the Milk, or overload and weaken the Stomach. Wine is, alſo, to be carefully abſtain'd from; only, in order to cheriſh the Stomach, a ſmall Quantity of *Hungarian* Wine, or of Hydromel made of *Pruſſian* Honey, may be allow'd.

But, before we preſcribe the Uſe of Milk, we are to examine, whether the Stomach is capable of bearing it, becauſe it will not agree with ſome Perſons: I have alſo obſerv'd, that thoſe who are accuſtom'd to Wine, or drink large Quantities of Ale, cannot commodiouſly bear Milk; nor is it proper for hypochondriacal Patients, and ſuch as labour under a violent Fever, accompanied with a Head-ach. If the Stomach is languid, and the meſeraic Veſſels obſtructed, Milk ſoon corrupts, becomes vapid, and produces terrible Diſorders. We are, therefore, to take care, that it may not remain in the Stomach; to prevent which, *Galen*, in his tenth Book, *De Medicam. Simpl.* orders it to be boil'd, and ignited Steel, or red-hot Flints, to be immerſed in it. The ſafeſt is Aſſes-milk, abounding with Serum, and containing little of a cheeſy Subſtance: This *Galen* prefers to all other kinds of Milk, in a Hectic. And *Hoffman* has wrote a Diſſertation, *De Mirabili Lactis Aſinini Uſu in Medendo.* If a ſufficient Quantity of Aſſes-milk cannot be had, ſweet Whey, properly prepar'd, may be uſed in its ſtead. Some diſtil Whey *in Balneo Mariæ*, and highly recommend the Water drawn off, both for Drinking, and, as an excellent Vehicle for other Medicines.

Beſides, in this Species of Fevers, we are to take all poſſible Care, both to keep the Craſis and Mixture of the Blood free from the intimate Diſſolution and Colliquation of its Elements, threaten'd by the continual Heat, and to preſerve a due Equilibrium, or Balance, between the Heat and the Moiſture. This Intention is moſt effectually anſwer'd by the Uſe of the gentle Aſtringents and Corroboratives every-where recommended by Phyſicians; ſuch as the Tinctures, or, rather, the Solutions, of Corals, or Mother of Pearl, with ſome ſubtile Acid, of a Quality friendly to Nature; ſuch as the Juices of Citrons, Barberies, *Seville* or *China* Oranges; the Tincture of Roſes, prepar'd with Roſe-water; and the Phlegm of Vitriol is, alſo, highly beneficial: The *Species de Hyacintho*, with a few Grains of Coral and Nitre, are gently aſtringent, corroborative, and effectual, for checking colliquative Sweats. A temperate balſamic Elixir, prepar'd

par'd from temperate reſinous Gums and Extracts, without Spirits of Wine, is, alſo, of ſingular Efficacy: Nor are we to omit the Bark of Caſcarilla, and the *Peruvian* Bark, made into the Form of an Electuary, with the Syrup of Citron-juice, or that of the *Indian* Nut, and the Addition of a due Quantity of Nitre; Red Oker, made up with Conſerve or Julap of Roſes, is, alſo, of ſingular Service. All theſe Medicines, provided the Impurities of the Fluids, and Faults of the Veſſels, are previouſly remov'd, are of ſingular Efficacy, and their Uſe highly to be approv'd of.

But the Preparations of Lead, recommended by the Chymiſts, for allaying hectic Heats, and checking Sweats, by no means deſerve the Encomiums beſtow'd on them; ſince, in conſequence of their aſtringent metalline Quality, they prove unfriendly to the Nerves, deſtroy the Tone of the Stomach and Inteſtines, and, by theſe means, do more Injury than Good. Hence we are, in theſe Caſes, to reject the Sugar of Lead, and the celebrated Preparation of it, commonly called the *Tinctura Antiphthiſica Germanorum*. But the *Antihecticum Poterii*, if prepar'd of pure Tin, Nitre, and Antimony, and exhibited with Emulſions, is ſo far from being ſo prejudicial as ſome think it, that it proves highly beneficial, in conſequence of its mild, corroborating, and diaphoretic Quality. Nor is Tin offenſive to the Nerves, by reaſon of the mild Sulphur it contains; nor aſtringent, which Lead is. The judicious *Muraltus*, in *M. N. C. Dec.* 2. *An.* 1. *Obſ.* 109. gives us his Opinion of this Medicine, in the following Words: "The *Diaphoreticum Joviale*, or the "*Antihecticum Poterii*, is of ſingular Service in correcting the "Acrimony of the Humours, which irritates the Nerves: This "Medicine, alſo, corroborates the Uterus, and often renders "thoſe who are emaciated and weak, robuſt, and full of Fleſh."

In ſlow and hectic Fevers, Baths are frequently recommended, eſpecially by the Antients. *Sennertus*, from *Galen*, deſcribes the Method of uſing them, at large: But, omitting all other Authorities, we ſhall only quote a Paſſage of *Proſper Alpinus*, from his ſixth Book, *De Med. Method.* relating to the various Uſes of Baths, and which runs thus: "Among external Remedies, "Baths, either of ſweet Water, or impregnated with Marſh-"mallows, Mallows, Violets, or other Subſtances of a like "Nature, are highly proper. In *Egypt* they prepare tepid Baths "for the Grandees, of the Milk of Aſſes, Camels, or Mares. "Epithems and Unctions are, alſo, recommended. Among "Baths, both thoſe of the tepid and cold Kind are beneficial; "the former moiſten the ſolid Parts, digeſt peccant and recre-"mentitious Humours, promote a due Perſpiration, and even, "by their gentle Warmth, allay the Heat of the Body; whereas "the latter, that is, cold Baths, refrigerate, condenſe the Skin, "and, by augmenting the Heat, increaſe the Strength. But it is "not ſafe for highly extenuated and languid Patients to uſe very cold "Baths, ſince, inſtead of augmenting the Heat, they will extinguiſh "it; becauſe it is already too weak and languid: But, they are high-"ly beneficial to robuſt Patients, who may uſe them twice a Day, "in the Morning and Evening before Meals: Weak Perſons ought "only to uſe them once a Day. Some are of Opinion, that mo-"derately cold Baths are both more ſafe and uſeful, than ſuch "as are exceſſively ſo: For this Reaſon, they firſt put the Patient "into a moderately warm Bath, and afterwards into one mo-"derately cold, ſo that it only appears to be rather tepid. The "*Egyptians* and *Arabians* uſe Baths, of the Water of the *Nile*, "and of the Milk of Camels, Aſſes, or Goats; they, alſo, "apply to the Thorax, Liver, Stomach, and Kidneys, Epithems "prepar'd of Milk, warm Oil of Roſes or Violets, the Juices of "the Ruſh, Lettuce, Endive, Purſlain, Polygonum, Water-len-"til, white Water-lily, and other Subſtances of a like Nature, "adding a little Milk and Saffron, to render them of a more "penetrating Quality." But, with reſpect to Baths in general, it is to be obſerv'd, that they are advantageouſly uſed in the Beginning of the Diſeaſe, and when it ariſes from a Loſs of Strength, as, alſo, in the ſlow Fevers of Infants, becauſe they are of an emollient and demulcent Nature, and, at once, relax and moiſten the rigid Fibres: But in the Progreſs of the Diſeaſe, and when internal Abſceſſes and Exulcerations are already form'd, they are of no Service.

One of the moſt conſiderable and efficacious Means of removing theſe chronical and troubleſome Fevers is Exerciſe. Among the Antients, *Hippocrates* and *Aretæus*, for the Cure of a Conſumption, highly extol'd various Kinds of Exerciſe, ſuch as Walking, Riding, Geſtation, Travelling, and Sailing. *Hippocrates*, in the thirty-fourth Book of his Treatiſe *de internis Affectionibus*, orders, that "If the Patient is ſtrong, he ſhould "for thirty Days be employ'd in cutting Wood, uſe ſufficient "Exerciſe, or walk by Day, ſetting apart the Night for Repoſe "and Reſt." But the moſt ſalutary and commodious Species of Exerciſe is Riding on Horſeback, or in a Chariot; during which, the Circulation and Progreſs of the Blood thro' the Meſentery is excellently aſſiſted by the continual Succuſſions of the Body. *Sydenham* and *Morton* are very diffuſe in their Praiſes of Riding, and its Advantages; and the former of theſe Authors does not heſitate to affirm, that, in hectic Diſorders, Riding is a kind of Specific, as infallible as Mercury in the *Lues Venerea*, or the *Peruvian* Bark in intermittent Fevers: And *Morton*, in his *Exercitat. de Phthiſ.* uſes the following Words: "There is no "more efficacious Remedy than daily Riding, protracted to "moderate Sweating, in ſlow and hectic Fevers, eſpecially "when ariſing from any Fault of the Stomach, or, perhaps, "from the prepoſterous Treatment of intermittent Fevers; the "exceſſive or unſeaſonable Uſe of fixing, aſtringent, and pre-"cipitating Subſtances; or from Drinking cold Liquors, when the "Body is over-heated, the preternatural Heat excited by which "preys upon the laudable Juices of the Body; or from the "acid, tough, and viſcid Saburra of the Stomach and Inteſtines, "preternaturally obſtructing the Paſſages; for, by the equable "Succuſſion of Riding, the viſcid Lentor, or vapid and lifeleſs "Chyle, with which the Body is ſtuffed, is reſolved and elimi-"nated from the Body, that the Appetite may be reſtored, and "a new and more laudable Chyle elaborated. But it is proper to "obſerve, that briſk and frequent Riding is highly beneficial in "ſlow Fevers; whereas moderate Riding is beſt ſuited to thoſe "of the hectic Kind, properly ſo called."

In theſe ſlow and conſumptive Fevers, the Meaſures of Relief are to be taken with all Expedition; for, when the Opportunity is neglected, when either Phyſician or Patient commits an Error, or when the Diſorder is long protracted, the Cure is in vain attempted, and the Diſtemper generally degenerates into a fatal Hectic. Thoſe who already labour under Fevers of this kind, find themſelves always worſt in the Autumn; becauſe, at this Seaſon, Nature is moſt faint and languid in performing the Offices of Secretion and Excretion. Beſides, ſince there are generally, about the Equinoxes, ſudden and unſalutary Changes of the Weather and Atmoſphere, Patients of this kind are not only for the moſt part worſt; but, alſo, die of incurable Hectics. It is, therefore, neceſſary, that about theſe Seaſons, they obſerve a ſtrict and proper Regimen, preſerve an eaſy State of Mind, and apply to ſome judicious Phyſician for Advice. *Frederic Hoffman.*

HEDERA.

The Characters are;

The paraſitic Tendril ſends forth Fibres, or Roots, into any thing they come near, capable of ſuſtaining them: The Leaves are angular; the Flower roſaceous, and, generally, hexapetalous; the Ovary, at the Bottom of the Flower, becomes a round Berry, pregnant with Seeds, which are gibbous on one Side, and flat on the other.

Boerhaave mentions four Species of this Plant; which are,

1. Hedera; arborea. *Offic. C. B. P.* 305. *Tourn. Inſt.* 613. *Boerh. Ind. A.* 2. 231. *Hedera corymboſa.* Ger. 708. Emac. 858. *Hedera Arborea ſive ſcandens & corymboſa nigra.* Park. Theat. 678. *Hedera communis major.* J. B. 2. 111. Raii Hiſt. 2. 1505. Synop. 3. 459. IVY.

The Leaves of Ivy, while they run upon the Ground, are more angular and corner'd; but, when the Stalks riſe up, and are faſten'd to a Wall or Tree, they become rounder, ending in one Point: Whence moſt of the old Botanic Writers have made two Species; that with the corner'd Leaves, becauſe it bore no Fruit while it lay on the Ground, they called *Helix*, or barren Ivy; and the other *Corymboſa*: The Leaves of both are of a firm Texture, and a dark-green Colour; thoſe of the firſt frequently full of ſmall white Veins: The Branches inſinuate themſelves, by ſhort Cirrhi, into a Wall, or the Body of a Tree, that it climbs on: The Flowers grow in Corymbi or Umbels, conſiſting of ſmall ſix-leaved yellowiſh Flowers, follow'd by round umbilicated Berries, black, when ripe; including ſeveral angular Seeds. Ivy grows every-where in Hedges, and flowers late in the Year; the Berries being not ripe till *January*, or later.

The Leaves are ſeldom or never uſed inwardly; but, outwardly, they are applied to Iſſues, to keep them cool, and free from Inflammations; as, alſo, to Scabs, and Sores, and ſcald Heads. Mr. *Boyle*, in his Uſefulneſs of experimental Philoſophy, commends a large Doſe of the full-ripe Berries, as a Remedy againſt the Plague; tho' *Schroder* ſays, they purge upwards and downwards. The Gum of Ivy is ſomewhat cauſtic, and commended to take away Spots and Freckles out of the Face. *Miller's Bot. Off.*

The Gum is a reſinous, dry, hard, and compact Subſtance; of a bay Colour, inclining to that of Gold, ſhining like Glaſs, but not pellucid; of a ſubacrid and ſubaſtringent Taſte, and fragrant Smell.

Geoffroy ſays, it is neither cauſtic nor depilatory, as the Antients imagin'd; but a powerful Reſolvent and Diſcutient, in which Intentions it is an Ingredient in ſeveral Plaiſters.

Dale ſays, that the Leaves are heating, drying, and ſubaſtringent.

2. Hedera; major; ſterilis. *C. B. P.* 305.

3. Hedera; communis; minor; foliis ex albo & viridi variis. *Hedera, Arborea. C. B. P.*

4. Hedera; monophyllos; Convolvuli foliis; Virginiana. *Pluk. Phyt.* 36. 2. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 231.

HEDERA TERRESTRIS. See CHAMÆCLEMA.

HEDERA TRIFOLIA. See TOXICODENDRON.

HEDERACEUS, or HEDERARIUS. An Epithet for the *Vaſa Præparantia*, or *Plexus Pampiniformis*; conſiſting of the ſpermatic Vein and Artery, in their Progreſs to the Teſticles.

HEDERULA. A Name for the *Lenticula*; *Aquatica*; *trifulca*.

HEDRA, ἵδρα. The *Anus*, or, ſometimes, the Excrement thence excreted. It, alſo, ſignifies the Baſis or Stool of an Abſceſs, that is, the Part ſubjected to that which is converted into Matter. It imports, further, in *Hippocrates*, a Species of Fracture. See FRACTURA.

HEDRICOS, ἱδρικός. An Epithet for Remedies appropriated to the *Anus*. *Paulus Ægineta*, *L.* 3. *C.* 59.

HEDYCHROI, ἡδύχροι. A Name for certain Paſtils or Troches, invented, as is ſaid, by *Andromachus*; and deſcrib'd by *Galen. de Antid*, *L.* 1. *C.* 10. and *de Theriaca ad Piſon. C.* 13. *Paulus Ægineta*, alſo, deſcribes them. *L.* 7. *C.* 11. They are only uſed for the *Theriaca Andromachi*. According to the *London* Diſpenſatory they are thus prepar'd.

Take of yellow Sanders, of the Leaves of Marjoram and Marum, and of Aſarum-roots, of each two Drams; of Valerian, Coſtus, Calamus Aromaticus, Aloes-wood, Cinnamon, Schœnanth, and Opobalſam, or Oil of Nutmegs by Expreſſion, of each three Drams; of Caſſia-wood, Indian Leaf, or in its Defect Mace, *Indian* Spikenard, Myrrh, and Saffron, of each ſix Drams; of Amomum, or the leſſer Cardamoms, one Ounce and an half; of Maſtich, one Dram; of Canary, a ſufficient Quantity: Let the Myrrh be diſſolved in Wine, and then the Saffron and Maſtich be well ſtirred in with it; afterwards put in the Opobalſam, and mix the other Ingredients, reduced to a fine Powder, with the Whole; and pour upon them Wine enough to make them into thick Troches, which are leiſurely to be dried.

HEDYOSMOS. A Name for Mint, on account of its ſweet Smell.

HEDYPNOIS.

The Characters are;

The Calyx of the Flower is like a fluted Pillar, or Melon: The little Leaves of the Flower-cup, when the Flower is fallen off, embrace, each of them, one ſingle umbilicated Seed; but in the Middle of the little Head are other naked Seeds, which form an Head.

Boerhaave mentions four Species of this Plant; which are,

1. Hedypnois; annua. *T.* 478.

Lemery, in his *Traité Univerſel des Drogues*, ſays, this Species of *Hedypnois* is accounted aperitive, detertive and vulnerary.

2. Hedypnois minor; Cretica; annua. *T. Cor.* 36.

3. Hedypnois; annua; capite maximo.

4. Hedypnois; quod Cichorium; ſemine adunco; flore triplo majore; capitulis minoribus. *Ind.* 27. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 92.

In the *Hiſtoria Plantarum*, attributed to *Boerhaave*, it is ſaid, that they agree in Virtues with the Succory.

Hedypnois is alſo a Name given to the *Dens Leonis*; *latiore folio*.

HEDYSARUM.

The Characters are;

The Flower is collected into a Head, or Spike; the Pod is articulated, and undulated, and each Articulation contains a Seed.

Boerhaave mentions eight Species of this Plant, none of which have any medicinal Virtues attributed to them, except the third, which is the Hedyſarum; Clypeatum; flore ſuaviter rubente. *Tourn. Inſt.* 401. *Boerh. Ind. A.* 2. 51. *Hedyſarum Clypeatum.* Ger. Emac. 1235. Raii Hiſt. 1. 929. Park. Parad. 339. *Onobrychis ſemine Clypeato, aſpero major.* C. B. P. 350. *Aſtragalus Romanus ſive Hedyſarum Clypeatum ſiliqua aſpera.* J. B. 3. 315. FRENCH HONEYSUCKLE.

This is cultivated in Gardens; flowers in *July*; and is eſteem'd deobſtruent and vulnerary.

Hedyſarum minimum Dalechampii. A Name for the *Fœnum Græcum*; *ſylveſtre*; πολυκεφάτιον; *minus*; *Monſpelienſe*.

HEDYSMA, ἥδυσμα. Whatever is mix'd with Aliments, or Medicines, whether liquid or ſolid, whether deſtin'd to external or internal Uſe, in order to communicate to them an agreeable Smell, or Taſte.

HEL. The ſame as Mel. *Rulandus.*

HELCOMA, or HELCOSIS, ἕλκωμα, or ἕλκωσις. An Exulceration.

HELCOS, ἕλκος. An Ulcer.

HELCOSIS. See HELCOMA.

HELCYDRION, ἑλκύδριον. A ſmall Ulcer, or ulceroſe Puſtule.

HELCYSMA, ἕλκυσμα. The Scoriæ of Silver, called alſo *Encauma*. *Dioſcorides*, *L.* 5. *C.* 101. ſays, that it is poſſeſs'd of the ſame Virtues as the *Molybdæna*, and that it is uſed in cicatrizing Plaiſter, being ſtyptic, and epiſpaſtic.

HELCYSTER, ἑλκυστὴρ, from ἕλκω, to draw. A Hook for extracting the Fœtus.

HELEAGNUS. A Name for the *Gale*; *Frutex Odoratus Septemtrionalium.* See GALE.

HELENIASTRUM. Baſtard Elecampane. *Miller* takes notice of two Sorts, both Natives of *America*. I know no medicinal Virtues attributed to either.

HELENIUM. *Boerhaave* makes this a Species of the *After*: But, according to *Miller*, the Characters are;

It hath a radiated Flower, whoſe Florets are Hermaphrodite, but the Semiflorets are Female; both theſe are yellow; the Ovaries, which reſt on a naked Placenta, are crowned with a Down: All theſe Parts are included in a ſcaly Cup. To theſe Notes may be added, the Leaves growing alternately on the Stalks, and the Flowers grow on the Top of the Branches.

Enula campana, *Helenium.* Offic. *Helenium.* Ger. 649. Emac. 793. Raii Hiſt. 1. 273. Synop. 81. *Helenium vulgare.* C. B. 276. *Helenium ſive Enula campana.* J. B. 3. 108. Park. 654. *After omnium maximus*, *Helenium dictus.* Tourn. Inſt. 483. Boerh. Ind. A. 94. ELECAMPANE.

This is a very large Plant, having great thick Roots, divided into ſeveral Branches, brown without, and white within, of a very ſtrong Scent. The lower Leaves are very long and large, ſoft and hairy underneath, and green above; broadeſt in the Middle, and ſharp-pointed at the End: It has ſometimes one, ſometimes more Stalks, which are divided, toward the Top, into ſeveral Branches, and grow to be four or five Feet high, having the Leaves ſet on without Foot-ſtalks, ſhort and broad at the Bottom, and ending ſharp-pointed. The Flowers grow on the Tops of the Stalks, they are larger than any Marigold, and near as big as a Sun-flower, conſiſting of a great Number of long and very narrow Petala, ſet about large brown fiſtular Thrums, which paſs away into Down, containing ſlender longiſh Seed.

It grows in moiſt Fields and Meadows, in ſeveral Parts of *England*; and is pretty much planted in Gardens, for the ſake of the Roots, which are only uſed.

The Roots of Elecampane are pneumonic, carminative, ſudorific, and alexipharmic; of great Service in Shortneſs of Breath, Coughs, Stuffing of the Lungs, and in infectious and contagious Diſtempers: They are good for the Stone, and Stoppage of Urine; and promote the menſtrual Flux, and to that End are mix'd with Chalybeats; they are, alſo, good for the Gout and Sciatica; outwardly they are uſed for the Itch, either the Juice or Powder mix'd with a proper Ointment.

Its Root is acrid, bitter, a little glutinous, aromatic, gives a faint Red to blue Paper, and ſmells like dry'd Orrice.

By the chymical Analyſis, beſide ſeveral acid Liquors, it yields a great deal of Oil, a little of an urinous Spirit, no concreted volatile Salt, the Leaves a good deal; ſo that this Plant ſeems to act by an oily volatile Salt, the Sal Ammoniac of which is not entirely diſengaged, and is greatly loaded with Sulphur.

The Root is ſtomachic, pectoral, diuretic, and provokes the Menſes: It is uſed in Ptiſans, Decoctions, and Apozems, for the Aſthma, inveterate Coughs, Dropſy, and Cachexy. There is a Confection made of theſe Roots, and they are boiled in Muſt, or Wort. Elecampane-wine ſtrengthens the Stomach, cures the Jaundice, provokes Urine, and protects one from the Injuries of a bad Air. The Extract has the ſame Virtues. Externally applied, they are reſolvent, and good for Diſeaſes of the Skin; they give Name to the *Unguentum Enulatum*, in which Mercury is ſometimes uſed. They are uſed in Ointments for the Itch. *Martyn's Tournefort.*

Miller enumerates thirty Species of this Plant.

UNGUENTUM ENULATUM. *Ointment of Elecampane.*

Take of Elecampane-root, boiled in Vinegar, beat and pulped through a Sieve, one Pound; of Turpentine waſhed in the ſame Decoction, two Ounces; of yellow Wax, one Ounce; of old Hog's Lard ſalted, and of old Oil, of each four Ounces; of common Salt, half an Ounce: Let the Lard, Wax, and Oil, melt together; and afterwards add the Turpentine, the Pulp of Elecampane, and Salt, finely powder'd, ſo as to make all together into an Ointment, S. A.

UNGUENTUM ENULATUM CUM MERCURIO.

Ointment of Elecampane, with Mercury.

This is made of the foregoing Ointment, with the Addition of two Ounces of Quick-ſilver, firſt very well kill'd, or incorporated with a ſufficient Quantity of Turpentine.

HELIOSELINUM. See APIUM.

HELIACUM, ἡλιακόν. An Epithet for the κῦρι μίγμα, the large *Cybi*, deſcribed in *Paulus Ægineta*, *L.* 7. *C.* 22.

HELIANTHEMOIDES. The Name of an *American* Plant, which grows near *Suriaam*, mention'd by *Boerhaave*. But I know no medicinal Virtues it is poſſeſs'd of.

HELIANTHEMUM.

The Characters are;

The Leaves are generally conjugated; the Flower-cup conſiſts of three Leaves; the Flower is pentapetalous, roſaceous, leſs

leſs than that of the Ciſtus, but in other Reſpects the ſame: The Fruit is almoſt globous, tricapſular, and divides into three Parts, as into ſo many rigid carinated Leaves; the Seeds are roundiſh, and fix'd to ſmall Capillaments.

Boerhaave mentions fifteen Species of this Plant; which are,

1. Helianthemum; vulgare; flore luteo. *J. B.* 2. 15. *Tourn. Inſt.* 248. *Boerh. Ind. A.* 276. *Panax Chironium, Helianthemum.* Offic. *Chamæciſtus vulgaris flore luteo.* C. B. P. 465. Raii Hiſt. 2. 1013. *Helianthemum vulgare.* Park. Theat. 656. Raii Synop. 3. 341. *Helianthemum Anglicum luteum.* Ger. 1100. Emac. 1282. DWARF SUN-FLOWER.

All Authors look upon this Species of *Helianthemum* to be vulnerary. *Tabernæmontanus* made an excellent Gargariſm of of it for the Diſeaſes of the Throat; he ordered this Plant to be boiled in Wine, and added to it a little Roch-alum. *Martyn's Tournefort.*

It grows in mountainous Places, and flowers in *June* and *July*.

The Root, taken internally, is good againſt the Bites of Serpents; and the Tops are effectual for the ſame Purpoſe. The Plant is aſtringent, and a good Demulcent, in the Form of a Decoction, particularly in Diarrhœas, Hæmorrhages, and Diſeaſes of the Fauces. *J. Bauhine* ſays, it is good in all Diſorders attended with a Flux of any Kind whatever.

2. Helianthemum; Ledi folio. *T.* 249.

3. Helianthemum; foliis majoribus; flore albo. *J. B.* 2. 16. *Chamæciſtus, vulgaris, flore albo majore.* C. B. P. 466.

4. Helianthemum; Lavendulæ folio. *T.* 249.

5. Helianthemum; flore albo; folio anguſto, hirſuto. *J. B.* 2. 17. *Chamæciſtus, folio Thymi incanis.* C. B. P. 466. *Chamæciſtus*, IV. Cluſ. H. 74.

6. Helianthemum; foliis Roſmarini, ſplendentibus, ſubtus incanis. *T.* 250.

7. Helianthemum; annuum; anguſtifolium; florum pedunculis cornucopioidibus. *H. Cath.*

8. Helianthemum; Salicis folio. *T.* 249.

9. Helianthemum; folio Pervincæ, ſubtus argenteo, pubeſcentibus fimbriis; flore luteo.

10. Helianthemum; Orientale fruteſcens; folio Oleæ, flore luteo. *Sher.*

11. Helianthemum; folio Roſmarini latiore, ſplendente, utrinque viridi; flore pallido.

12. Helianthemum; folio Roſmarini, viridi; floſculo parvo luteo; fructu in Calyce veſicario recondito.

13. Helianthemum; folio Roſmarini; luteum; incanum.

14. Helianthemum; folio Thymi incano. *J. B.* 2. 19. *Chamæciſtus, tenuifolius, Narbonenſis.* H. R. Park.

15. Helianthemum; album; Germanicum. *Tab. Ic.* 1062. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 276.

Miller enumerates fifty-three Species of this Plant.

HELICE. A Species of Willow.

HELICHRYSUM, from ἥλιος, the Sun, and χρυσὸς, Gold.

The Characters are;

The Flower-cup is ſquamoſe, ſplendid, and beautiful, on account of its fine Colour, which is like that of Gold, Silver, or ſome other agreeable Colour. In other reſpects it reſembles the *Filago.*

Boerhaave mentions nineteen Species of this Plant; which are,

1. Helichryſum; ſylveſtre; latifolium; flore parvo ſingulari. *T.* 452.

2. Helichryſum; Orientale. *C. B. P.* 264. *Park.* 69. *Tourn. Inſt.* 453. *Boerh. Ind. A.* 120. *Chryſocome.* Offic. *Heliochryſon, ſive Amaranthus luteus.* Park. Parad. 374. *Stœchas citrina floris magnitudine & colore ſpecioſa.* J. B. 3. 154. ORIENTAL GOLDY-LOCKS.

This grows in *Crete*, and flowers in *July*. The Root is us'd in Medicine, which is eſteem'd drying and aſtringent. It is ſaid to be good in Inflammations of the Lungs and Liver. It is, alſo, according to the Hiſtory of Plants attributed to *Boerhaave*, diuretic, ſudorific, attenuating, aperient, and vulnerary. It excites the Menſes, kills Worms, and diſſolves extravaſated and coagulated Blood.

3. Helichryſum; flore ſuaverubente. *H. C.*

4. Helichryſum; ſeu Stœchas citrina; anguſtifolia. *C. B. P.* 264. *Tourn. Inſt.* 425. *Boerh. Ind. A.* 120. *Stœchas citrina.* Offic. Ger. 520. *Stœchas citrina, ſive Amarantus luteus.* Ger. Emac. 646. *Stœchas citrina tenuifolia Narbonenſis.* J. B. 2. 154. Raii Hiſt. 1. 281. *Chryſocome ſive Coma aurea & Stœchas citrina vulgaris.* Park. 69. GOLDY-LOCKS.

This is a ſhrubby Plant, holding its Leaves all Winter. It has a hard woody Root, which ſhoots forth a great many ſlender Stalks; thoſe which bear Flowers, grow to be a Foot high, the others are not above half ſo long; they are thick-ſet with long, very narrow, ſharp-pointed Leaves, white and hoary, eſpecially underneath. The Flowers grow on the Tops, being Cluſters of ſmall, round, dry, ſcaly Heads, of a beautiful, ſhining, yellow Colour, which they retain a long while, if preſerved with any Care. The Leaves and Flowers have a pleaſant Scent, if rub'd between the Fingers. It grows in ſome Parts of *France* and *Italy*, and is frequently planted in Gardens, flowering in *July* and *Auguſt*. *Dale* ſays, it flowers in *May*; *Ray* ſays, in *April* and *May*.

It is accounted good for Obſtructions of the Liver and Spleen, diſſolves congeal'd Blood, and provokes Urine. *Matthiolus* gives it great Commendation; but it is ſeldom or never us'd in the Shops.

Dale ſays, it is good in Obſtructions of the Menſes, that it dries up Catarrhs, and kills Worms.

5. Helichryſum; Americanum; latifolium. *T.* 453.

6. Helichryſum; montanum; flore rotundiori, candido. *T.* 453. *Boerh. Ind. A.* 120. *Pes Cati.* Offic. *Gnaphalium montanum, ſive Pes Cati.* Park. 690. *Gnaphalium montanum.* Parad. 375. *Gnaphalium montanum album.* Ger. 516. Emac. 640. Raii Hiſt. 1. 283. Synop. 83. *Piloſella minor quibuſdam aliis Gnaphalii genus.* J. B. 3. 162. CAT'S-FOOT.

This Plant is vulnerary and aſtringent. *Du Remou* ſays, that they us'd to ſend from *Paris* to *Angiers* and *Tours* for this Plant, to make the Syrup of it, till one Mr. *Gouet*, an Apothecary of *Paris*, diſcover'd a good deal of it about that City. This Syrup is good for Defluxions of the Breaſt, eſpecially when the Patients complain of Seroſities, tickling down the Throat and Bronchia. The ſimple Syrup is made of the Cat's-foot alone; it is called *Syrupus de Hiſpidula, ſeu Aeluropo, vulgo de Pede Cati.* The compound Syrup is made of Barley-water, Jujubes, Raiſins, and Liquorice. *Schroder* adds Sebeſtens, Dates, Figs, Colts-foot, Sage of *Jeruſalem*, and Spleenwort.

Dale ſays, that it is drying and aſtringent; and that the Syrup is in Eſteem for Exulcerations of the Lungs, Spitting of Blood, and, particularly, for the Chin-cough.

7. Helichryſum; montanum; flore rotundiori, variegato. *T.* 453.

8. Helichryſum; Africanum; fœtidiſſimum; ampliſſimo folio. *T.* 454.

9. Helichryſum; Africanum; fœtidiſſimum; ampliſſimo folio. *T.* 454.

10. Helichryſum; ſylveſtre; latifolium; capitulis conglobatis. *C. B. P.* 264.

11. Helichryſum; arboreum; Africanum; Salviæ folio odorato.

12. Helichryſum; Africanum; folio oblongo, ſubtus cano; ſupra viridi; flore luteo. *Ind.* 42.

13. Helichryſum; Africanum; folio oblongo, anguſto; flore rubello, poſtea aureo. *Ind.* 42.

14. Helichryſum; Africanum; folio oblongo, tomentoſo, caulem amplectente; flore luteo. *Ind.* 43.

15. Helichryſum; Africanum; argenteum; repens; flore pulchro, magno, albo, diſco aureo. *H. R. D.*

16. Helichryſum; Africanum; arboreſcens: foliis incanis, latioribus. *H. R. D.*

17. Helichryſum; Africanum; fruteſcens; foliis Crithmi marini. *H. A.* 2. 113.

18. Helichryſum; Africanum; fruteſcens; foliis Stœchados citrinæ; flore aureo. *H. R. D.*

19. Helichryſum; anguſtiſſimo folio. *T.* 452. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 120.

The eighth and ninth Species ſmell like Caſtor, or Aſa-fœtida, and are us'd by the *Hottentots* as Antihyſterics; they are balſamic, and good againſt Palpitations of the Heart.

HELIOCAES, ἡλιοκαὶς. The Name of a compound eſcharotic Powder, deſcrib'd by *Paulus Ægineta, Lib.* 7. *Cap.* 13.

HELIOCHRYSUM. See HELICHRYSUM.

HELIOSCOPIOS. An Epithet for the *Tithymalus*; *ſubrotundus*; *foliis majoribus, crenatis.*

HELIOSIS, ἡλίωσις. Inſolation, that is, Sitting in the Sun.

HELIOTROPIUM.

The Characters are;

The Flower conſiſts of one Leaf, and is ſhap'd like a Funnel, having its Centre wrinkled and folded, and its Brim cut into ten Segments, alternately unequal: Theſe Flowers are collected into a long reflex'd Spike, reſembling a Scorpion's Tail: Each Flower is ſucceeded by four naked gibboſe Seeds.

Boerhaave mentions ten Species of this Plant; which are,

1. Heliotropium; majus; Dioſcoridis. *C. B. P.* 253. *Tourn. Inſt.* 139. *Boerh. Ind. A.* 190. *Heliotropium*; *majus.* Offic. Ger. 264. Emac. 334. Park. Theat. 438. Raii Hiſt. 1. 502. *Heliotropium majus, flore albo.* J. B. 3. 604. TURNSOLE. *Dale.*

The Leaves of this Plant are very bitter, and give a very deep-red Colour to blue Paper; which ſhews that their Salt is no otherwiſe different from that of the Earth, but in the Sal Ammoniac's being diſengag'd a little more than the other Principles, and mix'd with a great deal of fetid Oil, and Earth: The Juice of this Plant makes Warts fall off, and takes away the Ringworm. It is reſolvent, and proper to ſtop ſpreading Ulcers. *Martyn's Tournefort.*

It is cultivated in Gardens, and flowers in the Summer. A Decoction of the Herb purges off pituitous Humours; and is good againſt the Bites of Scorpions. The Seeds repreſs fleſhy Excreſcences,

Excreſcences; make penſile Warts fall off, provoke the Menſes, and haſten Delivery.

2. Heliotropium; Canarienſe; arboreſcens; folio Scorodoniæ. *H. A.* 129.

3. Heliotropium; arboreſcens; folio Teucrii; flore albo in Capitula denſa congeſto.

4. Heliotropium; Americanum; cœruleum; foliis hormini. *M. H.* 3. 451.

5. Heliotropium; Americanum; cœruleum; foliis hormini anguſtioribus. *M. H.* 3. 452.

6. Heliotropium; Americanum; procumbens; glaucophyllum. *Flor.* 2. 61.

7. Heliotropium; minus; anguſtifolium; arvenſe; ſeu hirſutum. *Flor.* 2. 61.

8. Heliotropium; minus; anguſtifolium; paluſtre; ſeu glabrum. *Flor.* 2. 61.

9. Heliotropium; minus; ſupinum. *Tourn. Inſt.* 139. *Boerh. Ind. A.* 119. *C. B. P.* 253. *Heliotropium minus.* Offic. Ger. 264. Emac. 334. Raii Hiſt. 1. 501. Park. Theat. 438. *Heliotropium minus quorundam. J. B.* 3. 605. *Heliotropium humi fuſum, flore minimo, ſemine magno.* Tourn. Corol. 7. SMALL TURNSOLE. It is cultivated in Gardens; the Herb is us'd, and agrees in Virtues with the *Heliotropium*; *majus*; *Dioſcoridis.*

10. Heliotropium; Mexicanum; mali Limonii foliis; Tlachichinoa patlahoac; ſeu Herba uſta; latifolia. *Rech. Hern.* 292. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 190.

Beſides the before-mention'd, *Dale* mentions another Heliotropium; which is the

Heliotropium tricoccum. *Offic. C. B.* 253. *Raii Hiſt.* 1. 165. *J. B.* 3. 606. Ger. 265. Emac. 335. *Park.* 439. *Ricinoides ex qua paratur Tournſol Gallorum.* Tourn. Inſt. 655. TURNSOLE.

This Turnſole is a Plant which grows in various Parts of *Languedoc*, and is the *Heliotropium*, or *Ricinoides*, of Botaniſts. Its Root, which is white, round, and generally pretty ſtrait, ſends out a round Foot-ſtalk, which is at laſt divided into various Ramifications. Its Leaves are of a pale-green, or, as it were, a cineritious Colour. Its Flowers, which are of a yellow Colour, are ſhut up in ſmall Buds, which form a kind of Cluſter: They are of two Sorts, ſince ſome of them are barren, and become dry, in proportion as the Cluſter increaſes; whilſt others of them produce Fruit.

The Juice of the Berry of this Plant being expreſs'd, Linen Rags are impregnated with it, and then expos'd to the Vapour of Urine, which gives them a red Colour. Theſe Rags are exported to *Holland*, where they extract the Lumps from them by a Method, which is, hitherto, a Secret: It is probable, however, that they are a kind of Fæcula. The Tincture of Heliotropium, or Turnſole, ſerves, in Chymiſtry, to try Acids and Alcalis; but is not us'd in Phyſic. There is a third Sort of Turnſole, brought from *Portugal*, which is us'd by the Scarlet-dyers. *Geoffroy.*

Alcaline Salts induce no Change on the Turnſole; Acids, according to their Strength, redden it by degrees, from a very faint Red to a very lively one: It is a Colour extremely ſuſceptible of Alteration; for the weakeſt Acid will change it. *Martyn's Tournefort.*

Dale ſays, it is us'd in Medicine againſt Cancers, gangrenous Ulcers, and ſtrumous Swellings.

HELIOTROPIUM. Offic. *Heliotropius.* Worm. 94. Aldrov. Muſ. Metall. 895. Boet. 257. De Laet. 80. Charlt. Foſſ. 33. Calc. Muſ. 219. *Lapis Porraceus guttatim, punctulatim, vel ſtbratim ſanguineus, Heliotropium dictus.* Cup. Hort. Cath. Supp. 2. 50. THE HELIOTROPE, or COMMON BLOODSTONE.

This is an opake Gem, of a green Colour, mark'd with bloody Spots, or Veins. It is ſaid to reſiſt Poiſon, and to ſtop Hæmorrhages.

HELITIS, ἑλῖτις. A Name for the *Squama Æris.* See Æs.

HELIX. The external Circle, or Border, of the Ear.

HELLEBORASTER. A Name for the *Helleborus*; *niger*; *flore viridi.*

HELLEBORASTER MAXIMUS. A Name for the *Helleborus*; *niger*; *fœtidus.*

HELLEBORASTRUM. See HELLEBORUS.

HELLEBORINE.

The Characters are;

The Root is fibrous, the Leaves nervous, and ſomewhat like thoſe of white-Hellebore; the Extremity of the Pedicle, or Foot-ſtalk, bears a Flower conſiſting of ſix diſſimilar Petals, five of which are expanded, and have ſome Reſemblance; the ſixth ſeems interpos'd like one of another kind; the Flowers are diſpos'd in the Form of a Spike; the Ovary is like that of the Orchis.

Boerhaave mentions four Species of this Plant; which are,

1. Helleborine; latifolia; montana. *C. B. P.* 186. *Raii Hiſt.* 11. 1230. *Synop.* 3. 383. *Boerh. Ind. A.* 2. 153. *Tourn. Inſt.* 436. *Helleborine.* Offic. Ger. 358. Emac. 442. *Elleborine flore viridante.* Park. Theat. 218. *Elleborine Dodonæi.* J. B. 3. 516. BASTARD HELLEBORE.

It grows in Copſes, and ſhady Groves; and flowers in *May.* The Herb is us'd, which is ſuppos'd, by ſome, to agree in Virtues with white Hellebore; but it is ſeldom or never found in our Shops. *Dale.*

2. Helleborine; flore carneo. *C. B. P.* 187. *M. H.* 3. 487. *J. B.* 3. 518.

3. Helleborine; anguſtifolia; paluſtris; ſive pratenſis. *C. B. P.* 187.

4. Helleborine; montana; anguſtifolia; purpuraſcens. *C. B. P.* 187.

HELLEBOROIDES.

The Characters are;

The Leaves are like thoſe of the Aconitum; the Extremity of the Pedicle runs into a ſmall Leaf, which is divided into nine Rays, expanded like a Star, and repreſenting a Calyx. The Calyx is floſcular, conſiſting of ſix floſcular kind of Leaves. The Flower is produc'd in the Centre of a Leaf, conſiſts of ſix ſmall bifid Petals, and is furniſh'd with a Multitude of Stamina; in other reſpects it agrees with the Hellebore.

Boerhaave mentions but one Species of this Plant; which is the

Helleboroides; hyemalis. *Helleborus, ranunculoides, hyemalis, radice tuberoſa, flore in medio folii.* H. L. 309. *Helleborus, niger, tuberoſus, ranunculi folio, flore luteo.* T. 272. *Helleborus ranunculoides, præcox, tuberoſus flore luteo.* M. H. 3. 359. *Aconitum unifolium, luteum, bulboſum.* C. B. P. 183. *Ranunculus, cum flore in medio folio, radice tuberoſa.* J. B. 3. 414. *Aconitum; luteum, minus.* Dod. p. 440. *Aconitum, hyemale.* H. Eyſt. *Hyem.* o. 1. *F.* 5. *Fig.* 2.

The *Hiſtoria Plantarum*, attributed to *Boerhaave*, ſays it agrees in Virtues with the black Hellebore.

HELLEBORO-RANUNCULUS.

The Characters are;

The Leaves are ſingle, and roundly turn'd like thoſe of the Ranunculus. The Calyx is pentaphyllous, the Leaves being of the ſame Colour with the Flower. The Flower is pentapetalous, roſaceous, and furniſh'd with numerous Stamina. The Fruit conſiſts of a Multitude of Vaginulæ, or ſmall Sheaths, each furniſh'd with its Tube, and collected into an Head, like the Ranunculus.

Helleboro-ranunculus; flore luteo globoſo. *Helleborus, ranunculoides, flore globoſo.* H. L. 309. *Helleborus, niger, ranunculi folio, flore globoſo, majore.* T. 272. *Pſeudo-helleborus, ranunculoides, luteus, flore globoſo.* M. H. 3. 461. *Ranunculus, aconiti folio, flore globoſo.* C. B. P. 182. *Ranunculus, flore globoſo, quibuſdam flos Trollius.* J. B. 3. 419. *Ranunculus, flore globoſo.* Dod. p. 430. H. Eyſt. Vern. o. 1. *F.* 12. *Fig.* 2.

The *Hiſtoria Plantarum*, attributed to *Boerhaave*, ſays that this Plant is cauſtic, like the Ranunculus.

HELLEBORUS NIGER. Black Hellebore.

The Characters are;

The Leaves are digitated, the Calyx pentaphyllous, or polyphyllous, and floſcular. The Flower is roſaceous, and conſiſts of five, ten, or fifteen ſmall fiſtulous Petals, like Tubes, in ſuch a manner as to reſemble a Multitude of hollow tubulated Horns; it is alſo furniſh'd with very numerous Stamina. In the Centre of the Flower grows the Ovary on the Apex of the Pedicle, and conſiſts of two, three, four, or more erect Pods, furniſh'd with a long Tube, and becoming a Fruit, conſiſting of membranaceous Vaginæ, or Sheaths, which open lengthwiſe, and are full of roundiſh or oval Seeds.

Boerhaave mentions five Species of black Hellebore; which are,

1. Helleborus niger fœtidus. *C. B. P.* 185. *Tourn. Inſt.* 272. *Elem. Bot.* 235. *Boerh. Ind. A.* 296. *Merc. Bot.* ii. 24. *Phyt. Brit.* 57. *Helleboraſtrum.* Offic. Cod. Med. lviii. Pharm. Bat. 57. Mer. Pin. 61. *Helleboraſter.* Rupp. Flor. Jen. 131. *Helleboraſter maximus.* Ger. 826. Emac. 976. Raii Hiſt. 1. 698. Synop. iii. 271. *Helleboraſter maximus, ſive Conſiligo.* Park. Theat. 212. *Helleboraſter niger ramoſus anguſtifolius ſemper virens elatior.* Hiſt. Oxon. 3. 359. *Helleborus niger ſylveſtris, adulterinus etiam Hyeme virens.* J. B. 880. *Helleborus ſylveſtris adulterinus, etiam Hyeme virens.* Chab. 528. SETTERWORT.

The Country-people frequently give the Powder of this Herb to their Children, for the Worms: But how dangerous a Medicine it is, may be underſtood by the following Accident: Some Years ago, when the Ground was cover'd with a very deep Snow, a Flock of Sheep, in *Ox-mead*, near *Fulborn* in *Cambridgeſhire*, finding nothing but this Herb above the Snow, eat plentifully of it. They ſoon appear'd terribly out of Order, and moſt of them died, a few being ſav'd, by timely giving them ſome Oil, which made them caſt up this Herb. Some of thoſe which died, being open'd, were found to have their Stomachs greatly inflam'd. This Account I had from the Man who attended them: He went with me to the very Spot, and, as he pointed out the Herb which poiſoned them, I found it to be this Species of Hellebore. *Martyn's Tournefort.*

It grows in woody Places, though but rarely, and flowers in *February* and *March*. The Leaves are uſed, which, being dried and pulveriz'd, are exhibited in ſmall Quantities to Children affected with Worms; and are eſteem'd, by the common ſort of People,

a moſt potent and certain Remedy: But *Tragus* very well obſerves, that it is not to be uſed internally, but avoided as a moſt pernicious Herb. *Dale.*

2. Helleborus; niger; hortenſis; flore viridi. *C. B. P.* 185. *Merc. Bot.* 2. 23. *Phyt. Brit.* 57. *Raii Hiſt.* 1. 697. *Synop.* 3. 271. *Boerh. Ind. A.* 296. *Tourn. Inſt.* 272. *Elem. Bot.* 235. *Rupp. Flor. Jen.* 131. *Helleboraſter.* Offic. *Helleboraſter minor flore viridante.* Park. Theat. 212. *Helleboraſter minor.* Park. Parad. 344. *Helleboraſtrum.* Ger. 824. Emac. 976. Mer. Pin. 61. *Helleborus niger ſylveſtris, ramoſus, latiore folio deciduo.* Hiſt. Oxon. 3. 359. *Helleborus niger vulgaris flore viridi vel herbaceo, radice diuturna.* J. B. 3. 636. Chab. 527. BEAR'S-FOOT. *Dale.*

The Leaves, infus'd, for three or four Hours, in Ale, and drank three Mornings, faſting, are accounted an excellent Preſervative againſt the Small-pox, and orher contagious Diſeaſes. *Raii Hiſt. Plant.*

It grows in mountainous Places, and flowers in *March* and *April.* The Parts us'd in Medicine are the Root and Leaves. The Leaves are recommended by Dr. *Johnſon*, againſt contagious Diſeaſes. The Root has the ſame Virtues with that of the black Hellebore, and may be taken inſtead of it; it purges the lower Belly, evacuating Phlegm, and yellow Bile. Farriers and Graſiers put a great deal of Confidence in this Herb, againſt the Murrain among their Horſes and Cattle. Their Method is to thruſt a Bodkin through the Dewlaps of their black Cattle, through the Skin under the Neck of their Horſes, and through the Ears of their Sheep, and then put a Fibre of the Root into the Wound; whence it is called a *Peg-Root. Dale.* The ſame Operation is deſcrib'd by *Columella*, one of the *Rei Ruſticæ Scriptores*, who wrote under the Emperor *Claudius.*

3. Helleborus; niger, flore roſeo. *C. B. P.* 186. *Boerh. Ind. A.* 297. *Hiſt. Oxon.* 3. 359. *Helleborus niger.* Offic. *Helleborus ſive Elleborus.* Cod. Med. 58. *Helleborus niger verus.* Ger. 825. Emac. 976. Park. Theat. 211. Parad. 344. Raii Hiſt. 1. 697. *Helleborus niger flore albo.* J. B. 3. 634. Chab. 527. *Helleborus niger anguſtioribus foliis.* Elem. Bot. 235. Tourn. Inſt. 272. Rupp. Flor. Jen. 130. *Melampodium.* Pharm. Bat. p. 71. BLACK HELLEBORE.

This Plant has blackiſh Roots, ſomewhat thick at the Head, and full of long and pretty large Fibres of the ſame Colour. The Leaves ſeldom grow above a Span high, on pretty thick round Stalks, being digitated, or divided into ſix or ſeven Parts, which are narrow next the Stalk, and broadeſt toward the End, where only they are indented about the Edges. What are uſually called the Flowers, grow ſingle on the like thick Foot-ſtalks, conſiſting of five greeniſh, white, pretty large, round Leaves, having a Bluſh of Purple on them, which fall not off till the Seed is ripe, and therefore are accounted, by Mr. *Ray*, to be only the Calyces, making the Flowers to be the fiſtular Petala, which encompaſs the Chives in the middle. It flowers ſometimes at the latter End of *September*, whence it is called *Chriſtmas* Flower.

Black Hellebore purges downwards, and expels Flegm and Bile, given either alone, or with Scammony and Salts; the Doſe is half a Dram, or a Dram; it is boiled alſo with Lentils, and in purging Broths. It is effectual in the Epilepſy, Melancholy, Mania, Gout, and Palſies. Uſed in Peſſaries, it provokes the Menſes, and kills the Fœtus: Put into Fiſtulas, and ſuffer'd to remain there for three Days, it cleanſes them. In like manner, in the Caſe of Deafneſs, it is introduced into the Ear, and left to remain there for two or three Days. It cures the Pſora, being anointed on the Parts with Frankincenſe, or Wax, or Pitch, and Oil of Cedar. Made into a Cataplaſm by itſelf, with Vinegar, it cures the Alphi, Lichen, and Lepra. Boil'd in Vinegar, and the Mouth waſhed therewith, it eaſes the Tooth-ach; it is alſo an Ingredient in ſeptic Medicines. Mixed with Barley-flour and Wine, it makes an effectual Cataplaſm in hydropical Caſes. Planted near the Root of Vines, it communicates a cathartic Quality to the Wine made of them. It is uſual, alſo, to ſprinkle the Houſes with it, from a Perſuaſion, that it cleanſes and purifies them: Out of the ſame religious Apprehenſion, alſo, when they dig it up, they ſtand, and make their Prayers to *Apollo* and *Æſculapius*, and watch againſt the Flight of an Eagle; for that Bird, they ſay, brings Danger with it, and even Death, to him whom it ſhall find digging up the Hellebore. They muſt, alſo, be very quick in taking it up, becauſe it emits ſuch Exhalations as oppreſs the Head; for which Reaſon they take Garlick beforehand, and now-and-then a Sup of Wine, by way of Precaution. *Dioſcorides, Lib.* 4. *Cap.* 151.

Galen de atra Bile, *Pliny*, and *Dioſcorides*, mention a famous Cure which *Melampus* perform'd upon the Daughters of *Prætus.* This Shepherd, obſerving his Goats always purg'd after feeding on Hellebore, gave the Milk of theſe Goats to the Daughters of *Prætus*, who were ſo very mad as to fanſy themſelves Cows, ſoon after the Goats had eaten Hellebore. The Experiment ſucceeded. See the PREFACE.

Dr. *Freind* tells us, that Hellebore was, amongſt the Antients, reckoned a rough Medicine, as well as dangerous. This Opinion, he ſeems to think, might take its Riſe from the Manner they uſed to give it in: For the Doſe, as we learn from *Aretæus*, was often to the Quantity of two Drams. *Actuarius* is one of the firſt who thought it could be taken very ſafely, without creating any great Diſorder; and commends it highly as an admirable Remedy, for ſeveral Intentions. But then the Doſe he orders, ſeldom exceeds a Dram.

The Experience of the Moderns has confirm'd the Juſtneſs of his Obſervation: From ſuch different Accounts of its Operation, among other Reaſons, ſome would infer, that the black Hellebore of the Antients is loſt, and that what we uſe now is another Plant.

What we now uſe is that above-deſcrib'd: It is a very innocent and efficacious Medicine; and when given in a moderate Doſe, is ſo far from being a violent Purger, that very often it does not purge at all; and though it ſometimes occaſions Vomiting, yet frequently it does not ſo much as offend the Stomach. *Avicenna* ſays, it provokes Urine, and the Menſes; which latter Quality is ſufficiently known. In Dropſies more wonderful Effects have been produced from it than any other Diuretic. However 'tis a Remedy which will not always equally work Wonders.

Avenzoar gives an Account, that his Father found out a particular Virtue in the Flowers of *Nenufar*, or *Nymphæa*, in correcting black Hellebore.

It potently purges melancholy Humours, and conſequently is a uſeful Medicine in all Affections proceeding from them, as the Mania, Madneſs, the hypochondriac Paſſion, Elephantiaſis, Herpes, Cancer, Quartan, Vertigo, Epilepſy, Apoplexy, and Itch; but it ought to be adminiſter'd with Caution, and to none but robuſt Perſons, becauſe of the violent Manner in which it is ſubject to work; but there is leſs Danger in the Decoction. It is corrected with Maſtich, Cinnamon, Aniſe, Fennel, and the like. Some write that black Hellebore, rightly prepar'd, is a harmleſs Medicine, and may ſafely be given to Children, Women with Child, and infirm Perſons. The Doſe in Subſtance is from fifteen Grains to half a Dram, or two Scruples; they who are very robuſt may take a Dram of the Infuſion, or from one Dram to two of the Decoction.

It is exhibited either in Subſtance, Infuſion, or Decoction; in Subſtance, firſt, in Powder, as in the following Preſcription:

> Take of Powder of black Hellebore, two Scruples; of Ginger, Maſtich, red Roſes, Cinnamon, Aniſe, each four Grains: Mix them in Broth; for Children let the Quantity of Hellebore be only one Scruple. Secondly, it is taken in Pills, made of the Powder aforeſaid, and a proper Syrup.

All the Virtue of this Root lies in its Bark, and ſmall Fibres; for the Pith, or medullary Subſtance, is to be thrown away: It is beſt corrected with Cloves, according to the Advice of M. *Herman*, Head Botaniſt of the Phyſic-garden at *Leyden.* M. *Hartman*, for an immoderate Flux of the Menſes, order'd a Girdle compos'd of the freſh Leaves of black Hellebore, ſew'd together, to be ty'd about the Waiſt. *Raii Hiſt. Plant.*

Though this has been in the greateſt Eſteem among the Antients, yet it now grows neglected, either through our Unacquaintance with its Virtues, or the Sort which comes to us not having the Efficacy of that which they made uſe of. The latter may be our Unhappineſs; for Botanic and Diſpenſatory Writers differ much in determining which is the true officinal Hellebore. *Matthiolus* tells us, that is the right which flowers like a Roſe; others, that it has a Sky-colour'd Flower; and *Bauhine* takes it to be *Elleborus niger, tenui folio, Buphthalmi flore.* And by the Strength and Manner of the Operation of that they ſpeak of, ours ſeems to be of the ſame Species, but much weaker in Efficacy. What comes to us now, will not operate much by Stool; but is a powerful Alterative, and wonderfully affects the Juices in the moſt remote Receſſes. For this Reaſon it greatly promotes all the thinner Secretions, and particularly that by Sweat, eſpecially if join'd with any convenient Volatiles. This Root is infallible in Obſtructions of the Menſes, and where Steel is not only ineffectual, but improper; as in plethoric Habits; for in ſuch Steel will ſometimes raiſe hyſteric Commotions, Convulſions, and a ſort of Furor Uterinus; whereas this ſo thins the Blood, as to diſpoſe it to that Diſcharge without making it more impetuous. So that tho' Steel and Hellebore both promote the Menſes, yet they do it different Ways, one by increaſing the Blood's Velocity, and giving it a greater Momentum in the Arteries of the Uterus, and the other by dividing it, and rendering it more fluid. In all nervous Caſes the moſt antient Practice confirms its Efficacy, but eſpecially in a Mania or Diſtraction. In this laſt Intention it has been ſo famous as to make it even proverbial, *To ſend ſuch a one to Anticyra*, whom they would inſinuate to be mad, becauſe that Country produced the greateſt Quantities of this Drug. *Paracelſus* commends it as inſtrumental in procuring long Life; to which Purpoſe one *Tachius* made Trial of it upon himſelf.

M. *Boulduc* gives ſome Experiments, which he made upon this Root, in the *Memoirs of the Academy of Sciences*, for the Year 1701. We ſhall not take notice of thoſe made by Diſtillation, becauſe

becauſe he himſelf believed them to be of no Conſequence. The Extract which he procured with Spirit of Wine was very little in Quantity, becauſe this Root contains few reſinous Parts: And I am, ſays he, the more confirmed in this, ſince from what remained I was able to get a great Quantity of an Extract with Water.

He alſo made an Extract of the Root with Water, wherewith was drawn all that could be extracted; for from the Reſidue there was nothing to be got by means of Spirit of Wine. Whence it ſeems reaſonable to conclude, that the ſaline Parts are able ſo to diſſolve its few reſinous ones, that both may be drawn off by Water, without the Aid of Spirit of Wine. He further remark'd, that the firſt Extract, which was purely reſinous, and made with Spirit of Wine, purged little, and with Irritation; that the Extract made of its Remainder with Water purged not at all, but was very diuretic; and that, on the other hand, the Extract made firſt with Water, and without Spirit of Wine, purged very gently. And this, he ſays, he has obſerved of moſt Purgatives: Whence he thinks, that the Extract, made by Spirit of Wine alone, ought to be ſuſpected; ſince, being deprived of its proper Salts, which, when joined to the Ferment of the Stomach, open, divide, and attenuate the Reſin, it happens that its thick and ſulphureous Parts adhere to the Fibres of the Stomach, and cauſe Gripings, and, by remaining undiſſolved ſome time, excite a Teneſmus. And this is confirm'd by Experience; for the moſt able practical Phyſicians correct the Reſin with Salt of Tartar. He confeſſes that to be a good Method in theſe Caſes; but ſuppoſes one may do without it, by leaving to thoſe reſinous Extracts the proper Salts which Nature has endued them with. Whence he affirms, that the way of making the Extract with Water is preferable to the common way of doing it by a ſulphureous Menſtruum; ſince thereby the Subſtance is freed from its terreſtrial Parts, without depriving it of any of its natural Principles. He takes notice, that the Hellebore, which is brought from *Switzerland*, is preferable to that which comes by the Way of *England*. This latter, whether it is ſpoiled by keeping, or loſing its Virtue in Tranſportation, he found to have little or no Effect.

So that, by this Perſon's Account, as well as the Reaſons above given, there is Ground to ſuſpect very much, that our Hellebore falls greatly ſhort of the Goodneſs of that uſed by the Antients; ſince we find there is ſo great a Difference between it, and what ſo near Neighbours as the *French* have in Uſe among them at this Time. Of ours, fifteen or twenty Grains, in Powder, are frequently given as an Alterative and a Sudorific; and in Tincture, where the Root has been one Part, and the Menſtruum three, it may be given to ſixty, or one hundred Drops to a Doſe. Its Virtues are beſt drawn, by rubbing a little Salt of Tartar with it in a groſs Powder, and letting it lie till the Air makes it run; for that ſo penetrates into the very Subſtance of the Root, that its Parts immediately join with the Menſtruum, as ſoon almoſt as put into it. Small Wine is the beſt, as moſt likely to take up all the Parts of any medicinal Efficacy.

The only Preparation of black Hellebore, in the College Diſpenſatory, is the *Tinctura Hellebori nigri*, which is thus prepar'd:

Take of black Hellebore-root, two Ounces; of Salt of Tartar, one Dram; of Cochineal, one Scruple; of *French* Brandy, one Pint: Draw out the Tincture by a warm Heat.

This is an admirable Medicine for many Purpoſes, but particularly it excels in opening uterine Obſtructions; and in ſanguine Conſtitutions, where Steel is hurtful, this never fails of forcing the menſtrual Diſcharges. In ſhort, it is a very convenient Form to give it, in all Caſes where the Roots do Service. Its Doſe is from twenty to one hundred Drops, in any ſuitable Vehicle. Some make it with a more ſpirituous Menſtruum; but this ſeems moſt likely to draw out both the reſinous and gummy, or ſaline Parts of the Simple.

Tinctura Melampodii.

Take Roots of black Hellebore, one Dram and an half; Calamus Aromaticus, two Ounces; Galangal, half an Ounce; Saffron, one Dram and an half; the leſſer Cardamoms, three Drams; Canary, three Quarts: Digeſt in a cloſe Veſſel twenty Hours in a Sand-heat, and then preſs it out, and filtre it for Uſe.

This is given from two to three Spoonfuls, in a Doſe over Night, or in the Morning: Its Operation is by Stool; and it is preſcribed for maniacal, hypochondriacal, and dropſical Perſons: In which obſtinate Caſes, it is accounted a very good Medicine.

4. Helleborus; niger; flore roſeo; minor; Belgicus.

5. Helleborus; niger; trifoliatus. *Ald. Hort. Farnſ.* 92. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 246.

HELLESPONTIA, ἑλλησποντία. The Name of two Plaiſters deſcribed by *Galen*, *de Comp. M. per G. L.* 6. *C.* 10, 11.

HELMINTHES, ἕλμινθες. Worms.

HELMINTHAGOGA. Medicines which expel Worms.

HELMINTHICA. The ſame as Helminthagoga.

HELNESED. Coral. *Rulandus.*

HELODES, ἑλώδης, from ἕλος. A Fen, or marſhy Place. An Epithet given to certain Fevers attended in the Beginning with profuſe Sweats, which afford no Relief. Mean time the Tongue is dry and rough, and the Skin hard, and, as it were, parched.

HELOSIS, ἕλωσις. A Diſorder of the Eye, conſiſting in an Everſion, or turning up, of the Eye-lids. *Gorræus.*

HELOTIS. A Name for the Diſtemper call'd *Plica Polonica.*

HELXINE. A Name for the *Parietaria*; *Officinarum & Dioſcoridis.* It is, alſo, a Name for the *Convolvulus*; *minor*; *arvenſis*; *flore Roſeo.*

HEMERALOPS, ἡμεραλωψ, from ἡμέρα, a Day, and ὤψ, the Eye. A Defect in the Sight, which conſiſts in being able to ſee in the Day-time only, and not in the Evening. It is the Reverſe of the *Nyctalops.*

HEMERIS. A Name for the *Quercus*; *cum longo Pediculo.*

HEMEROCALLIS. A Name for a ſort of Lily, call'd *Lilium*; *Hemerocallis*; *Chalcedonica*; *Polyanthos.* *Boerh. Index alt. Plant.*

HEMEROCOETOS, ἡμεροκοιτος. A Name for the Fiſh otherwiſe call'd Callionymus.

HEMICERAUNIOS, ἡμικεραύνιος. The Name of a Bandage, in *Galen*, for the Back and Breaſt.

HEMICRANIA, ἡμικρανία. A Species of Head-ach, affecting only one Side of the Head.

HEMIECTON, or HEMIECTEON, ἡμίεκτον, or ἡμιέκτεον. Half of an Hectеus. But, in *Hippocrates*, *Libro de his quæ Uterum non gerunt*, it ſeems to ſignify a Pot capable of containing this Meaſure, into which Ingredients were to be put for a Suffitus, or Fumigation, in caſe of uterine Diſorders there mentioned. Upon this, the Woman was directed to ſit, with her Legs wide aſunder, in order to receive the Vapour into the Vagina and Uterus.

HEMIMOERION, ἡμιμοίριον. Half a Dram. *Erotian.* Or, in general, the Half of any thing.

HEMINA, ἡμίνα, κοτύλη, an antient *Greek* Meaſure, the ſame with the Cotyle; which ſee.

HEMIOBOLION, HEMIOBOLON, ἡμιοβόλιον, ἡμιωβόλιον, ἡμιόβολον, from ἥμισυ, half, and ὄβολος, an Obolus, a Weight, the half of an Obolus, or the twelfth Part of a Drachma, or Dram, that is, five Grains.

HEMIOLION, ἡμιόλιον, from ἥμισυ, half, and ὅλος, the Whole, ſignifies in general, the Whole of any thing, and half as much more, or the ſame as *Seſquialtera*; but in *Galen*, *de C. M. S. L.* it is uſed particularly for the Weight of an Ounce and an half.

HEMIONIS, ἡμιονῖς, from ἡμίονος, a Mule, in *Hippocrates de Natura muliebri*, is Mule's Dung, which he there preſcribes to be burnt, triturated, and macerated in Urine, and ſo adminiſtered in the *Fluor Albus.*

HEMIONITIS, ἡμιονῖτις, from ἡμίονος, a Mule. *Muleſfern.*

It reſembles the *Lingua Cervina*, or Hart's-tongue, only the Leaves are more ſimple, and hollow'd into a Sinus at the Baſe, with two Lobes like Ears, or jagged at the ſame Part. *Boerh. Index alter, Pars* 1. *p.* 24.

Boerhaave mentions but one Species of this Plant; which is, Hemionitis; vulgaris. *C. B.* 353. *Raii Hiſt.* 1. 135. *Tourn. Inſt.* 546. *Boerh. Ind. A.* 24. *Hemionitis.* Offic. J. B. 3. 758. Ger. 977. *Hemionitis major.* Ger. Emac. 1138. Park. 1047. MULESFERN.

It is ſaid to be produc'd in *Italy*. The whole Herb is us'd; and, according to *Dioſcorides*, conſumes the Spleen, if drank in Vinegar. According to *Bobart*, it is good againſt Diſorders of the Spleen, and poſſeſs'd of the ſame Virtues with the Hart's-tongue. According to *Boerhaave*, it is aſtringent, vulnerary, pectoral, and good againſt Diſorders of the Spleen, and Spittings of Blood. *Dale.*

HEMIONIUM, ἡμίονιον, a Name, in *Dioſcorides*, for the Asplenon, or Asplenium.

HEMIOPON, ἡμίοπον, in *Galen's* Exegeſis, is expounded by ἥμισυ, half. *Foeſius.*

HEMIPAGIA, the ſame as Hemicrania. *Blancard.*

HEMIPLEGIA, HEMIPLEXIA, ἡμιπληγία, ἡ ἡμιπληξία, from ἥμισυ, half, and πλήσσω, to ſtrike. An Hemiplegy, or Hemiplexy, is when only half of the Head, and of the reſt of the Body, is affected after the manner of an Apoplexy. See Apoplexia, Caput, Paralysis.

HEMIRHOMBION, ἡμιρόμβιον, the ſame as Hemitomon.

HEMITOMON, ἡμίτομον, from ἥμισυ, half, and τέμνω, to cut, ſignifying cut thro' the Middle; a ſort of Bandage, mention'd by *Hippocrates*, *περ' ἑδρ.* call'd alſo *Semirhombus*, or half a *Rhombus*, from its Figure.

HEMITRITÆUS, ἡμιτριταῖος, from ἥμισυ half, and τριταῖος, third, or tertian, an Epithet of a Fever, is a *Greek* Word, ſignifying the ſame as Semitertiana; which ſee.

HEMITYBION, ἡμιτύβιον, according to *Heſychius*, is a Linen Piece of Apparel fringed on both Sides; according to the Scholiaſt on *Ariſtophanes's Plutus*, it is a Handkerchief, or ſoft Piece of Linen, to wipe off Sweat. But *Galen*, in his Exegeſis, makes

makes it a Piece of thick Linen Cloth, with an Eye to a Place in *Hippocrates, Lib. 2. de Morbis*, where the Word ſeems to be us'd in that Senſe, and agreeably enough with the ſame Meaning in *Lib. de Artic.*

HEMIXESTON, ἡμίξεστον. A Meaſure half a *Xeſtes*; that is, a *Cotyle*; for a *Xeſtes* contains two *Cotyles*.

HENRICUS RUBENS. Vitriol calcin'd to Redneſs.

HEPAR, ἧπαρ. The Liver.

A critical Knowledge of the Structure of this Bowel is of very great Importance both in Phyſic and Surgery; for, without this, it is not poſſible to judge accurately, with reſpect to many, and thoſe very terrible, Affections of this Organ.

The Liver is a large and pretty ſolid Maſs, of a dark-red Colour, a little inclined to yellow, ſituated immediately under the Arch of the Diaphragm, partly in the Right Hypochondrium, which it fills almoſt entirely, and partly in the Epigaſtrium, between the Appendix Enſiformis and Spina Dorſi, and terminating commonly in the Left Hypochondrium, into which it ſometimes runs a conſiderable Way. The Figure of the Liver is irregular, it being arched or convex on the upper Part, unequally concave on the lower, and very thick on the Right and back Sides. Towards the Left and anterior Sides, its Thickneſs decreaſes very much, and terminates there by a kind of Edge; and its Breadth is more extended from Right to Left, than from before backwards. The Liver may be divided into two Extremities, one great, the other ſmall; two Edges, one anterior, the other poſterior; two Sides, one ſuperior and convex, which is ſmooth and poliſhed, and proportioned to the Arch of the Diaphragm, and one inferior, concave and uneven, with ſeveral Eminences and Depreſſions. It may likewiſe be divided into two lateral Parts called Lobes; one of which is termed the Great or Right Lobe, the other, the Small, or Left Lobe. Theſe two Lobes are diſtinguiſhed above by a membranous Ligament; and below, very plainly, by a conſiderable Sciſſure lying in the ſame Direction with the ſuperior Ligament. The Eminences on the concave Side of the Liver belong to the great Lobe. The principal Eminence is a ſort of triangular or pyramidal Apophyſis ſituated backward, near the great Sciſſure, which diſtinguiſhes the two Lobes. This triangular Eminence is termed *Lobulus Spigelii*, or, ſimply, the ſmall Lobe of the Liver. One of its Angles advances a conſiderable Way toward the Middle of the lower Side of the great Lobe, and is loſt there. This Angle I call the Root of the *Lobulus*. Toward the fore Side, there is another Eminence leſs prominent, but broader; and to this Eminence, and the former, the Antients gave the Name of *Portæ*. The Depreſſions on the concave or lower Side of the Liver, which deſerve our Attention, are four in Number. The firſt is the Sciſſure which ſeparates the two Lobes, which run acroſs the concave Side, from the Eminences already mentioned to the anterior Edge, where it terminates by a Notch of different Depths, in different Subjects. This is termed the great Sciſſure of the Liver; and, in ſome Subjects, Part of it is an entire Tube. The ſecond Depreſſion is ſituated tranſverſely between the two Eminences of the great Lobe, and filled by the Sinus of the *Vena Portæ*, ſo called by the Antients, becauſe it lies between the Eminences of the ſame Name. The third Depreſſion is backward, between the great Lobe, and Lobulus Spigelii; and the Vena cava paſſes through it. The fourth is a kind of Sulcus, between the Lobulus, and ſmall Lobe of the Liver; which, in the Fœtus, ſerv'd to receive a venous Canal loſt in Adults, in whom it appears only as a kind of Ligament. This Sulcus is, in ſome meaſure, a Continuation of the great Sciſſure, and joins the Vena Cava, by an acute Angle. Beſides theſe four Depreſſions, there is one on the fore Part of the great Lobe, in which the Gall-bladder is lodged; and it ſometimes runs as far as the Edge, where it forms a ſmall Notch. We may likewiſe reckon, among theſe Depreſſions, a ſmall Cavity in the poſterior and lateral Part of the lower Side of the great Lobe, by which it reſts on the Right Kidney; and likewiſe a ſuperficial Cavity in the Left Lobe, where it runs over the Stomach. Laſtly, on the poſterior Edge of the Liver, there is a great Sinus common to both Lobes, which gives Paſſage to the Spina Dorſi, and Oeſophagus, near the Place where the Vena Cava deſcends; and we ſometimes meet with Sciſſures on both Sides of the Liver, which are not ordinary.

The convex Side of the Liver is commonly connected to the Diaphragm by three Ligaments, which are only Continuations of the membranous Lamina of the Peritonæum. One lies near the Edge of the Extremity of each Lobe, and one in the Middle; and they are accordingly termed Right, Middle, and Left Ligaments. There is a cellular Subſtance in the Duplicature of each, in which the Blood-veſſels and Lymphatics run, and which ſends off a kind of Lamina into the Subſtance of the Liver. The Right Ligament ſometimes connects the great Lobe to the Cartilages of the falſe Ribs; and the Left Ligament, or that of the ſmall Lobe, is often double, and advances toward the middle Ligament. This middle Ligament begins below, in the great Sciſſure of the Liver, near the Eminences called Portæ; and from thence paſſes through the anterior Notch, and over the convex Side of the Liver, at the Union of the two Lobes, and is fixed obliquely in the Diaphragm. It is likewiſe fixed along the upper and inner Part of the Vagina of the Right *Muſculus Rectus* of the Abdomen, in ſuch an oblique Manner, as to be nearer the Linea alba below than above. Beſides theſe Ligaments, the great Lobe of the Liver is likewiſe connected to the Right Ala of the tendinous Portion of the Diaphragm, not by a Ligament, but by a broad and immediate Adheſion, without the Intervention of the Membrane of the Peritonæum, which is only folded quite round this Adheſion, to form the external Membrane of all the reſt of the Body of the Liver. This broad Adheſion is commonly, though improperly, called *Ligamentum Coronarium*; but, in the firſt Place, it is not a Ligament, as has been already obſerved; and ſecondly, it is not circular, but oval, and very oblong: It is not on the upper Part of the convex Side of the Liver, but along the poſterior Part of the great Lobe; the broad Extremity of the Adheſion lying near the Notch, and the pointed Extremity towards the Right Hypochondrium. The middle Ligament, called improperly *Ligamentum Hepatis Suſpenſorium*, contains in its Duplicature a thick white Rope, like a round Ligament, which was the Umbilical Vein in the Fœtus. Thus the lower Part repreſents a *Falx*, the convex Edge of which is ſharp, and the other rounded: All theſe Ligaments ſerve to keep the Liver in its proper Situation, and to hinder it from inclining too much towards either Side: But we muſt not imagine, that any of them ſerve to ſuſpend it, becauſe it is ſufficiently ſupported by the Stomach and Inteſtines, eſpecially when they are filled. When the Stomach is empty, or when we faſt longer than ordinary, it is a common Expreſſion to ſay, The Stomach pinches us. As the Liver is not then ſuſtained by the Stomach and Inteſtines, it deſcends by its own Weight, and, principally by means of the middle Ligament, pulls the Diaphragm along with it. It is in that Place, therefore, that we have this uneaſy Senſation, and not at the ſuperior Orifice of the Stomach, as is commonly believed. The Right or great Lobe of the Liver, which lies in the Right Hypochondrium, reſts on the Right Kidney, by a ſmall ſuperficial Depreſſion above-mentioned; and it likewiſe covers a Portion of the Colon, and the Pylorus. About two Thirds of the ſmall or Left Lobe lie in the middle of the Epigaſtrium, and the remaining third Part advances over the Stomach, towards the Left Hypochondrium: This ſmall Lobe is ſituated almoſt horizontally; the great Lobe is very much inclined, and its thick Extremity runs down almoſt in a perpendicular Direction to the Right Kidney, on which it lies in the manner already ſaid. This Obſervation is of Uſe to diſtinguiſh the different Parts of the Liver, in Wounds, and Chirugical Operations. It may likewiſe ſerve to direct us in examining a Liver taken out of the Body; the Situation of which may be otherwiſe very eaſily miſtaken, eſpecially that of the Parts of the concave Side. The Paſſage of the Vena Cava, between the Body of the great Lobe, and the *Lobulus Spigelii*, may likewiſe ſerve for a Rule, in placing a detach'd Liver in its true Situation.

The Liver is compoſed of ſeveral kinds of Veſſels, the Ramifications of which are multiplied in an aſtoniſhing manner, and form, by the Intertexture of their capillary Extremities, an innumerable Collection of ſmall, pulpy, friable Corpuſcles, which are looked upon to be ſo many Organs deſigned to ſeparate from the Maſs of Blood a particular Fluid termed the Bile. The greateſt Part of theſe Veſſels, from one End to the other, is included in a membranous Vagina called *Capſula Venæ Portæ*, or *Capſula Gliſſoni*, from an *Engliſh* Author who firſt deſcribed it particularly. The Veſſel which carries the Blood to the Liver, is called the *Vena Portæ*, for the Reaſon already given. In the Deſcription of the Veins it is obſerved, that the Vena Portæ might be conſidered as two large Veins, the Trunks of which are joined endwiſe, and ſend out Branches and Ramifications in oppoſite Directions to each other; that one of theſe Veins is ramified in the Liver, the other lying without the Liver, and ſending its Branches and Ramifications to the Viſcera of the Abdomen; and laſtly, that the firſt of theſe large Veins may be termed *Vena Portæ Hepatica*, the other *Vena Portæ Ventralis*.

The particular Trunk of the Vena Portæ Hepatica is ſituated tranſverſely between the broad anterior Eminence of the great Lobe of the Liver, and the Root of the Lobulus, in a particular Sciſſure, and forms what is called the Sinus of the Vena Portæ. From this Sinus five principal Branches go out, which are afterwards divided into Millions of Ramifications, through the whole Subſtance of the Liver. At this Place the Vena Portæ lays down the common Office of a Vein, and becomes a kind of Artery, as it enters, and is again ramified in the Liver. The Extremities of all theſe Ramifications of the Trunk of the Vena Portæ Hepatica end in the pulpy, friable Corpuſcles, which ſeem to be thick, villous Folliculi, when examined through a Microſcope in clear Water.

It is in theſe Folliculi that the Bile is ſecreted, and it is immediately collected in the ſame Number of Extremities of another kind of Veſſels, which unite by numerous Ramifications into one common Trunk. Theſe Ramifications are termed *Pori Bilarii*, and the Trunk, *Ductus Hepaticus*; and the Ra-

mifications

mifications of theſe two Kinds of Veſſels are inveſted together, by the Capſula of the Vena Portæ.

The Blood, depriv'd of this bilious Fluid, is reconvey'd to the Heart, by a great Number of venous Ramifications, which afterwards unite into three principal Branches, beſides others which are leſs conſiderable, that terminate in the Vena Cava, and are called by the Name of Venæ Hepaticæ: The capillary Extremities of the Ramifications of the Vena Cava join thoſe of the Vena Portæ, and accompany them thro' the Liver; and, yet, the great Branches of both Veins interſect each other in ſeveral Places. When we cut the Liver in Slices, it is eaſy to diſtinguiſh, in each Slice, the Ramifications of the Vena Cava from thoſe of the Vena Portæ; the firſt being thinneſt and largeſt, and adhering cloſeſt to the Subſtance of the Liver; whereas thoſe of the Vena Portæ, which are inveſted by the cellular Capſula, appear to be a little rumpled, when empty, becauſe the cellular Capſula ſubſides, when it is cut; but the other Veins remain uniformly open, their Sides adhering to the Subſtance of the Liver.

The Liver receives from the cœliac Artery a particular Branch, term'd *Arteria Hepatica*, which, being very ſmall, when compared with the Bulk of that Bowel, ſeems deſign'd only for the Nouriſhment thereof, and not for the Secretion of the Bile. The *Plexus Hepaticus*, form'd by the *Nervi Sympathetici maximi & medii*, furniſhes a great Number of Nerves to the Subſtance of the Liver. The Ramifications of the Artery, and Nervous Plexus, are included in the cellular Capſula, together with thoſe of the *Vena Portæ*, and *Pori Bilarii*: The Pulſation of this Artery has been, by ſome Anatomiſts, taken for that of the Capſula; and, by this, they have endeavour'd to explain the arterial Function of the Vena Portæ: But they have not conſider'd, that the Blood in this Vein does not require to be pumped forward; becauſe ſo ſwift a Motion would have been prejudicial to the Secretion of the fine Oil of the Bile; for which a ſlow and almoſt inſenſible Motion is neceſſary. The Liver is cover'd exteriorly by a particular Membrane or Coat, which is a Continuation of the Peritonæum: There is likewiſe a membranous or filamentary Subſtance, which runs thro' this whole Bowel, and connects the Ramifications and Extremities of all its Veſſels to each other: This Subſtance ſeems to be a complicated Production of the Capſula of the Vena Portæ, and of the external Membrane of the Liver. The outer Surface of this Coat is very ſmooth, but its inner Surface is uneven, being made up of a great Number of thin membranous Laminæ, between which we obſerve, very diſtinctly, numerous lymphatic Veſſels on both the convex and concave Sides of the Liver; but it is more difficult to trace thoſe which accompany the filamentary Subſtance thro' that Bowel. I have already obſerv'd, that the Subſtance of the Liver is principally made up of pulpy friable Corpuſcles, each of which is bounded, and, in a manner, ſurrounded, by a particular Expanſion of the *Capſula Gliſſoni*; and all theſe Expanſions are connected by common Septa, in ſome meaſure reſembling a Honey-comb: Theſe Corpuſcles have ſeveral Angles, eſpecially in the inner Surface of the Liver; but, near the Surface, they are raiſed in the Form of ſmall Tubercles: Their pulpy Texture appears like radiated Tufts, a ſmall void Space being left in the middle of each. If we blow thro' a Pipe into the Vena Portæ, Vena Cava, Arteria Hepatica, or Trunk of the Pori Bilarii, but eſpecially through the two Veins, we obſerve the Liver to ſwell, and the Corpuſcles, near the Surface, are raiſed, and become more ſenſible: If we blow with much Force, we burſt theſe Corpuſcles; and the Air, getting between them and the external Membrane, raiſes it from the Subſtance of the Liver, in Bliſters.

The *Ductus Hepaticus*, or Trunk of the *Pori Bilarii*, having run a little Way, joins another Canal, called *Ductus Cyſticus* or *Veſicularis*, becauſe it comes from the Veſicula Fellis: Theſe two united Ducts form a common Trunk, nam'd *Ductus communis Cholidochus*, becauſe it conveys the Bile: This Duct, having reached the Incurvation of the Duodenum, inſinuates itſelf through the Coats of that Inteſtine, and opens into the Cavity thereof, not by a round Papilla, but by an oblong Orifice, rounded at the upper Part, and contracted at the lower, like the Spout of an Ewer, or like a common Tooth-picker: The Edges of this Orifice are raiſed, broad, and plaited; as we may ſee, by making this Portion of the Duodenum ſwim in clear Water: At the Entry of this Orifice, we ſee another ſmaller Opening, diſtinct from it, which is the Orifice of the *Ductus Pancreaticus*.

The Gall-bladder is a kind of ſmall Bag, ſhaped like a Pear, that is, narrow at one End, and wide at the other. The wide Extremity is termed the Fundus, or Bottom; the narrow Extremity, the Neck; and the middle Portion, the Body. About One-third of the Body of the Gall-bladder lies in a Depreſſion on the concave Side of the Liver, from the Trunk or Sinus of the Vena Portæ, where the Neck is ſituated to the anterior Edge of the great Lobe, a little towards the Right Side, where the Bottom is placed; and, in ſome Subjects, it advances beyond the Edge. When, therefore, we ſtand, the Gall-bladder lies in a Plane, inclined a little from behind, forward: When we lie upon the Back, it is almoſt inverted: When we lie on the Right Side, the Bottom is turned downward; and it is turned upward when we lie on the Left Side; and theſe Situations vary, according to the different Degrees of each Poſture. The Gall-bladder is compoſed of ſeveral Coats; the outermoſt of which is a Continuation of that which inveſts the Liver, and, conſequently, of the Peritonæum: The ſecond Coat is fleſhy, and made up of two Strata, one longitudinal, and the other tranſverſe; the Fibres of which have nearly the ſame irregular Direction with thoſe of the Stomach; and this Diſpoſition of the Fibres of theſe Viſcera is owing to the Inequality of their Diameters in the ſeveral Parts of them, and to their Incurvation: Theſe two Coats are, connected by a cellular Subſtance, continued, between the Body of the Gall-bladder and the Liver, all the Way to a whitiſh Stratum, which is look'd upon as the third Coat to the Gall-bladder, anſwering to the *Tunica Nervoſa* of the Inteſtines: The innermoſt or fourth Coat has, on the Inſide, a great Number of reticular Folds, filled with ſmall Lacunæ, like perforated Papillæ, eſpecially near the Neck of the Gall-bladder, where the Folds are longitudinal, and afterwards form a kind of ſmall rough Pylorus: Theſe Lacunæ are looked upon to be Glands. That Side of the Body of the Gall-bladder, which lies next the Liver, is connected to that Bowel by a vaſt Number of Filaments, which run a great Way into the Subſtance of the Liver; and, among theſe Filaments, there are ſome Ducts which form a Communication between the *Pori Bilarii* and Gall-bladder: Theſe Ducts were obſerved in Brutes long ago, and they have been very lately diſcover'd in Men likewiſe: They are moſt numerous near the Neck of the Bladder, and they are call'd *Ductus Cyſt-hepatici*, or *Hepatico-cyſtici*. The Neck of the Gall-bladder is form'd by the Contraction of the ſmall Extremity; and this Neck, bending afterwards in a particular manner, produces a narrow Canal, named *Ductus Cyſticus*: This Incurvation repreſents, in ſome meaſure, the Head of a Bird, of which the Cyſtic Duct, by the gradual Diminution of its Diameter, expreſſes the Beak: This cannot be ſeen when the Liver is out of its proper Situation; and even *in Situ* it is but imperfectly ſeen, when, in order to view the concave Side, the Liver is raiſed, and thruſt too much againſt the Diaphragm; for, by thus inverting the Liver, the Curvature is diſorder'd, and we ſee two in the Place of one. To ſee this Curvature in its true natural Situation, the Liver is to be raiſed but very little, and the Duodenum left untouched; then we muſt ſtoop, and look under the Liver, without diſordering any thing. This Incurvation may be of Uſe to hinder too precipitate a Diſcharge of the Bile contain'd in the Bladder, which ſome Situations of the Body might occaſion. The Neck of the Veſicula is, nearly, of the ſame Structure with the other Parts; it has, on the Inſide, ſeveral reticular Wrinkles, and ſome Folds, which appear like Fragments of a ſort of Valvulæ conniventes, ſituated very near each other, from the Neck to the Contraction of the Cyſtic Duct: The firſt of theſe Folds is pretty broad and large, and almoſt circular; the next is more oblique, and ſmaller in Size; and the reſt diminiſh in the ſame manner: Taken all together, they form a kind of ſpiral Aſcent, which may be ſeen thro' the Neck, on the Outſide, where it ſometimes appears like a Screw, eſpecially when the Neck is filled with any Fluid. This Obſervation is owing to *Heiſter*. By ſlitting the Neck and Duct, we ſee all theſe Folds very diſtinctly, eſpecially when we examine them in clear Water. When they are view'd in any other Manner, they eaſily deceive us, being miſtaken for true Valves, becauſe of their tranſverſe Situation: They may, however, in ſome meaſure, ſupply the Place of Valves, by hindering the Bile from running too faſt into the Duodenum; and the Contents of the Duodenum from entering this Duct. The internal Surface of all theſe biliary Ducts, that is, of the *Ductus Hepaticus*, *Cyſticus*, and *Cholidochus*, being examin'd thro' a Microſcope, in clear Water, appears to be, nearly, of the ſame Structure, thro' their whole Extent. The Cyſtic and Hepatic Ducts do not, in their ordinary and natural Situation, repreſent the Capital T of the *Greeks*, where they form the *Ductus Cholidochus*: After the Incurvation of the Neck of the Bladder, theſe two Ducts run very near each other, and they appear to be ſeparated, only when the Liver is raiſed up, in order to view them. The ſame Confuſion of theſe Parts happens, alſo, in an inverted Liver, when taken out of the Body; for then the Body of the Liver ſubſides, and is flatten'd, and thereby ſeparates the Ducts; whereas, in its true Situation, it is very much incurvated, and the Ducts are very near each other. The *Ductus Cholidochus* appears rather to be a Continuation of the *Ductus Cyſticus*, than the common Trunk of that and the *Ductus Hepaticus*; for I have obſerv'd, that this laſt Duct runs for ſome Space within the Sides of the former, before it opens into the Cavity, much in the ſame manner as the Ductus Cholidochus paſſes into the Duodenum. I have likewiſe obſerv'd, at the Opening of the Hepatic into the Cyſtic Duct, a ſmall looſe valvular Membrane, which may hinder the Bile from returning out of the *Ductus Cholidochus* into the *Hepaticus*. The Bile, which paſſes thro' the *Ductus Hepaticus* into the *Cholidochus*, may be called Hepatic; and that which is collected in the Gall-bladder, may be term'd Cyſtic: The Hepatic Bile flows continually

thro' the *Ductus Cholidochus* into the *Duodenum*; whereas the Cyſtic Bile flows only by reaſon of Plenitude, or Compreſſion.

The Trunk of the *Vena Portæ Ventralis* terminates between the Lobulus and the oppoſite Part of the great Lobe; and there joins the Trunk of the *Vena Portæ Hepatica*, in the tranſverſe Sinus of the Liver, between the Right Extremity and the Middle of that Sinus. The Umbilical Ligament, and, conſequently, the Umbilical Vein in the Fœtus, joins the Trunk of the *Vena Portæ Hepatica*, toward the Left Extremity of the tranſverſe Sinus of the Liver. The *Canalis Venoſus* in Man is not exactly oppoſite to the Umbilical Vein, but a little to the Right-hand; and, therefore, theſe three Veſſels lie in ſuch a Direction as to form two oppoſite Angles, reſembling thoſe of the Handle of a Wheel, or of a Spit. In the Fœtus, therefore, the Blood which comes from the Umbilical Vein, does not run directly thro' that contained in the Vena Portæ Hepatica in the Sinus, and, from thence, to the Canalis Venoſus; but is obliged to turn from Left to Right, and ſo to mix with the Blood in the Vena Portæ, before it enters that Canal, which opens into the Trunk of one of the great Hepatic Veins of the Vena Cava, near the Diaphragm. The Hepatic Vena Portæ gives off, commonly, five large Branches into the Liver; three from its Right Extremity into the great Lobe; and two from its Left Extremity into the ſmall Lobe; and, from the Interſtice between theſe, a ſmall Branch goes directly to the Middle of the convex Side of the Liver. The Hepatic Veins are commonly three large Branches of the Trunk of the Vena Cava inferior, which go out from it by one common Opening, eſpecially two of them; and, then ſeparating, they enter the Subſtance of the Liver, interſecting the Branches of the Hepatic Vena Portæ; and are ramified, in all Directions, in the manner already explain'd. The inferior Portion of the Opening of theſe Veins into the Vena Cava forms a kind of ſemilunar Valve: Below theſe Hepatic Veins, the Vena Cava inferior ſends off, in its Paſſage by the Liver, ſeveral other ſmall Hepatic Veins immediately from the Trunk, which ſeem to have the ſame relation to the Hepatic Artery, as the great Veins to the Vena Portæ. The Paſſage of the Vena Cava is thro' the Right Portion of the poſterior Sinus of the Liver, and, conſequently, on the Side of the great Lobe, which is hollow'd, at this Place, ſufficiently to give Paſſage to the Vein, of which it ſurrounds about Three-fourths, ſometimes more, and ſometimes the Whole: This Paſſage anſwers to the Interſtice between the Lobulus and the reſt of the great Lobe; and its Direction is, in the natural State, from above, downward, and a little from Right to Left; but when the Liver is view'd out of the Body, and inverted, it appears very oblique.

The Trunk of the great Vena Portæ, the Hepatic Arteries, the *Ductus Hepaticus*, or Trunk of the *Pori Bilarii*, and Nerves of the *Plexus Hepaticus*, form, all together, a large Bundle, before they enter the Liver; the Trunk of the Hepatic Vena Portæ is in the Middle of this Bundle; the Hepatic Arteries lie on the Right and Left Side of this Trunk; the Nerves ſurround it on all Sides, and they communicate with the *Plexus Meſentericus ſuperior*: Afterwards the firſt Branches of the Arteries, Nerves, and Pori Bilarii, leave the Trunk of the great Vein, and join, in the ſame manner, the Trunk of the ſmall or Hepatic Vena Portæ, and its Ramifications in the *Capſula Gliſſoni*, explain'd above. All theſe Branches of the Vena Portæ, and of the Arteries, Nerves, and Pori Bilarii, accompany each other, by Ramifications thro' the whole Subſtance of the Liver, forming every-where ſmall Faſciculi, in the ſame manner as the large Bundle is form'd by their Trunks. Each Branch of the Vena Portæ, Artery, Nerve, and Porus Bilarius, has a proper Vagina; and all the four have a common Vagina, diſtinguiſh'd from the former by cellular Septa, which are only Continuations of the Vaginæ of both Kinds. The convex Side of the common cellular Vagina is connected quite round to the Subſtance of the Liver, by numerous Filaments, which ariſe from it, and which form the cellular Subſtance found between the glandular Corpuſcles: The concave Side produces the cellular Septa above-mention'd. In this common Vagina the Veſſels, Ducts, and Nerves, are diſpoſed in ſuch a manner, as that the Branches of the Vena Portæ principally fill the Cavity of it, and it is in a lateral Situation; the arterial Branch and Porus Bilarius lie together, on the Side of the Vein, and the Nerve is divided into ſeveral Filaments, which run in between the Veſſels and Ducts, and chiefly accompany the Artery and Porus Bilarius; the Vena Portæ having by much the feweſt.

The Liver is the principal Organ for the Secretion of the Bile. The Villi of that immenſe Number of glandular Cells, of which it is compoſed, filtrate continually from the Blood of the Vena Portæ ſmall Drops of Bile, which, afterwards, inſinuate themſelves into the Pori Bilarii, and are, in part, lodged in the Gall-bladder, and, in part, run directly into the *Duodenum*, in the Manner already explain'd, in deſcribing the Biliary Ducts.

The Spleen, Omentum, Appendices Epiploicæ, Adipoſe Strata of the Meſentery, and thoſe of the great Inteſtines, and even the Pancreas, with the whole Series of Glands in the inteſtinal Canal, ſeem to contribute to the Formation of the Bile, as ſo many auxiliary, or, rather, preparatory Organs; but each of them in a different Way. It appears, (1.) That the venous Blood, which returns from all the inteſtinal Glands, and from the Pancreas, has left a great Portion of its Serum. (2.) That the Blood, which returns from the Spleen, has undergone a certain Change, by its Courſe being mechanically retarded; and, likewiſe, that its Texture is alter'd, by the Action of the numerous Nerves ſent thither by the Plexus Splenicus. (3.) That the Blood which returns from the Omenta, Appendices Epiploicæ, and from the Strata, and other Collections of Fat, is loaded with Oil. Theſe three Kinds of venous Blood meet in the Trunk of the *Vena Portæ Ventralis*, where they are mixed together; and from thence they enter the tranſverſe Sinus, or Trunk of the *Vena Portæ Hepatica*: In this Sinus they are ſtill more intimately mixed, as in a kind of Lake, and become one uniform Maſs of Blood, which being forced into the Branches of the *Vena Portæ Hepatica*, only by the ſupervening Blood from the other *Venæ Portæ*, and by the lateral Pulſations of the Ramifications of the Hepatic Artery, its Courſe muſt be very ſlow: The Secretion of the Bile depends partly on this ſlow Motion, and partly on theſe external Impulſes.

The veſicular Bile appears to be more exalted than that in the Hepatic Duct; and, by meeting in the Ductus Cholidochus, they ſeem to compoſe a third Kind of Bile, which, without the Cyſtic or Veſicular Bile, would, perhaps, be too mild; and too acrid, without the Hepatic: This Bile mixes, in the Duodenum, with the pancreatic Juice, and with that of the inteſtinal Glands; and from this Mixture a Fluid reſults, which is proper to ſeparate the chylous Matter from the groſs and uſeleſs Part of the alimentary Pulp, as it comes from the Stomach.

See BILIS.

See, alſo, *Tab.* XIII. *Tab.* XIV. *Fig.* 1. and 3. and *Tab.* XV. and the Explication of all theſe Figures.

From this Structure of the Liver, duly conſider'd, it will be eaſy to underſtand the Diſtempers to which this Organ is ſubjected in a particular Manner: The firſt, and moſt acute, of theſe is an Inflammation, called *Hepatitis*; which, perhaps, occurs more frequently than is generally apprehended; but, however, not ſo often as one would be ſubject to imagine, from the Conformation of the Part, unleſs it were conſider'd, that the Hepatic Artery is not very large, and, therefore, cannot convey to the Liver a great Quantity of Blood; and that the Force of the Blood circulating thro' the Ramifications of the *Vena Portæ*, is not ſo conſiderable as to ſubject this Organ very much to Inflammations.

An Inflammation of the Liver is ſeated in the Extremities of the Ramifications of the *Vena Portæ*, or Hepatic Artery; and it is evident, from the Diſpoſition of theſe Veſſels, that an Inflammation in either of them muſt ſoon be ſucceeded by one in the other.

The antecedent Cauſes of both theſe Species of Inflammation are the ſame as the general Cauſes of Inflammations, (ſee INFLAMMATIO) determined to this Organ. But there are other Cauſes, which are local, and relate more immediately to the particular Part: Thus an extraordinary Degree of Fatneſs, in the Omentum, may raiſe an Inflammation in the Liver, not only by compreſſing it, but this Fat may alſo diſſolve by Exerciſe, Motion, and Heat, and, being abſorb'd by the Veſſels, and convey'd to the Liver in too large Quantities, may there cauſe an Inflammation.

This Effect may, alſo, be produc'd by an atrabilarious Temperament of the Blood, or Bile; for when ſuch a Temperament is induced by an intimate Union of the Earth and Oil, and a Diſſipation of the ſpirituous and aqueous Particles of the Blood, or Bile, either of theſe Humours become ſubject to form Concretions and Stagnations, in the minute Extremities of the Branches of the Hepatic Artery, or Vena Portæ.

The Liver, alſo, ſuffers from Diſorders in remote Parts of the Body; for if acrimonious *Pus*, *Ichor*, or a ſcorbutic Sanies, is depoſited in any other Organ or Member, theſe, upon the Acceſſion of Heat, a Fever, violent Motion, an improper Diet, ill-applied Medicines, or Poiſons, are colliquated, moved, return'd into the Circulation, and, by this means, convey'd to, and depoſited in, the Liver.

Beſides theſe Cauſes, the Bile, when pinguious, acrimonious, and exalted, or what the Antients called *aduſt*, if put in Motion by adequate Cauſes; a Stone, chalky Concretions, a Scirrhus, Callus, Steatoma, Abſceſs, or Worms, occupying any Part of the Liver, Gall-bladder, or Biliary Ducts, upon the Acceſſion of any Cauſe ſufficient to put them in Motion, by compreſſing the ſmall Ramifications of the Hepatic Artery, and Vena Portæ, excite therein an Inflammation.

Cold, alſo, applied to the Liver when, by any means, overheated, contracts the Veſſels, inſpiſſates the Fluids, and thus produces an immediate Inflammation; and this Cold has much the ſame Effect, whether it is apply'd by means of the Air, Liquors drank, or Bathing.

An Abſtinence from diluting Liquors, during exceſſive Motion, great Heat, and profuſe Sweating, will, alſo, cauſe an Inflammation of the Liver; for, when the Blood is depriv'd of its aqueous Parts, without a freſh Supply, it becomes thick, and, conſequently, inclined to ſtagnate in the capillary Veſſels. Abſtinence, likewiſe, eſpecially from Drink, in burning Fevers, will,

for the ſame Reaſon, produce a like Effect: And the ſame Diſorder may be brought on by violent Paſſions and Perturbations of the Mind, which induce ſpaſmodic Strictures in the Veſſels of the Liver, and an irregular Circulation; as it frequently happens, in ſome Degree, during Hyſteric Diſorders, as *Sydenham* remarks.

Among the Cauſes of an Inflammation in this Organ, exceſſive Motion, excited by Emetics, muſt, farther, be reckon'd as one; for, by theſe, ſome Veſſels in the Liver may be ruptur'd; or the Blood, contain'd in all the abdominal Viſcera, may be impel'd with Violence into the *Vena Portæ*, and thence being convey'd, in too large Quantities, into the Liver, or too forcibly, or both, in either Caſe excite an Inflammation.

Laſtly, inveterate hypochondriac Diſorders will produce Inflammations of the Liver, for Reaſons given under the Article MELANCHOLIA.

The Effects of Inflammations of the Liver, ariſing from any of theſe Cauſes above ſpecify'd, are various, and determin'd by the various preceding Diſpoſitions of the Liver, the Variety of the Matter which is mov'd and fix'd upon the Liver, the material Cauſe of the Inflammation, and the different Cauſes which excite this Matter to Action, and impel it upon the Liver.

When the Caſe is only a ſimple Inflammation, the ſmall Veſſels are obſtructed; and, in conſequence of this, the Fluids, which ought to circulate through them, are ſtopt in the Part: Hence a Tumor ariſes, which compreſſes the adjacent Parts, and, by that means, propagates the Tumor to them; thus it proceeds, till almoſt the whole Organ is affected, which then compreſſes the Stomach, and is again compreſs'd by the Stomach when full; which Compreſſion is attended with Pain in the inflam'd Liver. It alſo affects the Diaphragm, and ſometimes excites Pain and Inflammation in that Part by compreſſing it, or account of its near Situation. Beſides, all the Blood receiv'd by the cœliac Artery, and the two meſenteric Arteries, is intercepted and ſtopt at the Liver; and, in conſequence of this, the Circulation of all the venous, arterial, and lymphatic Fluids, in the principal Viſcera of the Abdomen, is utterly obſtructed; and the Generation, Secretion, Excretion, and Circulation of the Bile, is entirely hinder'd. Hence a Jaundice is produc'd, with all its Conſequences; Putrefactions of the abdominal Viſcera, together with their contain'd Fluids; and a great Number of ill Conſequences, which are obvious from the Uſes of the Bile, (ſee BILIS) and the Functions of the Parts thus deſtroy'd.

Such an Inflammation of the Liver terminates in Health, ſome other Diſeaſe, or Death.

It terminates in Health, either ſpontaneouſly, by the Force of Nature, or by the Aſſiſtance of Art.

Nature performs the Cure, either by a ſalutary Reſolution, or by a due Concoction and Excretion of the morbific Matter.

Reſolution is brought about, if the Diſeaſe is recent, the Matter which forms it mild, and the Caſe, attended with the other Circumſtances mention'd under the Article INFLAMMATIO, as requiſite to a benign Reſolution, In this Caſe, it will be of great Importance towards the Cure, to promote the Work begun by Nature, by diluting, reſolving, and gently moving the obſtructing Matter by Epithems, Drinks, and Clyſters, which are moiſtening, lenient, emollient, diluting, reſolvent, abſtergent, gently ſtimulating, and ſaponaceous; proper Materials and Forms for which are abundantly ſpecify'd under the Articles FIBRA, LENTOR, ALCALI, and OBSTRUCTIO.

A Cure is brought about by a Concoction, and ſubſequent Excretion, of the morbific Matter; firſt, if, during the Diſeaſe, evident from the Signs above-mention'd, a bilious Diarrhœa, mix'd with a ſmall Quantity of Blood, comes on before the fourth Day, which carries off the obſtructing Matter, before concocted, and render'd moveable. But great Care muſt be taken in Practice, not to miſtake this ſalutary Diarrhœa for a morbid Dyſentery.

Secondly, If a large Quantity of acrid, thick, red Urine, with a whitiſh Sediment, is diſcharg'd before the fourth Day, and continues for a long time.

Thirdly, If, before any Signs of Suppuration appear, a ſlight Pain is perceiv'd in the Spleen.

Fourthly, If a copious Hæmorrhage happens from the Right Noſtril.

Fifthly, If a plentiful, univerſal, yelloviſh, and ſomewhat viſcid Sweat, breaks out before the fourth Day, continues long, and is attended with a Mitigation of the Symptoms.

A Phyſician ſhould always watch the ſpontaneous Motions of Nature, and, according to theſe, regulate his Conduct towards the Patient. Thus, in the firſt Caſe, that of a bilious Diarrhœa, all thoſe Things ſhould be adminiſter'd, which are capable of diluting, reſolving, moving, abſterging, gently expelling, and particularly ſuch as reſiſt a bilious Putrefaction; and theſe muſt be exhibited in Epithems, Clyſters, Fomentations, Drinks, Diet, and Medicines. Proper Materials and Forms for theſe are ſpecify'd under the Articles FIBRA and ALCALI. By theſe the ſalutary Operations of Nature are promoted.

In the ſecond Caſe, that is, a critical Diſcharge by Urine, ſoft, relaxing, and aperient Fomentations, are to be apply'd to the Region of the Kidneys, the Perinæum, and Hypogaſtrium: Mean time mild aperient Diuretics are to be exhibited; the Air of the Room is to be kept ſomewhat cool; Sweats, and all other Evacuations, are to be avoided; and mild diuretic Clyſters are to be adminiſter'd, in order to promote the critical Excretion begun by Nature.

In the third Caſe, that of a Pain in the Spleen, the ſame Methods are to be purſued as in the firſt and ſecond; but the Fomentations muſt be apply'd directly to the Region of the Spleen, and all the Tract betwixt that and the Liver.

In the fourth Caſe, that of an Hæmorrhage from the Noſe, the Noſtrils muſt be fomented, both internally and externally, with warm emollient Decoctions, in order to promote the Bleeding till the Symptoms are alleviated. But if the Hæmorrhage ſhould be too profuſe, it muſt be gently reſtrain'd by the Application of Styptics, and a ſubaſtringent Diet; but this muſt not be attempted too ſoon.

A mild Styptic uſeful on ſuch Occaſions:

Take of Roch-alum, one Dram; and of diſtil'd Plantain-water, one Ounce: Diſſolve together, and apply on Tents to the Noſtrils.

A ſtronger Styptic for the ſame Purpoſe may be prepar'd thus:

Take of the Sugar of Lead, one Dram; and of diſtil'd Roſe-water, one Ounce: Mix together, and uſe in the ſame Manner with the former.

Another ſtill ſtronger than the former two may be prepar'd thus:

Take of common Vitriol, one Dram; and of diſtil'd Roſe-water, ſix Drams: Mix together for the like Purpoſes.

In the fifth Caſe, that is, a critical Evacuation by Sweat, a copious Uſe of diluting and abſtergent Decoctions is requir'd; the Materials and Forms of which are ſpecify'd under that Part of the Article FIBRA, where we have treated of Diſeaſes proceeding from too great a Rigidity of the Fibres.

In all theſe Caſes, particular Care muſt be taken to free the Liver entirely from all the morbific Matter ſtagnating therein; otherwiſe its Removal will afterwards be difficult, and it may produce Indurations of this Organ, and all its Conſequences. And thus is the firſt and moſt mild Species of Jaundice to be treated.

If the Inflammation is recent, extremely violent, and without any Signs or Hopes of Reſolution, Concoction, and Excretions, the Caſe muſt be treated with the ſame Cautions and Remedies, and the ſame Method of Cure muſt be purſued, as is directed for a *Pleuriſy*, and *Paraphrenitis*, (which ſee) and other ſimilar inflammatory Diſorders; except that, in the Caſe before us, all antiphlogiſtic Fluids, which promote the Excretions by Stools, when either drank, or injected by way of Clyſter, are particularly ſerviceable. The Materials proper in Caſes of this Nature, are Garden-ſorrel, Meadow-ſorrel, and *French* Sorrel, Wood-ſorrel, Wild Orache, *Engliſh* Mercury, Gum Succory, Garden and Wild Succory, Dandelion, Endive, Fumitory, Hawk-weed, Lettuce, ſharp-pointed Dock, Purſlain, Syrup of Borrage, in a Doſe of two Ounces; Syrup of Succory, with Rhubarb, three Ounces; Syrup of Fumitory, two Ounces; and Syrup of the Five aperient Roots, two Ounces.

Take of Tamarinds, one Ounce; of ſweet Plums, three Ounces; of ſton'd Raiſins, and Currants, each two Ounces; of the Flowers of Dandelion, and Wild Succory, each one Ounce; of the Root of Viper's-graſs, four Ounces. Boil in two Pints of Water, for a Quarter of an Hour; and mix with the Liquor, of *Sal Polychreſtus*, one Dram; of Syrup of Succory, with Rhubarb, an Ounce and an half. Let the Patient drink an Ounce of this every Half-hour, uſing, at the ſame time, a proper Regimen, till his Body is render'd ſoluble.

Or,

Take of the Syrup of Succory, with Rhubarb, an Ounce and an half; of Sal Prunellæ, one Dram; of the diſtil'd Waters of Succory, and Fumitory, each two Ounces: Mix all together, and exhibit a Spoonful every Half-hour.

When the yellow icteritious Colour of the Eyes, Face, Urine, and Excrements, together with all the Symptoms taken notice of above as Diagnoſtics of this Diſtemper, entirely diſappear, we know that the Cure is completed.

Hence

Hence the Origin, Nature, Effects, and Cure of the ſecond and more ſevere Species of Jaundice may be underſtood.

But if, in an Inflammation of the Liver, the above-mention'd Remedies ſhould not be uſed, ſhould be apply'd too late, or without Effect, or if the Cauſe of the Inflammation be very conſiderable, a Suppuration of the Liver will enſue, as it happens in Inflammations of other Parts; but, with this Difference, that in the Liver, on account of the large Quantity of Blood and bilious Fluids ſtagnating therein, good Pus is very ſeldom form'd, unleſs in very ſmall Abſceſſes, and thoſe in the external Parts of this Organ; but, inſtead of this, a fatal Putrefaction is generally induced.

This Suppuration is prognoſticated, firſt, By the preceding Signs of an Inflammation in this Organ, as an inflammatory Pain, a yellow Colour in the Eyes, Skin, Urine, and Excrements, and an acute Fever.

Secondly, When there is no Reſolution nor Excretion of the concocted morbific Matter, and the Methods of Cure above-mention'd have not been put in Practice, there is Reaſon to believe, that a Suppuration will enſue.

Thirdly, A Change of the Symptoms, that is, a Remiſſion of the Pain, with ſubſequent Pulſation and Shiverings, whilſt the icterical Colour remains, are certain Preſages of a Suppuration.

Fourthly, Another ſuſpicious Sign of Suppuration is, the Duration of an Inflammation not of the moſt violent Kind, for more than three Days.

We are certain, that a Suppuration in this Organ has actually happen'd, firſt, If the four Circumſtances juſt above-mention'd have preceded.

Secondly, If a Tumor is perceiv'd in the Region of the Liver.

Thirdly, If the Symptoms are ſo alter'd, that, inſtead of a Pain, a Senſation of Weight is perceiv'd in the ſame Place, the icteritious Colour ſtill remaining.

Fourthly, If the Patient is affected with great Weakneſs, a hectic Fever, and exceſſive Thirſt.

The Conſequence of ſuch an Apoſtemation is,

Firſt, That the Liver is entirely corroded and conſum'd: Or,

Secondly, That the Abſceſs breaks, and diſcharges into the Cavity of the Abdomen a ſanious Sort of Pus: Or,

Thirdly, That the ſame Sort of Pus paſſes through the biliary Ducts into the Inteſtines: Or,

Fourthly, That it paſſes through the Ramifications of the *Vena Cava* into the Blood.

Fifthly, The Tumor may adhere to the *Peritonæum*, and form an external Abſceſs of the Liver, evident to the Sight and Touch.

In the firſt Caſe, that is, when the Liver is conſum'd, the Patient dies, after ſtruggling, for a long time, with a ſlow icterical Conſumption, a perpetual ſlow Fever, an intolerable Thirſt, exceſſive Weakneſs, inexpreſſible Anxiety, a Diſcharge of black Urine, a *Tympanitis*, and a ſanious and extremely fetid Diarrhœa. This is another Species of Jaundice, which admits of no Cure, and can even ſcarcely be palliated.

In the ſecond Caſe, that is, when the Abſceſs breaks, and diſcharges its Contents into the Cavity of the Abdomen, the Collection of Matter in this Cavity is perpetually increaſed by a freſh Supply from the Liver; and all the Fluids of the Body, together with the Aliment taken in, is continually converted into freſh Pus, and all the abdominal Viſcera contract Putrefaction. Hence an *Aſcites* reſembling a *Tympanitis*, and Death, preceded by a ſlow terrible Conſumption, and all its troubleſome Symptoms. This Species of Jaundice reſembles the preceding, and cannot be cur'd by any Art whatever.

In the third Caſe, that is, when the ſuppurated Matter and Ichor corrode the Extremities of the biliary Ducts, and paſs through their larger Ramifications into the Inteſtines, as they happen to paſs upwards or downwards, they either excite Diſcharges by Vomit, which are fetid, putrid, purulent, and ichorous, of a white, cineritious, brown, yellow, or dark Colour; or elſe Excretions by Stool, of the ſame Nature, attended with exceſſive Weakneſs: Theſe are called Colliquative Fluxes, and are ſoon mortal. This is another Termination of a Jaundice, which is much to be dreaded.

In the Caſes immediately above-mention'd, the only Hopes, even of a palliative Relief, ſeem to be placed in acid or aceſcent Subſtances, exhibited by way of Medicine or Aliment, as theſe powerfully reſiſt Putrefaction.

In the fourth Caſe, that is, if the Pus and Ichor corrode the Extremities of the *Vena Cava*, and paſs through its larger Ramifications into the Maſs of Blood, and are mix'd therewith, the moſt formidable Symptoms are excited, which ſoon terminate in Death; as enormous and frequent Faintings; exceſſive Weakneſs; a Pulſe in every reſpect bad; a general Perturbation of all the Functions.

In this Caſe there is no Method of Cure which can be relied on: Some Relief, however, may be expected from ſuch Remedies as maintain the Strength, reſiſt Putrefaction, and increaſe Humidity. Such are the following.

In the Summer-time:

Take of ripe Mulberries, Currans, Elder-berries, Cherries, and Barberries, each four Ounces: Bruiſe them, expreſs the Juice, and boil it; then, with every Ounce of it, mix one Yolk of an Egg; of Citron-juice, one Dram; of *Rheniſh* Wine, one Ounce; of toaſted Bread, grated down, a ſufficient Quantity; and of Sugar, a ſufficient Quantity: Mix up for a Draught.

In the Winter-time:

Take of the Rob of the above-mentioned Berries, one Ounce; of an Elæoſaccharum of Oil of Nutmeg, five Grains; of diſtil'd Citron-water, two Ounces; of *Rheniſh* Wine, one Ounce; one Yolk of an Egg; and of Sugar, a ſufficient Quantity: Expreſs for Uſe, adding a little toaſted Bread.

The ſame Intention is alſo anſwer'd by the following Preparation.

Take of the beſt and recent Leaves and Stalks of Lettuce, Endive, Dandelion, and Purſlain, each ſix Ounces; of Sorrel, three Ounces: Theſe are to be well cleans'd and waſh'd; then, boiling them gently, in a cloſe Veſſel, with Fleſh-broth, the Patient is to eat them with a little Butter, Salt, and Pepper.

In the laſt Caſe, that of an external Abſceſs, the Tumor muſt be open'd either by burning crude Flax upon it, by the actual or potential Cautery, or by Inciſion; and the Wound muſt be treated with corroſive and ſuppurative Applications, till it is open'd as far as the Abſceſs. If, then, the Pus diſcharg'd from this Abſceſs is white, of an equable and even Conſiſtence, and communicates no Colour to the Probe it touches, there are Hopes of a Cure, by the Treatment due to other Abſceſſes when open'd.

But if a yellow, brown, livid, or black, fetid Ichor is diſcharg'd, which tinges the Probe, apply'd to it, of various Colours, and reſembles the Dregs of Oil, the Patient will be deſtroy'd by a gradual Corroſion and Conſumption of the Liver, after being long afflicted with many of the Symptoms mention'd above. In this Caſe antiſeptic Medicines, which powerfully reſiſt Putrefaction, may ſomewhat palliate, but cannot cure.

But if an Inflammation of the Liver is attended with the Circumſtances mention'd under the Article INFLAMMATIO, as requiſite to produce a *Scirrhus*, the Inflammation will terminate in a *Scirrhus*; which, in time, growing hard, and increaſing in Bulk, injures the Place where it is ſituated, and the adjacent Parts; and hence produces a Jaundice, but of a more chronical Kind, accompanied with many of the Symptoms above-mention'd; and attended with the ſame Effects. Such a *Scirrhus* will not yield to Emollients, and by acrid Medicines is converted into a moſt dreadful *Cancer*, the terrible Effects of which are evident, from reflecting on what has been ſaid of a CANCER, compar'd with its Situation in this Organ. The Effect of ſuch a *Scirrhus* muſt be a perpetual Jaundice; which muſt be treated with extremely mild Remedies, and even with theſe can ſcarcely ever be cur'd.

If there is an Inflammation of the Liver, which neither reſolves, ſuppurates, nor turns to a Gangrene, and a Tumor and Hardneſs remain; if after this the Patient begins to feel Pain in the Part, a Cancer is certainly form'd.

It is remark'd, that Cows, in the Winter, have often ſcirrhous Livers, and that, upon being turned out to Graſs, in the Spring, they are cur'd by means of a profuſe Diarrhœa: Hence 'tis probable a Man may be cur'd of a Scirrhus of the Liver, by means of a continued Diet of emollient Vegetables, as Graſs, Succory, Endive, and the like; and Fruits, as Cherries, Currans, and Cucumbers; and Whey; avoiding Fleſh, and Fiſh of all ſorts, and Spices.

If a ſlight Inflammation happens in a ſmall Portion of the Liver only, it may lay a Foundation for a ſmall Stone, Scirrhus, Puſtule, or Abſceſs, which of themſelves can do no great Injury; but, upon the Acceſs of a Fever, may be inſtrumental in exciting another and more dangerous Inflammation, with all its Conſequences mention'd above.

Laſtly, An Inflammation of the Liver ſometimes terminates ſuddenly in Death, provided the Cauſes are ſo violent as to permit nothing to circulate through any Part of this Organ, and it is attended with a ſevere Fever. For then the Veſſels of the Liver are contracted at their Extremities, and their larger Ramifications diſtended, inſomuch that the Functions of this Organ are utterly interrupted; an exceſſive and ſudden Jaundice comes on; the Veſſels are ruptur'd; the Blood and Bile are extravaſated; and the Patient inſtantly expires.

This is prognoſticated,

Firſt, From the Violence of the Inflammation.

Secondly, From a ſudden and exceſſive Loſs of Strength.

We know that it has actually happen'd, when Blood, Bile, Excrements reſembling the Lees of Oil, green or black, fetid, and cadaverous, are diſcharg'd by Vomit, or Stool; when violent,

fever, and perpetual Hiccups torment the Patient; when the Fever is extremely intenſe, and the Thirſt unextinguiſhable; and when an exceſſive Paleneſs ſuddenly comes on.

From all that has been ſaid above, many Symptoms which occur in acute Diſtempers, frequently attributed erroneouſly to Malignity, may be clearly underſtood. For the State of all the abdominal Viſcera, and their reſpective Actions, as Digeſtion, Aſſimilation, Nutrition, Recruiting the Blood with freſh Supplies, and the Expulſion of the Excrements, depend upon the Liver. In this Organ there are three ſorts of Humours, which readily putrefy by Heat; that is, a thin Blood in large Quantities; the Cyſtic, and Hepatic Bile. It is, farther, to be remark'd, that the Situation of the Liver is ſuch, as renders it very ſubject to affect the Diaphragm and Heart; and that when the Extremities of the biliary Ducts are obſtructed, the bilious Fluid convey'd by the *Vena Portæ*, has an eaſy Acceſs to the *Vena Cava*.

Hence the Nature of the black Vomit, alſo, a Diſeaſe very frequent in the *Weſt Indies*, may be underſtood.

By conſidering all the Circumſtances above explain'd, we may arrive at an accurate Knowledge of various Species of Jaundices; and underſtand the Reaſons why this Diſtemper is ſometimes eaſily cur'd, and under what Circumſtances; why it is ſometimes extremely obſtinate; why it ſometimes proves fatal very ſuddenly; and why, at other times, it continues long before it deſtroys the Patient; why it ſometimes comes on, remains, diſappears, and returns, at Intervals; why the Appearance, Ceſſation, and Return of a Jaundice, are ſo frequently preceded by great Anxieties, enormous Vomitings, Pain, and Convulſions; and what it then imports, that is, that the Bile is prevented in the large Ducts, from flowing into the Duodenum; why a Jaundice, appearing in an acute Fever, before the ſeventh Day, is a Circumſtance of very bad Preſage; and why, after the ſeventh Day, it ſcarcely admits of a Cure; why a copious Dyſentery, of no long Continuance, effectually cures a Jaundice; why Bleeding is of ſo little Relief in Inflammations of the Liver; that is, becauſe the biliary Organs have not ſo immediate a Communication with the other Parts of the vaſcular Syſtem, but form, as it were, a conſiderable ſeparate Machine; why it is of ſo much Importance in acute Diſeaſes, to regard the Pains, Tumors, and Elevations of the Hypochondria; why the Colour of the Eyes and Urine ſo ſuddenly ſhew the Preſence and Termination of a Jaundice; why inflammatory, purulent, gangrenous, and ſcirrhous Diſorders of the Spleen, Stomach, Omentum, Meſentery, and Inteſtines, always affect the Liver in ſo violent a Manner; and why, on the other hand, inflammatory and ſcirrhous Diſorders of the Liver affect theſe Viſcera; why the Liver is ſometimes tumefied and augmented to ſo prodigious a Bulk; and why it is dry'd, and render'd friable, when the Fluids can no longer circulate through it; why a Dropſy ariſes from Diſorders of the Liver, and, ſometimes, a Tympanitis, of worſe Conſequence; for, when the bilious Particles are not ſecreted from the Blood by the Liver, theſe Particles attenuate the Blood, and render it extremely thin, ſo as to tranſude eaſily through the Veſſels, and be accumulated in the Cavities of the Body; ſee TYMPANITIS, and HYDROPS; why in a Dropſy the Liver is extenuated and dry, and the Spleen tumid: And, laſtly, hence we underſtand the Nature of an Hepatic Dyſentery, and an infinite Number of Circumſtances relative to Diſorders of this Kind.

I cannot forbear remarking, on this Occaſion, a very extraordinary Circumſtance, which happens upon the Bite of a Viper: It is, that the Perſon affected ſoon after vomits, and has his whole Skin, in a very ſhort time, ting'd with a yellow Colour, as in a Jaundice. If we reflect, that the Poiſon, receiv'd by the Bite of a Viper, diſpoſes the Blood to immediate Coagulations, and that the Bile effectually attenuates the Blood, and preſerves it from Coagulation, we may, perhaps, have Reaſon to believe, that by ſome Mechaniſm, at preſent unknown to us, the common biliary Duct, which tranſmits the Bile to the Duodenum, is ſpaſmodically conſtricted, in ſuch a manner as to prevent a Diſcharge of the Bile into the Inteſtine; and that the Vomiting is at the ſame time excited, in order to preſs the Liver and Gall-bladder, and force the Bile back into the Blood, that the approaching Coagulation may be prevented: For we find, that on other Occaſions, when the large biliary Duct, near the Duodenum, is obſtructed, Vomiting induces a Yellowneſs, by forcing the Bile into the Blood.

HEPATARIUS. The ſame as HEPATICUS, Hepatic.

HEPATEROS, ἡπατερὸς, from ἧπαρ, the Liver, is an Epithet of a Sort of Dyſentery, in which an aqueous Blood is excreted, like Water in which new-kill'd Fleſh has been waſh'd. *Gorræus.*

HEPATICA TRIFOLIA.

The Characters are;

The Root is fibrous and perrennial; the Pedicles of the Leaves ariſe from the Root; the Leaves conſiſt of three Lobes, the Stalks are naked, florigerous, or flower-bearing, ſimple, and ſpring from the Root. The Perianthium, or Calyx, is monophyllous, deeply cut, commonly into three, rarely into four Lobes, and permanent. The Flower is roſaceous, polypetalous, naturally pentapetalous, and furniſh'd with numerous Stamina. The Fruit is globular, and has every one of its Cells furniſh'd with a crooked Tube: In other reſpects it reſembles the leſſer Celandine.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Hepatica; trifolia; cœruleo flore. *Boerh. Ind. A.* 30. *Trifolium aureum, Hepatica nobilis* Offic. *Trifolium Hepaticum flore ſimplici.* C. B. Pin. 330. Raii Hiſt. 1. 580. *Trifolium Hepaticum, ſive Trinitatis Herba flore cæruleo.* J. B. 2. 389. *Hepatica nobilis, ſive trifolia.* Park: Theat. 1368. *Hepaticum trifolium.* Ger. 1032. Emac. 1203. *Ranunculus tridentatus vernus flore ſimplici cæruleo.* Tourn. Inſt. 286. NOBLE LIVERWORT.

The Flowers of this Liverwort ariſe out of the Ground early in the Spring, before the Leaves; they grow on long, ſlender, and ſomewhat hairy Foot-ſtalks, four or five Inches long, incloſe'd in a three-leav'd green Calyx: They are made up of ſix blue roundiſh-pointed Leaves, ſet about a ſmall green Head, with ſeveral whitiſh-blue Chives in the Middle; the green Head afterwards is inlarg'd into ſeveral ſmall naked Seeds. The Leaves come up when the Flowers are paſt, conſiſting each of a Leaf of three equal Lobes, round, and ſomewhat pointed at the End, of a dull-green Colour, growing on long Foot-ſtalks. The Root is ſmall and ſtringy. It is uſually planted in Gardens, and flowers in *March*.

The Leaves are us'd, though but very rarely, here in *England*; but they are commended by ſome foreign Authors, as a very good Vulnerary, and uſeful in Diſtempers of the Liver.

It is cultivated in Gardens, and flowers in the Spring. As to its Virtues, it corroborates the Stomach by its aſtringent Quality, and is, therefore, proper in all Diſorders proceeding from Relaxation, and where Aſtriction is requir'd: Hence it is of Service in vulnerary Drinks, in the Diabetes, Spitting of Blood, or making of bloody Urine. It is much commended in an Hernia; and the Leaves pulveriz'd are excellent in the Dyſentery. A Decoction of the Leaves is effectual againſt the Jaundice, Itch, fetid Ulcers, and the Quinſey. The whole Plant is of Service in Obſtructions of the Kidneys, Bladder, and Liver. *Boerh.* The *Dutch* make it an Ingredient in their compound Syrup of Succory. *Dale.*

2. Hepatica; trifolia; flore cœruleo; pleno. *Cluſ. H.* 248.
3. Hepatica; trifolia; rubro flore. *Cluſ. H.* 248.
4. Hepatica; trifolia; flore rubro; pleno.
5. Hepatica; trifolia; flore albo ſimplici.
6. Hepatica; trifolia; flore carneo, ſimplici.
7. Hepatica; trifolia; flore cinereo, ſimplici. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 30.

HEPATICA *fontana.* A Name for the *Lichen*; *primus.*

HEPATICA *minor ſtellaris.* A Name for the *Lichen*; *ſecundus.*

HEPATICA *minor umbellata.* A Name for the *Lichen*; *tertius.*

HEPATICA *vulgaris.* A Name for the *Lichen*; *maritimus.*

HEPATICUS FLOS. A Name for the *Parnaſſia*; *paluſtris & vulgaris.*

HEPATICUS, ἡπατικὸς, from ἧπαρ, the Liver, Hepatic, is an Epithet for any thing belonging to the Liver. They who labour under any Diſorder of the Liver are alſo call'd ἡπατικοὶ, *Hepatics*; though the Antients confin'd that Appellation to thoſe who were affected with an Inflammation of that Part, in the ſame manner as they gave the Names of *Pleuritics*, and *Peripneumonics*, to thoſe who were affected with Inflammations of the Pleura, or Lungs; and thus are we to underſtand the Word in the *Coac. Prænot.* But, in later Ages, ἡπατικοὶ, Hepatics, came to ſignify thoſe, who, without any manifeſt Diſorder of the Liver, ſuffer only by an Imbecillity of that Part, which diſables it from performing its Functions. This appears from *Galen, de C. M. S. L. Lib.* 8. *Cap.* 6. where he ſays, "that an hepatic, "as well as a cœliac and ſtomachic Affection is an Indiſpoſi- "tion of the Parts, without a Tumor. Phyſicians ſay, the Liver "is affected with an Inflammation, an Abſceſs, or a Scirrhus, "or ſome other Diſorder, without calling the Patient an He- "patic: But when there is no manifeſt Affection of that Part, "but merely an Inability, through Weakneſs, to diſcharge its "proper Functions, ſuch a Perſon has the Name of an Hepa- "tic given him." The Author of the *Definitiones Medicæ* ſays, "that Perſons long affected with a Pain of the Liver, attended "with a Tumor, and Hardneſs, and Loſs of Colour, are call'd "Hepatics."

HEPATITES, ἡπατίτης. See HEPAR.

HEPATORIUM. The ſame as EUPATORIUM.

HEPATUS. The Name of a Fiſh mention'd by *Aldrovandus de Piſcibus, Lib.* 1. *Cap.* 12.

HEPHÆSTIAS. The Name of a Plaiſter, very good to induce a Cicatrix; it was prepar'd of Tiles, eſpecially ſuch as had been burnt in Kilns, becauſe they have more of a drying and abſterſive Quality. *Caſtellus.*

HEPHTHOTES, ἑφθότης, is, properly, a Concoction, or Colliquation, produc'd by Elixation, or Boiling. *Hippocrates, Lib. de Rat. Vict. in Morb. acut.* tells us, that too much Sleep diſſolves the Body, and induces ἑφθότητα· which *Galen*, on the Place, explains by ῥωθώτης, "a Liſtleſſneſs." So, *Lib.* 4. *Epid.* they, who, under a Fever, have their Bodies, through a Redun-

dance of Humidities, diſſolv'd, as it were, into a State of Elevation, by the humid Heat, are call'd ἐφθοί, Hephthi.

HEPIALA. The ſame as EPIALA.

HEPSANA, ἕψανα, in *Hippocrates, Lib. 2. de Morb. Mul.* are boil'd Aliments with the Broth.

HEPSEMA, ἕψημα. The ſame as DEFRUTUM. See DECOCTIO.

HEPTAPHARMACUM, ἑπταφάρμακον, from ἑπτὰ, ſeven, and φάρμακον, a Medicine, or Remedy. A relaxing, ſuppurating and incarning Medicine, ſo called from the Number of its Ingredients; which are Ceruſs, Litharge, Wax, Pitch, Colophony, Bull's Fat, and Frankincenſe, as it is deſcrib'd by *Aetius, Tetrab.* 4. *Serm.* 3. *Cap.* 27.

HEPTAPHYLLUM, ἑπτάφυλλον, from ἑπτὰ, ſeven, and φύλλον, a Leaf, is Tormentil; ſo call'd from the Number of its Leaves, which are commonly ſeven, ſurrounding the Stalk. *Blancard.*

HEPTAPLEUROS, ἑπταπλευρος, from ἑπτὰ, ſeven, and πλευρὰ, a Rib. Having ſeven Ribs; an Epithet beſtow'd on the Nation of the *Ligurians*, according to *Pollux. Caſtellus.* Heptapleuron is, alſo, the *Plantago major*, or greater Plantain; a Name given it, becauſe it is furniſh'd with ſeven Ribs. *Blancard.*

HERACLEIUS, ἡρακλειος, from Ἡρακλῆς, *Hercules*, Herculean, is an Epithet of the Epilepſy, *Hippocr. Lib. de Morb. Mul.* ſo call'd either becauſe *Hercules* was the firſt of the Heroes who labour'd under it; or becauſe it is a great and violent Diſorder, and difficult to be ſubdued, as is the Opinion of *Galen, Com. in 6 Epid.* with whom agrees *Ariſtotle*, in *Erotian*, who adds, that the Mania was antiently ſo call'd, becauſe Heroes, as *Hercules*, were only ſubject to that Diſorder. *Herculeus Lapis* is the Magnes, or Loadſtone. *Galen de Uſu Partium, Lib.* 6. & *de Locis Affect. Lib.* 6. *Caſtellus.*

HERACLEOTICUM. A Name for the *Origanum*; ſo call'd from *Heraclea*, a City of *Pontus*, where it was produc'd in greateſt Plenty, or beſt in its Kind. *Blancard.*

HERALEA, according to *Blancard*, is a Name for ſeveral Herbs, taken from *Hercules*; but, on what account, he profeſſes himſelf ignorant.

HERBA. See the Explications of Terms under the Article BOTANY.

HERBA BENEDICTA, HERBA DORIA, HERBA FELIS — See CARYOPHYLLATA. DORIA; *Narbonenſium.* CATARIA; *major*; *vulgaris.*

HERBA GERARDI, HERBA HÆMORRHOIDUM, HERBA JUDAICA — See ANGELICA. CHELIDONIUM; *minus.* SIDERITIS; *hirſuta*; *procumbens.*

HERBA MAXIMA, HERBA PARALYSIS — See CORONA SOLIS. PRIMULA VERIS.

HERBA PARIS.

The Characters are;

The Calyx conſiſts of four Leaves, which expand in Rays. The Flower is tetrapetalous; the Petals diſpos'd in the Form of a Croſs, and furniſh'd with four Stamina. The Fruit is ſoft, globular, furniſh'd with four Tubes, divided into four Cells, and full of oblong Seeds.

Boerhaave mentions but one Species of this Plant; which is,

Herba Paris. *Offic. Ger.* 318. *Emac.* 61. *Raii Hiſt.* 1. 670. *Synop.* 3. 264. *Park. Theat.* 390. *J. B.* 3. 613. *Tourn. Inſt.* 233. *Boerh. Ind. A.* 2. 72. *Solanum quadrifolium bacciferum.* C. B. Pin. 167.

HERB PARIS.

The Roots of this Herb run creeping along on the Surface of the Earth, being ſlender, and of a brown Colour, ſhooting up here-and-there, being long round Stalks half a Foot high; having uſually four, tho' ſometimes five or ſix Leaves, which are pretty broad and roundiſh, narroweſt next the Stalk, and ending in a ſharp Point. From among theſe ariſes a ſlender Stalk, two or three Inches high, bearing one ſingle Flower, compoſed of four long green Leaves, with as many very narrow ones under them, of the ſame Colour, having ſeveral Stamina among them; in the Middle of theſe grows a roundiſh Black-berry, about as big as a Grape, of an inſipid Taſte. It is found in moiſt ſhady Woods, which have a good Soil; the neareſt Place to *London*, that I know of, where it grows, is *Chiſelhurſt* in *Kent*, in a Wood by the Bog, at the Entrance of it next the Town. It flowers in *April* and *May*, and the Berry is ripe in *July*.

Though this Plant was formerly accounted of a poiſonous Nature, being reckon'd among the Aconites, *Fuchſius* calling it *Aconitum Pardalianches*; yet Authors, who have wrote ſince, attribute to it quite contrary Effects, eſteeming it to be a Counterpoiſon, and an Alexipharmic, and good in malignant and peſtilential Fevers.

Parkinſon ſays, the Roots, boiled in Wine, help the Colic; and the Leaves, apply'd outwardly, repreſs Tumors and Inflammations, eſpecially in the Scrotum and Teſticles, and ripen peſtilential Tumors.

Baptiſta Sardus, and *Caſalpinus*, have affirmed, that the *Herba Paris* is good for Madneſs. The firſt of theſe preſcribed half a Spoonful of the Powder, taken faſting for twenty Days. *Camerarius* ſays, the Powder of its Roots eaſes the Colic. *Pena* and *Lobel* relate, that the following Antidote cured ſome Dogs, which had been made to take Arſenic and corroſive Sublimate; and others, which had eaten Arſenic mix'd with the *Nux Vomica.*

> Take of the Root of Bohemian Angelica and wild Angelica, of *Vincetoxicum*, great Valerian, Polypody, Marſhmallows, and Nettles, of each four Drams; two Drams of the Bark of *Mezereon Germanorum*, thirty-ſix Plants of *Herba Paris*, twenty-four Fruits of the ſame Plant: Macerate the Roots in Vinegar; dry them, and powder them with the reſt. The Doſe is two Drams in Red-wine.

Tragus ſays, the *Herba Paris*, bruiſed and apply'd as a Cataplaſm, aſſwages the Inflammation, and diſſolves the Swelling of the Teſticles; it is a ſovereign Remedy for Whitlows: The diſtil'd Water of it cures Inflammations of the Eyes. *Martyn's Tournefort.*

The Berries are eſteem'd Alexipharmic, and good againſt peſtilential Diſeaſes, and Poiſons. The Leaves contus'd, and made into the Form of a Cataplaſm, are good for peſtilential Buboes, and hot Tumors. The Plant, apply'd as a Topic, eaſes Iſchiadic Pains, is good in Contuſions, and is eſteem'd an Antihyſteric.

HERBA PETRI, HERBA SACRA, HERBA SARDAO — See PRIMULA VERIS. VERBENA. RANUNCULUS; PALUSTRIS; APII FOLIO; LÆVIS

HERBA S. JOHANNIS, HERBA S. LAURENTII, HERBA S. PETRI, HERBA SCORBUTI, HERBA STELLÆ, HERBA STUDIOSORUM — See ARTEMISIA. BUGULA. CRITHMUM. COCHLEARIA. CORONOPUS HORTENSIS. CHENOPODIUM; LINI FOLIO VILLOSO.

HERBA TERRIBILIS, HERBA TRINITATIS — See ALYPUM. HEPATICA; TRIFOLIA; COERULEO FLORE.

HERBA TURCA, HERBA VENENOSA, HERBA VENTI — See HERNIARIA. SIUM; ERUCÆ FOLIO. PHLOMIS; NARBONENSIS; FOLIO HORMINI; FLORE PURPURASCENTE.

HERBA VIVA — See POLYPODIUM SENSIBILE; AUT POLYPODIUM VIRGINIANUM.

Herba vulneraria ſeu Virga aurea vulgo Germanica. Offic. *Conyzæ affinis Germanica.* C. B. 266. *Conyzis affinis Herba vulneraria ſive Solidago Sarracenica III. Tragi hirſuta.* J. B. 2. 1051. GERMAN GOLDEN-ROD.

It grows in mountainous Places, and flowers in *July*. The Herb is uſed, and is poſſeſs'd of the ſame Virtues with the *Virga aurea*; for which it is ſold in the Shops of *Germany*, as *Buxbaums* affirms.

HERBARIUS, βοτανικὸς, an Herbaliſt, Herboriſt, or Botaniſt.

HERBATUM *Canadenſium*, ſeu *Panaces Moſchatum*, Cornut. *Panaces Moſchatum Americanum*, ſweet-ſcented All-heal of *America*. Park. A Plant growing in *Canada* in *America*, two Cubits in Height, with Leaves a Foot long, reſembling thoſe of the Garden Coſtus, or Dittander. The Flowers are white, like thoſe of the Garden Panax, and diffuſe their Fragrancy to a good Diſtance, having a more grateful Smell than Muſk; the Leaves have an acrid and aromatic Taſte, with ſomewhat of a bitteriſh Reliſh at laſt, but the Root has not the ſame Bitterneſs. It flowers in *September* and *October*.

The Operations of this and the other *Panax racemoſa Americana* are found to be more alimental than medicinal, being familiarly eaten by the Natives, and *French*. *Parkinſon.*

HERBIVORUS, πομφάγος, herbivorous. An Epithet of Animals which live on Graſs and Herbs, thus diſtinguiſhing them from carnivorous or Fleſh-eating Animals.

HERCULES, Ἡρακλῆς, beſides the noted Hero of that Name, is a Term for ſeveral Medicines of draſtic and potent Qualities, particularly of a Collyrium, effectual for curing the Ægilops, in *Aetius, Tetrab.* 3. *Serm.* 4. *Cap.* 55. And another Medicine appropriated for drying and conſuming Excreſcences, and conſiſting of equal Parts of Squama Æris, Miſy, burnt Chalcitis, Atramentum Sutorium, and burnt Alum, is called by the ſame Author ἡρακλῆς ξηρὸς, "dry (or drying) *Hercules*." Among chymical Preparations, *Hercules Bovii* is a celebrated Cathartic and Emetic. *Caſtellus.* See MERCURIUS.

HERCULIS CLAVA. *Arbor ſpinoſa Virginiana, Caudice & Ramis Lanigera ſpinoſa Malabarica ſimilis.* "*Hercules's* Club, "or the thorny *Virginian* Tree, in its Trunk and Branches reſembling the thorny lanigerous or Wool-bearing Tree of *Malabar*;" from which it differs in the acrimonious and hot Taſte of its Bark. *Raii H. P. p.* 1806. I find no Account of its medicinal Virtues.

HEREOS, in *Paracelſus*, *Lib.* 3. *de Orig. Morb. invifibil.* is a ſort of imaginary Love, in nocturnal Pollutions. *Caſtellus.*

HERINACEUS, call'd alſo *Erinaceus.* Offic. Schrod. 5. 286. Charl. Exert. 19. *Herinaceus.* Schw. Quad. 96. *Herinacus & Erinaceus*, Mer. Pin. 167. *Echinus terreſtris.* Jonſ. de Quad. 119. Aldrov. de Quad. Digit. 268. *Echinus ſive Erinaceus terreſtris.* Raii Synop. A. 231. THE HEDGHOG, or URCHIN.

It is found in Thickets and Hedges. What is uſeful in Medicine, are the whole Animal, the Liver, the Feet, and the Ventricle. The Hedghog boiled, or burnt to Aſhes, helps an involuntary Diſcharge of Urine, is grateful to the Stomach, and excites Excretions by Urine and Stool; externally it cures the *Alopecia*, being rubbed on the Part. The Liver, or the Body dry'd, and taken in Oxymel, is effectual in nephritic Diſorders, and cures a Cachexy, Dropſy, Convulſions, and Elephantiaſis, and dries up Rheums in the Viſcera. *Dioſ.* The Fat is moſt ſucceſsfully uſed in a Hernia. *Hart.* The Membrane, or Coat, of the Ventricle, is recommended for the Colic. *Schrod.* The Decoction, or Broth, of the Fleſh, is very ſerviceable in the Dropſy, by provoking Urine. *Dale.*

HERMANNIA.

The Characters are;

The Calyx is monophyllous, reſembling a Bladder, quinquefid, and deeply jagged. The Flower is pentapetalous, the lower Petals narrow, the upper ones broad, and in a manner convolved on one Side, ſurrounding the Bottom of the Ovary; whence, alſo, proceed five Stamina. The Ovary is ſeated in the Bottom of the Calyx, and is pentagonal, pentangious, that is, conſiſting of five Veſſels, and furniſhed with a long Tube.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Hermannia; fruteſcens; folio oblongo, ſerrato. *T.* 656.

2. Hermannia; fruteſcens; folio oblongo, ſerrato latiori. *Ind.* 115.

3. Hermannia; fruteſcens; folio groſſulariæ parvo, hirſuto. *Ind.* 115.

4. Hermannia; fruteſcens; folio Ibiſci hirſuto, molli; caule piloſo. *Ind.* 115.

5. Hermannia; fruteſcens; folio multifido, tenui; caule rubro. *Ind.* 116.

6. Hermannia; fruteſcens; folio oblongo, molli, cordato, hirſuto. *Ind.* 116.

7. Hermannia; fruteſcens; folio Lavendulæ latiori & obtuſo; flore parvo, aureo. *H. R. D. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 273.

In the *Hiſtoria Plantarum*, aſcrib'd to *Boerhaave*, this Plant is ſaid to be us'd in *Africa*, for the ſame Purpoſes as Mallows; and the Nature of the former ſeems to approach very near to that of the latter, ſince their Taſte and Smell are the ſame.

HERMAPHRODITUS, ἑρμαφρόδιτος, from Ἑρμῆς, Mercury, and Ἀφροδίτη, Venus. An Hermaphrodite; that is, one who partakes of both Sexes.

As I look upon all the Hiſtories related of Hermaphrodites to be merely imaginary, I ſhall only obſerve, that of many I have ſeen who have been reported to be ſo, I have met with none who were any more than mere Women, whoſe *Clitoris* was grown to an exorbitant Size, and whoſe *Labia Pudendorum* were preternaturally tumid.

HERMES, Ἑρμῆς, is the *Greek* Name for *Thoth*, or *Thouth*, the ſame Perſon whom the *Latins* call *Mercurius*, Mercury, and whom ſome learned Men conjecture to be the ſame with *Chanaan*, the Son of *Cham*; but, tho' theſe two might be different Perſons, they might at leaſt have lived at one time, and *Hermes* be the older; for *Bochart*, in his *Phaleg*, has proved that *Chronos*, or *Saturn*, was the ſame Perſon as *Noah*. Now we learn from *Sanchoniathon*, that *Hermes*, or *Thoth*, or *Tacuitus*, (as he was called by the *Egyptians* and *Phenicians*) was one of *Saturn*'s Counſellors; and *Diodorus Siculus* ſays, that *Hermes* was Secretary to *Oſiris* and *Iſis*, the moſt antient King and Queen of *Egypt*, who were both ſaid to be the Children, or Grand-children, of *Chronos*. *Sanchoniathon* makes *Hermes* a *Phœnician*, and the Son of *Miſor*, who lived about the Time before-mention'd; and *Clemens Alexandrinus* makes him a Native of *Thebes* in *Egypt*; and others ſay, that he was the Son of *Philon* by his Daughter *Proſerpina*. Whoever he was, it is certain, that the *Egyptians*, and after them all other Nations, have aſcribed to him the Invention of all Arts and Sciences, and of Medicine in particular; for which Reaſon the Antients, doubtleſs, often repreſented their *Mercury* accompany'd with the Goddeſs *Hygieia*, or *Health*, which he was ſuppoſed to have brought to Mortals with his Medicines. *Joſephus* tells us, that the Sons of *Seth* built Columns, on which they engraved what they knew of Aſtronomy: *Mercury* took the ſame Meaſures in leaving to Poſterity the Monuments of his Knowledge, as we are inform'd by *Euſebius*, from *Manetho*, an *Egyptian* Prieſt, who ſays that *Thoyt*, or the firſt *Mercury*, had writ many Things in ſacred Language and Characters, and that *Agathodæmon*, or the ſecond *Mercury*, the Father of *Thoth*, tranſlated theſe Writings into *Greek*, after the Deluge, and compoſed Books of them in ſacred Letters, which were preſerv'd in the moſt ſecret Place of the *Egyptian* Temples. *Iamblichus*, alſo, ſays there were Columns in *Egypt* quite cover'd with Writings, containing the Doctrine of *Mercury*; and ſays farther, that *Pythagoras* and *Plato* received great Improvements from what they had read in the Writings of *Mercury*. *Plato* himſelf, in more than one Place, ſpeaks of the Columns on which the *Egyptians*, and other antient People, wrote their Laws, and the Hiſtory of their Times, with the moſt conſiderable of their Inventions.

Whether all that is related of theſe Columns, and the Extracts which the *Egyptian* Prieſts pretended they made from them, be true or not, what was publiſh'd of them gave occaſion to a Multitude of Writings, or Books, which paſſed for Copies of theſe Extracts, and were pretended to be the genuine Works of *Mercury*. *Iamblichus* reckons thirty-ſix thouſand, five hundred twenty-five of thoſe Books; but though the Books of the Antients were commonly very ſhort, there appears an Exaggeration, and ſome learned Men have had Reaſon to reduce thoſe Books to ſo many Verſes. Of all thoſe pretended Books of *Mercury*, there are not many whoſe Titles are preſerved, and fewer which have deſcended entire to us. Some of them are printed, and others are kept in Libraries, as in that of *Vienna*, of which you may find an Account in *Lambecius*, *Morhofius*, and other Authors. There are ſeveral things concerning Chymiſtry, and the famous *Emerald-table* of *Hermes*. But, if *Hermes* was the Inventor of Chymiſtry, it was not of medicinal, but metallic Chymiſtry. Of the Books of *Mercury*, mention'd by the Antients, and which concern'd Medicine, there were ſeveral much ſuſpected in *Galen*'s time; particularly one, of which that Author ſpeaks, and ſays, it was one of thoſe which was aſcribed to the *Egyptian Mercury*.

We have mention'd the *Sacred Books* of *Mercury*, which were very carefully preſerved in the *Egyptian* Temples; it was, doubtleſs, one of thoſe Books, called by *Diodorus*, ſimply, *The ſacred Book*, which regulated the Practice of Medicine in *Egypt*, ſo far as that they who followed its Precepts were exempt from Blame, though the Patient died under their Hands; but if they deviated from them in any manner whatſoever, and the Patient happen'd to die, they were condemn'd as Murderers. *Clemens Alexandrinus* is more full to the Purpoſe, and ſays, "There were "two-and-forty Books of *Hermes*, which were moſt conſider-"able; thirty-ſix of them contain the whole *Egyptian* Philo-"ſophy, and were read to the Sacrificers and the Prophets; the "other ſix, which related to Medicine, were learn'd by the "*Paſtophori* *. The firſt of theſe treats of the Conſtruction of "the Body; the ſecond, of Diſeaſes; the third, of neceſſary "Inſtructions; the fourth, of Medicines; the fifth, of Diſeaſes "of the Eyes; and the laſt, of Diſeaſes incident to Women."

There can be nothing more exact than this Method; but theſe Books, very probably, were compoſ'd ſome Ages after *Hermes*, at a time when Medicine was much improved; and it is not to be doubted but the *Egyptian* Prieſts paſſed their own Works under the Name of their *Hermes*, or ſome celebrated Phyſician; and, if the thing were not in a manner ſelf-evident, we might infer as much from *Iamblichus*, who aſſures us, that "the *Egyp-*"*tian* Prieſts, out of a Perſuaſion, that *Mercury* was the Inventor "of every thing, generally attributed to him their own Inven-"tions," or did Honour to themſelves, "in putting his Name "to their own Works."

At preſent we have not the leaſt Remains of theſe Books, and therefore know no more of this Medicine of *Hermes* than the general Heads of what it treated: If there are any other Books, which were aſcribed to him, and are preſerved down to our Times, and are really genuine, we may plainly infer from their Contents, that a great Part of the *Hermetic* Medicine was founded upon Magic and Aſtrology. This is confirm'd by a Paſſage in the Book intituled *Aſclepius*, which was look'd upon, in antient Times, to be a Work of *Hermes*; and the *Latin* Verſion which we have of it is aſcribed to *Apuleius*. This Paſſage mentions certain Statues, which inflicted Diſeaſes, and alſo cured them, predicted Futurities, and did other prodigious things: *Hermes*, in the ſame Place, is called *Triſmegiſtus*, that is, *thrice greateſt*, which was the Surname given him by Antiquity.

The Book of the *thirty-ſix ſacred Herbs of the Horoſcope*, quoted by *Galen*, though granted to be ſpurious, is at leaſt a Proof, that *Mercury* was generally believed not to confine himſelf to the ordinary Methods of Medicine; for otherwiſe they would not have aſcribed to him a Treatiſe of that Kind. The Title of this Book has a near Relation to what *Origen* writes, "That the *Egyptians* ſaid, there were thirty-ſix Demons, or "thirty-ſix Gods of the Air, who were Sharers in the Body of "Man, which was alſo divided into as many Parts." He adds, "That the *Egyptians* knew the Names of theſe Demons in "the Language of the Country, and believed, that by invoking "each of them, according to the Part which was diſeaſed, they "were cured."

It is probable, however, that *Mercury* made uſe, alſo, of ſome

* The *Paſtophori* were an Order of Prieſts, ſo called, becauſe they wore long Cloaks, or were appointed to carry the Bed of *Venus*, on certain ceremonious Occaſions: They were the principal Perſons who practiſed Medicine in *Egypt*.

ordinary

ordinary or natural Remedies; but we have but little left on Record of that Nature. The Herb called *Moly*, which *Mercury* preſented to *Ulyſſes*, as a Preſervative againſt the Charms of *Circe*, is ſtill reckon'd among ſuperſtitious Remedies. But that which bears the Name of *Mercury*, (*Mercurialis*) was probably uſed originally for the ſame Purpoſes as we employ it for at preſent. To *Mercurialis* we may add *Coral*, which, being pulverized, and infuſed in pure Wine, *Mercury* ſaid, was good againſt the Poiſon of Serpents. The Author of the Hymn to *Mercury*, which is aſcrib'd to *Orpheus*, and where we find what has been ſaid of *Coral*, ſpeaks alſo of a Grotto of *Mercury*, in which were kept "all manner of good things," and where "Diſeaſes had no "Power;" and that there were Remedies in particular "againſt "the Bites of Serpents, for Lunatics, and for Lepers." But *Orpheus* does not inform us, what Means *Mercury* made uſe of to work theſe Effects.

I find no more Particulars of the Medicine of *Hermes*, unleſs we have a mind to make him paſs for the Author of all the antient medicinal Practice in *Egypt*. *Ariſtotle* ſpeaks of an antient Law of the *Egyptians*, by which "Phyſicians were prohibited "to move the Humours (that is, to purge, as appears from "the Practice of *Hippocrates*) before the fourth Day of the "Diſtemper, as they would anſwer it at their own Peril." This ſeems to have relation to what has been ſaid, that the Phyſicians of that Country were obliged to regulate their Practice by what they called the *Sacred Book*; and perhaps this Law was contain'd in the Book which was aſcribed to *Mercury*. *Diodorus*, alſo, obſerves, that the *Egyptian* Medicine conſiſted wholly in *Abſtinence*, *Clyſters*, and *Emetics*; but there are no Proofs, that *Hermes* eſtabliſhed this Method in particular.

Anubis, or *Hermanubis*, was the ſame as *Hermes*, or *Mercury*; the *Caduceus*, born by the former in ſome Medals, is a Proof of it; and *Diodorus Siculus* aſſures us of it. He is repreſented with the Head of a Dog, becauſe that Animal is an Emblem of Sagacity; he is join'd in ſome Medals to *Iſis*, becauſe he was her Preceptor, or Counſellor.

HERMESIA. A Name in *Libavius de Igne Natur.* for *Chymia Hermetica*, or the Hermetic Chymiſtry. *Caſtellus.*

HERMETICA MEDICINA, Hermetic Medicine, or Chymical Medicine. See HERMES.

HERMODACTYLUS. See BEHEN, and COLCHICUM.

The Characters are;

It has all the Appearance of the *Iris*; the Leaves are narrow, and triangular, or quadrangular; the Root is tuberous, being compoſed of a Collection of Tubercles.

Boerhaave mentions but one Species of this Plant; which is,

Hermodactylus; folio quadrangulo. *T. C.* 50. *Hermodactylus verus.* Matth. 778. *Iris tuberoſa.* H. Eyſt. Vern. o. 5. F. 4. Fig. 2. Dod. p. 248, 249. *Iris tuberoſa, folio anguloſo.* C. B. P. 40. *Iris tuberoſa, Belgarum, & ſecundum Aldrovandum Lonchitis prima Dioſcoridis.* Lob. Obſ. 51. Adverſ. 363. Ic. 98. *Iris bulboſa, præcox.* Cluſ. SNAKES-HEAD IRIS.

The Root of this Plant has a Tubercle, which purges very powerfully both upwards and downwards, for which Reaſon it is commended in the Gout, as a powerful Cathartic. This Root, when old, often loſes all its purgative Virtue: It is commended as a Specific in the *Gutta Serena*: They mix it with Ginger, on account of its Viſcoſity, which is ſubject to excite Gripes. *Hiſt. Plant. aſcript. Boerhaav.*

This Plant has, by ſome Botanic Writers, been ſuppoſed the true Hermodactyl; but what has been long uſed in *Europe* for that, is a true *Colchicum*.

HERMOLAOS. The Name of a *Collyrium Staticum*, that is, a Collyrium which repreſſes and ſtops Defluxions: There are two of them ſo called, the greater and the leſs, both which are deſcribed by *Aetius*, *Tetrab.* 2. *Serm.* 3. *Cap.* 102.

HERNANDIA, *Jack in a Box*, is a Plant very common in *Jamaica*, *Barbadoes*, *St. Chriſtophers*, and many other Places in the *Weſt Indies*; where it is known by the Name of *Jack in a Box*. *Miller's Dictionary*, *Vol.* 2.

HERNIA. A Rupture.

RUPTURES *in general.*

Moſt preternatural Tumors about the lower Part of the Abdomen, the Navel, Groin, and Scrotum, cauſed by a Deſcent of the Inteſtines or Omentum, are in general termed Ruptures. Theſe differ (1.) as to their Situations: Thus thoſe formed at the Navel are called Umbilical Ruptures, or *Omphalocele* and *Exomphalos*; thoſe in the Inguen, inguinal Ruptures, or *Bubonocele*; thoſe of the Scrotum, *Oſcheocele*; in other Parts of the Belly, they are diſtinguiſhed by the Name of Ventral. (2.) They differ in the Contents, and from thence too receive different Appellations. A Tumor, proceeding from a Falling out of the Inteſtines, is termed an *Enterocele*; from the Omentum, an *Epiplocele*; from Wind, a *Pneumatocele*; from Water, an *Hydrocele*. (3.) They differ as to their Size, ſome being ſmall, others larger, and others of an enormous Bulk; ſome ſoft, others hard; ſome fixed, ſome moveable, and eaſily returned into the Abdomen; others not without great Difficulty, or not at all; the laſt are called adheſive Ruptures. Sometimes the Parts prolapſed are ſo confined by Stricture and Inflammation, that the Wind and Fæces can by no means be tranſmitted; theſe we denominate incarcerated Ruptures; ſome are free from Pain; others very painful, and attended with Sickneſs, Vomiting, and many bad Symptoms.

The OMPHALOCELE.

An *Omphalocele*, *Exomphalos*, or umbilical Rupture, is a preternatural Prominence of the Abdomen at the Navel. Theſe differ in Size and Figure. Some of them, eſpecially at the Beginning, are ſmall, others large, and others of a prodigious Magnitude; ſome round, others pointed, and others cylindrical; which laſt I met with in a pregnant Woman, whoſe Navel was often diſtended to the Size and Shape of the Penis, extremely painful, and containing only Wind. Theſe alſo differ as to their Contents; for ſome contain the Inteſtines; others the Omentum; others Air or Water; further, they are ſoft or hard, returnable or nor, painful or incarcerated. *Scultetus, in Armament. Chirurg. Tab.* XXX. furniſhes us with Repreſentations of theſe Ruptures.

The Cauſes are various, though the immediate Cauſe is always ſome Violence offered to the Abdomen, and principally the Navel: For the common Origin is either a violent ſudden Motion, Fall, Leap, Blow, or Strain, in lifting great Weights, Coughing, Sneezing, and difficult Labours in Women: For any one of theſe Accidents will forcibly dilate the Peritonæum, as *Dionis* affirms, or ſometimes break it, eſpecially if it is weak; and, when it is thus dilated, the Inteſtines and Omentum, or the Omentum only, or Wind, is forc'd through the Navel. Sometimes a Laxity and Weakneſs of the Peritonæum, near the Navel, cauſes this Diſorder, eſpecially when it ariſes from ſome preceding Violence, or vehement Crying, in Infants; for I have often ſeen them labour under this Diſorder ſoon after the Birth, eſpecially when the Navel, after the Navel-ſtring falls off, is not ſecured for ſome time by a proper Bandage.

We know an Omphalocele by the Sight and Touch, aſſiſted by the Ear; for the Navel is preternaturally prominent: The Tumor, upon the Preſſure of the Fingers, (unleſs the prolapſed Parts adhere externally) returns into the Belly, and, at its Return, makes ſome Noiſe, eſpecially if the Patient lies on his Back. This is a certain Indication, that it proceeds from a Deſcent of the Inteſtines. Sometimes the Tumor is remarkably ſoft, and then we may reaſonably conclude, that Wind, or the Omentum only, has forc'd a Paſſage; though, as this covers the Inteſtines, it ſeldom deſcends without being accompanied with them. The Deſcent of the Omentum alone is term'd a Rupture of the Omentum; that of the Inteſtines alone, an umbilical Rupture of the Inteſtines; if the Swelling continues, after the Inteſtines are return'd into the Abdomen, it indicates a Deſcent, both of the Inteſtines and Omentum, though, frequently, both the Omentum and Inteſtines are return'd together. In dropſical Perſons, the Navel is often diſtended by Water, as appears from *Scultetus's* Figure, and a remarkable Inſtance in *Purmannus's Chirurg. Curioſ.* But the Habit of Body ſhews, that this proceeds from Water, and may be called an aqueous umbilical Rupture, as that which contains Wind, is termed *flatulent*.

An Omphalocele in Children is not very dangerous, and, for the moſt part, eaſily cur'd. In Adults, likewiſe, there is no great Danger, while the Parts are capable of being return'd. But, as, in the laſt, they are never entirely free from Danger; if the Deſcent, or rather Protruſion of the Inteſtines through a narrow Foramen of the Navel, ariſes from a ſudden Fall, and cannot be returned into the Belly, it is a troubleſome, very hazardous Caſe; for, it is almoſt impoſſible, but that, from the Stricture of the Paſſage, the Blood muſt be prevented from returning out of the protruded Inteſtines; and the ſtagnating Fluids in the Veſſels occaſion Inflammation, exceſſive Pain and Anguiſh, with Vomiting; and, indeed, the worſt Kind of it, a Vomiting of the Feces (the Vulgar call this *Miſerere*, Phyſicians the *Iliac Paſſion*); and, likewiſe, a Mortification of the Inteſtines, followed by a painful Death. But, when this Diſorder has increas'd gradually, and the Aperture of the Perinæum is large enough to tranſmit the Inteſtines, the Hazard is not ſo great, particularly in Children, and young Men. Though, unleſs they apply a Bandage to repreſs the Inteſtines and Omentum, and abſtain from Cold, violent Motion, too plentiful Feeding, eſpecially on hard, thick, and flatulent Meats, it is very probable they will deſcend, the Place of the Deſcent be ſtraiten'd, the Inteſtines confin'd, and ſo firmly incloſ'd in the external Tumor, with extreme Pains, that they can never be return'd, but bring on the above-mention'd Symptoms, and Death itſelf. Experience convinces us, that no chirurgical Operation will have any Effect upon this Diſorder, but that it is rather hurtful, when the Hernia is conſiderable; for moſt Patients die under it, or very ſoon after. But, if the Inteſtines can be return'd, an Omphalocele, as well as any other Rupture, is ſooner cured in Children than in Adults, by the Uſe of a proper Bandage, and the Obſervation of a regular Diet and Exerciſe. The Neglect of theſe is often followed by a Relapſe. If this Tumor contains Wind only, the Diſeaſe is inconſiderable; if Water, it threatens a Dropſy.

There are two Methods of Cure, one adapted to the Caſe when the Inteſtines can, the other when they cannot, be return'd. In the firſt Caſe, the prominent Navel, with the prolapſed Inteſtines and Omentum, muſt be returned, and bound up tightly, to prevent a Relapſe. Therefore, when the Aperture is large enough, after laying the Patient on his Back, you muſt depreſs and force them tenderly with your Hand, till they return; then proceed according to the Age: For, in tender Infants, I have often known an Hernia cured, after Repreſſion and Repoſition, by applying a ſmall, round, proper Plaiſter, to the Navel, laying over that another, covered with Linen or Leather, to ſecure it; over this I put next a ſimple thick Compreſs, in a recent, and ſlight Diſorder; then faſten the Whole with a ſimple Roller, three Fingers broad, and carried ſeveral Times, in circular Directions, round the Body; and am very careful, that, whenever this is open'd, it is immediately bound up again. Thus, in a few Weeks, have I ſometimes completed my Cure. But, when the Diſorder is inveterate, I uſe a double Compreſs of a leſs Size, and upon that, as more conducive to the Repreſſion, I lay a leaden Plate, then a larger Compreſs, and proceed as before. But, in young Men, Adults, and old Men, to prevent a Relapſe of the Omentum or Inteſtines, you muſt apply a Truſs ſuitable to the Purpoſe, furniſhed with a peculiar Plate; and faſten'd round the Belly. The beſt are theſe repreſented *Tab.* XLV. *Fig.* 6. made of Leather, and, *Fig.* 7. of Wire, though there are others not deſpicable. But before you uſe this Bandage, you ſhould lay on the Navel a ſound ſtrengthening Plaiſter; upon that, a ſticking Plaiſter with a Compreſs. I am convinced from long Experience, that this Method, diligently purſued for ſome Months, will complete the Cure; and eſpecially if the Patient is young, or the Diſorder recent: More adult and aged Perſons are ſeldom reſtored to perfect Health; but if they would prevent a Return of this Rupture, from whatever Origin it ſprings, they muſt wear theſe Truſſes during their whole Lives; for by the Diſuſe of them, with an irregular Diet, and too violent Exerciſe, they will be expoſed to imminent Danger of their former Diſorder, the Iliac Paſſion, and Death itſelf, if it is a Deſcent of the Inteſtines, or *Omentum*.

This Cure then is only partial in Adults; and, among the Moderns, except *Saviard*, no one mentions a perfect or radical Cure. But the Antients, as appears from the moſt excellent *Celſus*, were ſollicitous about this Affair; and he has directed various Methods, the principal of which it cannot be amiſs here to recite. "The Patient ought to lie on his Back, (ſays he) that the Inteſtines or Cawl may be returned into the Belly; and a Needle with a double Thread, muſt be paſs'd thro' the inferior Part of the Navel, being then empty; and with theſe Threads, the different Sides of the Navel muſt be tied very tight, (as in a Straphyloma): Thus, what is above the Knot, dies; the Navel ſubſides, and is cloſed with a firm Cicatrix." Some before the Ligature, cut the Top in a rectilinear Direction, that by introducing a Finger, they may repel the Rupture; and perhaps foranother Reaſon, leſt they ſhould paſs the Needle thro' the Inteſtines or Omentum at the ſame time. Some (without doubt, to procure a ſtronger *Cicatrix*) cauterized the deligated Part with Cauſtics, or the Cautery; and then healed the Ulcer, as in other Burns. And he aſſerts this to be the propereſt Method, not only in a Deſcent of the Inteſtines or *Omentum*, or both, but alſo where Water deſcends. It requires a good Habit of Body, and that the Patient be neither an Infant, nor old. Further, he ſays, it is ſerviceable in ſlight Tumors, but dangerous in conſiderable ones. Theſe Obſervations partly agree with thoſe of the Moderns, and partly incite us to the Study of more perfect Remedies.

Saviard, a Surgeon at *Paris*, attended a Girl about fourteen Months old, who laboured under this Malady. He laid her on her Back, and, having repreſſed the Inteſtines, elevated, as much as he could, the umbilical Tumor, which was as big as a Gooſe's Egg, and gave it to an Aſſiſtant to hold. Afterwards, he tied the Skin at the Bottom with a quadruple waxed Thread; in two Days he put on another Ligature, when the Swelling began to putrefy, and three Days after he added a third, always making the former Ligatures tighter, ſo that the Tumor at laſt was ſeparated, and the Girl perfectly cured. He affirms, that he met with the ſame Succeſs a ſecond time, in another Girl, *Obſ. Chirurg.* and it is ſurpriſing, that *Garengeot* has made no mention of this, and, as *Saviard* himſelf does not inform us, whether theſe Cures might not have been performed by the Bandage deſcribed above, without flying to that cruel Method, there are ſufficient Grounds for us to think they might.

But if the Aperture is ſo narrow, that the Inteſtines cannot be repelled, and the Patient is troubled with a Vomiting, and acute Pains, as well in the Tumor, as the Belly; then the Application of a Bandage in this, and other real *Herniæ*, is uſeleſs and improper, becauſe it would preſs the Parts too much; in this Caſe, therefore, rather apply proper Clyſters, and emollient Cataplaſms, as a Decoction of white Bread and Milk, with Butter and Saffron, and the like: With theſe foment and mollify the Inteſtines, till they can be conveniently return'd into the Belly. Then the Patient ought to lie on his Back, with his Head low, and, having removed the Cataplaſms, you may try with your Hand tenderly, whether they are fit to be repelled: After you have done this, and continued it for ſome time, ſtill finding the Inteſtines unfit for Repoſition, inject the Smoak of Tobacco, through proper Tubes (delineated *Tab.* LV. *Fig.* 13.) into the *Anus*, till it gives a Stool, and they are relaxed. Long Experience convinces me of the wonderful Efficacy of this Remedy, which is uſually ſtyled a *Tobacco-clyſter*. If there is a large Quantity of Blood, or an Inflammation in the Inteſtines, which is very common, then you muſt immediately open a Vein, and bleed plentifully, as in other Inflammations; for, by this, the Veins and Inteſtines ſubſide, the bad Symptoms decreaſe, and by a gentle Preſſure of the Hand, the prolaps'd Parts return into the *Abdomen*. After this Reſtitution, however it is compaſſed, you muſt preſs the Orifice at the Navel with your Fingers, and a Compreſs; and then compreſs it with a Truſs, or rather a proper Linen Bandage, as before ordered.

But if theſe Medicines, with the bleeding, have no Effect in twenty or four-and-twenty Hours, and every thing rather ſeems worſe, have immediate recourſe to the Chirurgical Operation, as the only remaining Hope; for, as this Operation, ſeaſonably performed, will be very inſtrumental to the Recovery, of the Patient ſo the Procraſtination of it will render it entirely vain and uſeleſs. For within twenty-four Hours, eſpecially in young and vigorous Men, a Gangrene or *Sphacelus* comes on and deſtroys the inflamed Inteſtines: In old Men indeed they come on ſlower. The Sphacelus is followed by a Vomiting, and increaſing Weakneſs, Coldneſs in the Extremities, and cold Sweats, and very ſoon by certain Death. As for the Operation, let the Aperture of the *Abdomen* be enlarged ſufficiently to reſtore the compreſſed, incarcerated Inteſtines. This, therefore, is the Method: The Patient is laid on a Bed, or on a Table, with his Head ſomewhat low, but his Belly and Buttocks elevated; and is either faſtned down with Cords, or ſecured by ſtrong Men, to prevent his moving; then the Skin, over the prominent Navel, is held tranſverſely by the Surgeon, or his Aſſiſtant, and, being drawn tight, if the Tumor is inconſiderable, an Inciſion is made with a Knife, but this with the utmoſt Caution, leſt you wound the Inteſtines at the ſame time. Therefore the ſafeſt Way is, after making a ſmall Puncture, to introduce immediately the Director (*Tab.* XXII. M, and N) under the Skin, and, by moving the Knife carefully, enlarge the Wound longitudinally; and when this will not ſuffice in a large Tumor, make a tranſverſe Inciſion, and divide the four Angles cautiouſly. In the next Place, divide the Fat, and Membranes with your Fingers, a Pair of Sciſſars, or the Knife; and, that you may not injure the Membrane, which immediately inveſts the Inteſtine, elevate that, and make a ſmall Inciſion, as before directed, with reſpect to the Skin. Thus, having uncover'd the Inteſtines, inſert the Director under the Membrane, dilate the Wound with a proper Inſtrument, and, when every thing is open to your View, preſs the Inteſtines gently with your Fingers into the Abdomen. But when the Foramen of the Navel is too ſmall to admit a Return, having inſerted the Director, or ſecured the Inteſtines with your Finger, you may enlarge it upwards, and towards the Left Side of the Belly, with an obtuſe Pair of Sciſſars, or a Knife that has a Button on its Point, (See *Tab.* XXVI. *Fig.* 3, 4, or 5) till it will anſwer your Purpoſe. In Inciſions of the Navel, made otherwiſe, the umbilical Vein and Artery may be injured, which is dangerous.

To avoid the Danger of the preceding Inſtruments, the Moderns have invented others; and, firſt, a Director (*Tab.* XLV. *Fig.* 8.) with Wings [AA] to preſs down the Inteſtines, and prevent any Injury from the Knife, which is in its Groove, during the Enlargement of the Foramen. Further, *Morand*, a celebrated Surgeon at *Paris*, has contriv'd another for this Uſe, which the *French* term *Biſtouri gaſtrorraphique* (See *Tab.* XLV. *Fig.* 9.) This I forgot to mention, when I treated of Wounds of the *Abdomen*, which, in my Opinion, is as ſerviceable in dilating the Aperture of incarcerated Ruptures, as in theſe: The End is introduced into the *Abdomen*, as far as [B]; then taking hold of the Handles [CC], as a Pair of Sciſſars, and elevating the moveable Arm [D], which is ſharp like a Knife, in the ſuperior Part E E, the narrow Aperture is enlarged, ſo that the Inteſtines can be reſtor'd. Beſides, *Le Dran*, another famous Surgeon of *Paris*, has lately invented and contriv'd a kind of latent Inciſion-knife, which I have exhibited *Tab.* XLV. *Fig.* 10. 11. In *Fig.* 10. you have it incloſ'd, and conceal'd; in 11. open, and divided into its component Parts. The Part A A, *Fig.* 10. is paſs'd into the Aperture, which is to be dilated; then the Handle K is taken into the Right-hand, and the Plate F properly depreſs'd with the Thumb: Thus the Knife, hitherto conceal'd in the Groove A A, is elevated (ſee *Fig.* 11. C D); ſo that the Top D remains conceal'd in the Cavity, that it may not hurt or prick the Inteſtines; and the Part C enlarges the narrow Paſſage, through which the Inteſtines may be reſtor'd. You will find a farther Explanation of this Inſtrument (which the *French* call *Biſtouri Herniaire de Mr. Le Dran.*) in the Explication of *Table* XLV.

When the Inteſtines are thus replac'd, the Wound, being held, and preſs'd by an Aſſiſtant, ſhould be join'd by the knotted Suture,

Suture, (though the Moderns, as *Garengeot* aſſures us, reject this Suture; and I think, it may be ſafely omitted, particularly in ſmall Inciſions) and bound up, till it is heal'd, in the manner directed in a Gaſtroraphy. After the firſt Dreſſing, the Patient muſt keep himſelf quiet, and the Bandage muſt remain for three or four Days, unleſs any extraordinary Symptoms require the contrary, for this will promote the Agglutination; and, after the firſt Opening, it may be dreſſed every Day, as in other Wounds of the Belly: And, when the Wound is perfectly healed, a proper Bandage is ſtill neceſſary, to form a ſtrong *Cicatrix*, and prevent a Relapſe. But more adult and old Men, unleſs they wear a Truſs all their Lives, are never ſecure; while Infants, Boys, and young Men, are, for the moſt part, completely cured.

That you may not be ignorant how far our Method of Cure agrees with *Petit's*, I will give you a ſhort Account of it, out of *Garengeot's Operat. Chirurg.* The Integuments of the Tumor, together with the Fat, are held up, partly by the Surgeon, and partly by his Aſſiſtant; and firſt a rectilinear, then a tranſverſe Inciſion is made with a Knife; then the Wound, after dividing the four Angles, is enlarg'd by the Director and Knife, or the Introduction of the Fingers; after this, a *Raiſeau*, ſomewhat reſembling an Inteſtine, appears, which muſt be cautiouſly removed by a crooked Knife. Next the Membrane, which is the Sacculus, after an Inciſion of the emergent **Raiſeau*, which contains the fallen Inteſtines, is elevated, and a ſmall Inciſion made; the Efflux of the Lymph will demonſtrate, that the Operation is rightly performed. Afterwards, the middle or fore Finger is paſſed into the Wound, in ſuch a manner, that, by the Direction of it, the Sacculus may be cut croſs-ways with a crooked, blunt Pair of Sciſſars, (See *Tab.* XXII. *Fig.* D). When there appears any preternatural Excreſcence, (which is frequent in the Cawl) united to the external Parts, whether it conſiſts of Fleſh or Fat, it muſt be taken off; if then the *Omentum* is not fallen beyond the Lips of the umbilical *Annulus*, there is room for Hope; but if it is, and appears very large, the Diſorder ſeems deſperate, whether it be replaced, or removed, ſo that, though the Inteſtines are reſtored, Death enſues. However, they ought to be returned, if the Aperture is large enough; and, if not, you may introduce a Knife, with a Button, ſomewhat ſharp, (ſee *Tab.* V. *Fig.* 3, 4, 5.) and carry it upwards in an oblique Direction, towards the Left Side of the Belly, till you have dilated it ſufficiently. When the *Hernia* is not large, *Petit* takes another Method; he, in ſome meaſure, enlarges the Aperture of the Belly, and reſtores the Inteſtines with the Sacculus entire. But he does not ſufficiently explain to us his Manner of doing it without Inciſion.

Having done this, *Petit* proceeds to the Bandage, and Agglutination of the Wound; which I will deſcribe to you in the exacteſt manner: He orders, without any Suture, a large Linen Pellet (Gal. *Pelote*) dipt in the White of an Egg, and tied with a Thread, to be laid on the Aperture, thro' which the Inteſtines were fallen, then he fills the reſt of the Wound with ſmall twiſted Linen Cloths, and Rolls of Lints (Gall. *Bourdonnets*); and, having anointed the adjacent Parts with Oil of Roſes, he covers it carefully with two or three Compreſſes, each larger than the inferior, and applies the Napkin and Scapulary: Next Day, he removes the Pellet, tho' it adheres firmly to the *Foramen*, and Lips of the Wound; and aſſerts, that ſcarce any Traces of either are left: Afterwards he fills the Wound again with Cloth and Lint; but leaves us in the Dark, as to the manner of Healing: Nor are we better acquainted with *Garengeot's* Reaſons for preferring a double and tranſverſe Inciſion to the common Practice of a ſingle and rectilinear one, when that will ſuffice: He likewiſe gives us *Le Dran's* Obſervation, where, in a Rupture of this kind, the Sacculus being open, a Cell of the Colon only was incarcerated, which occaſion'd a Vomiting. But, during the Proceſs, eſpecially at firſt, Bleeding, Purging, or Clyſters, and a regular Diet, is abſolutely neceſſary.

Dionis, in his Book of Surgery, ſays, *That an unſightly Prominence of the Navel never proceeds from too great an Expanſion of the Peritonæum*; but, always, rather *from a Rupture of it*; and, therefore, the Inteſtines are to be found immediately under the Skin, and not contain'd in any Sacculus. But this Error may be confuted, from my Annotations on that learned Author, and the following Obſervation: I ſaw, when I was Profeſſor of Phyſic and Surgery at *Altorf*, with *Carolus de Colonia*, a Surgeon of *Norimberg*, a tall fat Gentleman, whoſe Navel was very prominent (ſee *Tab.* XLV. *Fig.* 12.); A A A A denote the Extremity of the external Skin in the Navel, like a large Annulus: In this a thin pellucid Membrane, or, more probably, the *Peritonæum*, was compriſed, thro' which the Inteſtines B B B manifeſtly appear'd, in the living Subject. As long as he wore the Truſs, with a large hard Pillow, (ſee *Fig.* 6.) they remain'd in their natural Poſition; but, upon the Removal of that, they, with the thin Membrane, contain'd in a ſort of Bag, deſcended, and formed a Tumor beyond the Navel. I do not know, this has occurred to any one elſe in Practice; tho' it is beyond all doubt, that *Palfyn* and *Garengeot* differ, in their Sentiments, from *Dionis*, and agree with me, that there is always a Bag, or a preternatural Diſtenſion of the *Peritonæum*, in theſe Ruptures, which contain the Inteſtines. In the Interim, we ſhould not condemn *Dionis's* Opinion, as abſolutely falſe, ſince he declares, it is founded on Obſervations made both on dead and living Subjects; but, rather, think ſuch Caſes may have been; for it is certainly beſt to be circumſpect in the Cure of an Umbilical Rupture, and not raſhly cut the Inteſtines inſtead of the Bag, or, as *Garengeot* terms it, the *Raiſeau*: And, indeed, I am convinced, from Experience, that *Dionis* had ſome Foundation for his Opinion; and *Garengeot* himſelf, *pag.* 313. 367. *Tom.* I. *Chirurg. Edit.* II. ſhews, that a Rupture of the *Peritonæum* ſometimes attends theſe *Herniæ*.

Explication of Tab. XLV.

Fig. 1. Exhibits a triangular-pointed Steel Needle, inſerted in a Tube; it is called a *Trocar*, deſtined for perforating the Belly of a dropſical Perſon, and, chiefly, extracting the Water out of that and the *Scrotum*. A is the Handle, B the triangular Point, C the Tube into which it is inſerted.

Fig. 2. Repreſents it alone, without the Tube, made of Iron or Steel. A C is in the Handle, B C the poliſhed Needle, B the triangular Point.

Fig. 3. Shews the poliſhed Tube by itſelf, generally made of Silver, thro' which, after extracting the Needle, the preternatural Humours flow: A A is the Part remaining in the Belly, where the Needle is taken out, B B the Plate, and eſpecially the concave Part of it, with two Apertures, into which you may tranſmit a Thread, and, if Occaſion requires, tie the Tube, to prevent its ſlipping into the Belly: C ſhews a kind of elliptical *Foramen*, on each Side, that the Liquor may enter, not only into the extreme Aperture, but, likewiſe, into theſe lateral ones: D is the Aperture, in the middle of the Tube, into which the Needle is introduced; and, when the Belly is perforated, upon the Extraction of that, the Water is diſcharged through it.

Fig. 4. Is *Petit's* Tube, for the ſame Uſe: A A the cylindrical Part, with a Slit almoſt the whole Length, into which, he thinks, the Water inſinuates itſelf eaſier than into the other. B the Plate, with an Aperture, into which the Steel Needle is introduced, and through which the Liquor is emitted: C C another Plate, hollowed like a Pipe, through which the Water commodiouſly flows into the Veſſel under it.

Fig. 5. A A A A exhibits an Inſtrument, reſembling a Croſs, for repreſſing a Gibboſity in Children, which is applied to the Back; ſo that the longer Part lies on the *Spina Dorſi*, the ſhorter on the *Scapulæ*: B B is an Iron Ring, which, being cover'd with Leather or Silk, is put round the Neck, and, by a proper Loop, put thro' the Apertures *a a*, may be made more lax or tight, as Neceſſity requires. C C two Leather Strings: The Left hangs down, that you may ſee the Holes at the Bottom, thro' which the Strings are paſſed: D D are the Strings; that on the Left untied; the other repreſents the Manner of tying it about the Shoulder: E E the Bandage paſſed thro' the Apertures F, which faſtens the lower Extremity round the Belly.

Fig. 6. Repreſents the Bandage for Umbilical Ruptures: A is the Steel Truſs, cover'd with Leather or Fuſtian, with ſome Cotton, or boiled Hair, under it: This is put upon the Navel, having firſt laid on a Plaiſter and Compreſs: It may have a Button in the Middle. B B B the Belt to encompaſs the Waiſt, made of Leather or Fuſtian: C the Buckle, which faſtens the Belt: D the Truſs, with the Button in the Middle.

Fig. 7. Another Kind of Inſtrument, for the ſame Uſe, made of Steel or Braſs Wire, and bent in a peculiar manner. A the Part laid on the Navel; B B B that which ſurrounds the Abdomen; C C that which is fitted to the Inguen; this compreſſes the Belly and Navel by its own Elaſticity: It ſhould be cover'd with Leather or Cotton, and the Part ſtuffed with boil'd Horſe-hair, or ſome other proper Material, and the Whole ſuited to the Size of the Patient.

Fig. 8. Is the Director, for a proper Dilatation and Inciſion of an incarcerated Rupture. A A the Plate, reſembling an Heart, to keep the Knife from wounding the Inteſtines.

Fig. 9. *Morand's* gaſtroraphic Inciſion-knife, for the ſame Uſe. A ſhews the obtuſe Part, which is introduced into the Abdomen, thro' the Aperture: B the Hinge, which joins the two Parts of the Inſtrument: C C the Handle, for the Fingers: D the inferior Part of the moveable Arm, ſomewhat round or obtuſe: E E the ſuperior or acute Part, by the Elevation of which, the narrow Aperture is enlarged.

Fig. 10. and 11. Repreſent *Le Dran's* Inciſion-knife for Ruptures. The firſt ſhews it joined together, the other ſeparate,

* Neither I, ſays *Heiſter*, nor any one I have converſed with, underſtand this Word *Raiſeau*; nor is it in any *French* Dictionary: For tho' *Rainſeau* ſignifies a Ramulus, yet, after the moſt diligent Search, I could never diſcover, in any umbilical Rupture, any *Ramulus*, reſembling an Inteſtine; and, therefore, wiſh *Garengeot* had been more explicit. But if, for *Rainſeau*, we read *Reſeau* or *Reſeul*, which Words are in the Dictionaries, and ſignify a Net, or little Net, it is ſtill as unintelligible to me, how an Inteſtine can appear like a Net; ſince there is the wideſt Difference between them.

that the internal Structure may be better conceiv'd: A A the excavated Director, in which the ſmall Knife is concealed: B the longitudinal Half of this Knife: D the End, which the Author calls a Swallow's Tail; this is moved in the Groove, to prevent the Extremity from ſlipping out: E E the Lever, which elevates the Knife: F the Handle of the Lever, which, by a Preſſure of the Thumb, elevates the inferior Part of the Lever. G an elaſtic Plate, by which the ſmall Knife, after the Operation, is return'd into the Groove, and concealed. H H the two lateral Wings, which cover and defend the Inteſtine: I I two erect Wings, which include the Lever: K the Handle of the whole Inſtrument: L the Screw upon which the Lever turns.

Fig. 12. Is an Umbilical Rupture, remarkably large: A A A A ſhew the Skin of the Navel, very much diſtended, in the Shape of a Ring, above two Inches Diameter, and connected with a thin Membrane, undoubtedly the Peritonæum, through which the Inteſtines B B B might be ſeen.

Of other HERNIÆ, *particularly the Ventral.*

We have already ſaid, that a Deſcent of the Inteſtines and Omentum, or either of them, occaſioning an unſightly Prominence of the Navel, is termed an *Omphalocele*, or Umbilical Rupture; and this Name is diverſified, according to the Part affected. So, for Inſtance, when the Inteſtines or Omentum deſcend into the *Scrotum*, it is called *Scrotal*; when into the Groin, *Inguinal*; if they fall into the external Part of the Thigh, *Femoral*; if this Accident happens in any other Part of the Belly, we denominate it *Ventral*; which is obſerv'd to be ſometimes in the *Linea Alba*, as well above as below the Navel. Ruptures are alſo divided into true and ſpurious: True, when the Inteſtines or Omentum deſcend; ſpurious, when neither of them does, but the Tumor ariſes from ſome other Cauſe, as an *Hydrocele*, *Sarcocele*, and *Variocele*. As for what belongs to the ventral *Hernia*, moſt Authors, of the laſt Age, have entirely omitted it, or ſpoken very ſlightly of it, tho' it was known to, and deſcribed by the Antients, and I have ſeen ſeveral Inſtances of it: I ſhall, therefore, be very particular in my Explication of this Diſorder. They differ greatly, for ſome are ſmall, ſome large; ſome on the Right Side, ſome on the Left, and others in the Middle; ſome eaſy, others difficult, to be return'd, and, as we ſaid of the *Omphalocele*, attended with exceſſive Pain; theſe we call incarcerated.

As for the Cauſes of theſe Diſorders, there are two Opinions; *Dionis* thinks, a ventral Rupture does not ariſe ſo much from a Diſtention, as from a Burſting, of the interior Membrane of the *Abdomen*, and is, therefore, occaſion'd only on a ſudden, and by a very great Violence. On the other hand, *Garengeot*, with good Reaſon, attributes it, not only to a Burſting of the *Peritonæum*, and a Laceration of it, by any violent Hurt of the Belly, but, much oftener, to a Separation of it, by any Cauſe, to ſuch a Degree, that it never grows together again: So that the Muſcles, and, principally, the tranſverſe Muſcle of the *Abdomen* is entirely, partly, or, in ſome of its Fibres, relaxed, burſt, or, by ſome other means, ſo far injur'd, that, upon any violent Motion or Force, the Inteſtines protrude and ſeparate the *Peritonæum*.

A ventral Rupture, particularly that which may be eaſily return'd, is known, generally, by theſe Symptoms: The Skin, in ſome Part of the Belly, is indecently puffed up, like a Tumor: This yields to the Preſſure of the Hand, and retreats into the *Abdomen*, but, upon the Removal of the Hand, appears again, with ſome Noiſe. Upon Coughing, Holding the Breath, or Straining, as is common at Stool, the Tumor grows ſurpriſingly hard, and has the Appearance of diſtended or inflated Inteſtines, tho' they ſeldom come out but one after another, which cauſes an inſenſible Increaſe of the Tumor, tho' it was ſmall at the Beginning. When this Rupture is incarcerated, it has all the Symptoms of an *Hernia Umbilicalis*; and every Age is ſubject to it, Adults, as well as Infants and young Men.

It requires a particular Care, to diſtinguiſh this from an Abſceſs, leſt you ſhould inconſiderately treat it in an improper manner, and Experience ſhews us, that many have been deceived: I myſelf knew a Surgeon, who would have made an Inciſion into a Rupture, had not I diſſuaded him from it, as if it had been an Abſceſs. In Adults, and Men far advanced in Years, it is very difficult to cure, and ſo troubleſome, that they are almoſt incapable of any Buſineſs; and even tho' you ſhould cut it, you can ſcarce ſucceed, as the Peritonæum is quite defective. Moreover, when the Aperture, through which the Inteſtines are fallen, is too narrow, ſo that they are greatly compreſſed by it, there is imminent Danger, as in an umbilical, inguinal, or ſcrotal Rupture, of intenſe Pains, an Inflammation, Vomiting, even of the Fæces, and Death, from this violent Conſtriction. A Rupture in the *Linea alba*, either above, or chiefly below the Navel, according to moſt Writers, is uſually incurable; though, ſince the Place of the Deſcent is commonly larger than in other *Herniæ*, it is often leſs dangerous.

Though this Diſorder is very troubleſome, it may be cured, if taken in time; or, at leaſt, mitigated, eſpecially in Infants and young Men; for it is inexpreſſible what Advantage accrues from the Uſe of the Truſs (*Tab.* XLV. *Fig.* 6); particularly if the Iron Plate A be of a due Size; and kept conſtantly round the Belly, with a Plaiſter under it. And even, if the Patients are old, and the Diſorder of long Continuance, it will prevent worſe Conſequences. *Celſus* ſays, when the Antients attempted a complete Cure, they proceeded thus: "Paſſing a Needle with "two Threads through the Baſis, they tied the diſtended "Skin on each Side, as in the Navel, or Uvula; ſo that what "was above the Thread died away." Some cut the middle of the Tumor, in the Form of a Myrtle-leaf, and then join'd the Lips by Suture. But, to confeſs the Truth, both theſe Methods ſeem to me more dangerous than the Truſs; for the Operator will ſcarce be able to refrain from hurting the Inteſtines, or tying them up with the Skin; and there may be a better way diſcover'd, or, at leaſt, the old one improv'd upon. When the Inteſtines, in this Rupture, cannot be replac'd, follow the Rules laid down for an Omphalocele. *Garengeot* aſſures us, that *Petit* did this with Succeſs; for he reſtor'd a Taylor, in about five Days, to his former Health, without any Aperture of the Bag made by the prolaps'd Peritonæum, but only laying it bare, and enlarging the Foramen with a Knife. But if this Misfortune ariſes from the Peritonæum, from an old Wound, by Laceration or Inciſion, as that never concretes, they are not contain'd in the Bag, but rather are contiguous to the Integuments; therefore this Operation requires the utmoſt Skill, leſt, while we inveſtigate the Bag, we ſhould touch or injure the Inteſtines with the Knife. Laſtly, this Admonition cannot be too often repeated, that Adults, though they are freed from this Diſorder, ſhould never leave off the Truſs, for fear of a Relapſe. *Saviard, Obſ. Chir.* 59. gives an Inſtance of a new Species of Hernia ventralis, after the *Cæſarean* Section. See BUBONOCELE.

Of the Deſcent of the Inteſtines into the Scrotum, or Scrotal Rupture.

We come now to Tumors in the Scrotum, which proceed from almoſt the ſame Cauſe with the others. In treating of theſe, we ſhall ſhew, in general, what the Diſorder is, and the different Species of it; then explain each particularly. We call every preternatural Tumor of the *Scrotum*, a *ſcrotal Hernia*, and it is either *true*, or *ſpurious*: True when it is occaſioned by a Deſcent of the Inteſtines or *Omentum*; falſe, when the Teſticles, or ſpermatic Veſſels are tumified by ſome Humour contain'd therein, or when any noxious *Humor*, or *Flatus*, or ſome ſuch Matter, diſtends the Part unnaturally. Under theſe *Genera* are ſeveral *Species* contained, and the Name and Method of Cure is diverſified according to the Variety of the peccant Matter, which occaſions the Diſtention; for, when the Inteſtine deſcends through the *Proceſſus Peritonæi*, we term it an *Enterocele*; when the *Omentum* falls, an *Epiplocele*. When the *Scrotum* is diſtended by foreign Humours, as the *Serum*, or Water, we call it an *Hydrocele*; when by Blood, an *Hæmatocele*; if it happens from Wind, *Pneumatocele*. Farther, if either Teſticle is preternaturally increaſed and hardened, it is denominated a *Sarcocele*. A Tumor of the ſpermatic Veins is an *Hernia Varicoſa*, *Varicoſele*, or *Circoſele*; and an Abſceſs in the *Scrotum* is termed an *Hernia humoralis*. Sometimes two of theſe happen together, and then they are diſtinguiſhed by a proper Connexion of their Names, as *Entero-epiplocele*, *Hydro-enterocele*. Sometimes there is a *Hydrocele* in one Side of the *Scrotum*, and an *Enterocele* in the other; an Inſtance of which I lately ſaw; and ſo it is with the reſt. Now we will enter upon an accurate Examination of the Nature and Diſpoſition of each.

Of the ENTEROCELE.

An *Enterocele* is a Tumor ariſing from a Deſcent of the Inteſtines through the Ring of the Muſcles of the *Abdomen*, and Proceſs of the Peritonæum, into the *Scrotum* (See *Tab.* XLVI. *Fig.* 3. A B). Some term this an *Oſcheocele*, and perfect Rupture, in Contradiſtinction to the *Bubonocele*, a kind of imperfect Rupture, which does not extend to the *Scrotum*. It is manifeſt this Diſorder ariſes from a vehement Protruſion by the Inteſtines, and an Expanſion of the *Peritonæum*, with the Ring of the Muſcles, ſo that it hangs down in the *Scrotum*. (ſee *Tab.* XLVI. *Fig.* 4. D); or from a Burſting of the *Peritonæum*, which naturally ſtops the Perforation at the Rings, by ſome uncommon external Violence, ſo that the Inteſtines are forced through that, and the *Proceſſus Peritonæi* into the *Scrotum*. Experience teaches, that the latter Accident does not happen ſo frequently as the former. *Ægineta* ſays, the *Peritonæum* may be broken by outward Force, ſuddenly and with great Pain; this is confirmed by others, mentioned under the Article BUBONOCELE, who have ſeen it. If a Rupture is cauſed by too great a Diſtention of the *Peritonæum*, it increaſes gradually, and with extreme Pain; in general theſe *Herniæ* inſeſt but one Side, though ſometimes they reach both, and for the moſt part the Inteſtines deſcend alone, though they may be accompanied by the Omentum.

As for the Cauſes of an *Enterocele*, they are very much the ſame with thoſe of a *Bubonocele*, or *Omphalocele*, that is, a violent Fall, Leap, or Blow; a vehement Strain in moving or lifting Bodies;

Bodies; or, laſtly, Vomiting or Coughing; and, according to the Diverſity of the Cauſe, the Diſorder is formed inſtantly, or imperceptibly. It appears to the Touch like a Bladder or Inteſtine diſtended with Air. At firſt the Tumor ſhews itſelf ſmall, about the upper Part of the *Pudenda*, which, unleſs prevented at the Beginning, by degrees deſcends more and more, in ſuch a manner, however, that the Teſticle of the affected Side, near the Tumor, may be felt by the Fingers, though ſometimes the gradual Increaſe is ſo great, that the *Scrotum* hangs down to the Middle of the Thigh, or even the Knees. The other Symptoms of an *Enterocele* are almoſt the ſame with thoſe of a *Bubonocele*, *viz.* a preternatural Tumor about the private Parts, particularly in the *Scrotum*, like an inflated Bladder to the Touch, and extending itſelf from the Ring of the abdominal Muſcle to the *Scrotum*, near which the Teſticle may be perceived by the Fingers (*a*): This, when the Diſorder is not very great, nor the Part inflamed, ſometimes leſſens, and ſometimes increaſes; particularly, when the Patient lies on his Back, it ſpontaneouſly retreats from the *Scrotum* into the *Abdomen*, or at leaſt decreaſes, and is then generally without Pain; or it may be repreſſed by the Hands towards the *Inguen*, or into the Belly, and then it makes ſome Noiſe; but upon removing the Hand, or the Patient riſing, it returns again with the ſame Noiſe. It is increaſed by crying, Satiety, or carrying a great Weight; but contracted by Cold, and is dilated by Heat. Sometimes the deſcended Inteſtines are inflamed or ſwelled vaſtly with the Fæces, or adhere to the neighbouring Parts; then they cannot be repelled by the Hands. Upon preſſing this Tumor we plainly perceive an inflated Inteſtine, and a Swelling of the Rings of the abdominal Muſcles, and that ſometimes increaſing, ſometimes decreaſing, ſometimes with a Noiſe. Whenever, therefore, we find a Tumor can be forced into the Belly, we conclude it is an *Enterocele*. Men labouring under this Diſeaſe ſometimes, for the Reaſons already given, feel Pains not unlike the Colic, either more or leſs violent, in the *Scrotum*, *Inguen*, and *Abdomen*. Some are troubled with a *Nauſea* and Vomiting. When it is occaſioned ſuddenly, and by any violent Force, the Annulus of the abdominal Muſcles is often ſo narrow, that the Inteſtines cannot be repelled. Conſequently there is Danger of a worſe, that is, an incarcerated Rupture.

Though we have obſerved, that an *Enterocele*, in ſome Men, and ſometimes in pregnant Women, may be ſupported without any extraordinary Pain; yet that generally increaſes with the Tumor, ſo far as to render robuſt Men unfit for Labour; and, unleſs they are ſecured by a proper Truſs, there is great Danger, either from Cold, Leaping, Straining, Coughing, flatulent Food, Vomitings, Falling, Paſſion, and other ſuch or ſlighter Cauſes, that more of the Inteſtines will deſcend, and bring on an incarcerated Rupture, with other Diſorders mention'd under BUBONOCELE, that is, acute Pains, Vomiting, the Iliac Paſſion, and Hazard of Death itſelf. On the contrary, if they defend themſelves with a proper Truſs, and refrain from violent Motion, young Men may be perfectly reſtored, and Adults and old Men, as Experience proves, live as long, and, if they are otherwiſe in a good State of Body, as healthful a Life as others. We muſt obſerve, that a Deſcent of the Inteſtines with the Omentum, is leſs dangerous than that of the former only.

If this Hernia is not yet incarcerated, nor the Inteſtines intercepted, nor united with the external Parts, your principal Care muſt be both to reſtore them to their native Situation, and ſecure them there; and, further, to reunite the diſtended Annulus of the Abdomen; or rather contract it, ſo that they may not fall out again. After replacing the Inteſtines, there are two Methods of uniting *, or rather contracting, the Aperture of the Abdomen, as we have ſaid in a Bubonocele; *viz.* by binding it with a proper Bandage, or by Section, commonly call'd κήλοτομία, or Caſtration, becauſe a Teſticle is generally cut out. An Attempt to cure it by Ointments, Plaiſters, or any other Medicines, without binding, or by Tranſplantation, or Sympathy, is vain, at leaſt uncertain, and often ſuperſtitious. The beſt Remedy, therefore, for Ruptures which are recent, inconſiderable, and not incarcerated, is a proper Bandage, as we have deſcrib'd under the Article BUBONOCELE; for by this, as I have often experienced, not only Infants, and young Men, but Adults, when the Diſorder has been of little Continuance, and ſlight, have been abſolutely freed from it, eſpecially if proper internal and external corroborating Medicines, with a ſuitable Manner of living, have been added †; and if the Patient is old, or the Diſeaſe inveterate, theſe will alleviate it; for by a proper Application of them, the Inteſtines and Omentum may be contain'd in the Abdomen, worſe Symptoms prevented, and the Patient execute any Work, wherein very great Strength is not requiſite.

Of the CELOTOMIA, *or Caſtration.*

I cannot but join with thoſe who condemn the Method of Cure by Caſtration, which is perform'd, by, firſt, tying up the Proceſſus Peritonæi, and ſpermatic Veſſels, ſince it deprives the Patient of a Part ſo neceſſary to Generation, and he may be treated in a much ſafer and gentler Method; for Inciſion is very far from being effectual in theſe Caſes, and, at the ſame time, throws him into cruel Agonies, and an imminent Danger of his Life. And the Patient, or his Relations, ſhould avoid ſuch a Surgeon more than a Plague, ſince they muſt neceſſarily know, that the whole Art of a Quack conſiſts in getting Money, that it is void of Experience and Judgment, and conſequently made up of mere Fraud. It is, for this Reaſon, incumbent on all Magiſtrates and Governors, as the Cuſtom of ſome Countries is, to prohibit all itinerant Empirics the undertaking this pernicious and dangerous Method of Cure, without the Advice and Conſent of able Phyſicians. And, in my Opinion, the Temerity and Cruelty is very extraordinary, which attempts a Remedy accompanied with the moſt intenſe Agonies, the Loſs of a Teſticle, the Danger of Death, and a perpetual Apprehenſion of a Relapſe; for after this Operation, the Inteſtine and Peritonæum have often fallen down, and the Hernia return'd, as *Celſus*, *Cyprianus*, an eminent *Dutch* Surgeon, and my own Experience, thoroughly convince me. Let us, therefore, ſtick to the old Way of Bandage. See my Diſſertation on removing the Abuſe of Celotomy, publiſh'd at *Helmſtadt*, in the Year 1728‖.

As we think Bandage very ſerviceable in the Cure of an Enterocele, or Epiplocele, we ſhall explain how they are to be form'd, and applied. That is beſt which compreſſes the Part of the Belly where the Inteſtine falls down, ſo that neither the Inteſtine nor Caul can deſcend from thence; which is done by fitting it carefully to the Patient's Body. The Induſtry of the Moderns is very commendable, which has invented and deſcrib'd various convenient and proper Bandages for the Cure of this Rupture, either in one or both Sides. Thoſe which I think moſt ſuitable, are repreſented *Tab.* XLVI. *Fig.* 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15. and they are made of different Materials; thoſe for Infants and Youths, of thick Linen, or Fuſtian, ſtuffed with Cotton, or of ſoft Leather; thoſe for ſtronger Men, of ſtrong Leather, or Steel. Theſe Bandages, over a ſticking Plaiſter, being tied round the Body, not only repreſs the Inteſtines, and compreſs the Proceſſus Peritonæi, but ſometimes unite, or, at leaſt, contract the Coats ſo, that the Inteſtines can not fall down again. They ſhould be kept on for ſix Months at leaſt, and a thin Diet ſhould be obſerv'd, with Abſtinence from Leaping, Riding, and all violent Exerciſes, taking, at the ſame time, gentle Purges, and ſtrengthening Medicines, leſt the Inteſtines, being too much inflated, ſhould deſcend again through the Muſcles of the Abdomen. This Method ſeldom fails of curing a Patient under twenty Years old; nor ought we to deſpair, if he is thirty or forty, when the Diſorder is recent, and the Surgeon brings immediate Aſſiſtance. If he is older, we can never expect a perfect Recovery, and both the Patient and Surgeon ſhould content themſelves with the Relief that comes from a proper Bandage, and the Security of preventing a ſecond Deſcent of the Inteſtine and Omentum: For, I think, after what has been ſaid, nobody will have recourſe to the Inciſion-knife.

Celotomy, that is, Caſtration, is another Method us'd by Quacks, and abhorr'd by all regular Surgeons, 1. From the acute Pain attending it. 2. From the Danger of Life. 3. From the irreparable Loſs of a Teſticle. 4. From the continual Apprehenſions of a Relapſe. And theſe Reaſons are more prevailing, if the Patient is young. However, ſome Sections of an Hernia may, and ought to be undertaken, when the Inteſtines cannot be repel'd, and a Bandage, or other Remedies, are ineffectual; as when the fallen Inteſtines are united, either with the Scrotum, or the Proceſſus Peritonæi, in ſuch a manner, that they can by no means be forced into the Belly, but impede the Patient from doing his Buſineſs, and threaten him with the Calamity of an incarcerated Rupture. But Mountebanks, without this Adheſion of the Inteſtines to the neighbouring Parts, and when they may be repel'd, have frequently perform'd this Operation, both on Infants and old Men.

(*a*) It ſeldom happens, as GARENGEOT writes, that the Teſticle is ſo far immerſed in the Inteſtines, that it cannot be felt, becauſe it is contained in a peculiar Cover.

* Some aſſert this Aperture is never reunited, only contracted, the Truth of this can be learnt only from Experience.

† About the End of the laſt Century, a *Frenchman (Prieur de Cabrier)* boaſted, that he had found an Arcanum, which would cure any Rupture, without Bandage or Section. *Lewis* XIV. oblig'd him to diſcover it, for a Sum of Money; and then made it public for the Good of Mankind. It conſiſted of Spirit of Salt, with a certain Quantity of red Wine to be taken often every Day. See *Verduc, Lib. de Faſciis, p.* 24. *Valentini Polychreſt. Exot. p.* 89. *Dionis, Chir. Cap. de Herniis:* However, this did not prove effectual, without any Bandage.

‖ Some think the Loſs of a Teſticle entirely diſqualifies a Man for Generation; but I know this to be an Error, from many Inſtances; however, without doubt, a Man with two will ſucceed better, as we ſee better with two Eyes than one.

The Patient is laid on his Back upon a Table, with his Head reclining, and his Hips elevated, and either bound faſt down with Cords, or his Head, Hands, and Feet, held by ſtrong Men ſo faſt, that he can neither turn, nor move himſelf. Then the Operator protrudes the Inteſtines into the Belly, and then orders his Aſſiſtant to compreſs the Aperture of the Abdomen firmly with his Hand; then he makes an Inciſion, about three or four Fingers-breadth long, according to the different Size of the Body, through the ſuperior and lateral Part of the Scrotum, with the ſubjacent Fat, drawn upwards in the manner directed for the Cure of a Bubonocele, and for cutting Fontanels and Setons; he then ſeparates the Proceſs of the Peritonæum, now bare, and the Teſticle, from the neighbouring Parts, with his Fingers, and tears it out of the Scrotum with inexpreſſible Torment to the Patient; then he draws out the Proceſs, as far as he judges proper, and binds it round the upper Part with a Silk or Linen Ligature as in the Extirpation of Tubercles, tying up at the ſame time the ſeminal Veins and Arteries, to prevent an Hæmorrhage upon the Application of the Knife: Others ſeparate the Proceſs of the Peritonæum from the neighbouring Parts with their Fingers, and tie it with a String, before they extract the Teſticle; and to keep the Teſticle from the Sight of the Spectators and Relations, conceal it in one Hand; and afterwards, with all the Dexterity they are Maſters of, cut off whatever is ty'd, and the Teſticle, leaving a Finger's-breadth below the Bandage; then ſteal away the Teſticle, and fill the Wound with Lint, and, laying a Plaiſter and Compreſs over it, bind it up. When the whole Operation is performed, they put the Patient into Bed, as if he was ſtill poſſeſſed of his Teſticle. The Dreſſing is renewed for ſeveral Days, with Oil of Eggs, of St. John's-wort, or ſome other vulnerary Oil, till the Ligature of the Proceſs of the Peritonæum, and ſpermatic Veſſels, looſens and falls off ſpontaneouſly, which happens generally on the fifth, ſixth, or ſeventh Day. When the Ligature is fallen off, they heal the Wound with balſamic Medicines, and then they have perfected their Cure. In the mean time, if they are not Blockheads, they preſcribe Reſt for twelve or fourteen Days, and the Diet uſual after great Wounds, or chirurgical Operations; and they ought to continue this, till the Patient dies, or recovers. But every one, of the leaſt Experience, knows, that moſt Men, after the Operation, are ſeized with a Fever, Spaſms, and Convulſions, eſpecially if the Operator is not very dexterous, or the Diet neglected: Beſides, thoſe, who are thus cured, frequently relapſe into their old Diſorder. Some Surgeons, particularly the *Italians*, as appears from the Writings of *Fabricius ab Aquapendente*, and *Scultetus*, attempt a Remedy ſtill more inhuman; for, before they tie up the Proceſs of the Peritonæum, they paſs a large Needle through it with coarſe waxed Thread, and, after cutting off the Teſticle, cauterize the Wound of the ſpermatic Veſſels with a hot Iron.

The third and leſs cruel Method is termed the *Sectio*, or *Punctura Aurea*, exactly deſcribed by *Paré* and *Geiger*, contrived to prevent the Loſs of a Teſticle, and other ill Conſequences. It is thus: The Patient is laid on his Back, the Inteſtines are return'd, as we have already ſhewn, and, by an Inciſion, the Proceſs of the Peritonæum is laid bare, and the upper Part of it, near the Annulus of the Muſcles, ty'd with a fine Gold Wire, the Teſticle ſtill continuing in its proper Situation. This Thread is wound gently round the Proceſs of the Peritonæum, with a Forceps, in ſuch a manner, that the ſeminal Veſſels are inſenſible of any Compreſſion, and yet the Proceſs ſo ſtraitened, that the Inteſtines cannot deſcend into the Scrotum. But this is diſapprov'd of by myſelf, as well as others; for when the Bandage is lax, the Inteſtines eaſily depreſs it by their own Weight; and, when it is tight, the ſpermatic Veſſels likewiſe are compreſs'd, and the Teſticle is neceſſarily corrupted, not to mention the Difficulty of curing the Wound made in the Inguen, and the Fiſtula, a uſual Attendant upon this Operation, which muſt proceed from the continual Irritation of the Parts, by the Gold Thread. Hence I conclude, that ſkilful Surgeons will always depend upon the Bandage for a Cure of this Rupture, as long as the Inteſtines can be return'd.

Mr. *Jo. Douglas*, a celebrated Surgeon, at *London*, communicated to me the Method of one *Littlejohn*, without Inciſion. Firſt he returned the Inteſtines into the Belly, then applied a corroſive Medicine above the Os Pubis, to the Place where the Inteſtines deſcended (and he recommends Oil of Vitriol) in ſuch Plenty, that it might ſoon penetrate the Skin; for the deeper the Eſchar, the more effectual the Remedy: Therefore he orders it to be repeated for three or four Days, that the Skin may be the more corroded; and, upon every freſh Application of the Oil of Vitriol, he removed the old Eſchar, that it might penetrate the better; then he dreſſed the Wound with a Plaiſter of Paracelſus and Oxycroceum mix'd in equal Parts, and ſpread upon Leather, and ſecured it with Compreſſes and Bandage. This Plaiſter alone, he affirms, is ſufficient to ſeparate the Eſchar, and cure the Ulcer. If there was any Excreſcence of ſpongy Fleſh, he ordered it to be eaten off with the Lapis Infernalis. The Patient muſt obſerve a ſpare Diet, and refrain from Exerciſe, till the Wound is cured. After which, he lays the Rupture-plaiſter on the Cicatrix, and applies a proper Bandage. This Bandage muſt be worn, till the Cicatrix is ſtrong enough to prevent a Relapſe. King *George* I. out of his Princely Liberality, gave Five thouſand Pounds for this Arcanum, which was ſoon after deſpiſed by the *Engliſh*. See *Heuſton*'s Hiſtory of Ruptures, and *Douglas*'s Syllabus of Chirurgical Operations.

Sermes, a Surgeon of *Amſterdam*, and an old Acquaintance of mine, in his Treatiſe of *Lithotomy*, written in *Dutch*, *Anno* 1726, gives another Method of curing theſe Ruptures, without the Loſs of a Teſticle; which he confeſſes not to be his own Invention, but what he learnt from ſome, who were Eye-witneſſes of it in *Ruſſia*. A *Ruſſian* Surgeon laid ſuch Patients on a Bench upon their Backs, and ſecured them by the Aſſiſtance of ſtrong Men; then he made a rectilinear Inciſion, ſomewhat long, into the Groin, as is uſual in Celotomy, and ſearched for the Proceſs of the Peritonæum, opened it with a Knife, and there inveſtigated the Sack of the Rupture, which contained the Inteſtines (ſee *Tab.* XLVI. *Fig.* 4.). When he had found it, he extracted it out of the Wound with ſome Violence (*undoubtedly, after looſening it from the Parts, to which it is connected*); and ty'd it with a ſtrong Thread, as near as he could, to the abdominal Muſcles, (ſee *Fig.* IV. B B) and left the Thread hanging out of the Wound; he then dreſſed the Wound, as uſual, till the Thread fell off ſpontaneouſly. Thus he cured many, without any Injury to the Teſticle, or ſpermatic Veſſels; and not one, as they ſolemnly affirm, died. *Sermes* approves of this Method in Adults, when the Inteſtines cannot be contained in the Belly by Bandages, and the Patients undergo great Pain and Uneaſineſs. But the Certainty of this can only be confirmed by Experience. However, this is ſure, that, if it ſucceeds, it is preferable to the common Way, becauſe the Teſticle, and other Parts, are kept entire by it. And we muſt further learn from Experience, whether Ruptures, thus cured, do not return as eaſily, as thoſe cured by the vulgar Method, when the Sack and ſpermatic Veſſels are ty'd together; for I ſee no Reaſon, which can hinder it more in one than the other. And this is the more to be dreaded, when the Ruptures are large and inveterate; and, conſequently, the Place of the Deſcent greatly expanded and debilitated. Laſtly, we muſt obſerve, that a certain *Swiſs*, one *Freitage*, in the Year 1721. deſcribed this Method, as well known to his Father, a Surgeon at *Strasburgh*; and the Son, in his Diſſertation, ſays, it was practiſed by his Father ſucceſsfully, with this Difference, that he perforated the Saccus with a Needle and Thread, before he made the Ligature. Thus, alſo, in the Year 1730. a Diſſertation appeared at *Keil* in *Holſtein*, wherein the Author *Jor. Henr. Schuckman* affirms, that he had practis'd this Method with good Succeſs, and commends it greatly.

Some, for the Preſervation of the Teſticle, do not tie up the Proceſs, and ſpermatic Veſſels, but, repreſſing the Inteſtines and Omentum, ſcarify the Annulus and Skin, then bind it up properly, for the Promotion of a firm Cicatrix; and thus they declare they have cured many; particularly if they wore the Bandage long enough afterwards. But my Opinion is, that this Method is more effectual in Infants and Boys, than Men advanced in Years.

If an Enterocele is ſo large, that the Inteſtines cannot be return'd, principally if it happens from their Adheſion to the Proceſs of the Peritonæum, Annulus, Scrotum, or laſtly to the Teſticle, and expoſes the Patient to the Danger of the Iliac Paſſion, then all Bandages are abſolutely ineffectual, and rather excite or increaſe the Pain, Inflammation, and other dangerous Symptoms; nor are Medicines of any Service; but our ſole Hope of averting the Danger of an untimely Death, and the Iliac Paſſion, and reſtoring the Patient to his former Vigour, is in the Knife; for I know of no one yet, who has contrived a better and milder Method. When, therefore, this Operation muſt be performed, place the Patient, as before directed: You muſt firſt divide the Integuments, for Reaſons already given, till the Proceſs of the Peritonæum, and ſeparated Cover of the Inteſtines, appear to your View. Having done this, ſeparate the Inteſtines from the adherent Parts, with the utmoſt Caution, either with a ſmall Knife, your Finger, a Pen, or ſome ſuch Inſtrument, always conducting your Knife, in ſuch a manner, as, if Cutting is unavoidable, you may cut any thing rather than the Inteſtines; and, when they are ſeparated from the adhering Parts, force them into the Belly. This muſt be done too, if you unexpectedly meet with an incarcerated Rupture, adhering to the external Parts. Laſtly, having reſtored the Inteſtines, you muſt not only heal the Wound, but apply the Bandage, called *Spica*, to prevent a Relapſe.

An incarcerated ENTEROCELE.

If the Stricture of the Inteſtine is ſo great in an Enterocele, that it cannot be returned, and conſequently becomes an incarcerated Rupture, and Cataplaſms, Bleeding, Clyſters, eſpecially one of the Smoke of Tobacco, are ineffectual, you muſt apply the Knife, to preſerve the Patient, as we directed in the incarcerated Bubonocele. And, for the better Illuſtration of this intricate Diſeaſe and Operation, you have *Manchart*'s Figures, in *Tab.* XLVII. *Fig.* 1, 2, and 3. taken from his Diſſertation on incarcerated Ruptures of the Scrotum; and there you will find them

them explained. In the mean time, I beg leave to add the following Obſervations to what has been already ſaid.

When the Rupture is ſlight, and the Inteſtine reducible without dividing the Coat of the Saccus, then the ſuperior Parts of the Whole ſhould be expoſed to View by Inciſion; for by this means the Inteſtines may be ſafely returned; then proceed as in a Bubonocele. But, (2.) when the Diſorder is of a worſe kind, or the Inteſtine and Omentum adhere to the neighbouring Parts, or a large Quantity of Humour is contained in the Saccus, the preceding Method is not effectual, but you muſt divide the Saccus, and return the Inteſtines; but, if this is impracticable from a Stricture at the Ring, dilate that by Inciſion, and, having freed the Inteſtines and Omentum from their Adheſion, reſtore them to their proper Situations, as before directed. But the Inteſtines muſt be treated with ſo much Tenderneſs, as rather to divide the Part, to which it adheres *, even if it be the Teſticle itſelf, than injure its own Coats †. In the next Place, the Sacculus is to be freed from its Adheſion, and ty'd with a waxed Thread three or four times doubled about the ſuperior Part, near the Ring, the Part of the Sacculus below the Ligature is to be extirpated, and the Wound dreſſed, as in other ſuch Caſes. After the Thread is fallen off, there is a ſort of Tubercle, or firm Cicatrix, formed, which, being agglutinated to the ſcarified Wound of the Abdomen, retains the Inteſtines ſecurely, and prevents a Relapſe. But be very cautious of binding the ſpermatic Veins and Arteries. (3.) If the epigaſtric Artery is divided in this Operation, leſt a Profuſion of Blood ſhould be an Impediment to you, let an Aſſiſtant preſs and keep it cloſe to the Inguen, with a Roll of Lint, either dry, or dipt in ſome Aſtringent; or tie it up with a Needle and Thread. (4.) When the prolaps'd Inteſtine is ſo diſtended either by Flatulences or Fæces, that it cannot be commodiouſly reduced, nothing, to many Surgeons, appears more ſalutary and conducive to the Reduction of the Inteſtine, than gradually drawing out of the Abdomen the Parts moſt adjacent to it, and to preſs into theſe the Flatulences and Fæces contain'd in the Part before prolaps'd; and thus gently to return the gradually-leſſen'd Ducts of the Inteſtine. But leſt this difficult Extraction and Depreſſion of the Inteſtine ſhould weaken, or entirely rupture its Parts, which are already too much debilitated, I think it more expedient by an Inciſion, to be made in the manner above-deſcrib'd, to enlarge the Perforation of the Abdomen, as much as ſhall ſeem neceſſary; and then to replace the prolaps'd Inteſtines. As for the Meaſures to be afterwards taken, they are the ſame with thoſe uſed in an INCARCERATED BUBONOCELE; which ſee. (5.) When the Meſentery is found prolaps'd along with the Inteſtines, then, according to the Obſervation of Mr. *Petit*, the former is to be return'd before any Attempt is made to reduce the latter; for, unleſs this Caution is obſerv'd, the Inteſtines almoſt always fall down again. On the contrary, when the Omentum is fallen out along with the Inteſtines, the latter are always to be replac'd before the former. (6.) If, with the Sacculus of the Peritonæum, the Inteſtine is alſo wounded, Suture muſt be us'd, in order to join the Inteſtine to the Wound of the Abdomen. As for the other Meaſures to be taken, they are the ſame with thoſe us'd in Wounds of the Inteſtines. See ABDOMEN. (7.) When the Inteſtine is found corrupted, the corrupted Part is to cut off, and the ſound Part, by Suture, join'd to the Wound of the Abdomen. (8.) It ſometimes happens, that the Bladder, eſpecially in pregnant Women, and thoſe labouring under a Suppreſſion of Urine, falls thro' the Ring of the abdominal Muſcles. When this Accident happens, the prolaps'd Part of the Bladder is to be replac'd in the ſame manner we have directed for the Reduction of the Inteſtines. (9.) After the Operation is perform'd, the looſe and ſuperfluous Parts of the Skin of the Scrotum are to be cut off with a Pair of Sciſſars; for thus a cloſer and ſtronger Cicatrix is form'd, by which means the Return of the Hernia is the more powerfully prevented. And, laſtly, Compreſſes are to be apply'd to the Scrotum, and ſecur'd by a Bandage proper for ſuſpending the Scrotum.

Of an EPIPLOCELE, *or Deſcent of the* OMENTUM.
